Mr. Guay (St. Boniface): In other words, at the time at which this was decided, it was the best plane for the use it was to be put to?

Dr. Arnell: The White Paper was quite specific concerning a new role, a mobility that, in fact, had never really been developed in the context of the White Paper. This was part of a \$1.5 billion equipment program and was clearly spelled out. If you go through

● 2035

it, you will find we have, in fact, procured almost everything that was in that original equipment list. We either have it in its entirety or we are getting towards the end of it. I would suggest that the DDH-280s is the only major expenditure still left of the five-year program. We noted today there is \$100-odd million still to be paid after this year. It can be documented from late 1964 right through to today that about 75 per cent or 80 per cent of the total program has been obtained. We have spent to date, as I recall, in the order of \$1.3 billion of the total. Given the increased labour costs and so on, the original program, as laid out in 1964, will probably cost, in its entirety, about \$1-3/4 billion instead of \$1.5 billions.

I think, personally, that this is pretty good for a five-year program, bearing in mind the inflation which we have experienced which was not, in fact, anticipated. The whole program was based on a 3 per cent per year increase in inflation. In fact, last year the

official figure, I believe, was 5 per cent. If a project's labour costs go up 10 per cent, no government is going to say, "we will not pay your increased labour costs".

Mr. Guay (St. Boniface): I am not interested in the cost at all.

Dr. Arnell: No, but I am just trying to show you that this is part of a complete program which, when read in its entirety, is quite a reasonable program, judging by the White Paper which was the basis for the program.

Mr. Guay (St. Boniface): You can appreciate the fact, Doctor, that I have not had a chance to read your program, particularly those sections concerning defence.

Dr. Arnell: I am only trying to explain to you that there is a rational history to these programs. It is only when you look at them out of context that they really do not make as much sense as they do in context.

Mr. Guay (St. Boniface): It would be rather difficult for you at this time to say that this will be the type of plane that will be efficient and appropriate for your training program. This would be relatively hard to define at the moment, would it not?

Dr. Arnell: The one point is that it will always be good as a future trainer. We will never have any problem using it as a trainer, even if it loses all other roles.

Mr. Guay (St. Boniface): I see.

Dr. Arnell: I think this is the point that General Adamson tried to make earlier.

Brig. Gen. Adamson: Exactly.

Dr. Arnell: We plan to use it for other purposes first, but its final role will be as a supersonic trainer to take the pilots from the tutor stage to the level of a high performance airplane, regardless of whatever else may be in the system.

Brig. Gen. Adamson: In point of fact, as Dr. Arnell well knows, we have what we refer to as a future resources requirement for a replacement for the T-33 in the early 1970s. If it so happens that the CF-5, as a result of the deliberations that are now being taken, ends up as a training aircraft, then as far as I am concerned, as the Director General Operations - Air, we are going to end up with an excellent trainer that will, in fact, replace the other resource requirements that we were going to have to put up anyway. Therefore, my feeling is that we have had the best of both worlds, as it were, and we are reaching a decision that is not going to cost us more money.

The Chairman: Do you have any further questions Mr. Guay?

Mr. Guay (St. Boniface): No, thank you, Mr. Chairman.

The Chairman: Mr. Ryan.

Brig. Gen. Adamson: I might just refer to the question of the previous questioner, if I may. He said that the aircraft could not fly from Toronto to Montreal. It could, in fact, do that and drop a load, although the load would not be as heavy as if it carried half weight from Toronto to Montreal. It is just a combination of what you want to equip it with within the total 1,500 mile range that it has.

● 2040

The Chairman: Mr. Ryan.

Mr. Ryan: After hearing about the plane's advantages, I would say that it is not a lemon at all. It is an all-around plane and it will have a great deal of utility in the future. It will not only serve 50 per cent of its life as a trainer, but in the interim, it could be useful in the event of war in Europe. In Canada, in the event of lodgements, it could be used as a tactical or even a strategic weapons carrier.

Dr. Arnell: You should not use the word "strategic". The point is, you encounter navigation problems with a strategic carrier. You are on your own for too long, and this is not designed with sophisticated navigation equipment at the moment. This is not to say that you might not be able to upgrade it, but this equipment is not in the aircraft which we are buying.

Mr. Ryan: Would you be inclined to agree with me that the fact it does not have a refueling plane to complement it is being used against it in rather an unfair way. It was really designed as an all around plane, and not just as a plane to replace the CF-104 in Europe.

Dr. Arnell: As I said earlier, and General Adamson reiterated the deployment of the aircraft, whether you have a refueling tanker to accompany it or not, is essentially a question of time, not of capability. As you said, you can fly this 1,500 miles on a ferry range. There is virtually nowhere in the world that you cannot go in 1,500 mile sections. The only thing is, it takes you longer if you have to stop and refuel every 1,500 miles than, in fact, if you . . .

Mr. Ryan: This would not be any good to us in the event of a nuclear war in Europe. Immediately it would not be of any use to us, and likely it is not of any use at all.

Dr. Arnell: It was never intended for that; it was intended for the other role.

Mr. Ryan: Yes.

Dr. Arnell: If you go back to the White Paper, there the other roles are made evident.

Mr. Ryan: But if we did have it in Europe on our bases there, it would still be useful as a tactical carrier. It might not reach the Russian border, as Mr. Guay points out, but it would certainly fly into the countries between the German and the Russian borders, it could be used to get through concentrated areas.

Dr. Arnell: Yes, but here again, I must say that this is looking for an alternate role for it than the one for which it was originally bought. If you go back to 1964, which is when this was put in the program, you will remember that the CF-104 was still a very new airplane. It was in Europe with a known life of the best part of 10 years. Therefore the CF-5 was not being bought for a job in Europe. This is about the one thing that you can say it was not being bought for.

You might have queried some of the other things, but the White Paper says these were some of the things we were going to do. Now we are five years down the line on the CF-104 and people are questioning the role of the 104s and so on; it is almost in looking for an alternate role that they say, "Can you not use this instead." But the 104s were there when this was bought and, in fact, can be there for a while longer, as you well know.

Mr. Ryan: I take it that this plane could fit in perfectly, or almost perfectly, into a new policy which is being involved. It might not, but it might.

Dr. Arnell: Yes.

Mr. Ryan: It is a very useful bit of hardware to have in our cupboard. Would this be correct?

Dr. Arnell: Anyone who might be critical about it now, is prejudging.

Mr. Ryan: Prejudging, that is what I wished to say.

The Chairman: Are there any further questions about this? Mr. Howard.

Mr. Howard (Okanagan Boundary): I was wondering about this business of repelling some lodgement. This term "lodgement" is used in Canada. I assume this means that anyone making such a "lodgement" would be kind enough to do so within 200 or 300 miles of a paved runway, from which the aircraft

could operate; otherwise it would not be of any use to you, would it?

Brig. Gen. Adamson: I think the words were those of the previous questioners and were not agreed to by myself. No, the airplane could not be used in that role. At least it would be very difficult and the lodgement would have to choose its place, as you suggested, within the range of the runways from which the airplane might operate. The airplane as Dr. Arnell has said at great length, is in full support.

Dr. Arnell: I should say something about the lodgement. I must admit that this afternoon I did not, in fact, go into this fully. Within this context, as it has been used within the military in looking at it, there are, in fact, areas, particularly on the two coasts, that are very much within the range of this aircraft which were in the old context of enemy lodgement. One can question whether this is a significant thing today, but do not forget that particularly, as a result of the fact that there were enemy lodgements during World War II, this has always been a possibility that can never be ignored com-

• 2045

pletely. Enemy lodgements were there, in fact, they were within the range of adequate airfields. We tend to think of Baffin Island as being the only place where there could be any lodgements, but there are many rather isolated coastal areas, on both coasts, within the province. I am not trying to raise a trivial point here at all. This is something that has been in the books since World War II. I do not say that there are any particular risks involved, however, it is a point that the military must have in the back of its mind along with everything else.

[Interpretation]

Mr. Prud'homme: Supplementary question. Right now is there one . . .

[English]

The Chairman: Mr. Prud'homme on a supplementary.

[Interpretation]

Mr. Prud'homme: Right now, is there one or are there any countries which have manifested their desire to use the CF-5?

[English]

Dr. Arnell: He is asking whether there are many countries that have decided to use the CF-5.

Brig. Gen. Adamson: The CF-5?

Dr. Arnell: Well, the F-5.

Brig. Gen. Adamson: Well the CF-5 has been purchased by Holland as well.

Dr. Arnell: I mean figures on the F-5.

Brig. Gen. Adamson: The F-5 is in service in a number of countries around the world. We could get the number for you, but at this time I can quote some examples: The Philippines and Norway have it and it has been given on the Military Assistance Programs, by the Americans, to some of the Middle East countries. It is used extensively around the world, that is, the American version of the aircraft. Our version of it has been considerably modified.

Mr. Prud'homme: What does Holland use it for?

Brig. Gen. Adamson: Holland is using the aircraft for the same role in which we are intending to make it useful—close support.

Mr. Prud'homme: Do you think other countries might follow Holland's example in using it?

Brig. Gen. Adamson: I think Mr. Pepin was in Malaysia, suggesting that we might sell some there. That is one other example. It is a minor sale, but it is a possibility.

Mr. Prud'homme: Mind you I knew about Holland. Many people are under the impression that it is a Canadian mistake, but now, if it were a mistake, it would be a collection of them.

Brig. Gen. Adamson: It is an airplane that has been very successful in its original role in the States, and that role was as a trainer. It is now being modified in the United States from the original engine combination to an updated engine called the -21 engine, to give it greater capability than our airplane, because the engine will have more thrust. It is again being looked at by them for various combinations that they might be able to make useful themselves, in addition to other Military Assistance Programs that they might be considering. It is in wide use throughout the world.

Mr. Prud'homme: Would it be very expensive for us to modify it accordingly?

Brig. Gen. Adamson: We have no particular wish, within the concept that we are intending to put it into use now, or for any other use that we might want to use it for, to modify it. It is perfectly adequate as it is.

The Chairman: Are there any other questions for Dr. Arnell or General Adamson? If not, on your behalf I would like to thank Dr. Arnell for being so patient with us. I would also like to thank you, General

Adamson, for coming here this evening to give us information about the planes. Thank you very much Dr. Arnell.

Dr. Arnell: Although some of the questions have been difficult, I cannot say that I did not enjoy it.

The Chairman: Gentlemen, we will adjourn until Tuesday, May 6, 11 a.m., in Room 308 West Block, when the witness will be Lieutenant General F.R. Sharp, the Deputy Commander of NORAD. We will commence our NORAD investigation next week. Thank you, very much.

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament
1968-69

STANDING COMMITTEE

ON

**EXTERNAL AFFAIRS and
NATIONAL DEFENCE**

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 41

TUESDAY, MAY 6, 1969

Respecting
Policy-defence and external affairs.

WITNESSES:

Hugh R. Stewart,
Clerk of the Committee.

REPORT TO THE HOUSE

Tuesday, May 6, 1969.

The Standing Committee on External Affairs and National Defence has the honour to present its

SIXTH REPORT

Pursuant to its Order of Reference of February 20, 1969, your Committee has considered the following items listed in the Estimates 1969-70:

Votes 1, 5, 7, 10, 12, 15, 20, 25, 30, 35, 45, 48 and 50, relating to the Department of National Defence; and

Vote 55 relating to Defence Construction (1951) Limited.

Your Committee commends them to the House.

A copy of the relevant Minutes of Proceedings and Evidence (*Issues Nos. 36, 37 and 40*) is tabled.

Respectfully submitted,

IAN WAHN,
Chairman

MINUTES OF PROCEEDINGS

Tuesday, May 6, 1969
(64)

The Standing committee on External Affairs and National Defence met at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Barrett, Brewin, Buchanan, Cafik, Fairweather, Gibson, Guay (*St. Boniface*), Laniel, Laprise, Legault, Nesbitt, Nowlan, Penner, Prud'homme, Roberts, Ryan, Stewart (*Marquette*), Stewart (*Cochrane*), Wahn, Winch (20).

Witnesses: Lieutenant General F. R. Sharp, Deputy Commander of NORAD and Brigadier General N. L. Magnusson, Deputy Director, NORAD Combat Operations Center, Colorado Springs.

The Chairman made an opening statement, introducing the witness, Lieutenant General F. R. Sharp, Deputy Commander of NORAD. General Sharp made an introductory statement respecting NORAD.

Members of the Committee questioned General Sharp about NORAD, especially in relation to his working paper on this subject, which had been distributed previously.

Copies of a NORAD booklet entitled *Aerospace Defence Information*, were distributed.

It was agreed that General Sharp's advance presentation and his biography be printed as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix XX*)

With the questioning continuing, at 12:40 p.m. the Committee adjourned until 3:30 p.m. this day.

AFTERNOON SITTING (65)

The Standing Committee on External Affairs and National Defence met at 3:35 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Buchanan, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Legault, Nowlan, Penner, Roberts, Ryan, Wahn, Winch (12).

Witnesses: Lieutenant General F. R. Sharp, Deputy Commander of NORAD and Colonel Henry M. Walsh, Director Continental Plans, Canadian Forces headquarters.

During this afternoon sitting, Members completed their questioning of General Sharp. He agreed to provide the Committee with additional information concerning the cost of the various Canadian components in NORAD.

The Chairman thanked Lieutenant General Sharp, Brigadier General Magnusson and Colonel Walsh for their testimony.

At 5:15 p.m. the Committee adjourned, until Thursday, May 8, 1969 at 8:00 p.m., when the Secretary of State for External Affairs and the Minister on National Defence will appear.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, May 6, 1969. • 1110

The Chairman: Gentlemen, I think perhaps we are ready to begin.

Today the Committee begins its review of Canadian air defence policy, in particular its review of NORAD. I would like to welcome to these hearings on your behalf as our first witness Lt. General F. R. Sharp, Deputy Commander of NORAD.

The Committee requested the Department of National Defence to prepare a comprehensive working paper on North American air defence to serve as a basis of this preliminary discussion with General Sharp. This paper was received yesterday and the clerk has distributed copies to members. The paper outlines the historical background of the NORAD Agreement, the current organizational arrangements of NORAD, the threat that NORAD is designed to meet, the current forces and capabilities of the NORAD system, the potential evolution of the threat and possible improvements in the air defence system.

I would like to point out that, having only received the working paper yesterday, our discussion today can only be of a preliminary nature. After completing it, and after giving the paper detailed consideration, the Committee may wish next month to invite General Sharp to appear again if that would be possible for him.

General Sharp has had a distinguished career in the Canadian forces. Prior to his present assignment as Deputy Commander of NORAD, he served as Deputy Chief of the Defence Staff. A detailed biography has been circulated to members. We are grateful to General Sharp for coming from Colorado springs to appear before us today.

Before asking the witness to make any introductory remarks he may wish to make, I should mention that General Sharp is a public servant. He is here as a representative of the Department of National Defence and is not in a position to express his personal views in a public forum such as this committee's hearing. In particular it may be difficult for him to comment in areas of policy where the government position is currently under review. I am sure members will respect his position in this matter.

And if a question is asked which would be difficult for General Sharp I know he will free just to indicate that he is not in a position to answer for this reason.

General Sharp, do you have a few introductory remarks?

Lieutenant General F. R. Sharp (Deputy Commander of Norad): First of all, Mr. Chairman, I would like to tell you that it is a privilege to appear before this Committee again; I hope that this subject will not be quite as controversial as was the subject during my last appearance.

Although time has been short, I understand that most of you have had an opportunity to read the paper. I hope it will help you in your deliberations. I am here today to answer any questions that I can concerning NORAD. I have with me, General Magnusson, who is the Deputy Chief of the Combat Operations Center in Colorado Springs, and Colonel Walsh, who is a member of the Planning Staff at Canadian Forces Headquarters in Ottawa.

The Chairman: Thank you very much, General Sharp.

Before calling on questioners, I might mention to members that we will be meeting at 8 o'clock Thursday night when the Secretary of State for External Affairs and the Minister of National Defence, will be here to give their views on NORAD. That will be this coming Thursday in the evening. Mr. Ryan?

Mr. Ryan: General Sharp, I note on page 4 of your presentation that there are 683 American NORAD personnel in Canada and 249 Canadians in the United States. I understand that the 249 Canadians are well spread throughout the four main regions that cover parts of both the U.S. and Canada.

Lt. Gen. Sharp: That is correct; they are also concentrated in NORAD headquarters in Colorado Springs.

Mr. Ryan: Yes. Would there be any place other than the headquarters where they would be con-

centrated, or would they be pretty well spread through the U.S.?

Lt. Gen. Sharp: No, there is a concentration in Brunswick, Maine, and also a smaller concentration in Tacoma, Washington state.

Mr. Ryan: Yes, thank you. In your opinion, do our Canadians learn everything about NORAD and its equipment, or do they just learn about those things that they need to know?

Lt. Gen. Sharp: No, as far as NORAD equipment is concerned, they can learn everything. However, they should first of all learn about the equipment with which they have to work. They can learn about equipment with which they do not have to work; there is no restriction in this sense, if that is what you are trying to determine.

Mr. Ryan: Yes. Do our men receive much in the way of training from the Americans, or is this all Canadian training?

Lt. Gen. Sharp: There are some special courses in connection with the computers that we receive from the Americans. There are also some weapon training courses which we receive from the Americans.

Mr. Ryan: When we were with the NATO tour in the southern United States last September, apparently there were two Canadian officers at Fort Bliss who ranked one and two in the class there. What would that work be with which they were associated there?

Lt. Gen. Sharp: I do not know, Mr. Ryan. I would have to get their names and see what courses they were on.

Mr. Ryan: Yes. You point out that the continent has been divided into five regions to enhance operational control: the Western, Eastern, Central, Northern and Alaskan regions. Apparently, however, no Canadians are in Alaska; we are not represented there at all. Is there an explanation for this?

Lt. Gen. Sharp: Yes. The general principle is that where a region's geographic area includes Canada, there will be Canadians on the staff; if it does not, there probably will not be any Canadians. Alaska does not cover any Canadian territory, and therefore no Canadians are on the staff.

Mr. Ryan: I see. You say that the main threat direction would cross Canada, that is, from Russia across Canadian territory, to hit the main part of the United States, presumably, and that it is still necessary to have defence against manned bombers over Canada. Would you explain why this is necessary?

Lt. Gen. Sharp: Well, from the military point of view, NORAD has been given the responsibility by both the Canadian and American governments to provide for the air defence of North America; as long as we have that responsibility, we must look at the threat in terms of capabilities. The Russians have the capability of bombing this continent, and since the governments have given us the responsibility to defend against this threat, we need the wherewithal to do so.

Mr. Ryan: I understand that the Russians have developed a stand-off capability with their bombers. In other words they can fly within a certain distance from their target, let us say 200 or 300 miles, and let loose an atomic weapon that would zero in on its target with great accuracy.

Lt. Gen. Sharp: That is correct.

Mr. Ryan: I understand also that the Russians have not abolished their present bombing fleet.

Lt. Gen. Sharp: No, they have not done away with it, however, to be quite fair about this, neither have they increased it.

Mr. Ryan: No. I understand that they have the capability of producing a more sophisticated bomber than the one they have now, but that they have not proceeded with it. Is this the case as far as we know?

Lt. Gen. Sharp: That is the case as far as we know, right.

Mr. Ryan: Why is it, General, that we place so much emphasis on the North when, in these days, the FOBS can come around at us from other directions, and particularly from the East and the West more than from the North? What do we have to guard against the threat from France or Russia or some other country, by nuclear submarines or nuclear emplacements, along our Continental Shelf?

Lt. Gen. Sharp: That is a large question. I think you have to go back and look at the development of Russian weapon systems. It started out with the bomber; their only means of approach, taking into consideration their range, was over the North. We began to get into the ICBM era and, again, the only means of approach was over the North. When your development which you have mentioned was coming along...

Mr. Fairweather: Mr. Chairman, excuse me. We are having great difficulty in hearing the witness.

Lt. Gen. Sharp: I am sorry. Your developments which you have mentioned do indeed, or might indeed, give the Russians the capability to approach, with something such as FOBS, from another direction. You will notice in the paper that was given to you, a mention of a new radar which is being located in Florida, and which is designed to look to the South for the very reason that you have mentioned. However, I believe I am correct in saying that although the Russians perhaps have this capability, they have not demonstrated the FOBS capability as yet. In other words, up until now, the threat has been from the North; in the future it might be from anywhere—not necessarily will be, but might be.

Mr. Ryan: Are we in a position to prevent nuclear missiles from submarines or emplacements on the

● 1120

Continental Shelf from landing in Canada and the United States, from our Eastern and Western coastal areas?

Lt. Gen. Sharp: Yes. If we take the case of ballistic missiles launched from submarines. At the moment, these are of relatively short range—within a few hundred miles—and they would have to come in off the North American coast. To counter this threat and, at least, to give us warning of this—again I believe that it is mentioned in the paper—radars along the coast are being modified so that they will be able to detect launches from submarines.

Mr. Ryan: What do we have that can stop the missile, once we know that it is coming in?

Lt. Gen. Sharp: Nothing.

Mr. Ryan: Nothing at all?

Lt. Gen. Sharp: No.

Mr. Ryan: Do we now have devices that can detect the placing or the actual existing emplacement of submarine silos or banks of weapons, either on our continental shelves or under the ice of the Arctic?

Lt. Gen. Sharp: I am sorry. I prefer to answer that question in closed session.

Mr. Ryan: On page 25, paragraph 2, you say:

The threat of a ballistic missile attack is increasing as the Soviet Union increases its' inventory of inter-continental ballistic missiles and submarine-launched submarine ballistic missiles.

Is this an increase of a large order, or is it just a gradual increase over the last few years?

Lt. Gen. Sharp: It is both. It is a steady increase in totals, and it is of a fairly large order. I would like to make one statement about the threat. I know that the papers say that the threat has increased. From my own personal point of view, the capability has increased. Threat also includes intention. I do not know the Russian intention. However, the Russian capability is increasing.

Mr. Ryan: And you state, also on page 25, paragraph 3, that:

At present, there is no method by which such satellites . . .

Which would mean the space vehicle satellites.

. . . could be identified as hostile and; therefore, warning of an attack would not be available.

This is the present situation. Am I correct?

Lt. Gen. Sharp: This is the present situation. That is correct.

Mr. Ryan: Thank you Mr. Chairman.

The Chairman: Mr. Winch.

Mr. Winch: Mr. Chairman, I wonder—if you would agree, in order to expedite the work of the Committee—if I could present my Thursday's questions at once. Would that be agreeable, sir?

The Chairman: I think that Lt. Gen. Sharp could make a note of the questions and answer them one at a time.

Lt. Gen. Sharp: Of course.

Mr. Winch: Are you agreeable? I think that it might expedite the work.

First, General, could you inform us if NORAD is strictly an alliance for defence against man-bomber aircraft and if so, in the event of attack, is it's purpose to down the bombers over Canadian territory?

Secondly, does NORAD have control graphs situated at Colorado Springs which show on the screen all flights on and around North America? What co-ordination does NORAD have with air and sea rescue if—I think I have the right term—a blip disappears from your screen? Is there still an aircraft headquar-

● 1125

ters for NORAD in the air, over the United States, 24 hours a day? What is the purpose and the efficiency of the NORAD control headquarters in Canada?

Lastly, what is the purpose and the function of NORAD exercise, which I understand is to take place next week as a joint United States and Canadian manoeuvre?

Lt. Gen. Sharp: I believe you first question was, "Is NORAD strictly an alliance for defence against the man-bomber?" In so far as active defences—that is, being able to do something about the bomber vis-à-vis, say, an ICBM—the answer is yes. However, NORAD also has the responsibility for attack warnings by other means, say ICBM's or submarine-launched ballistic missiles.

Mr. Winch: I am sorry, I do not want to interrupt. Do I understand, that the NORAD system is such that it can detect ICBM's?

Lt. Gen. Sharp: That is correct. There is no doubt about it.

Mr. Winch: Can you state the height and range or is that classified?

Lt. Gen. Sharp: We can detect them at any height at all, but the length of warning it will give depends upon the height of the trajectory. We can detect that.

Mr. Winch: Is it the idea to shoot them down over Canadian soil?

Lt. Gen. Sharp: No, the idea is to warn. We do not have the capability to shoot them down. The idea is to warn in sufficient time in order to retaliate, if it is decided to do so. Hopefully, this will be sufficient deterrent.

Mr. Winch: You mean, to warn the Strategic Air Command, is that the correct term?

Lt. Gen. Sharp: No, it is to warn much higher than that. Actually, it is to warn the President of the United States.

Now, is the purpose to shoot down bombers over Canadian territory? Our aim is to shoot down bombers as far North as possible, in most cases that probably would mean over Canadian territory, but it might mean over Alaska which is American territory.

Mr. Winch: I am sorry. Can I then ask, is your warning system such that you would have the time to give the warning and get the alliance forces to shoot them down over Alaska?

Lt. Gen. Sharp: Oh yes. The answer is yes, definitely.

Mr. Winch: The next is on your relationship with air sea rescue.

Lt. Gen. Sharp: Yes, there are . . .

Mr. Winch: I had the privilege of being in Colorado and of seeing the screen graphic that you have.

Lt. Gen. Sharp: We have a very quick and close relationship with the air-sea rescue agencies. The co-ordination, in the situation that you postulated, would not take place from Colorado Springs. It would take place from the division headquarters, one of the lower formations which keep minute to minute track of aircraft—not all aircraft but certain aircraft—and co-ordination would come from that headquarters, if the blip disappeared and if other circumstances indicated that search and rescue was required. It would be from this headquarters that the search and rescue organization was contacted. They have direct and, in most cases open, lines. In other words, it is not even a question of dialing; it is a question of picking up the telephone.

Mr. Winch: Then as far as air-sea rescue is concerned, it is divisional and you do not require the establishment at Colorado Springs? I am now speaking of the civilian, not the military aspect.

● 1130

Lt. Gen. Sharp: I may be wrong, but I do not believe that we have a civilian search and rescue aspect at Colorado Springs, have we not?

The Chairman: Would you approach the table and use the microphone, Brig. Gen. Magnusson.

Brig. Gen. N. L. Magnusson (Deputy Director, NORAD Combat Operations Center, Colorado Springs): We do not have a search and rescue organization at Colorado Springs. We simply monitor all flights. They are also monitored within each position and region. As Lt. Gen. Sharp mentioned, co-ordination of search and rescue would be shared between the division and the search and rescue agency.

Mr. Winch: Thank you, sir. The next question concerns headquarter control.

Lt. Gen. Sharp: The question, as I understood it, was based on the assumption that you thought that there was a NORAD control aircraft in the air 24 hours a day. To my knowledge that is not true now. I do not think it was in the past.

Mr. Winch: My understanding was—when our Committee flew to Colorado Springs—that in the event that Colorado Springs went out, there would be an

aircraft somewhere over the United States that was there 24 hours a day and that could take over. I mean is it up 24 hours a day? That was my first one. What then is the position of North Bay?

Lt. Gen. Sharp: Mr. Brewin, those are SAC airplanes. They are not NORAD airplanes that perhaps you are referring to.

Mr. Winch: I understand that they have some connection with Colorado Springs.

Lt. Gen. Sharp: There are not any NORAD airplanes that do this.

Mr. Winch: What is North Bay's position?

Lt. Gen. Sharp: The Headquarters at North Bay is a regional headquarters, which is the next lower organizational formation below that of NORAD Headquarters. It is also a divisional headquarters which is one step further down. The function of the divisional headquarters is to give day-to-day control to the SAGE system of intercepts, to intercept aircraft during exercises and to provide actual intercepts, if necessary.

Mr. Winch: If Colorado Springs went out, is North Bay capable of taking over its function?

Lt. Gen. Sharp: Not at present.

Mr. Winch: I beg your pardon.

Lt. Gen. Sharp: Not at present.

Mr. Winch: Is it anticipated?

Lt. Gen. Sharp: There is a NORAD request—a recommendation, I imagine—to give North Bay this capability.

Mr. Winch: Can I now ask about the exercise next week?

Lt. Gen. Sharp: Yes, I am sorry. Each week we conduct many exercises. I am not familiar, in detail, with the purpose of this particular exercise. In general, we conduct the exercises in order to give training to our ground and air crew, to our computer operators, and to our battle management staff in an attempt to keep them up to date on procedures and to attest their effectiveness and efficiency. In other words, it is training. Each exercise might be designed for a particular purpose. It might be designed particularly to give training to the people in the SAGE centre or particularly to give counter measures training to the air crew. I do not know what this particular exercise is designed to do, but in general, it will cover one of those things that I have mentioned.

Mr. Winch: May I finally ask, is it contemplated that the organization of NORAD, if continued, will have any part to play in a proposal of anti-ballistic missile, missile anti-anti et cetera?

Lt. Gen. Sharp: Is it contemplated by whom?

Mr. Winch: Is there any tie-in, any relationship, or any function for NORAD, if this policy now being discussed goes into effect in the United States?

Lt. Gen. Sharp: I think, Mr. Winch, that this is a
● 1135

controversial problem even in the United States. I do not think that it would be proper for me now to make any comment on ABMs.

Mr. Winch: You cannot even state whether NORAD would have any function if that went into effect?

Lt. Gen. Sharp: Since the United States has not decided to go ahead with it, they cannot possibly have made a decision like that.

Mr. Winch: Thank you.

The Chairman: Mr. Nowlan, and then Mr. Ralph Stewart. Mr. Nowlan.

Mr. Nowlan: General Sharp, perhaps you are not able to comment on this, however, it does flow a little from Mr. Winch's last question. There is some evidence or testimony in the United States that submarine lodge missiles, the Polaris, which everyone thought at one time were beyond detection and/or destruction are now not quite the deterrent which we thought that they might be. Could you comment on that?

Lt. Gen. Sharp: I have read what I think is the piece of paper that you have read. I cannot comment on it simply because I do not know the answer. As a general comment, however, due to the rate of progress, or increases in knowledge in science and technology these days, it would certainly not surprise me if someone were to discover a way of countering this weapon.

Mr. Nowlan: This leads me more or less to the other question of Mr. Ryan's which you answered earlier. You pointed out that NORAD has not the capability to intercept or destroy ballistic missiles. That is on page 14 of the paper which we received. It is mainly a detection agency as far as ballistic missiles are concerned. The concept has been until now, at least, that the retaliatory force of Minutemen sites, Polaris submarines and airborne SAC bombers was the deterrent. You cannot discuss this area at all; although, you do say that the capabilities, the assets and the liabil-

ities in these different types of deterrents have changed so that the whole picture might change. Is that a fair way to put it, as far as you are concerned?

Lt. Gen. Sharp: Yes.

Mr. Nowlan: There must have been a conscious decision at one time, not to attempt the interception and destruction of inter-ballistic missiles and instead rely on the deterrent of the second strike.

Lt. Gen. Sharp: I do not think I would completely agree with that. The technology has not existed until recently.

Mr. Nowlan: I see.

Lt. Gen. Sharp: I do not think that you could say that it was a conscious decision not to build something. I do not think that it was possible to do so until recently.

Mr. Nowlan: We were aware of interballistic missiles.

Lt. Gen. Sharp: That is correct.

Mr. Nowlan: We were also aware of other types of these formidable devices in the air. I appreciate that this is an area in which you may not be able to explore, but certainly someone must have thought that the retaliatory deterrent force of Minutemen, large missiles and the SAC bomber would be enough to scare off anyone who wanted to use the intercontinental missile.

Lt. Gen. Sharp: That is correct.

Mr. Nowlan: That must have been assessed and considered?

Lt. Gen. Sharp: I would think that is correct.

Mr. Nowlan: I do not know how this Committee is able to make any value judgment on this, unless we obtain some information. Have those three factors changed so dramatically because technology has changed, that this is no longer a valid assumption? This is my point.

Lt. Gen. Sharp: You can get some very conflicting answers to that one.

Mr. Nowlan: In my view, the answer is yes. The technology has changed, and this makes these assumptions invalid or subject to revision.

Lt. Gen. Sharp: Yes, subject to revision and reassessment.

Mr. Nowlan: Re-assessed. I will not press much further with that. I must say that unless this Committee, Mr. Chairman, can obtain information on that at some stage, then it will make our job of discussion or definition of the interballistic missiles as an ABM program a little difficult. In the discussion of what we have today—in contrast to what we might have or what any other country might have—I would like to direct my questions, General Sharp, to two areas. One is the CF-5, the other is the BOMARC Missile. Concerning the CF-5, as I understand it, we have three interceptor squadrons now, the CF-101 B Voodoo. From your point of view—and this is strictly technology or within your competence, I would hope—is there any suggestion or could the CF5s be used anywhere within the NORAD concept?

● 1140

Lt. Gen. Sharp: To my knowledge there is no suggestion that they will be. Certainly, they could not be used in the present NORAD concept without significant modification. It would be necessary for me to check with the engineers to discuss if that is even possible.

Mr. Nowlan: Are the three CF-101 B Voodoo squadrons, which we have along with the 18 American squadrons, equipped with nuclear warheads?

Lt. Gen. Sharp: Yes.

Mr. Nowlan: Has that always been the case?

Lt. Gen. Sharp: It has been the case for a considerable period of time. I am not too sure whether or not it was always the case. Did we ever have 101's without nuclear warheads?

Gen. Magnusson: No, sir. The 101's have always been equipped with nuclear weapons. They also have conventional weapons.

Mr. Nowlan: I want to speak of the Bomarc. Is that the Sidewinder the 101 uses? That really was not my supplementary.

Gen. Magnusson: The Sidewinder is the Genü.

Mr. Nolan: The Sidewinder is not a nuclear device, is it?

Gen. Magnusson: It can be.

Lt. Gen. Sharp: It can be.

Mr. Nowlan: In any event, coming to the Bomarc and the two squadrons that we have at Mazacaza or wherever . . .

Lt. Gen. Sharp: Macaza.

Mr. Nowlan: I massacred the name. However, they are at Macaza and North Bay. Are those two squadrons equipped with nuclear warheads?

Lt. Gen. Sharp: Yes, they are.

Mr. Nowlan: Are they fully operational?

Lt. Gen. Sharp: Yes, they are.

Mr. Nowlan: How long has this been in effect?

Mr. Cafik: Since Mr. Diefenbaker left office?

Lt. Gen. Sharp: Since 1963, I think.

Mr. Nowlan: You say they are fully operational now. There is no hiatus here. The government said they were going to go ahead with it, and yet I understood there was a pause which almost reflected that they really did not equip the Bomarc at North Bay or Macaza.

Lt. Gen. Sharp: You are going back a few years.

Mr. Nowlan: A couple of years.

Lt. Gen. Sharp: At the present time they are fully operational.

Mr. Nowlan: What I want to find out is when did they become fully operational in the NORAD sense? In the same sense than the eight squadrons in the . . .

Lt. Gen. Sharp: 1963.

Mr. Nowlan: Again, the Bomarc is purely a bomber deterrent?

Lt. Gen. Sharp: Yes.

Mr. Nowlan: So, as far as the intercontinental missile is concerned, whether it is from a submarine or from another continent, as you said earlier, NORAD has no intercept or destroy function as far as this device is concerned?

Lt. Gen. Sharp: That is correct.

Mr. Nowlan: That is all.

The Chairman: For the information of the members, I might mention that we hope to have a briefing next week on ABMs by Dr. Lindsey of the Department of National Defence. Mr. Ralph Stewart.

Mr. Stewart (Cochrane): Before I begin, Mr. Chairman, would it be possible to have some of these pieces

of literature sooner? Is it a question of not having them presented in time? Even if it is on a weekend, this would be fine. We usually work weekends and we do not mind reading them on weekends. We are at a bit of a disadvantage if we cannot read these before we come in.

The Chairman: I know it would have been helpful if we could have had this particular working paper, which is a long statement and a very helpful one, available to members before the weekend. We did, in fact, receive it from the Department of National quite late on Friday which made it impossible to distribute them. However, are doing our best to get them as soon as we possibly can so that members will have a more adequate opportunity of studying them.

Mr. Stewart (Cochrane): Perhaps the steering committee could also consider the possibility that briefings to familiarize the Committee with the various aspects of NORAD would probably be much better and more useful if they were given on the site of either North Bay or Colorado Springs.

● 1145

The Chairman: Thank you, Mr. Stewart.

Mr. Stewart (Cochrane): General Sharp, I wanted to go back to this threat question for a moment. When we were in Europe we spoke to different people and some of us seemed to have a difficult time getting them to admit that the defence of North America was, in fact, a contribution to NATO in the over-all sense that we are members of NATO, and any defence for this continent is also a defence of NATO.

In speaking about the threat the opinion there was that the threat to Canada lies in Europe. Some even went so far as to say that there was no threat to North America. Could you compare the two threats—the threat from that angle and the threat to North America directly? Would you say that the threat in Europe is greater, or that the threat to North America is greater?

Lt. Gen. Sharp: I do not know that I am capable of giving you a reasonable answer on that. I suppose this is to a certain extent a personal view. The idea is to take the minimum action required to deter war, because it must never happen.

I do not think one can say that you can deter it better, or all more likely to be able to deter it, by having forces in Europe rather than by having them in North America, or vice versa. I think both contribute to the deterrence. I really do not think it is fair to try to make a comparison saying that the threat is greater in Europe than in North America. They are together,

but the idea is to be able to somehow deter war and to do this at minimum cost.

Mr. Stewart (Cochrane): In any case, General, would you agree that there is a threat to North America?

Lt. Gen. Sharp: I would agree that the Russians have a capability of destroying North America. To say that there is a threat at the present moment, right now, would mean that I was also saying that they had the intention of doing so right now.

An hon. member: You do not believe that?

Lt. Gen. Sharp: Is that a supplementary question?

Mr. Stewart (Cochrane): He was asking for a personal opinion, I think.

General, when you are at NORAD and you overlook the plotting board, or the tote board or whatever is in operation at the moment, and you see the whole picture for North America, could you tell us, if it is not classified, is our air space, North American air space, being violated?

Lt. Gen. Sharp: As of right now, the answer is no.

Mr. Stewart (Cochrane): Does it happen often that aircraft come into our area?

Lt. Gen. Sharp: With a possible one or two exceptions, although there have been many that have approached quite closely to our area, they have not, in fact, penetrated.

Mr. Stewart (Cochrane): We were talking a while ago about submarines. I assure that you have on your plotting board the location of submarines that are close to North America. Can you tell us anything about that or is it strictly classified?

Lt. Gen. Sharp: It depends on what you want to know about it.

Mr. Stewart (Cochrane): I would like to know their numbers, how close they are, do they come down the St. Lawrence like they used to, and that kind of thing?

Lt. Gen. Sharp: The answer is that they do not come even near to that close.

Mr. Stewart (Cochrane): I wonder if we could change a little bit. In the defence of North America we consider the Maritime role as part of this defence. Is Canada capable of making a contribution in that regard with our present equipment in the navy?

Lt. Gen. Sharp: I can answer that question. It really does not have much to do with NORAD. Of course we

can make a useful contribution with our present equipment.

Mr. Stewart (Cochrane): Does NORAD have control over the sea forces?

• 1150

Lt. Gen. Sharp: No.

Mr. Stewart (Cochrane): What about SACLAN? Is that a separate thing?

Lt. Gen. Sharp: It is completely separate.

Mr. Stewart (Cochrane): That has nothing to do with NORAD?

Lt. Gen. Sharp: No.

Mr. Stewart (Cochrane): General, this next question deals with your previous experience before going to NORAD, but it is tied in with it. We have a number of reserve forces in Canada which train from time to time. Do they make a contribution to the defence of North America, or would they if we were attacked?

Lt. Gen. Sharp: They make a contribution to the defence of North America, yes, but they are not forces designed to assist in the direct air defence of North America, and therefore do not come under NORAD. However, they certainly would make a contribution to the defence of North America if required to do so.

Mr. Stewart (Cochrane): If suddenly we did not have them any more, would you consider that we had lost a great deal, besides the fact that we would have gained \$50 million?

Lt. Gen. Sharp: I think that everything we have right now in the services is very useful; if we lost them we would lose to that extent. I think they are useful, yes.

Mr. Stewart (Cochrane): Thank you very much, General.

The Chairman: Mr. Gibson and then Mr. Nesbitt.

Mr. Gibson: General, sir, at page 14 of the brief, I quote:

THE SPACE THREAT

It has been known for some time that the USSR has been developing a space vehicle which could have a "fractional orbital bomb" capability.

I am unfamiliar with the terms and the concept; I would be most obliged if you would enlarge on that, sir?

Lt. Gen. Sharp: Yes. Present space vehicles orbit around and around the earth; this gives you a better opportunity to determine their exact trajectory. If, however, somebody could develop a vehicle that would only go part way around the earth, and then come back down again, you would get much less warning and much less opportunity to determine its trajectory; so the fractional orbit means exactly what it says.

Mr. Gibson: It means then, just going a part of the way. At page 17 of the brief, sir, you referred to and I quote again:

All NORAD interceptors are equipped to carry air-to-air missiles with nuclear warheads.

This puzzles me. I thought the object of an interceptor was merely to knockout an enemy plane in its course. What is the purpose of these nuclear warheads on these particular interceptors?

Lt. Gen. Sharp: Their purpose is to do what you said, to knock it out.

Mr. Gibson: I see. If these nuclear warheads are fired, is there any danger of proliferation from the knocking out of the aircraft?

Lt. Gen. Sharp: Of course there would be some fallout.

Mr. Gibson: Yes. They are designed to be effective over Canada, I presume.

Lt. Gen. Sharp: Yes. They are designed to be effective; they are equally effective over Canada and the United States. They were not designed specifically to be effective only over Canada.

Mr. Gibson: No. Thank you, that is all.

The Chairman: Mr. Nesbitt.

Mr. Nesbitt: Yes, there are two or three questions I would like to ask if I may, General. The questions all relate to those raised by Mr. Stewart: I realize that you may not find it possible to answer some of them.

First then, how many approaches to North America from the Atlantic side, from the Pacific side and over the Polar regions, have been made in the last 12 months by Soviet aircraft?

● 1155

Lt. Gen. Sharp: I cannot give you a direct answer to that, Mr. Nesbitt. I can say however that there has been a number of approaches in the last few months; there has been an increase over previous approaches.

Mr. Nesbitt: Could you tell us . . .

Mr. Winch: I wonder if I may have a supplementary on that Mr. Nesbitt?

Mr. Nesbitt: Yes.

The Chairman: Mr. Winch on a supplementary.

Mr. Winch: Yes, General, in view of the question just asked, as evidence is conclusive of the use of U.S.A. spy planes over certain territories, can NORAD as a detection system, detect if any spy planes have flown over Canada, and if so, have they been noticed?

Lt. Gen. Sharp: The answer is yes; in recent times I have been down to NORAD, and there have not been any.

Mr. Winch: But you cannot detect?

Lt. Gen. Sharp: Correct.

The Chairman: Mr. Nesbitt.

Mr. Nesbitt: Yes. I am not pressing for answers if it is not wise to do so, but could you give us any indication of whether the increased number of approaches have been from the Pacific region, the Arctic region or the Atlantic region?

Lt. Gen. Sharp: The Arctic.

Mr. Nesbitt: The Arctic region. The second question . . .

The Chairman: May I ask a supplementary? How close would they come on an approach or can you say, General Sharp? What do you mean by an approach?

Lt. Gen. Sharp: Generally speaking an approach is within 30 or 40 miles, and sometimes even closer.

The Chairman: Thank you.

Mr. Nesbitt: The second question relates to submarines; you mentioned that they do not come into the St. Lawrence area, but that they regulated farther out. Could you give us an idea of how far they come from the actual coast line of North America? If you cannot, I realize that it may not be wise to answer that.

Lt. Gen. Sharp: I do not know the answer to that question. In very general terms, I would say, 300 miles; some, I am sure come closer. I would like to be more precise in answering your question.

Mr. Nesbitt: If they came within 300 miles of the coast, their capability at the present time of sending missiles accurately to major targets, would be somewhat limited.

Lt. Gen. Sharp: Yes. You must also remember, Mr. Nesbitt, that there are a great many Russian submarines that do not have the sublaunched ballistic missile capability, a great many.

Mr. Nesbitt: Now, the third question; it is composed of a couple of parts. Is the military assessment at the present time presuming that a deliberate surprise Soviet nuclear attack on the mainland of North America is perhaps unlikely?

Lt. Gen. Sharp: At the present time?

Mr. Nesbitt: Yes.

Lt. Gen. Sharp: In my view at the present time, it is unlikely. You are getting into the assessing of intentions and this is really a political—

Mr. Nesbitt: It is really a political capability plus intentions which requires an assessment.

Lt. Gen. Sharp: It is more of a political assessment, when you get into assessing intentions, than it is a military one.

Mr. Nesbitt: That is why I phrased the question in that way: it is military assessment which is, of course, capability plus intention; for which information is gathered from other sources.

The second part of my question is this. Is it considered likely—and this comes closer to capability perhaps, than to intention—that any Soviet military adventures of a conventional nature might eventually escalate into a nuclear war, against mainland North America, such as the Arctic Islands of Canada, the Aleutians or even Greenland?

Lt. Gen. Sharp: I think not.

Mr. Nesbitt: It is not considered at all likely that there will be a conventional seaborne invasion, or airborne invasion, or something like that?

Lt. Gen. Sharp: I would think not.

Mr. Nesbitt: Is it considered possible that a Soviet military venture of a conventional nature might conceivably take place in central Europe, let us say against the Baltic coast of Germany or Denmark, or perhaps against Berlin or some other place? Is that considered a possibility from a capability point of view?

Lt. Gen. Sharp: They are certainly capable of starting such an adventure, but whether they, at the present time intend to do it, I should think not.

● 1200

Mr. Nesbitt: When one considers capability plus intention, there is a much greater likelihood of a conventional military thrust by the Soviet Union against Germany or Denmark or perhaps even Sweden, than there would be against North America?

Lt. Gen. Sharp: No doubt.

Mr. Nesbitt: If a conventional military thrust occurred in this area, this could escalate into a nuclear war?

Lt. Gen. Sharp: Yes.

Mr. Nesbitt: It could?

Lt. Gen. Sharp: Yes.

Mr. Nesbitt: Thank you.

Mr. Nowlan: Mr. Chairman, I wonder if I could ask a supplementary to the supplementary that Mr. Winch asked on these spy planes?

The Chairman: Mr. Nowlan on a supplementary.

Mr. Nowlan: The General said that they had been picked up from time to time but not, as I understood it, while he had been there?

Lt. Gen. Sharp: No, I am sorry. If I said that, I did not mean to imply that.

Mr. Nowlan: NORAD has not picked up any of these over flight spy planes?

Lt. Gen. Sharp: Not while I had been there.

Mr. Nowlan: Were there any before you were there, do you know?

Lt. Gen. Sharp: I am sorry, I do not know.

The Chairman: Before calling on the next questioner, would the Committee agree to print General Sharp's advance presentation and his biography as appendices to this day's Minutes of Proceedings and Evidence?

Some hon. Members: Agreed.

The Chairman: I should correct an announcement that I made earlier. The briefing next week by Dr. Lindsey of the Department of National Defence will be on AWACS. The briefing on ABM's by Dr. Lindsey will be several weeks from now.

The next questioner is Mr. Laniel followed by Mr. Brewin. Mr. Laniel.

Mr. Laniel: Thank you, Mr. Chairman. General, it is said in the brief, and it has been said before, that the principal function of NORAD is merely the protection of the U.S. deterrents and at the same time, it will minimize the damages that occurred from any attack. The reason why I asked you this question is I am wondering when we speak of our participation in NORAD how far can we go in thinking of this as a defence of North America? It is only a protection as far as we protect the deterrents, but it is not a protection against the destruction of North America, is it?

Lt. Gen. Sharp: Presumably, if you are able to protect the deterrent so that it remains credible in eyes of the Russians, they will be deterred from any nuclear war. Surely, that is the best protection that one could give the people of North America. If a war ever starts you will never get military equipment that will protect the population. You may minimize, but there will be a vast wordly nothing in comparison. It must be arranged in such a way that the deterrent is credible and one way of doing this, amongst many others, is to provide protection so that it can withstand the first strike.

Mr. Laniel: You say in your brief that the Russian threat and capability has increased and it still is increasing. On page 7 of your brief you say:

In the past six years interceptor and missile defence forces have been reduced by approximately one third.

Does this mean that the capability of defence in that sense is also reduced or is it because of our improved sophisticated system or aircraft that we have kept the same capability?

Lt. Gen. Sharp: It is a little of both I think. The number of bombers that the Russians have has decreased so in that sense their capability has diminished. On the other hand they have improved their electronic counter-measures and they have introduced air-to-surface missiles. In that sense their capability has increased.

However, we have in fact reduced our defence forces against the bomber by about, in rough terms 30 per cent, and I think we probably still have about the same capability. It may be a little less than we had before the reduction was made, taking all these other factors into consideration.

Mr. Laniel: Yes, but I am trying to conclude here whether or not by reducing the forces we can maintain our capability. I am just asking myself the question. Could the United States not protect its deterrents, because this is the main function of NORAD, without the contribution of Canada. In your brief you say that no adequate defence system could be established or it

would be doubtful unless Canada participated in it. Would the withdrawal from Canada on a long-term program permit at the same time the maintenance of the defence capability of NORAD?

● 1205

Lt. Gen. Sharp: You are receiving a briefing on AWACS next week which will outline for you some of the changes and proposals that are under consideration to improve the air defence against the bomber. I think you will see from this that Canadian territory and airspace at least, is still necessary from the point of view of defending the deterrent against the bomber.

Mr. Laniel: Somewhere at the beginning of your brief it is said that Canadian territory and U.S. territory is unrestricted to the use of NORAD airplanes.

Lt. Gen. Sharp: That is correct.

Mr. Laniel: Does this apply to SAC bombers too?

Lt. Gen. Sharp: In the case of both American airplanes in NORAD and SAC bombers, there are agreements between the two governments which outline when and under what circumstances flights over Canadian territory can take place.

Mr. Laniel: This is controlled? You mean by this that any flight by a U.S. aircraft, let us say carrying a warhead or a nuclear bomb, is known by Canada and by the Canadian Forces?

Lt. Gen. Sharp: That is correct.

Mr. Laniel: There was a question, I think by Mr. Winch, to which you gave the answer that NORAD had no capability to intercept or destroy an ICBM. However, to the question asked concerning command and control of the eventual ABM system, you dodged a little. As a military person, would not you think that if this or such a system be installed or put forward it should come under NORAD because it is merely a defence system? Is it not?

Lt. Gen. Sharp: It is merely a defence system and from a purely military point of view I would say the answer to your question is yes. However, there are other important considerations that would also have to be taken into account when one is deciding under whose control you are going to put it. For example there are political considerations that are very important.

Mr. Laniel: Yes, but NORAD's radar system is capable of determining the target or the track of an ICBM with a 15 to 20 minutes warning. All right, you have direct lines, but one can ask himself all kinds of questions especially when you speak of submarine

launches. Perhaps you could answer that one. How much time would you get to warn of a launch coming from a submarine outside of our coast?

Lt. Gen. Sharp: A very few minutes.

Mr. Laniel: A very few minutes. Is that five minutes?

● 1210

Lt. Gen. Sharp: A few more, but not many more. I do not think it is quite the black and white situation that you state, Mr. Laniel. You are quite correct in that the various warning systems which are now in existence and those that will be included in the Safeguard system, if it is built, intermesh. From the point of view of warning it would be desirable that they be part of a single total system, but this may not be desirable from the point of view of who commands and controls the ABM's, provided the warning was given to the appropriate authorities in a timely way. While I might personally argue that it come under NORAD, I think there would be a military argument that would say that it need not come under NORAD.

I think also that until this system is approved in one form or another it is a little premature to try to work out the details of who is going to control it; it depends to a certain extent on the kind of system and where it is going to be placed.

Mr. Laniel: Something come to my mind right now. I am thinking about the contribution of Canada to a big system such as NORAD, which has also a defence capability; I wonder, if we follow this possibility of giving authority to someone else over the ABMs, why not give authority to NORAD over the Bomarsc and the Nike Hercules, then NORAD could become a detecting organization and we could be at a more comparable level with the United States?

Lt. Gen. Sharp: I agree. From that point of view, it would make sense to put it under NORAD.

Mr. Laniel: One way or the other let us make the choice. One last question, Mr. Chairman. In the brief it is said that the bomber threat is the cheapest way to lay an attack, have a larger payload and more flexibility. However, the defence against it is easier, and unless NORAD develops and remains capable of defending against bomber attacks, it prevents other countries from launching nuclear attacks by conventional planes over North America. How can you come to such a deduction? I do not think there is a danger in any way. No one would be enough of a fool to launch an attack without having the capability of a deterrent behind it; I think that only Russia can do this.

Lt. Gen. Sharp: I agree.

Mr. Laniel: Thank you, Mr. Chairman.

The Chairman: Mr. Brewin.

Mr. Brewin: General Sharp, I wanted to concentrate my questions on the reality of the threat from manned bombers. I understand that the purpose of NORAD installations is to deal with the threat of manned bombers. I want to go into the question with you of the reality of that threat. First of all, I suppose that you go into the reality from the point of view of capability and intention. Dealing with capability, it is clear, is it not, that the Russians have not expanded their capability in this field for many years?

Lt. Gen. Sharp: In the sense that they have not expanded the number of bombers, that is correct. In the sense that they have improved their electronic counter measures and have introduced the air-to-surface missile, your statement is not correct. In that sense they have expanded.

Mr. Brewin: On the other hand, they have concentrated on and immensely expanded their ICBM capacity to launch a blow on North America.

Lt. Gen. Sharp: Right.

Mr. Brewin: Then dealing with intention, as I understand it, if the manned bombers were launched,

● 1215

they would give ample warning; I do not mean that they would intend to give warning, but with our warning devices there would, in fact be ample warning of a couple of hours, of any attack by manned bombers. Is that correct?

Lt. Gen. Sharp: That is correct.

Mr. Brewin: I want to suggest to you that with the tremendous destructive power, most of it in the position of invulnerability, that if one had warning of the attack, first of all, many of the targets, if the targets included the SAC, would be off the ground: in addition to that, an immense and unthinkable destructive power could be struck on the USSR by a retaliatory blow. Is that not correct?

Lt. Gen. Sharp: That is correct.

Mr. Brewin: If that is so, do you not agree that if the Russians launched an attack by manned bombers under those conditions, with warning plus retaliation, they would have to be stark raving mad.

Lt. Gen. Sharp: You are asking me, Mr. Brewin, to agree with you, that the undertaking to which the Governments of Canada and the United States have agreed, to provide for bomber defences, is wrong; I am not about to do that.

Mr. Brewin: It would hardly be fair to ask you to do that. I understand, but I just wanted your opinion. If we are dealing with intention and the reality of the threat, and you have dealt with that in your paper, we can judge it from a political point of view to the best of our ability; even from a military point of view, you have to assess the intention to some extent, with this capacity of warning, and massive retaliatory power, massive from a military point of view. If you were giving advice to politicians in the USSR, for example, if you can imagine that, surely you would tell them that they would be crazy to try such a thing.

Lt. Gen. Sharp: Let us look at situation if we were to follow your advice and do away with our bomber defences. Does that include doing away with our radars?

Mr. Brewin: No, no, no. I suggested that the part of this which made it crazy, was a warning system plus retaliatory powers.

Lt. Gen. Sharp: So we are going to keep the radars?

Mr. Brewin: Oh indeed, but improve them.

Lt. Gen. Sharp: Are we going to keep some interceptors so as to give positive identification of unknown incoming aircraft?

Mr. Brewin: I think you are putting me on the spot now.

Lt. Gen. Sharp: I am sorry, Mr. Brewin, I am trying to understand your question.

Mr. Brewin: My question is whether or not under present conditions, not under some imaginary conditions, you do not think that with this power of detection that we have, and I presume we will improve it, so far as the approach of manned bombers is concerned, plus the power of retaliation which is invulnerable to some extent, would it take the intention of a mad man to launch any such attack?

Lt. Gen. Sharp: I do not think that they would launch a purely bomber attack at the moment, I believe to a certain extent that this is true, because we can defend against it. If you take the situation where we cannot defend against it on the other hand, what is to prevent these aircraft, even though we can detect them from roaming at large over North America? Do you want that?

Mr. Brewin: Well I would think that if they started roaming at large, they could be warned to stay off. I do remember Cuba as you do.

Lt. Gen. Sharp: That is fine. Now let us carry that one step further. You warn them to stay off and they do not stay off. Your only alternative then, is to threaten with nuclear war; I do not think that this is the kind of brinkmanship in which we want to get involved.

Mr. Brewin: I want to pass to another aspect of the question. I would like to ask you about the vulnerability of our installation, our Bomarc and our Voodoo interceptors. In your view are they vulnerable and to what extent to a missile attack?

Lt. Gen. Sharp: Yes, with the air-to-surface missile, our radars become more vulnerable than they were in the past. In other words, we would have less time

● 1220

to intercept an incoming bomber than we had previously when they only had free-fall bombs. We would, however, have a chance of intercepting them. In the case of the Bomarc that is less true, because in general terms, the range of the Bomarc is greater than the range of the air-to-surface missile.

Mr. Brewin: What about the surface-to-surface ICBM? Are our installations not vulnerable to them?

Lt. Gen. Sharp: Yes, absolutely.

Mr. Brewin: Therefore, supposing one was going to use the bombers, if one was in the USSR, would it not be the part of prudence to take out a good many of these installations with the ICBMs, before you sent your bombers over?

Lt. Gen. Sharp: I think it would be the part of prudence to concentrate everything that you could on the second strike capability of the United States; once you have knocked that out, you can do anything else you want, can you not? That is why in my view it must be protected.

Mr. Brewin: But what I am suggesting to you is that installations which are vulnerable to missiles—and I think in your paper you say the Russians have somewhere in the neighbourhood of 1,000 missiles—not too useful, are they? If they are vulnerable to this sort of attack, would they not be taken out before they could be used to defend against an incoming bomber threat?

Lt. Gen. Sharp: If they wanted to use their weapons on that rather than use them in trying to knock out American second-strike weapons, your postulation is correct.

Mr. Brewin: Are we committed in any way to this airborne warning and control system or are we just discussing it?

Lt. Gen. Sharp: The question should be asked of someone else, I suppose, but to my knowledge we are just discussing it.

Mr. Brewin: What about the new interceptors? I do not know whether the word obsolete is too extreme or rude to use in describing the Voodoos, but assuming that they are obsolete, are we replacing them? Is there any discussion of a new interceptor?

Lt. Gen. Sharp: There is no plan I know of at the moment that has been approved to replace the CF-101. On the other hand the air staff, or the Vice Chief of the Defence Staff in Ottawa, are always trying to look ahead and see what new aircraft, what new ships, and what new tanks, if they are still going to be required, will be necessary for the future. So, there is discussion in that sense.

Mr. Brewin: We are not committed to any new family, if that is the right word, of interceptor.

Lt. Gen. Sharp: No, sir, not to my knowledge.

Mr. Brewin: Thank you.

The Chairman: Gentlemen, General Sharp has very kindly said that if necessary, he will be available this afternoon to continue the questioning, and we have a room lined up if we do find it necessary. That will be room 371, West Block. Therefore, we do not have to hurry our questioning if we do not want to. I still have four questioners. Mr. Cafik.

Mr. Cafik: General, earlier in the evidence that you were giving you informed us the Americans had made some overtures to Canada, I gather, in regard to expanding the facilities at North Bay, so that . . .

Lt. Gen. Sharp: I am sorry, it was NORAD.

Mr. Cafik: NORAD. Yes, NORAD had made a request to, I presume, the Canadian government possibly to consider the expansion of North Bay so that it could replace Colorado Springs if something happened.

Lt. Gen. Sharp: It would be as an alternative headquarters.

Mr. Cafik: How long ago did they do this? Do you know?

Lt. Gen. Sharp: No, I do not recall how long ago they put in this request. I understand, however, that it

is under consideration now and I think there will be a decision shortly on it, one way or the other.

Mr. Cafik: I see. Has it been going on for a number of years or is this a recent development?

● 1225

Lt. Gen. Sharp: No, there have been as I understand it, tentative NORAD plans or proposals to increase the facilities at North Bay so that it could become an alternative headquarters. When this was put up as a firm proposal I do not know, but I do know that it has been under consideration at NORAD for some number of years.

Mr. Cafik: And are they also considering establishing other alternate sites; in other words, making three or four such sites, or are they quite content with just the North Bay alternative?

Lt. Gen. Sharp: There is one other right now.

Mr. Cafik: There is one other that is being considered?

Lt. Gen. Sharp: No, it is in existence.

Mr. Cafik: Is that in the United States?

Lt. Gen. Sharp: That is correct.

Mr. Cafik: Our whole strategy seems to be based around the deterrent system, of course, and the capability for a second strike. This leads me to ask if you are in a position to inform me of what the Russian capability is in terms of ABM, how effective it is, or how long it would be before they had an effective system. I would like answers to questions along this line so that we would know how effective our deterrent really is. To have it is one thing. It is another thing if they could destroy it before it did them any damage. Do you have any comments in this regard?

Lt. Gen. Sharp: The only comment that I could make on this would be to give you the information which has already been given publicly by, I believe, Mr. Laird. It might have been Mr. Packard. Their statement was that they had in position about 50 or 60 ABM sites.

Mr. Cafik: Are these ABM's effective against any kind of incoming ICMB's?

Lt. Gen. Sharp: I cannot give you that information I do not know the answer, and if I did, I do not know whether or not I would be allowed to give it to you. However, I do not know the answer to that. I presume that the Russians must feel they are effective or they would not have put them in.

Mr. Cafik: Do you have any projections in terms of time of how long it would be before Russia was in a position to totally defend itself against any incoming missiles? This seems to be the real central question. If they are working toward the achievement of this objective, our whole deterrent system would collapse if they ever reached that objective.

Lt. Gen. Sharp: You are moving out of the scope of my responsibilities, but I think I can make one comment on this. Defending a population or a city against an ICBM is one problem and defending a hardened ICBM against an incoming ICBM is a completely different problem.

In the case of the cities, only a few have to get through, or maybe just one, to destroy a city. It does not have to be all that accurate with today's warheads. On the other hand, to destroy a hardened ICBM in the ground, one needs to be very accurate, or alternatively, have a very large warhead. So, the defence problem is different. When you ask me if the Russians could ever develop systems to defend themselves against all ICBM's, I would say no, in the case of populations. In the case of their hardened ICBM's I do not know the answer, but chances are they could better do that than defend their cities. It just follows from the technology of it.

I do not have any inside or secret information about this, so I am not trying to hide anything from you. I am just giving you my personal opinion based on very layman-type knowledge.

Mr. Cafik: There has been a lot of talk recently about the protection of our northern frontiers, Canada's sovereignty, etc. In your opinion do the Russians, in fact, recognize the sovereignty that we express over the north? Is there any danger to our northern frontiers? I am sure they do not have to launch an invasion, I would think they would only have to walk across and take over a certain territory at the present moment.

Lt. Gen. Sharp: I could not give you anymore than a layman-type answer on that.

Mr. Cafik: Do they use the airspace over the far north without any recognition of our claims to the sovereignty of that territory?

Lt. Gen. Sharp: Are you speaking of our airspace?

Mr. Cafik: Yes.

Lt. Gen. Sharp: No.

Mr. Cafik: They do not?

Lt. Gen. Sharp: They approach it, but they have not flown over it. There may be one or two exceptions to that but the number would be very small.

Mr. Cafik: That is fine.

Mr. Legault: Mr. Chairman, I wanted to ask a supplemental to the question that was being put by Mr. Nesbitt a while ago. It dealt with the frequent visits of Russian bombers off our coast. As you recall approximately a year ago the press certainly brought out something sensational indicating that there had been a number of these Russian bears, I believe they called them, which came within a certain range of the Newfoundland coast. At that particular time when inquiring, I was led to believe that this was practically a daily occurrence. Would that be so?

● 1230

Lt. Gen. Sharp: No, it would not.

Mr. Legault: Thank you. I would like to return to the question of the Bomarc which has a nuclear warhead. If I understand correctly, the range is approximately 300 or 400 miles, which definitely indicates that the explosion would be over Canada. This is compared to the manned bomber. Would you consider that the new concept of the AMB's is a more sophisticated system of destroying nuclear arms that would be directed against Canada, or the United States?

Lt. Gen. Sharp: The Bomarc is designed to destroy bombers.

Mr. Legault: That is right.

Lt. Gen. Sharp: The ABM is designed to destroy ballistic missiles, not bombers.

Mr. Legault: Then, you would not require the use of both?

Lt. Gen. Sharp: If you intend to continue and to provide a defence against the bombers, the AMB will not give it to you.

Mr. Legault: Could you tell me, General, if the present use of NORAD would consider some civilian uses as far as the need would be for aircrafts? We can definitely make use of this, in order to direct or to help the domestic aspect of our air space.

Lt. Gen. Sharp: If I may be permitted a personal view on this, I believe that the control of civilian traffic—which is rapidly increasing over North America and particularly around our more populated areas,—could be improved considerably by adopting the same type of radar computer control that we use in intercepts. I would agree completely that the same

installation. the same radars and perhaps the same computers, but different programs, could be used both for intercept purposes and civilian control of aircraft. I think that there is great room for combining these two, and as a matter of fact, in the United States they are now giving consideration to this. They may be in Canada, I am not positive. I have now been gone for three months.

Mr. Legault: A while ago, you said that consideration is now being given to establishing North Bay as the alternative to Colorado Springs. Some previous witnesses, I believe, stated last fall that in case Colorado Springs were knocked out, then North Bay, would be the alternative. From your statement, this is not the case.

Lt. Gen. Sharp: Any one of the regions could be an alternative. To be an effective alternative they must be kept up to date, be given up to date information on everything that is going on, much the same as we have in Colorado Springs. They must have this in their computers, and be able to display it. At the moment, they do not have the ability at North Bay to accept, or to display all of this information. They

• 1235

are able to accept some, so that they would only be moderately effective as ALCOP, as we call it. The necessary changes would include increasing the communications, changing the computer program, and perhaps some of the displays.

Mr. Legault: Thank you.

The Chairman: Gentlemen, before the others leave, the room in which we will be meeting this afternoon will be 307, West Block directly across the hall. It is not 371 as I mentioned earlier. 307 West Block then at 3.30 p.m. Mr. Roberts? I am sorry; Mr. Guay and then Mr. Roberts.

Mr. Guay (St. Boniface): My question is a very short one, General. On page 9 of the Aerospace Defence Information brief, you made a simple statement; in fact as you say

Simply stated, the mission of the DEW Line is to detect unidentified objects flying over the northern Polar regions and relay the warning to NORAD Combat Operations Center near Colorado Springs, Colorado.

Are these unidentified objects of concern to you, and are they similar to those that have been reported across Canada from time to time?

Lt. Gen. Sharp: No, I think that it was an unfortunate choice of words. There is no connection. We are thinking of bombers.

Mr. Guay (St. Boniface): Are you concerned with unidentified objects, in the sense of the word that I am putting it, rather than in yours?

Lt. Gen. Sharp: No, the responsibility for that concern has been passed to another department. I have forgotten which one.

Mr. Guay (St. Boniface): The reason why I ask that question is due to the fact that on page 24 of the other brief you mention camera that will take satellite identifications by photographing them while they are illuminated by the sun, and yet the camera is in the darkness. Can you give us an explication of what is involved there?

Lt. Gen. Sharp: I will try. In the first place, a newspaper report in Canada—I believe it was a few months ago, and I am sure it was through no one's fault—appeared to misunderstand the capability of this particular camera. Actually, it will fix the relative position, or determine very accurately, the position of a satellite relative to the earth. It performs this by taking a photograph. However, it is not a photograph in the sense of blowing it up and seeing the appearance of the object.

We pass information to this camera which allows it to point directly—or as closely as we can point it—at the object. The camera moves at the same speed, and in the same direction as the object. It then takes a time exposure, and if it is moving at precisely the same speed and in the same direction, the object will appear as a spot. Everything else that is not moving at the same speed, or in the same direction will appear as a trace.

In that sense, we are able to determine precisely the position of the object. If it appears as a bit of a trace, then your prediction of the trajectory and position is a bit out. It fixes it in this manner, but it does not take a picture in the sense of blowing it up and examining the object.

Mr. Guay (St. Boniface): Thank you, Mr. Chairman.

The Chairman: This might be a convenient time to stop before lunch. Mr. Roberts will be the first questioner when we reconvene at 3.30 p.m. Thank you very much, General Sharp.

AFTERNOON SITTING

• 1535

The Chairman: Gentlemen, I think we can start. Our first question this afternoon will be Mr. Roberts.

Mr. Roberts: Mr. Chairman, Lt. Gen. Sharp, I apologize if I go over some ground that you have

already covered this morning. If I do so then simply tell me and I will read the report. There may be a surplus of manned bombers in the hands of the Russians but there is a deficiency of piloted passenger aircraft between Toronto and Ottawa, which is one of the reasons why I was not here for your presentation this morning.

I really want to direct most of my questions essentially to pages 10 to 12 which concern the Bomber Threat to try to get some of these things clear in my own mind. Can you give me some idea of the overall cost of anti-bomber defence, which is one of the various military functions NORAD performs. What percentage of the budget would be devoted to anti-bomber defence? Is it possible to give a budgetary breakdown?

Lt. Gen. Sharp: Do you wish a breakdown of the Canadian budget?

Mr. Roberts: No, the total budget. I think in your paper somewhere it said the Canadian costs would run somewhere between 8 to 10 per cent of the overall budget of NORAD. Therefore, I assume by pro rating it, if we knew how much the overall cost of anti-bomber defence was, we could give a Canadian percentage of it.

Lt. Gen. Sharp: We prepared the first draft at NORAD of this paper but not the final draft. One of the questions we tried to answer in the short time available to us concerned the costs. We were not able to break them down in the form which you ask for primarily because a lot of the systems that we use in anti-bomber defences, communications for example, are also used for other reasons. It is very difficult. However, the annual operating costs—I hope you will accept these very rough figures—are \$135 million for Canada and \$1.76 billion for the United States.

Mr. Roberts: Would I then be right or wrong in saying, very hypothetically of course, if Canada and the United States decided that anti-bomber defence was outmoded or useless and wished to get out of this particular aspect of NORAD while preserving the warning systems and the anti-missile defence arrangement, the budget would then be reduced by this amount?

Lt. Gen. Sharp: I am sorry. Did you say preserving the warning systems?

Mr. Roberts: Yes.

Lt. Gen. Sharp: The bomber warning systems?

Mr. Roberts: No, the missile warning system. Would we then reduce the budget by \$1.76 billion for the United States and \$135 million for Canada?

Lt. Gen. Sharp: If you got out of everything I suppose the answer might be yes. The system we have does other things. For example, if you want to get out of the actual anti-bomber defences but still maintain a capability of surveillance in peacetime over your own air space, even if you cannot do anything about it, then you would not make anything like those savings.

Mr. Roberts: Could I now ask you something about the effectiveness of the anti-bomber defence against the roughly 150 Russian bombers? I have heard it said, and I do not know whether these figures have any real justification or not, that the most pessimistic interception rate is one out of ten, and the most optimistic is five out of ten. If those figures were correct, at the most optimistic rates we would be able to intercept about 75 out of the 150 bombers, assuming the whole force was sent against us. Are those figures roughly accurate or are they wildly inaccurate?

Lt. Gen. Sharp: I would think that the most optimistic rate is not nearly high enough and I would think that the pessimistic rate is too low. It is not all that easy however to make an exact prediction on this. Let us take two hypothetical extremes. If everything that could possibly go wrong for the defences went wrong, and if everything went exactly right for the offenses,

● 1540

then the interception rate might be fairly low. The probability of this happening, however, is very remote.

Mr. Roberts: What about the reverse side of the argument? Assuming that things work well on both sides, both the attacking and defending side, what percentage of the bombing . . .

Lt. Gen. Sharp: I would rather give that in the closed session.

Mr. Roberts: Are we going to have a closed session, Mr. Chairman?

The Chairman: We do not have one organized at the present time. I might consider that. There are a number of questions of that type.

Mr. Roberts: Obviously not for this one question, but is there are other questions that arise, it might be useful.

I was very interested in your reasons for the design of NORAD, which stressed that the anti-bomber defence was developed as a means—and I believe I am accurate—of defending the deterrent power of North America. As you went on, you explained the situation that with technological developments, war and other things have become much more complicated. Is the justification now, that our anti-bomber defence is a defensive arrangement which prevents unpleasant things happening to us, or is it part of a deterrent

arrangement that protects the deterrent power retaliating against the Soviet union? These two justifications are not exclusive. What is the primary justification for the anti-bomber defence?

Lt. Gen. Sharp: In my view, the prime justification is to protect the deterrent force, in the hope and belief that by protecting this force, war will be deterred. Although anti-bomber defences may help you prevent some casualties, once war has started, there will still be a large number of them. However, the idea is to prevent the war from starting.

Mr. Roberts: Perhaps, we could go into that in some detail because frankly, I do not understand exactly how it does that. Presumably it is to protect the deterrent power. If 150 nuclear weapon-bearing airplanes are flying at us, can we not detect and assess them in sufficient time to release our retaliatory power?

Lt. Gen. Sharp: Yes, we could Mr. Roberts: If the 150 bombers were brought into play, we would already be in a situation in which Intercontinental Ballistic Missiles are being used on both sides, would we not?

Lt. Gen. Sharp: The Russian believes—and it is credible in his eyes—that the decision will be made that rapidly, and probably it would. Take the two situations: one where Russian bombers are allowed to roam over North America at large and the other situation where they prohibited. Which of those two situations is most likely to deter? After all, the deterrent factor is what you want. I say that the situation in which we can stop a large percentage of their bombers is more likely to deter than the other.

Mr. Roberts: But is not the whole doctrine of deterrence based upon not so much the interception of the delivery of the nuclear weapons against you but your capacity to retaliate regardless of the effectiveness or ineffectiveness of the opposing attack?

Lt. Gen. Sharp: That is correct.

Mr. Roberts: In *The New York Times Magazine* of this weekend, a very interesting article quotes Mr. McNamara's last official statements on the American capacity to retaliate. It gives the number of warheads which would be delivered to the Soviet Union, and describes their effect. The figures are quite startling. If 100 warheads were delivered to the Soviet Union, almost 59 per cent of their industrial capacity would be destroyed. The number of Soviet dead would be approximately 15 per cent.

If you increase to 200 warheads, the industrial capacity of the Soviet Union which would be destroyed would be 72 per cent. If only 200 of approx-

imately 1,000 of the missiles in silos, plus the bombers and the submarines, reached the target, the Soviet Union would have, at most, 28 per cent of their industrial capacity maintained. The article then states that they are now equipping these with multiple warheads, so that in the very near future a capacity of 10,000 to 11,000 warheads will be reached.

The sufficient power for a retaliatory strike is the arrival of at least, 200 out of 11,000 warheads on

● 1545

target. In those circumstances, is it rational to say that the defence against bomber attack against the American retaliatory capacity actually increases our effective retaliatory capacity? Is it not the case that even if 150 or more bombers got through, it would still be difficult to conceive of a circumstance in which the United States would not have a sufficient second strike capacity to deter the Soviet Union from such an attack?

Lt. Gen. Sharp: I do not know where the paper obtained those figures.

Mr. Roberts: These were released by Mr. McNamara—at least according to the article.

Lt. Gen. Sharp: Not the ones about 10,000, I believe.

Mr. Roberts: No, this was mentioned in a Senate hearing on the ABM in the United States.

Lt. Gen. Sharp: I can only present this situation to you. I believe that it is a matter of judgement. I do not know who can make an accurate judgement to the size of force that can survive a first strike and still be able to deter. How do you make that judgement? But, on the other hand, imagine that you make a very fine judgement and err on the wrong side. The consequences of making such a mistake could be extremely disastrous. Admittedly, you do not want to have more weapons than you actually need since they are very expensive. I presume that they tend to escalate and we want to avoid that. It is very important, in my view, to deter. I do not know how to make the judgement of how many survivable weapons you should have in order to deter.

Mr. Roberts: Perhaps I could put it another way. Is it really conceivable—anything is conceivable I suppose—or very likely that we would receive an attack by armed bombers without also being subjected to a ballistic missile attack? Are one of the scenarios which the military have, a possibility of a purely bomber attack which is not accompanied by the use of missiles?

Lt. Gen. Sharp: I do not know whether they have that scenario or not, but in my view, that is unlikely

unless you have no bomber defences. I think that you can visualize a situation where they could send over reconnaissance flights and you would not really know whether they were reconnaissance flights or not. You could either ask or warn them to leave. If they did not leave, but persisted, then the only alternative left to you under these circumstances is to threaten them with nuclear war. Again, as I repeated this morning, I do not think that this is the kind of situation that we want to get involved in.

Mr. Roberts: You could wait to see if they do attack, and even if they did so and the attack was successful, you would still have the capacity to retaliate.

Lt. Gen. Sharp: I do not want to wait and see if they attack. I think that we want to avoid being attacked and prevent that from happening.

Mr. Roberts: I think that the whole purpose of a deterrent system is not to have a preemptive attack, but to maintain the power to retaliate irregardless of the nature of the attack which is brought against you.

Lt. Gen. Sharp: Do you really want to be in the position in which you know that there are bombers coming in, you have not any defences, you cannot do anything about it, and you must wait to see if they are going to drop atomic bombs on you before you can do anything about it? I do not think that you want to be in that position.

Mr. Roberts: You are now switching from deterrent defence. The whole logic of a deterrent argument is that, in point of fact, regardless of the effectiveness of any attack that can be brought to bear against you, you are still able to inflict extraordinary damage on your opponent.

Lt. Gen. Sharp: I am sorry. You were the one who said: "Let us wait and see", in the first instance. I agree with you in that.

Mr. Roberts: If there were an all-out exchange of nuclear missiles, do we have any effective defence against the destruction of an enormously large part of our society?

Lt. Gen. Sharp: No, we have not.

Mr. Roberts: Under those circumstances, what would the bombers that do come through, have left to bomb? If we were to receive an attack of a wave of bombers, which I think would also involve an exchange of Intercontinental missiles . . .

Lt. Gen. Sharp: Right.

Mr. Roberts: If the missiles are flying back and forth, there is no real effective defence.

● 1550

Lt. Gen. Sharp: Correct.

Mr. Roberts: Assuming that the bombers got through, what would be left for them to bomb?

Lt. Gen. Sharp: Again, you have got into the position in which the attack has occurred, and you have just finished making the statement that the idea is to deter it. I am quite prepared to admit that—if we have not succeeded in deterring—although the bombers may find some targets, by that time most of the North American civilization will have gone. The question is: Do the bomber defences add to the credibility of the deterrents? Surely, that is the criterion by which you must judge it.

Mr. Roberts: Yes, but if they are deterring a non-existent threat, then they are not much of a deterrent.

I notice your phrase here in the first paragraph on page 10. It says:

The manned bomber continues to be the cheapest and most effective means for delivery of nuclear weapons.

What I am really suggesting is that it is also a superfluous means and therefore, perhaps, it does not make all that much sense to defend against it. And it is superfluous . . .

Lt. Gen. Sharp: If there are no defences against the bomber it is not superfluous and it is the cheapest.

Mr. Roberts: It would be superfluous if even under the breakdown of a deterrent system there were no targets for the bomber to attack.

Lt. Gen. Sharp: This is if the deterrent system breaks down. All I am saying is that it adds to the deterrent. If it has broken down they can use it as a second strike. However, how valid that is I do not know.

Mr. Roberts: Perhaps I could try another attack which I admit is related to the same question. Do you think that if we could effectively defend North America against the manned bomber and against the intercontinental ballistic missiles that we should do so?

Lt. Gen. Sharp: First of all I would like to say that kind of a major and important decision is not one that should be made by military people. It should be made by governments. We in NORAD are charged with the responsibility of defending against the air attack and

warning against other kinds of attacks. As long as we are charged with that responsibility, we will continue to recommend the kind of equipments we need to do it.

Mr. Roberts: Perhaps I could again put this in another context. Professor Yarmolinsky, as you probably know, testified before the Committee earlier this year, in February, and what I took from his testimony was that we have reached a position of nuclear stalemate which depends for its balance on both sides maintaining an effective second strike capacity.

Lt. Gen. Sharp: That is correct.

Mr. Roberts: He argued that in relation to the Chinese threat, the most dangerous stage was the one between the stage where they have a first strike capacity, but no second strike capacity. At that stage they will have a temptation to strike first, because they know if they do not strike first under attack, they may never get a chance to strike at all.

He argued very forcefully, I thought, that the balance depends on both sides having the capacity, if they are attacked, no matter how effectively they are attacked, to be able to strike back. So, we find ourselves in this paradoxical situation that one man's effective defence, if we could get to it, would destroy the other man's effective deterrent, and that would be a very destabilizing thing to do in the world.

In other words, while we have a vested interest in the maintenance of a credible and efficient second strike power in the hands of the United States, we also have an interest in the maintenance of the credible second strike capacity in the hands of the Soviet Union.

Lt. Gen. Sharp: That is right.

Mr. Roberts: If the NORAD anti-bomber defence is, as you say, a more or less effective defence, does that not, to the extent that we make it effective, diminish the Russian deterrent, and therefore the balance on which we depend?

• 1555

Lt. Gen. Sharp: No, only if it is taken in isolation, but considering the ICBM threat as well, I would think not.

Mr. Roberts: Are you not then saying that through anti-bomber defence we are, in effect, reducing the number of times that we can be destroyed, but we are not diminishing the fact that we are going to be destroyed if we get into this kind of all-out war.

Lt. Gen. Sharp: If a war starts you may just as well face it. Many people are going to be destroyed. You

have got to create a system which will deter this from starting, and there is a subtle difference here.

Mr. Roberts: Yes, but . . .

Lt. Gen. Sharp: There is another point, if I may be permitted to give a personal opinion. The effectiveness of military deterrents will not last forever. There eventually has to be an agreement between governments.

Mr. Roberts: I agree entirely. My point really comes down to this. What I am trying to get at is how does an increased or an improved bomber defence improve the protection of our deterrent system? Since our deterrent is based upon our ability to launch intercontinental ballistic missiles at them and their deterrent is based on their ability to launch intercontinental ballistic missiles at us, in both cases successfully, that is what the deterrent depends on. Therefore, a bomber defence is superfluous to that equation. This is my argument and obviously not yours.

Lt. Gen. Sharp: Bombers can destroy missiles and hardened silos.

Mr. Roberts: By the time the bombers get there the missiles and the silos will have gone.

Lt. Gen. Sharp: This gives them about two hours to make that kind of a decision. I would say if they had longer to make that decision, the deterrent would be more credible. I am not saying they would not make the decision in two hours. However, if the Russians think that the West has to and will make this decision in two hours as opposed to knowing that they will have a second strike survive, then surely the latter situation is more of a deterrent.

Mr. Roberts: I find it hard to believe that the Russians would send the planes and wait to see whether or not in two hours the Americans are going to decide to retaliate with their continental missiles.

Lt. Gen. Sharp: I am not suggesting that.

Mr. Roberts: If they are not going to do that, I would suggest they would operate on the assumption that the Americans, having detected an attack, would reply with their retaliatory force. At least, that is what we are trying to make them believe in establishing a credible deterrent.

Lt. Gen. Sharp: Without any defences against bombers, how do you detect it?

Mr. Roberts: Is it credible to believe that the bombers will go without missiles also going?

Lt. Gen. Sharp: They would if they could get through to all of the second strike force of the United States.

Mr. Roberts: Is that really feasible to do?

Lt. Gen. Sharp: It would be if there were not any defences.

Mr. Roberts: With the number of planes that they have at their disposal, or likely to have at their disposal?

Lt. Gen. Sharp: It would take quite a bit, yes.

Mr. Roberts: Could they reduce the over-kill potential that we have to, in effect, so disable the Soviet Union as to make this attack impossible?

Lt. Gen. Sharp: I think a discussion along that line which Mr. Cadieux gave in the House is quoted in the paper.

Mr. Nowlan: On pages 10 and 11 your own Minister of Defence sets all this out in very logical form, Mr. Roberts.

Mr. Roberts: Mr. Nowlan, I can only suggest you have a look at my speech which took apart the Minister's arguments piece by piece.

Lt. Gen. Sharp: I would not want to get into that one.

Mr. Roberts: I will be glad to send you a copy.

Mr. Nowlan: Mr. Chairman, I will take Mr. Cadieux any day in front of Mr. Roberts on this theory, but not on everything, perhaps.

The Chairman: Mr. Roberts, did you have any further questions?

Mr. Roberts: I just wanted to go on, in fact, to deal with these. Are you limiting me? Sometimes we operate on a 20 minute basis.

I thought we might go on and look at that defence which was provided by the Minister of National Defence whose arguments I should respect, I suppose.

Mr. Nowlan: There is a recent precedent for you to follow too, Mr. Roberts. You could walk across the floor.

Mr. Roberts: I am already across the floor. You can see where I sit.

Mr. Nowlan: You could shift your seat.

The Chairman: What page is this on, Mr. Roberts?

Mr. Roberts: It is on page 11. Perhaps we could go to page 12, because I think that contains the fundamentals of the argument. At the end of the first paragraph the argument is that if you did not have anti-bomber defence,

The balance would be quickly distorted to a much greater degree than that implied by the original "bomber threat".

and that:

... such a situation would be destabilizing and must be discouraged.

However, on the basis of the strategy we have already discussed, that is to say if you are relying upon a deterrent, that is not true is it? What would really be destabilizing would be the destruction of the other side's deterrent by an effective defence system.

Lt. Gen. Sharp: Or vice versa.

Mr. Roberts: Or vice versa. I am not asking you to comment on this, but Mr. Cadieux's argument that increased bomber defence would render the situation more stabilized is, in fact, contrary to the situation on the basis of the doctrine which we have been upholding since 1960. I know I cannot ask you to speak for the Minister, and I am not trying to push you into that, but could you perhaps explain to me why the balance ...

● 1600

The Chairman: The Minister will be here on Thursday evening in case you wish to put the question then.

Mr. Roberts: Perhaps General Sharp will want to defer to him.

Why would the balance be quickly distorted? As I think I said earlier, the balance that counts is not whether we have equal retaliatory capacity with the Soviet Union. It is not that we can kill them as many times as they can kill us. The important balance is in spite of an attack we have a sufficient capacity to inflict unacceptable damage on them. So that within those limits that, they have increased or improved bomber defence, it simply meant that we would preserve 15 per cent more retaliatory capacity than we otherwise would have; that would not in fact change the nuclear stalemate at all. To go back to Mr. McNamara's figures, if we came down from getting through 1600 warheads to getting through 400 warheads, that would mean that we would destroy only 76 per cent of the Russian industrial capacity, rather than 77 per cent. That is not much of a change in the balance for an increased protection in your deterrent.

Lt. Gen. Sharp: You are asking me to make a judgment on what level of second-strike force is sufficient to act as a credible deterrent; I do not know.

Mr. Roberts: You do not know.

Lt. Gen. Sharp: I do not know the answer to that, no. Do you, as a matter of interest?

Mr. Roberts: Knowledge, I suppose, is a one hundred per cent thing, but you have to make some kind of assessment.

Lt. Gen. Sharp: The consequences of being too low are terrible.

Mr. Roberts: You have admitted that we have no second defence at the moment against destruction; you have also said that no matter how strong the attack would be against us at the moment, a reasonable assessment is that we will be able to retaliate in such a way as to virtually destroy their society.

Lt. Gen. Sharp: You are really asking me to say what is the American assessment of the size of survivable or second-strike force required to deter. I think that kind of a question should be put to the authorities who make that decision. Our job is to defend.

Mr. Roberts: To defend or to deter?

Lt. Gen. Sharp: Deter by defending.

Mr. Roberts: But you cannot really estimate how effective your defence will be?

Lt. Gen. Sharp: Yes I can.

Mr. Roberts: In closed session.

Lt. Gen. Sharp: Sure.

Mr. Roberts: One of the arguments presented in Mr. Cadieux' argument is that if we did not have an effective anti-bomber defence, the Russians would be able to mount an effective threat at a much lower cost. Am I right in thinking that one of the reasons that we maintain an anti-bomber defence is to drive the Russians to more expensive forms of attack?

Lt. Gen. Sharp: That could be but I am not privy to that political reasoning.

Mr. Roberts: Could we reverse it and say that perhaps the Russians might maintain one, two or three long-range bombers, to ensure that we would maintain an expensive system of anti-bomber defence and detection?

Lt. Gen. Sharp: I have seen that suggested by certain people. I do not believe it.

Mr. Roberts: Would you agree that basically our defence depends upon the effectiveness of our retaliatory strike force, not upon the costing arrangements, dear or cheap, which the Russians would have to develop in order to attack us.

Lt. Gen. Sharp: Yes I think I would say it depends upon the effectiveness of our survivable, retaliatory strike force.

Mr. Roberts: One last question: would you agree that it is not the effectiveness of the Russian attack which should worry us but that what we would be really destabilizing, would be a situation where we could defend ourselves sufficiently against a Russian attack?

Lt. Gen. Sharp: No, I would not agree to that. From the Western point of view that would be destabilizing. If I were a Russian, I would certainly say so.

Mr. Roberts: Thank you, Mr. Chairman.

The Chairman: Gentlemen I have a number of members for the second round of questioning, but before calling on them, are there any members who are on the first round of questioning? If not, I have a few specific questions myself. I wonder if I could ask the witness before we go to the second round of questionings. The questions relate to the specific working paper; in reference to the first question on page five of the working paper, General Sharp, where you give the manning for the various regions; the total comes to 9,380; on page four you mentioned that we had 14,000. Could you tell us, where are the missing 4,620?

Lt. Gen. Sharp: Page four includes civilians and page five does not.

The Chairman: These approximately 4,620 civilians account for the difference?

Lt. Gen. Sharp: That would account for most of the difference, yes.

The Chairman: There is some other military support.

● 1605

Lt. Gen. Sharp: Yes.

The Chairman: Do you have the American figures for these various regions? Can you give them to us?

Lt. Gen. Sharp: We could get those for you.

The Chairman: If you would please, and have the copy go to the Clerk. Towards the bottom of page five you say that:

Canadian Officers are in command of the Northern NORAD Region and two of the thirteen NORAD Divisions . . .

If we look at the map of the region, the Northern NORAD Region is quite far to the north. It does not include many populated areas, I would think, in Canada. Then it comes down, with the exception of Divisions 41 and 36, which come further south.

Lt. Gen. Sharp: Generally speaking, that comment is correct.

The Chairman: Which are the two NORAD Divisions in which Canadian officers are in command?

Lt. Gen. Sharp: The 41st NORAD Division with Headquarters at North Bay, and the 36th with Headquarters in Brunswick, Maine.

The Chairman: Do either of those Divisions include any American territory?

Lt. Gen. Sharp: Yes the 36th includes American territory, and a little is included in the 41st.

The Chairman: There is some American territory.

Lt. Gen. Sharp: Yes, but a very small amount.

The Chairman: In 41. Is there very much in 36?

Lt. Gen. Sharp: Most of Maine, and some of New Hampshire and Vermont are included.

The Chairman: On page four you refer to the Alaskan Command as being "a separate U.S. unified command." Does that have any special significance? It would appear from the statement to be in a different category than the other regions. Is this directly under the command of NORAD or is it a separate command?

Lt. Gen. Sharp: For air defence purpose, it responds to our operational control. However a "unified command" means it has, in this case, ground elements in it too, which are commanded purely by Americans, for the purpose of protecting Alaska.

The Chairman: Well is it correct to say that the air component is under NORAD Command, or does it merely have its activities co-ordinated with NORAD?

Lt. Gen. Sharp: None of the components are under command, in the sense of the word's military under-

standing. They take their operational instructions from us and respond precisely to our operational instructions. In that sense they are under command.

The Chairman: But is the air component of the Alaskan region different in any respect from the other regions, which, as I understand it, are under your direct command?

Lt. Gen. Sharp: From the point of view of intercepting aircraft and investigating unknown aircraft, the answer is no. They are not different in any respect.

The Chairman: Turning to page one, General Sharp, it says that the NORAD

. . . agreement was reached only after the conduct of analytical studies, all of which led to the conclusion that the air defence of North America is a single, indivisible problem.

Were those analytical studies published and are they available, or by studies do you just mean discussions?

Lt. Gen. Sharp: No, they were published, but they are not available as far as I know to the public.

● 1610

The Chairman: I see.

Lt. Gen. Sharp: In other words words they are still classified.

The Chairman: Farther down that page it says:

The Commander-in-Chief of NORAD was to be responsible to the Chiefs of Staff Committee of Canada (now superceded by the Chief of the Canadian Defence Staff) and to the Joint Chiefs of Staff of the United States.

Is it really possible for a military officer to be equally responsible to two separate commanders who may or may not agree, in theory at any rate? This is a nice statement, but is it meaningful?

Lt. Gen. Sharp: Yes, it is meaningful from a purely military point of view you, and I suppose even if you are not in the military one would prefer to have one boss instead of two. This is the arrangement that the government has decided on and it seems to me that it was the best that they could make under the circumstances. To the best of my knowledge it works.

The Chairman: Does this mean that before any action can be taken by NORAD the command must be given by both the Canadian authorities and the US authorities?

Lt. Gen. Sharp: No, in most cases concerning actions, these are agreed to prior to the need to make the decision. In other words we have very specific operating procedures which allow the Commander to make decisions and which have been agreed to by both governments. There are, however, some specific actions that cannot be taken until proper authorities in both governments agree, but there are very few of those.

The Chairman: Turn to page 2 of General Sharp's statement:

A single integrated command to exercise operational control was, therefore, a mandatory requirement.

It is probably quite clear that it is certainly convenient to have a single integrated command, probably most efficient to have a single integrated command, but is it absolutely essential?

I am referring to the fact that before NORAD came into effect there was a high degree of co-operation and co-ordination between the American and Canadian forces which seemed to work quite well.

I am also referring to the fact that when this Committee was in Europe discussing the French withdrawal from NATO, we were told on many occasions that although they theoretically had withdrawn from the joint command structure they replaced that with a form of liaison. In effect, everything worked out exactly the same as it had worked before in that everything was working quite satisfactorily, apparently, on a co-operative or co-ordinated basis rather than as a joint command.

I am really asking for your comment on this sentence. Realizing that it is convenient, is it essential to have a joint command in NORAD or in your view, could much the same result be achieved by a co-ordinated effort between the two countries?

Lt. Gen. Sharp: No, I do not think the same result could be achieved. It is much more effective to have it under one command. The difference between the situation we had before NORAD and now is the

● 1615

methods by which we intercept aircraft have changed considerably because of the introduction of computers and the communications networks that go with them.

The fact that both the interceptors and the bombers operate at increased speeds and the decision has to be made very very quickly, we have to be able to pass along vital information from one part of the country to the other. To do this you must have it

under—must is a pretty strong word—or you should have it under one command for effective defence. If you want as effective a defence as equipment will give you, it should be under one command.

In the case of NATO, I suppose I am not really qualified to speak on that, but in that situation they are setting up a similar air defence network to SAGE. Am I correct in saying that France is in on this?

Mr. Ryan: Yes, you are.

Lt. Gen. Sharp: In that particular case, in the case of air defence, they are certainly operating under one computer system.

The Chairman: Yes, I can see that you need a computer system, but does it follow that there has to be a joint command?

Lt. Gen. Sharp: Yes, it does.

The Chairman: If you turn to page 6 of the working paper, there is a reference to the SAGE system, I do not know whether this is described elsewhere in the paper or not, I cannot recall it. Could you tell us what this does briefly, or is it possible to summarize just what this does?

Lt. Gen. Sharp: What SAGE does?

The Chairman: Yes.

Lt. Gen. Sharp: I can give you one or two examples and you can see if that helps. If not, you can ask additional questions.

Take the example of an aircraft whose presence is picked up by radar. The information concerning the aircraft that the radar has, its position, its speed and its course, is transmitted automatically into the computer. The computer is programmed in such a way that it keeps track of the progress of this object, it computes the direction that an interceptor would have to fly to intercept it, and it knows the interceptors speed.

These instructions can then be transmitted automatically by data link to the interceptor aircraft or can be given by voice over radio. In other words, it computes very quickly a large number of complicated mathematical decisions which were previously made manually. Does that help?

The Chairman: Yes, I think that explains to my satisfaction the purpose of the equipment.

... the concept of Air Defence has been changing from an overall to a perimeter type defence.

What does that mean?

Lt. Gen. Sharp: When NORAD was first set up or after it had been set up a few years, we had radar coverage over most of the southern part of North America; that is, from the Pinetree south. There was some overlap of radar coverage on the principle that if one became unservicable or was knocked out for some reason the two beside it could cover the same territory.

In recent times some of the radars which used to exist in the central part of the United States have been de-activated. This means that we now have radar coverage around the periphery of the populated part of North America. A reason for this, of course, was the introduction by the Russians of air-to-surface missiles, which meant that they did not have to come in so far to hit their targets.

The Chairman: On that same page you mention that in 1969 the present five NORAD Regions will be reduced to four, as indicated on chart 2. Is Alaska one of the regions referred to?

● 1620

Lt. Gen. Sharp: Alaska is one of the regions that will remain.

The Chairman: That will be the forth region.

On page 8 you state that there is no evidence of the introduction of a new Soviet bomber. What was the date of introduction of the latest Soviet bomber?

Lt. Gen. Sharp: I cannot give you the answer, but it is approximately ten years ago.

The Chairman: There has been no change, or there has been no new bomber, introduced within the last two years by the Soviets?

Lt. Gen. Sharp: No.

The Chairman: Later on that page, near the bottom of the page, you refer to the fact that:

... the Soviet Union has had about 45 ballistic missile launch tubes in their nuclear powered submarine force, but a new class of submarine having 16 missile tubes is in series production.

Does NORAD have a function here?

Lt. Gen. Sharp: We have a function in the sense that one of our responsibilities is to detect and warn of sub-launched ballistic missiles.

The Chairman: Yes, I think that is referred to somewhere in this paper. On page 13, reference is made to the BMEWS system. Is that under command of NORAD or is that just an ancillary organization?

Lt. Gen. Sharp: It is under our operational control.

The Chairman: On page 15, there is a reference to the Space Detection and Tracking System. Is that under NORAD, or is that again an ancillary organization?

Lt. Gen. Sharp: That provides us with information. It is under the command of the United States Air Force.

The Chairman: There is no problem of co-ordination in view of the fact that it is not under your direct command?

Lt. Gen. Sharp: No.

The Chairman: Referring to your earlier suggestion that it is very difficult to operate these systems unless there was a . . .

Lt. Gen. Sharp: No, in one case they provide us with information and in another case it is a question of actually taking decisions to fight an air battle.

The Chairman: Turning to page 19, General Sharp, there is a reference to the Nike and Hercules air defence weapons. They are designed to defend against what?

Lt. Gen. Sharp: Against bombers.

The Chairman: Against bomber attack. On page 20, there is a reference to the Distant Early Warning Line. You mention there are six major stations and 23 auxiliary stations. Are these radars? Down below you refer to long ranger radars, but you do not mention radars.

Lt. Gen. Sharp: No, these are radars, but they have no control point.

The Chairman: Coming to that question of the "Pinetree" Line which is referred to later on the page, is there any reason why that is not shown on the third chart which is entitled "NORAD Warning Systems"?

Lt. Gen. Sharp: It is still operational.

The Chairman: It is still operational although it may not be shown on that chart. Is there any suggestion that it is going to be discontinued?

Lt. Gen. Sharp: I think when you receive the briefing on AWACS one of the possibilities, if this new system is introduced, is that some of these radars can be closed and perhaps the remainder co-ordinated with the Department of Transport, in the case of Canada, and FAA in the case of the United States. However, I

think you would get better information if you waited until you received the briefing on AWACS.

The Chairman: On page 23 there is reference to the Space Detection and Tracking System. Is that under the command of NORAD or is that an ancillary organization?

Lt. Gen. Sharp: The information-gathering parts of it are not under the command of NORAD. The part that actually analyses the information, although not under the actual command of NORAD, is, in fact, located in the mountain in Colorado Springs and responds directly to our request for information.

● 1625

The Chairman: On page 24, there is the reference to a Space Detection "fence" provided by the U.S. Naval Space Surveillance System and the BMEWS system. I presume those are not under NORAD command either?

Lt. Gen. Sharp: No, but they do respond in the same way as explained with the others.

The Chairman: A more general question, General Sharp, and perhaps this is just a matter of personal opinion as far as you are concerned. Evidence has been given to this Committee from time to time that the greatest danger that Canada faces is a nuclear interchange between Russia and the United States. We hope it does not happen but we face the possibility, I suppose, that it could. Would you view this as the greatest possible military danger that Canada faces?

Lt. Gen. Sharp: It could certainly by all measures cause the greatest damage to Canada, and in that sense, yes, I would agree it is the greatest danger. I am trying to think of other things that would cause less damage but which might be more likely to happen. It depends on how you put it. I would say in answer to your general question, yes.

The Chairman: If that was so, if that could cause the greatest damage, can you answer this question? Is it important that Canada should try to develop an effective civil defence system to at least minimize the damage which might be caused, or as some people think, is such a system just impossible as a practical matter?

Lt. Gen. Sharp: Again, to be quite honest with you, I cannot make up my own mind on this. I try to look at it from this point of view: will it increase deterrence? Is it a thing that is likely to reduce the likelihood of war? On that basis, I would have a hard time convincing myself that it would. On the other hand, I also find it very difficult to argue against any program

which, if war did occur, would help save lives. I am caught in that dilemma.

The Chairman: I was thinking of that latter aspect. If you say, as you do, that a nuclear interchange is the greatest danger that we face in Canada from the point of view of destruction, and if we have to concede the possibility that it may happen, despite our best efforts, then should we not do the best we can to minimize the damage and loss of life that would result?

Lt. Gen. Sharp: If you put it that way, I would have to agree.

The Chairman: Thank you very much, General Sharp.

On the second round of questioning I have Mr. Ryan, Mr. Nowlan, and Mr. Legault. Mr. Ryan.

Mr. Ryan: Thank you, Mr. Chairman. General, with respect to SAGE which is the semi-automatic ground environment computer, you have listed 30 site locations in Canada. I am looking at chart 4 of your presentation and there are also apparently some manual long range radar sites in Canada. Could you give us a little more detail on the difference between these two types? If one is completely computerized and the other not at all, or is one of more use in the north, and the other in the south. What is the picture on this?

Lt. Gen. Sharp: In the first place I want to make sure I understand your question. SAGE is not a radar site. SAGE is a computer that takes information from many . . .

Mr. Ryan: Yes, but it ties in with radar.

Lt. Gen. Sharp: Yes, with radar. There are two divisions which do not have the computer to receive the radar information. It is received instead by people who go through the same mathematical computation that the computer goes through and make the decisions. There are two of them. One is in Alaska and the other is in the Goose Bay area.

Mr. Ryan: There are three or four in Labrador too, according to this.

Lt. Gen. Sharp: Those are the radars that feed into the centre which is not computerized. These are radars that feed into the centre which is computerized.

● 1630

Mr. Ryan: Yes, that would be at North Bay, would it, the ones which you are pointing to?

Lt. Gen. Sharp: That would be at North Bay, yes.

Mr. Ryan: It is quite clear that none of these systems have any capability at all of tying in with anything that could shoot down an ICBM or a satellite—just bombers, or other aircraft coming in?

Lt. Gen. Sharp: Yes, that is correct.

Mr. Ryan: Do you have under your control the Pilot Sentinel system or the Pilot Safeguard system?

Lt. Gen. Sharp: No.

Mr. Ryan: In fact, both these systems not only have radars but they also have tied in with them, computers and the actual missiles, the Spartans and Sprints. I would take it that if an ABM system is deployed, it is almost a must that it tie in with NORAD and your detection system, would it not? Or would there not be danger of duplication, mis-identification, and this sort of thing?

Lt. Gen. Sharp: No, because radar detects and identifies bombers, and the ABM system detects and intercepts ICBMs. We have other radars that also detect ICBMs, and it will be very important that these other radars, plus the SAFEGUARD radars, are tied into one centre. It would have to be that way.

Mr. Ryan: Would not your ships at sea, your aircraft on the coast have radars that would feed into you too, and be able to pick up ICBMs?

Lt. Gen. Sharp: No; possibly ships at sea.

Mr. Ryan: Would there be any conflict between one system which is a multiple array system and the other which is a standard type of radar?

Lt. Gen. Sharp: No.

Mr. Ryan: Do you have any problem at NORAD headquarters over the question of the height of air space? In other words, is there any internationally recognized standards as to how high up the atmosphere is? When is an object a satellite which can pass freely over a country, and when is it an aircraft which must be identified and possibly even shot down?

Lt. Gen. Sharp: I had occasion to ask that same question at about the same time that you wondered about it. The answer that I received from our legal people was that there is a height. At the same time they could not give me an precise height. I believe if you want to dig any deeper than that, you would be well advised to ask the appropriate legal office. I cannot give it to you other than in that general area.

Mr. Ryan: Generally the atmosphere goes up about 100 miles and the highest plane can fly as high as 20 miles or so. Is that roughly the situation?

Lt. Gen. Sharp: They have gone much higher than that, to 100,000 feet.

Mr. Ryan: There would be quite an area between, roughly, the 20-mile and the 100-mile distance. Some satellites could come in under the 100-mile ceiling, can they not, without burning up?

Lt. Gen. Sharp: Yes. It is possible to construct a missile (I do not know whether you would call it an ICBM or a satellite) which has a lower trajectory, but whether you could claim that the one having the lower trajectory is violating your air space and the one having a higher trajectory is not, I do not know. In any event if it is coming after you, it is a bit too late.

Mr. Ryan: If it is not classified, General, could you tell us how many Russian satellites, if any, are presently flying over North American, or sufficiently close that they could be photographing our continent for military purposes?

Lt. Gen. Sharp: We keep track of all in distant space. The last time I looked at the board, and they change it almost daily, there were over 1600 of them. Of the 1600, there are some that are of particular importance to us for the very reason that you suggest, and we keep precise track of them. How many Russian satellites there are flying over North America at this particular moment, I cannot tell you, but I can assure you that there are some.

● 1635

Mr. Ryan: Do we keep track of the docking operations of the Soviets with their satellites? Is this going on at the present time to any extent, to your knowledge? What I am getting at is, would it be possible to have a Trojan horse situation with a satellite?

Lt. Gen. Sharp: We are able to keep track of the positioned satellites, and in the majority of cases we know the country of origin. We do not know in every case the intention or what is in the satellite. The only way we could positively determine that, and we cannot possibly determine it at the moment though there are proposals being put up by various scientists that would help us in that assessment, would be to go up and look. It seems to me a pretty crude way of doing it, but I submit that I cannot think of a better one. We attempt to assess the intent of the satellite or the reason it is up there, but we cannot do so in every case.

Mr. Ryan: Do you have any standard height at which you do not take any objection to objects flying over our air space?

Lt. Gen. Sharp: If it is an aircraft, and it is not an authorized flight, or it is an unknown flight, we inves-

tigate and try to find out. Actually, we do find out what kind of an aircraft it is and from where it is coming. We are able to do this. If it is a satellite, on the other hand, we cannot do anything about it except to know that it is there. Again we get back to the question of international law, with which I am not all that familiar, but I do understand it is within international law to fly satellites over any country.

The Chairman: May I ask a supplementary question?

Mr. Ryan: Yes, Mr. Chairman.

The Chairman: How do you know that a satellite is a Russian satellite? I do not suppose they paint a red star.

Lt. Gen. Sharp: No, we detect it when it takes off so we know where it comes from.

Mr. Ryan: Are you ever advised of the taking off of a satellite by the Soviets and told that it will fly over a certain area?

Lt. Gen. Sharp: No.

Mr. Ryan: Are there any flying over North America now that are close enough to take photographs of military value in your opinion?

Lt. Gen. Sharp: Yes.

Mr. Ryan: I take it that they do not need to have high-flying spy planes if they have sufficiently good cameras in the satellites for military purposes?

Lt. Gen. Sharp: In general terms, that would be a fair assumption. There may be specific installations or other things that might not give you a precise enough picture and therefore you would want an aircraft. However, at the moment I cannot think of any.

Mr. Ryan: It has been said, General, that if you knock out with nuclear weapons a block of land, roughly from Boston to Montreal, to Chicago, to St. Louis, to Norfolk, Virginia, you would knock out North America. Would you agree with that from what you know of the picture at Cheyenne Mountain?

Lt. Gen. Sharp: I would hate to agree or disagree. I am as familiar as any ordinary layman would be in economics and population distribution in North America, but I would, at least, want to think about that question before answering it.

Mr. Ryan: Supposing in that scenario that Russia's ICBMs knocked it out on a first strike, would Russian manned bombers be able to knock out our second-strike capacity? In other words would they be able to

come in and finish the job on heartland, and there go after any other installations they were interested in?

● 1640

Lt. Gen. Sharp: Not with our present defences.

Mr. Ryan: Not with your present defences.

On page 3 of the Aerospace Defence Information which has been submitted to this Committee, the fourth paragraph from the top... First of all I should say that NORAD means North American Air Defense Command. Does it General? A lot of people are confused at the initialling.

Lt. Gen. Sharp: Yes.

Mr. Ryan: I would take it that, generally, anything to do with the air above or about the country is your responsibility for detection purposes.

Lt. Gen. Sharp: For detection purposes, yes.

Mr. Ryan: You say on page 3 of this presentation that:

The NORAD mission has been broken down into three basic actions... detect, determine intent, and, if necessary, destroy.

If this is your role, I submit that you are only fulfilling it in part, since you can pretty well detect, you cannot really determine the intent too well, and in many cases, in fact in the worst cases, you cannot destroy at all. Is this the picture?

Lt. Gen. Sharp: Do you include ICBMs?

Mr. Ryan: Yes, I am. This is definitely in your area, is it not?

Lt. Gen. Sharp: That is correct.

Mr. Ryan: I am also concerned with FOB's and the like—satellites. Are you not responsible for what comes up from under the sea, or the land for that matter, right to Mars and beyond?

Lt. Gen. Sharp: When the plan was originally drawn up, when it was originally conceived and agreed to, at that time the only threat was from airplanes and, therefore, the terms of reference were written to cover air. Some people could argue and, in fact do argue, that from the point of view of destroying, while our terms of reference cover air, they do not cover beyond that.

Mr. Ryan: In other words, they are thinking of the atmosphere.

Lt. Gen. Sharp: That is correct. However, we argued about the responsibility for detecting a bomber in space beyond the air. Our NORAD officer would argue that this also includes the responsibility for destroying, if we can, objects in space. However, there are many people who do not agree.

Mr. Ryan: I take it that the NORAD mission as defined in this presentation is rather antiquated in its outlook.

Lt. Gen. Sharp: I believe it would have to be "if the ABM system is destroyed". However, a re-clarification of the terms of reference will be necessary.

Mr. Ryan: You have told us that you are only capable of defending against aircraft of different kinds, and possibly submarines and ships.

Lt. Gen. Sharp: No, it is not our function to attack submarines or ships.

Mr. Ryan: I see. Yes. Of course, you have a few ships in your command, but they are mostly for detection purposes.

Lt. Gen. Sharp: We no longer have ships in our command for detection purposes.

Mr. Ryan: You have some ships according to your presentation. Are these not with you any longer? I do not wish to go into this at the moment.

Lt. Gen. Sharp: What is said there in that respect is wrong.

Mr. Ryan: Yes. The situation is, in fact, that your capability is only against aircraft and possibly submarines. Is there anything else?

Lt. Gen. Sharp: From the point of view of actual defence, this is correct. From the point of view of being able to detect and warn, we can do this in respect to ICBMs and satellites.

Mr. Ryan: Is there any other capability in North America of stopping ICBM's and satellites?

Lt. Gen. Sharp: No.

Mr. Ryan: Then this is all we are capable of. NORAD has everything that we are capable of. There is no question about it.

Lt. Gen. Sharp: Yes, we have.

Mr. Ryan: There is a tremendous gap, then, in our defence of this continent.

Lt. Gen. Sharp: Yes, with . . .

Mr. Ryan: We can only defend against part of the main threat.

● 1645

Lt. Gen. Sharp: Except that aside from the Russian SS-9, the U.S. Minutemen are protected in hardened silos against ICBM's. They are not similarly protected against bombers.

Mr. Ryan: Yes. I have a few more questions, Mr. Chairman, if we have the time.

The Chairman: Please proceed, Mr. Ryan.

Mr. Ryan: You refer in your presentation to IFF—Identification, Friend or Foe. Apparently this is a radar that challenges and accepts automatic replies from friendly aircraft.

Lt. Gen. Sharp: That is correct.

Mr. Ryan: If it challenges an aircraft and does not get a reply, the aircraft is then suspect?

Lt. Gen. Sharp: Or the wrong reply.

Mr. Ryan: I suppose it has something to do with codes and radar and this sort of thing?

Lt. Gen. Sharp: Yes.

Mr. Ryan: This ties in with flight plan information?

Lt. Gen. Sharp: Correct.

Mr. Ryan: Does this system work to your complete satisfaction?

Lt. Gen. Sharp: I do not suppose a military man is ever satisfied with the equipment he has. Of all the equipment we have had, we are satisfied with this system the most. Let me put it that way.

Mr. Ryan: When this Committee was in France, we had the pleasure of listening to General Gallois who was supposed to have been a right hand man to General De Gaulle in the development of the "force de France". He advises that France has the capability of 200 or 300 megatons of nuclear ammunition and its missile-carrying submarines and manned aircraft will knock out any country in the world. Would you believe it would be possible for France to do this to the United States today?

Lt. Gen. Sharp: I think that you really should ask either the United States or France. I would have to say no.

Mr. Ryan: You would have to say no. In this presentation it is revealed that there are 225 giant SS-9 missiles in being in the U.S.S.R. They stopped production in early 1968 and resumed production again last December. Do we have any idea of the numbers that are being produced in the reproduction run? What is the real nature of, and could you give us some details on this SS-9?

Lt. Gen. Sharp: In the first place, I cannot answer your first question. The essential difference between the SS-9, however, and the other ICBM's is that it carries a much larger warhead and, therefore, does not have to be as accurate as do the others to be equally effective. It is mainly a matter of warheads—much, much larger warheads.

Mr. Ryan: It is not so much a question of range? It has the same range as the other ICBM's?

Lt. Gen. Sharp: Yes, it has the same range as some of the others.

Mr. Ryan: On page 23 of your presentation you speak about CADIN cost-sharing. Could you tell us what that is, General, please.

Lt. Gen. Sharp: If you do not mind, Colonel Walsh can, I am sure, explain this better than I can.

Colonel Henry M. Walsh (Director of Continental Plans, Canadian Forces Headquarters): CADIN stands for Canadian Air Defence Integration North. It was a program in the early 1960s to install 7 new radars; 5 in the West, 1 in Chibougamau, and the other at Moosee. It also included the two Bomarc squadrons, as well as the tying in of all the radars in Canada into the computer system. It was a joint Canada-U.S. program where the costs were shared in a certain way for these new installations. Does that cover the question?

Mr. Ryan: Yes it does, thank you. Thank you, Mr. Chairman, those are all of my questions.

The Chairman: Mr. Nowlan.

Mr. Nowlan: Mr. Chairman, I will try to be fairly brief. I was interested in one of the General's answers earlier concerning the components of this NORAD defence system and personnel, and the question you raised, Mr. Chairman, about page 4, of the totals mentioned and how the Canadian figure includes personnel and families or civilians . . .

Lt. Gen. Sharp: Not families.

• 1650

Mr. Nowlan: . . . or civilians. I wanted to ask first before I started the other questions, is that true also

for the other figure on page 4 of 144,000 personnel that is used as a total group figure?

Lt. Gen. Sharp: The answer is yes.

The Chairman: I wonder if you would explain that? The 144,000 are all military, or military and civilian?

Lt. Gen. Sharp: My understanding is that they are military and civilian. If I am wrong in that, we will send word in and it can be corrected.

Mr. Nowlan: I only asked it to clarify and get the right term of reference. In talking about the Canadian component part of that as far as the service personnel are concerned, of 9,380, has there been any change in that in the last, say, five years? And if so, in what way?

Lt. Gen. Sharp: Yes, there have been some reductions in the last five years.

Mr. Nowlan: I mean, I am not talking about the odd reduction.

Lt. Gen. Sharp: No, no.

Mr. Nowlan: I wonder if it is possible to find out where the changes have occurred?

Lt. Gen. Sharp: They closed some radar stations which resulted in a reduction in personnel.

Mr. Nowlan: Only in that way has there been a reduction?

Lt. Gen. Sharp: Yes.

Mr. Nowlan: Fine. Well, talking about radar, is it fair to assume that of the 683 Americans in Canada, they would basically be in the radar area, either on the Dew Line or that portion of the Pinetree Line the Americans are in? Or where else would they be?

Lt. Gen. Sharp: I would say approximately one-third are in radar, about one-third associated with the security arrangements for nuclear weapons, and the remainder spread about.

Mr. Nowlan: Are there, in turn, any Canadians serving in the American Pinetree area?

Lt. Gen. Sharp: Do you mean in Canada or the United States?

Mr. Nowlan: Pardon me: Canadians in the United States. You mentioned it earlier.

Lt. Gen. Sharp: The only Canadians in the United States are in the headquarters and controlling elements.

Mr. Nowlan: That is the only place where there are any Canadians in the United States, basically?

Lt. Gen. Sharp: In NORAD, yes.

Mr. Nowlan: I do not have too many more questions but I want to try to get something clear in my own mind. In talking about the Canadian contribution to NORAD—and all the questions here today are trying to find out history and the projection, perhaps,—as I interpret the figures as far as personnel are concerned, we contribute about 12 per cent of total personnel. Would that be fair? I am talking about the armed services.

Lt. Gen. Sharp: My assessment would put it a little lower but it would be 10 or 12 per cent.

Mr. Nowlan: Yes, 10 or 12 per cent. You may not be able to have this figure but surely, perhaps, we could get the figure somewhere. What is the NORAD cost? What I understand from the paper and what you have said today is the summary of our NORAD contribution and, as I understand it, that includes three of 18 interceptor squadrons, two of 10 Bomarc squadrons . . .

Lt. Gen. Sharp: No. I am sorry, that was a misprint; it is two of eight.

Mr. Nowlan: Two of eight Bomarc squadrons?

Lt. Gen. Sharp: That is, two of 10. Did you say regular? The Air National Guard of the United States are almost regular. What page is that?

Mr. Nowlan: That is page 19, the part on the Bomarc story. Well, would the Bomarc National Guard be a figure that the Americans consider cost-wise as part of their NORAD contribution?

Lt. Gen. Sharp: Yes. They would cost the National Guard.

● 1655

Mr. Nowlan: Canadians contribute three of 18 squadrons, we contribute two of eight Bomarc squadrons and we operate, perhaps with help, 27 of 99 long-range radar stations. Is that not correct?

Lt. Gen. Sharp: That is correct.

Mr. Nowlan: On top of this and separate from it, is the DEW system, but that, as I understand the paper and the evidence, is still administered in effect by the American Air Force under a special contract. There are no Canadians involved.

Lt. Gen. Sharp: The DEW Line?

Mr. Nowlan: The DEW Line.

Lt. Gen. Sharp: We command the stations belonging to Canada, but they pay for it.

Mr. Nowlan: Is there any other area then, other than these squadrons, Bomarcs, and our participation in the long-range or Pinetree radar system, where cost to Canadians is involved?

Lt. Gen. Sharp: At least that I can think of, two very small elements. One is the Baker-Nunn camera at Cold Lake which is very small as far as cost is concerned to operate, and the electronic warfare squadron that we use in exercises which is located in Canada. I cannot think of anything else.

Mr. Nowlan: Other than those two exceptions, this is the basic contribution of Canada, and also the cost to Canada in these three areas—the interceptors, the Bomarcs, and the Pinetree.

Lt. Gen. Sharp: Right.

Mr. Nowlan: Now, the only cost in dollars in the paper really was on page 19. It said that the operation and maintenance of the Bomarcs in Canada was about \$3.4 million, and as a man who was on the NATO committee and heard the cost of the brigade and the air division, I wondered if it was possible, General, to give us a cost figure for our contribution. In other words, for the three squadrons of interceptors or the two of eight Bomarcs, and our Pinetree contribution?

Lt. Gen. Sharp: I think it is possible to obtain the cost figures of the Canadian contribution for this Committee. I do not have it right here but I think that is possible. If you want to compare it with the American contribution, however, their cost figure are difficult to get for two reasons. In the first place, some of the units that perform functions for NORAD, perform functions for other commands as well, and you would have to make an arbitrary division of costs in that respect. Secondly, even their cost factors, let alone their actual costs, is classified information.

Mr. Nowlan: I see. Of course from the paper and from history we know they contributed very greatly in capital costs when we wanted those early warning systems, but I was trying to get the relative comparison of the present operating costs for . . . It seems to me, Mr. Chairman, that for our personnel contribution of 10 to 12 per cent . . .

Lt. Gen. Sharp: We did give an approximate comparison this morning or this afternoon: \$135 million, Canada—\$1.76 billion, U.S.

Mr. Nowlan: What were those figures? That is what I wanted to get.

Lt. Gen. Sharp: Those are annual operating costs.

Lt. Gen. Sharp: Yes, but it is very approximate.

Mr. Nowlan: This is what I wanted, so could I have those again, please?

The Chairman: A supplementary question, does that include any capital costs, or is that purely operational?

Lt. Gen. Sharp: \$135 million for Canada and \$1.76 billion for the United States.

Lt. Gen. Sharp: Annual operating costs.

The Chairman: General, is that for the entire NORAD system? Not the bomber system. Is it the entire NORAD system?

The Chairman: It does not include any amortization of capital costs over a period?

Lt. Gen. Sharp: That is the entire system.

Lt. Gen. Sharp: No.

Mr. Nowlan: There is no division, but you think we could get it, of the \$135 million between the component parts that Canada contributes to NORAD. In other words, breaking down the \$135 million . . .

The Chairman: Or if you did get something, you would spend something on capital items.

Lt. Gen. Sharp: Breaking it down into squadrons and radars and things like that?

Lt. Gen. Sharp: Our accounting system is not such that they amortize.

Mr. Nowlan: That is right. Also Pinetree.

Lt. Gen. Sharp: I would think so. I am sure that could be given.

The Chairman: Could you get that information then?

Lt. Gen. Sharp: Right.

Mr. Nowlan: I was going to come to it but you have come to it in anticipation. In our contribution dollar wise—I have not figured it out but perhaps five or six per cent of cost is personnel cost or, our contribution is 10 to 12 per cent, you say. Yet in the three component parts, interceptors, Bomarc and Pinetree, we contribute 16 per cent of the squadrons, 20 per cent of the Bomarc and 15 per cent of the Pinetree.

Mr. Nowlan: I have a last leading question, Mr. Chairman. Then for would it not be fair to say that the \$135 million, in our contribution both to the squadron's Bomarc and Pinetree, is out of all proportion to our dollar contribution? Our percentage contribution to these three component parts, excluding the Air National Guard squadrons, is much higher in proportion or in ratio than our dollar contribution.

Lt. Gen. Sharp: I suggest that you should not exclude the Air National Guard squadrons, nor should you exclude the Nike/Hercules which would add greatly to the American dollar figure. You have not explored one other aspect of it: our contribution in geography vis-a-vis the Americans.

An hon. Member: We could give them the Maritimes!

Mr. Nowlan: Thank you, very much. That is under NATO Maritime Command.

● 1700

Lt. Gen. Sharp: We do not contribute any Nike/Hercules.

The Chairman: Mr. Legault.

Mr. Nowlan: I see.

Lt. Gen. Sharp: The National Guard squadrons are not included in your percentage.

Mr. Legault: Thank you, Mr. Chairman. General, could you please tell me if the Bomarc installation could be effective? Could it carry a warhead other than the nuclear warhead?

Lt. Gen. Sharp: The answer is no, not the Bomarc B which is the kind of Bomarc we have in Canada.

Mr. Legault: This was the definite plan, when they were constructed in 1958?

Mr. Nowlan: I see. This is an added contribution . . .

Lt. Gen. Sharp: That brings it down to, as Colonel Walsh says, about eight per cent.

Lt. Gen. Sharp: Yes.

Mr. Nowlan: About eight per cent. This comparison in dollars, while it is an approximate figure, it is one that you have used before? It is accepted, is it, within the trade—\$135 million to \$1.76 billion?

Mr. Legault: Could you tell me if in the case of a bomber attack of a conventional nature, would NORAD immediately assume that these bombers were

carrying nuclear arms? Would you react as if they carried nuclear arms?

Lt. Gen. Sharp: May I first of all go back to my answer concerning the Bomarc's? I want to be as fair as possible in answering. I think I know what was behind the question.

Mr. Legault: It relates to a question that I asked you this morning: would the nuclear warheads, if launched, explode within 300 or 400 miles of the base?

Lt. Gen. Sharp: Yes.

Mr. Legault: This was the intent of the question.

Lt. Gen. Sharp: I wanted to make this point. The Bomarc A, which the Americans originally installed, did not carry a nuclear warhead; if there was any controversy years ago in Canada, there was room for misunderstanding, because the old one did not have the nuclear warhead and the new one did; we bought the new one.

Mr. Legault: Thank you. In the case of a bomber attack such as in my second question, do you have to assume and react as if these bombers were carrying nuclear bombs?

Lt. Gen. Sharp: We do so assume, yes.

Mr. Legault: You would then react as if they were carrying them. However, it might be retaliation, as encountered in the difficulties between China and Russia today where nuclear arms have not been used, just conventional arms.

Lt. Gen. Sharp: That is a valid comment. However, at the moment we assume that the Russian bombers will be carrying nuclear warheads.

● 1705

Mr. Legault: You would react in that very way?

Lt. Gen. Sharp: Yes.

Mr. Legault: Would the political implication at the time, have some bearing on your decision?

Lt. Gen. Sharp: I suppose it would.

Mr. Legault: Do commercial airliners that fly in and out of this country carry the IFF, Identification Friend or Foe?

Lt. Gen. Sharp: The answer is no.

Mr. Legault: If a commercial airliner not identified as a military aircraft, was coming into the country

with the intent of attacking, and was carrying some nuclear bombs would there not be any possible way of identifying the origin of that aircraft? Retaliation would not be possible?

Lt. Gen. Sharp: Commercial airliners have to file flight plans. If we see an aircraft coming in through our radar, at a time and place that does not correlate with any flight plan, we send up an aircraft to investigate and try to identify it.

If this was a commercial airplane and it was carrying a nuclear bomb, we would not be aware of that fact, at least . . .

Mr. Legault: I am thinking in terms of the last world war: all hopes had been placed on the Maginot Line as a military achievement that would protect France; it did not serve any purpose whatsoever. In this particular case I think that it would be . . .

Lt. Gen. Sharp: In this particular case, France did not have a strike force to protect. There is a difference between that situation and the one of today, is there not?

Mr. Legault: Yes, but I am only referring to possibilities. Anyone who would attack and would be aware of the retaliation forces, would come into the country with something that would confuse the Military; that would create a situation where retaliation would be impossible.

Lt. Gen. Sharp: I would agree with you that they would attempt to confuse; whether they could do this to the extent where retaliation would be impossible, is doubtful in my estimation.

Mr. Legault: Thank you, General.

The Chairman: General Sharp, may I ask a question with reference to these cost figures mentioned? I realize how rough they are. You mentioned \$135 million as being the Canadian portion for the operating expenses of NORAD. Looking at the new form departmental Estimates we have and which were reported to the House today, there is a heading under Activity:

Maintain Suitable Capabilities to participate in the Joint Defence of North America

If I read these figures correctly, it shows the Forecast Expenditures of 1968-69, that would be for the fiscal year which has just ended, as \$258,731,000 or approximately \$259 million; the proposed estimates for the coming year are shown as \$267,114,000.

Lt. Gen. Sharp: What was the heading again, please?

The Chairman: The heading under activities is:

Maintain Suitable Capabilities to participate in the Joint Defence of North America

Lt. Gen. Sharp: Yes, it must include not only air, but also ground and sea.

An hon. member: Would it include part of the Maritime Command as well, Mr. Chairman?

Lt. Gen. Sharp: We would like to give you, according to Mr. Grant, a paragraph or two on the full costs; that would be more factual than any information we could give you at the moment.

The Chairman: That would be very helpful. I gather that this figure of \$135 million, does not include capital items.

Lt. Gen. Sharp: That is correct.

The Chairman: That might also be one reason for the divergence from these figures in our Estimates. My second question is this. Can you give us, even a rough guess, as to the proportion of the total NORAD program, which is involved in the bomber defence on a cost basis? Is it one-tenth of the total, or a quarter of the total?

● 1710

Lt. Gen. Sharp: A rough guess?

The Chairman: I was wondering what proportion of the total NORAD cost commitment, is attributable to bomber defence?

Lt. Gen. Sharp: I cannot answer that now. I think we could try to get the answer to that for you, although it will be difficult.

The Chairman: It might require an allocation of costs.

Col. Walsh: May I say that the \$1.76 billion is for bomber defences.

The Chairman: Only for that?

Col. Walsh: I am pretty sure of that.

Lt. Gen. Sharp: I think we had better find out the estimate to be certain of our facts; several people want to make comparisons. We better have the right figures.

The Chairman: I continue to come back to this because originally I thought that the reference to the \$1.76 billion was for bomber defences, however, on the second line of questioning, it was suggested that it was for the total NORAD program.

Col. Walsh: Yes, it is for bomber defences: I am quite certain of that; also, it does not include ABM's.

The Chairman: Then similarly, the \$135 million would constitute only the Canadian portion of the bomber defence, rather than the Canadian portion for the total NORAD budget?

Col. Walsh: We do not have anything on this.

The Chairman: Thank you. It would be helpful if we could get this information, Mr. Howard.

Mr. Howard (Okanagan-Boundary): Thank you. There was something said about the NORAD system being a two-key system. If any retaliatory action were necessary, permission would have to be obtained from Washington and Ottawa. In Ottawa, who gives that permission?

Lt. Gen. Sharp: We contact the operation centre at Canadian Forces Headquarters which is manned 24 hours a day, They would contact the Chief of Defence Staff who would either contact or go directly to the Minister. It would then be the Minister's judgment as to whom he would talk to or discuss this with. I think that it would be a matter of timing.

Mr. Howard (Okanagan-Boundary): Does the Minister of National Defense have the authority to make a decision to . . . ?

Lt. Gen. Sharp: I recommend that you ask Mr. Cadieux when he is here on Thursday, I believe that it is.

Mr. Ryan: We know that there is a hot line telephone in his office.

Mr. Howard (Okanagan-Boundary): Perhaps politically, but I am now speaking of the military aspect. President of the United States is accompanied by a very complicated system for instant communication and that two automobiles, both equipped with elaborate communication systems, are required.

Lt. Gen. Sharp: Perhaps our Prime Minister is a better communicator than the President of the United States.

Mr. Howard (Okanagan-Boundary): Perhaps politically, but I am now speaking of the military aspect. What mechanical system is involved in communicating with the Prime Minister if he goes skiing or with the Minister of National Defence if he is at a political meeting in Rimouski, Quebec? What system do we have to ensure that we will not hold up the war?

Lt. Gen. Sharp: To be certain that you get the right answer, ask the man involved! He will be here on Thursday night.

May 6, 1969

External Affairs and National Defence

1411

Mr. Howard (Okanagan-Boundary): All right. Thank you.

The Chairman: Are there any other questions from the members? Gentlemen, you may or may not have seen the press release which the Committee issued, but in it we indicated that we were distributing copies of your working paper throughout the country to the academics and the important and intellectual people such as the editors of the major newspapers. We also invited comments. We are looking forward, with a great deal of interest, to the comments that we receive from the community of intellectuals situated across Canada.

If questions are received from them, or if a member of the Committee has further information, would it be possible to funnel further questions through the Department of National Defence to you? Hopefully,

we might obtain answers to questions which may come up if you are not available.

Lt. Gen. Sharp: No, I am sure that will be possible.

The Chairman: On behalf of the members of the Committee, I would like to thank you for your attendance in Ottawa today, and for the manner in which you have answered our questions. I think that the intensity and the length of the questioning indicates the intensity of the interest of the members in this particular subject. Thank you very much, Lt. Gen. Sharp, and thank you Brig. Gen. Magnusson, Col. Walsh and the other members of your staff.

We adjourn until Thursday, May 8, 1969 at 8:00 p.m. when the Secretary of State for External Affairs and the Minister of National Defence will be present to discuss NORAD.

APPENDIX XX

NORTH AMERICAN AIR DEFENCE

HISTORICAL BACKGROUND

The intergovernmental agreement to form a combined U.S./Canadian command for air defence of the continent was signed 12 May 1958. This agreement was reached only after the conduct of analytical studies, all of which led to the conclusion that the air defence of North America is a single, indivisible problem. The original agreement stipulated that NORAD would be maintained for a period of 10 years or such shorter period as agreed to by both countries. The Commander-in-Chief of NORAD was to be responsible to the Chiefs of Staff Committee of Canada (now superseded by the Chief of the Canadian Defence Staff) and to the Joint Chiefs of Staff of the United States. It was stipulated that the Commander-in-Chief of NORAD and his deputy would not be from the same country, and that, in the absence of the Commander-in-Chief of NORAD, command would pass to his deputy. Canada and the United States have since renewed the agreement for a further five years from 12 May 1968 with the new proviso that either party can request a review at any time but after such a review can terminate the agreement on one year's notice.

The need to make provision for the coordinated defence of North America arose from the development of a nuclear capability by the Soviet Union combined with the development of a long range bomber force which made it clear that the newly developed weapons could (if desired) be delivered against North America. Canada's geographical position astride the most likely strike routes for the Soviet bomber force made the air defence of U.S. and Canada a common problem. Canadian airspace would have to be penetrated to attack primary targets in the U.S. even in the event that the attacker had no desire to attack Canadian targets. It was concluded that effective air defence of the North American continent would require the coordinated efforts of both countries and the unrestricted use of Canadian and U.S. airspace by the defending forces. A single integrated command to exercise operational control was, therefore, a mandatory requirement.

The emergence of a direct threat to North America provoked a serious debate in the 1950's. Doubts were expressed about the feasibility of establishing an air defence system which would be fully effective against manned bombers. It was argued that even if a few bombers armed with thermo-nuclear weapons suc-

ceeded in getting through, they would be capable of inflicting enormous devastation on North America. It was also argued that, since the security of the West rested primarily on the deterrent in the form of the Strategic Air Command, there would be a greater gain in security if any additional funds were allocated to SAC rather than to an air defence system.

The counter argument, which ultimately prevailed, was that SAC bomber bases, owing to the large concentration of bombers on each base, were vulnerable to an attack by a relatively small number of aircraft. Such vulnerability could serve as a temptation for the USSR to launch a preemptive attack. To guard against this danger a detection system was developed to provide the maximum warning time for SAC bombers to get off their bases and be launched on retaliatory missions. An active defence system was also needed which required that any attack against North America be launched in considerable strength, thereby significantly increasing the chance of warning. At the same time an active defence made penetration of North American airspace by hostile bombers extremely difficult and costly. The principal function of the air defences of North America during this period was to enhance the survivability of the U.S. deterrent forces (SAC) and to minimize the damage caused in any attack by destroying as many bombers as possible before they could reach their targets.

CURRENT NORAD
ORGANIZATIONAL ARRANGEMENTS

The command and control facilities for the Commander-in-Chief of NORAD are now located in a hardened facility in Cheyenne Mountain near Colorado Springs. Their eight computers sift and sort the great variety of information which is received from NORAD and worldwide sensor systems and other sources to give CINCNORAD and his staff constantly updated information in supervising the air defence of North America.

NORAD operational forces are made up of some 144,000 personnel at some 350 locations. These forces are provided by three military component commands, the Canadian Armed Forces Air Defence Command, the USAF Aerospace Defense Command, and the U.S. Army Air Defense Command. In addition, the Commander-in-Chief of Alaskan Command, a separate U.S. unified command, is responsible to CINCNORAD for

the air defence of Alaska. Of the 144,000 personnel, 14,000 are provided by the Canadian Forces, 108,000 provided by USAF ADC, and 22,000 by the U.S. Army (these figures include civilians). There are 683 American NORAD personnel in Canada and 249 Canadians in the United States.

The Commander-in-Chief of NORAD exercises operational control only of the forces made available to him by the component commands. To enhance operational control the continent has been divided into five Regions (Western, Eastern, Central, Northern and Alaskan). Four of these Regions include both U.S. and Canadian territory and airspace, while Alaskan Region is solely within U.S. boundaries (Chart 1). Each Region is commanded by a general officer who is responsible to CINCNORAD for the air defence of his geographical area. He monitors and coordinates the air action, plans the use of assigned forces, and supervises the methods and procedures by which an air battle would be fought in his area.

All Regions are jointly manned by Canadian and U.S. servicemen, with the exception of Alaskan NORAD Region. The Canadian manning is as follows:

A	Western	1,600
B	Central	1,400
C	Northern	6,200
D	Eastern	180
E	Alaskan	NIL

NORAD Regions are further sub-divided into Divisions and the number of divisions is determined by the amount of air traffic and the number of vital targets located within the particular Region. The manning of NORAD Divisions (see Chart 2) is largely dependent on the geographical area involved and the forces made available. That is, in those Divisions where both Canadian and U.S. forces or territory are involved, joint manning is in effect. Canadian officers are in command of the Northern NORAD Region and two of the thirteen NORAD Divisions, and Canadian officers serve as Vice Commanders of two Regions and four Divisions.

The NORAD Divisions exercise direct control over the defensive forces which include manned interceptors, Bomarcas, Nike/Hercules and Hawk missiles. All Divisions with the exception of those in Alaska and the 37th NORAD Division at Goose Bay, Labrador, are equipped with the SAGE (Semi-Automatic Ground Environment) system. The system includes computers which are capable of accepting a large volume of information and transposing it into a readily usable form for air battle management.

The overall operational command and control of NORAD forces is exercised by CINCNORAD by means of a sophisticated command and control

system. The computers at each Division and Region provide information to the computers in Cheyenne Mountain where the data is analyzed and correlated and presented in the form of constantly updated displays. At the same time information flows in from a great variety of other sources. All of this information is checked and double checked and displayed to assist the Commander-in-Chief and his staff in carrying out the air defence of the North American continent.

There have been many changes in the NORAD posture since the inception of the command in May 1958. Due to technological advances and changes in the bomber threat the concept of Air Defence has been changing from an overall to a perimeter type defence. This has made possible a substantial reduction in defensive forces and consolidation of command and control facilities. In the past six years interceptor and missile defence forces have been reduced by approximately one third. Corresponding reduction has also been carried out in radars and in the control system. A further reduction in the control system will be effected in 1969 when the present five NORAD Regions will be reduced to four (see Chart 2).

THE THREAT

The nation which poses the most serious threat to North America is the USSR. It is estimated that the Soviet Union will have achieved numerical parity with the U.S. in land based intercontinental ballistic launchers by mid-1969 and will have a larger inventory than the U.S. by 1970. This will permit them to plan on the basis of strikes against more targets and provide them increased assurance of destruction of their present targets if deterrence fails and intercontinental nuclear war were to occur.

The size and character of the threat has changed very significantly since the inception of NORAD in 1958. The emphasis has shifted from a solely bomber threat in 1958 to a massive missile and a limited but still significant bomber threat in 1969. However, the nature of the bomber threat is changing from that of the 'free fall' bomber to that of the air to surface missile carrier with improved survivability and stand off strike capability of several hundred miles.

Although there is still no evidence of Soviet introduction of a new bomber of intercontinental range in the early 1970s, improvements in the present force continue to be noted. For example, sophisticated electronic counter measures are now employed to complicate the air defence problem.

Analysis of the threat to North America reveals the following:

- a. The Soviet Union has between 950 and 1000 ICBM launchers operational including a significant number of SS 9 which can carry a warhead in excess of 20 megatons and is the missile on which

the Soviets have been testing Multiple Re-entry Vehicles.

b. Until now, the Soviet Union has had about 45 ballistic missile launch tubes in their nuclear powered submarine force, but a new class of submarine having 16 missile tubes is in series production. It is expected to have the capability of firing a missile of 1500 miles range and thereby markedly improve Soviet strike capabilities.

c. As of now, the Soviet Union has about 150 subsonic jet and turbo prop bombers of intercontinental range. About half of these are equipped with air to surface missiles, one per aircraft. These bombers have a two-way mission capability to any target in North America. The Soviets also have about 700 medium bombers which are believed to be targetted on Eurasia, but a few might be committed to an attack on North America. In a "Greater Than Expected Threat" situation it is conceivable that something less than half of these bombers might be used on one-way missions, but in view of the growth of Soviet ICBM/SLBM capabilities this is not considered very probable. In this unlikely case the obvious targets would be in Hawaii, Alaska and Canada.

THE BOMBER THREAT

Developments during the past decade such as the airborne alert concept for Strategic Air Command bombers, the maintenance missiles in hardened silos, and the U.S. Polaris submarines have eased the requirement to protect the deterrent forces of the U.S. from bomber attack. However, the requirement for these defences has by no means been eliminated. The manned bomber continues to be the cheapest and most effective means for delivery of nuclear weapons. The recent increase in Soviet training flights to the periphery of North America seems to suggest a renewed interest in this means of attack. It is generally more accurate than a missile, can carry a larger payload and is more flexible. Moreover, the effectiveness of the bomber increases in inverse proportion to the effectiveness of the defences against it. If North America anti-bomber defences were eliminated altogether the megatonnage which the USSR would be able to deliver in an attack would be greatly increased.

In addition, any other country with a nuclear capability would be able to launch an effective attack against the U.S. and Canada with relatively cheap and unsophisticated delivery systems.

Thus, NORAD's defences serve to "put up the price of admission" by forcing a would-be attacker to either concentrate all his weapons against fewer targets, or to produce more sophisticated and expensive delivery systems in an attempt to circumvent the defences.

The Minister of National Defence speaking in Ottawa on 27 January 1969, expressed the need for continuing anti-bomber defences in this way, quote:

"Let us look more closely at the place of the bomber in the strategic system. At the moment, the superpowers find it more economical to concentrate offensive capability in intercontinental and submarine-launched missiles. But why is this so? Simply because effective defence against bombers is feasible and both sides maintain such defences—just enough to discourage the other side from investing in the cheaper and more accurate delivery system that bombers represent.

"What would happen if one side abandoned its bomber defences? In all likelihood, the other side would immediately do most of the following things:

- *Refurbish the bombers it still has in service.
- *Modify some of its transport aircraft to carry bombs.
- *Build more bombers.
- *Perhaps use tankers and heavy tactical aircraft as bombers.
- *Remove the jamming equipment from its bombers and replace it with more bomb racks.
- *Forget about using load-limiting stand-off missiles, and finally
- *Target to cities intercontinental missiles which had previously been aimed at air defence facilities.

The balance would be quickly distorted to a much greater degree than that implied by the original "bomber threat".

"One side would have available an inexpensive offensive system, which would threaten both the population and the land-based second strike forces of the other. Any movement toward such a situation would be destabilizing and must be discouraged. Thus, air defence will be needed as long as bombers represent either an existing or a potential threat to second strike forces.

Because of our geography, it is doubtful that the United States could, in the foreseeable future, maintain an air defence system adequate to meet the requirements I have just reviewed, unless there is close and active cooperation from Canada. If we made life difficult for the United States in its endeavours to establish adequate air defences, we would only make the nuclear balance less stable. Such behaviour on Canada's part would be acting against Canada's own security interests. Canada's defence cooperation with the United States has developed by

a series of carefully negotiated agreements, arising out of the joint pronouncement of Prime Minister King and President Roosevelt at Ogdensburg in 1940. NORAD is an important example of such cooperation, and has served Canada well. In my view, NORAD is still important to Canada's security."

THE BALLISTIC MISSILE THREAT

In relation to its responsibility for warning, NORAD carries out certain tasks with regard to the detection of ballistic missiles and sub-launched ballistic missiles. At present a good capability exists to detect and determine the intention of any ICBMs launched over the polar regions. This capability is provided by the Ballistic Missile Early Warning System (BMEWS) located in three sites at Clear, in Alaska, Thule, in Greenland, and Fylingdale Moor, in England. These sites were established between 1960 and 1963 by the United States at a cost of approximately \$920 million dollars. The sites at Clear and Thule are operated by U.S. personnel and the site at Fylingdale Moor is under the operational control of the Royal Air Force.

The BMEWS sites consist of radar scanners and trackers which have the capability of constantly probing space for possible missile launches. The warning capability of the BMEWS is between 15 and 20 minutes. The information gleaned by the BMEWS sites is sifted and correlated by a computer system and relayed automatically to the computers in the NORAD Cheyenne Mountain complex at Colorado Springs, over cables and radio circuits, much of them through Canada. At the NORAD Combat Centre the data is processed by the NORAD computers and displayed instantaneously. Processed warning information is passed to all user agencies such as National Defence HQ in Ottawa, the National Military Command Centre in Washington, SAC, SHAPE, RAF Headquarters, etc.

In addition to the BMEWS system the United States Air Force in modifying seven of its coastal radars to provide a detection and warning capability against submarine-launched ballistic missile attack. This new system employs modified radars which are capable of both searching and tracking and can detect any missile launched or approaching within several hundred miles of the Canadian and U.S. coastlines. As is the case with BMEWS, the computers at the radar sites can calculate the launch and impact points for any detected missiles which appear to be a threat and automatically transmit the threat message to the NORAD Combat Operation Centre.

In summary, NORAD has a capability to detect, identify and give warning of ICBM and SLBM attacks against the North American continent. NORAD does not, however, have any capability to intercept or destroy ballistic missiles. The preservation of the

retaliatory force, through hardened Minuteman sites, Polaris submarines and airborne SAC bombers, has been considered the best counter against any ballistic missile attack and a sufficient deterrent to a pre-emptive first strike.

THE SPACE THREAT

It has been known for some time that the USSR has been developing a space vehicle which could have a "fractional orbital bomb" capability. Although there is no indication as yet that such a weapon is being deployed, NORAD must be alert to all possibilities and have the capability of providing warning of any space events that occur.

The Space Detection and Tracking System consists of a network of radar, radio and optical sensors concentrated in the northern hemisphere supplying data to the NORAD Space Defense Center on orbiting satellites. The system is multi-service, composed of USAF, US Navy and Canadian Armed Forces sensors (the Canadian input is a Baker Nunn Camera located at Cold Lake, Alberta) along with a number of civilian scientific agencies which contribute data on a co-operative basis. A computerized master catalogue of space vehicles—payloads and debris—is maintained by the Space Defense Center in the NORAD Combat Operations complex in Cheyenne Mountain. The center also determines orbits of space objects, keeps a schedule of their positions, predicts their future positions, and predicts the time and general location of their re-entry into the earth's atmosphere. Even after precise data are established on a satellite position, surveillance of the object must continue to ensure updating of the orbital information. More than 12,000 observations are made daily on approximately 1600 objects by the sensor network and are processed by space object identification experts using both computer and hand processed data. Orbital information on satellites of interest to NORAD is fed into the data base of the computers which support the NORAD Combat Operations Center and is presented in constantly updated displays for the CINC and his staff.

SUMMARY OF CURRENT NORAD CAPABILITIES

Although the threat during the past decade has changed from solely a bomber threat to a mixed missile and bomber threat the basic tasks of NORAD have not changed. CINCNORAD is charged with the responsibility of defending North America if we are subject to an air attack. Unlike the strategic offensive forces, whose mission is to strike those enemy forces not yet launched into battle, NORAD's mission is to defend against those enemy bomber forces en route to their targets. NORAD's task, therefore, is to defend the North American continent against air attack in a "hot war" and to effectively "police" this same area in peacetime.

With present equipment and facilities NORAD is capable of:

A. Detecting, identifying and destroying the manned bomber.

B. Detecting, and providing warning of an ICBM attack over the northern regions.

C. Detecting satellites, predicting their orbits and their future position.

PRESENT FORCES

Fighter Interceptors

NORAD has at present assigned to it three Canadian Air Defence Command fighter interceptor squadrons totalling 48 aircraft situated at Chatham in New Brunswick, Bagotville in Quebec and at Comox in British Columbia. These squadrons are equipped with the CF101 Voodoo interceptor. The USAF provides 18 squadrons of F106 Delta-Dart and F101B Voodoo fighter interceptors deployed around the perimeter of the continental U.S. and in Alaska. In addition, the USAF provides 21 other fighter interceptor squadrons manned by the National Guard and equipped with first line aircraft such as F102 Delta Dagger. All NORAD interceptors are equipped to carry air-to-air missiles with nuclear warheads. The fighter interceptors are directed and controlled by the NORAD divisional commanders within whose area of responsibility they are located. A percentage of the interceptor force is maintained on a five-minute state of alert 24 hours a day to ensure the interception and identification of any unknown aircraft penetrating North American air space. The remainder of the force is kept at lower states of alert under normal peacetime conditions but the entire operationally ready force must be capable of responding within three hours. When there is an increase in world tension the CINCNORAD will raise the alert status of this force after obtaining the authority to do so from the governments of Canada and the United States.

Under certain circumstances and at the request of CINCNORAD, other forces augment those already assigned to NORAD. These forces are provided by the U.S. Navy and the USAF Tactical Air Command and the Canadian Forces Air Defence Command, and consist of several squadrons of fighter interceptor aircraft.

It is difficult to accurately assess the relative contributions made by Canada and the U.S. to the NORAD interceptor forces. Canada provides three Regular Force interceptor squadrons as compared with 18 U.S. regular squadrons (or approximately 14% of the regular interceptor force). If the U.S. National Guard interceptors are included the Canadian percentage of the force is about 8% of the total.

BOMARC MISSILES

NORAD has a total of 10 Bomarc B missile squadrons in its inventory. Two squadrons, one located at La Macaza in Quebec, and one at North Bay, Ontario, are provided by Canada. The remaining eight Bomarc squadrons are in the northeastern United States. The Bomarc missiles are on a constant state of alert, ready to be launched within seconds if hostile forces penetrate North American air space.

The Bomarc squadrons are under the direct operational control of the division commander. The operational concept includes a "fail safe" system of control which ensures that the launching of a Bomarc missile can only be actuated from the SAGE direction centre. To ensure positive control a "two-key" procedure is employed whereby a Canadian and an American officer are each required to turn a key to make the launch system operative. The officers carrying the "two keys" are on duty in the SAGE direction centres 24 hours a day. The activation of the launch system can only be carried out on the receipt of properly authenticated instructions from the NORAD Combat Centre. These instructions would be passed by the CINC only after he had obtained authority from the governments of Canada and the United States. Equivalent control procedures apply to nuclear equipped interceptors.

Canadian forces operate and control 20% of the inventory of NORAD Bomarc missiles. The Bomarc sites in Canada were constructed under the US/Canada cost-sharing agreement for North American defence in which the US paid two-thirds of the capital costs of all CADIN (Continental Air Defence Integration North) facilities, and Canada paid one-third. These included the SAGE (Semi Automatic Ground Environment) system for the Northern NORAD Region and 41st NORAD Division situated at North Bay, the long-range radar sites in Canada, the telecommunication requirements and the Bomarc squadrons. The overall capital cost of this entire program was approximately \$450 million dollars. The Canadian share was about \$150 million dollars. At the present time the total annual operating and maintenance costs for the two Canadian Bomarc squadrons is \$3.4 million dollars per year.

Nike/Hercules Missiles

There are no Nike/Hercules air defence weapons situated in Canada. This short-range weapon is provided to NORAD by the U.S. Army Air Defense Command. Nike/Hercules batteries are deployed to provide point defence of 24 major cities and industrial areas in the continental United States. In addition, the Nike/Hercules is used in the Alaskan NORAD Region.

Surveillance and Warning Facilities

The first detection of a manned bomber attack is provided by the Distant Early Warning (DEW) Line.

This warning line which consists of six major stations and 23 auxiliary stations, was constructed by the United States and is maintained by the USAF through a civilian contract with the Federal Electric Company. Four of the main stations are located in the Canadian Arctic (see Chart 2). The Military Commander at each main station in Canada is a Canadian Forces officer and he exercises operational control for NORAD. Warning provided by the DEW line is sufficient to permit CINCNORAD to alert the civil defence agencies of Canada and the U.S. and to provide the time for the strategic retaliatory bomber forces of SAC to become airborne. At the same time NORAD defensive forces would be brought up on alert status prepared to meet an attacking force.

Long-Range Radars

The second element of the surveillance and control system is the "Pinetree" Line of long-range radars positioned in southern Canada and in the United States. At present there are 27 long-range radars manned and operated by the CF Air Defence Command, and 99 operated by the United States Air Force. In addition, the radars are supplemented by a number of gap-filler radars in the USA and Airborne Early Warning and Control aircraft patrolling the coasts. Three of the USAF long-range radars are situated in Newfoundland and Labrador.

A typical surveillance radar continually scans the air-space surrounding the station to an approximate distance of about 250 miles. Supporting the search radar are two height finders. Working in combination, the search radar and height finder radars track the incoming aircraft and measure its speed and altitude. An electronic device at the radar site called IFF (Identification Friend or Foe) challenges aircraft by the surveillance radar and accepts the automatic replies from friendly aircraft. In the computerized part of the NORAD system (which includes all but Alaska and the division at Goose Bay) all data are converted at the radar station into digital form and transmitted directly to the appropriate SAGE or BUIC (Back Up Interceptor Control) facility where the data are entered into the facility's computer automatically. The computer then assists the interceptor and weapons control personnel in directing NORAD fighters to intercept the penetrating aircraft.

Twenty % of the NORAD long-range radars are operated by Canada. The USAF gap fillers and airborne radar systems are an additional contribution made by the US. While it is difficult to make an accurate comparison it would be safe to assume that in terms of numbers of units only, the Canadian portion of the overall radar system would comprise about 15% of the system. Approximately one third of the capital costs of the Pinetree System was paid by Canada. The distribution of radars on the North American continent is shown in Charts 3 and 4 attached.

Command and Control Facilities

Command and control facilities available to the Commander-in-Chief NORAD are shown in Chart 1 attached. As stated previously, the North American continent has been divided into Regions which, in turn, have been divided into Divisions. Within the Divisions, are alternate control centres called BUICS (Back Up Interceptor Control facilities). All Regions with the exception of Alaskan NORAD Region embrace both US and Canadian territory and airspace.

Northern NORAD Region is equipped with the SAGE system and is automatically tied into the NORAD COC at Colorado Springs. Construction of the underground facility at North Bay was undertaken by Canada under a cost-sharing agreement. Of the total cost of 51.8 million dollars, approximately one third was paid by Canada. The US paid the capital costs of construction of all other Regions in the NORAD system as well as the Combat Operations Center at Colorado Springs (approximately \$142 million).

There are two NORAD Divisions situated in Canada, one at Goose Bay (which is a manual operation) and the other at North Bay co-located with Northern Norad Region, and sharing its computer and communications. CADIN cost-sharing was applied to the capital costs of construction of the Division at North Bay and USAF paid all the costs at Goose Bay. All other NORAD Divisions were constructed with U.S. funds.

Ballistic Missile Early Warning System

The contribution of this system to North American defence and the cost to the United States was outlined on page 13.

Space Detection and Tracking System

The entire Space Detection and Tracking System (SPADATS) has been provided by the United States. Canada's contribution consists of manning the Baker-Nunn camera located at Cold Lake, Alberta. The system (see Chart 5) includes various sensors operated by:

- U.S. Air Force Aerospace Defense Command Spacotrack system
- U.S. Naval Space Surveillance System
- Ballistic Missile Early Warning System
- Canadian Armed Forces Air Defence Command Satellite Tracking Unit.

The system operation is relatively simple. The Space Defense Center in the NORAD COC tells a specific sensor where and when to look for a specific satellite and then the sensor sends the resulting data back to the Center.

The U.S. SPADATS System comprises detection and tracking radars at Shemya, Alaska; Moorestown, New Jersey; Diyarbakir, Turkey; Eglin AFB, Fla, and

Trinidad. In addition, there are three optical sensors in the system (Baker-Nunn cameras) situated at Sand Island in the Pacific, Edwards Air Force Base in California and Jupiter, Fla.

A space detection "fence" is provided by the U.S. Naval Space Surveillance System across the United States from California to Georgia. The system which has been in operation since 1959, has three powerful transmitter stations and six receivers all located in the United States. The information from this system is processed by high speed computers and the position of the satellite is precisely determined and passed by data link to the NORAD Combat Operations Center.

Other supporting systems in satellite tracking include the BMEWS system which provides about 25 % of the satellite observations reported to the Space Defense Center. Baker-Nunn cameras, including the Canadian installation at Cold Lake, provide satellite identification by photographing objects illuminated by the sun while the cameras themselves are in darkness.

In summary, it is estimated that Canada contributes approximately 8% to 10% of the overall costs of maintaining and operating the NORAD system.

POTENTIAL EVOLUTION OF THE THREAT

The threat of a bomber attack will continue to exist as long as the USSR maintains a significant bomber force. Such a force exists today and probably will continue to exist for the next decade. What is less certain is whether the Soviet Union will develop and produce a new supersonic bomber to supplant the existing force. A technological capability to place such a bomber into production has been demonstrated by the recent flight of the Tupolev 144 supersonic trans-

port aircraft. One of the objectives of a manned bomber defence is to discourage Soviet bomber development.

The threat of a ballistic missile attack is increasing as the Soviet Union increases its inventory of intercontinental ballistic missiles and submarine-launched submarine ballistic missiles.

It is hoped that all nations will abide by the provisions of the treaty banning the stationing of weapons of mass destruction in outer space since it is within the present state of space vehicle technology to develop orbital satellites which can carry several nuclear warheads. At present there is no method by which such satellites could be identified as hostile and, therefore, warning of an attack would not be available. However, if such a threat were to develop, it is very likely that methods could be developed to identify possible hostile objects and provide a means to destroy them.

POSSIBLE IMPROVEMENTS IN AIR DEFENCE

Against the present threat there are a number of improvements which could be made in the air defences of North America. To counter the threat of attack by bombers whose capability has been improved considerably by the introduction of the air to surface missile and improved electronic counter-measures, a combination of AWACS (Airborne Warning and Control System) and an Advanced Manned Interceptor would be desirable.

A number of options have been proposed for both an AWACS aircraft and for an improved manned interceptor. In discussing alternatives before the Senate Armed Forces Committee in 1968, Mr. McNamara, the Secretary of Defense for the U.S. provided these alternatives:

ALTERNATIVE AIR DEFENSE FORCES, 1976

	Alternative 1	Alternative 2	Alternative 3
Interceptors	F101, F102 F4, F106	F12	F106X
Airborne Command & Control	E121	AWACS	AWACS
Ground Based Control	SAGE/BUIC	FAA	FAA
10 year Prog. Costs	\$11.7B	\$13.7B	\$12.3B
Annual Level-off Cost	\$1.12B	\$.75B	\$.69B

Mr. McNamara concluded that while the F12 would be a superior aircraft in discouraging such future threats as very long range air to surface missiles and supersonic bombers, the F106X would be best in the light of present requirements. In his testimony, he indicated that the U.S. would proceed with the development of the AWACS and F106X and to this end allocated

funds in the 1969 budget. The AWACS development program is now in the contract definition stage with \$40 million allocated in FY 1969 and \$75 million in FY 1970. The F106X program would improve the existing inventory of F106 aircraft giving them a "look down, shoot down" capability.

Since Mr. McNamara's announcement, the concept for modernizing the air defence system has continued to evolve. The details of the modernized system and present thinking as to how its components might be employed will be the subject of a separate paper being prepared for the Committee, and can be examined fully at a later meeting.

The North American Air Defence Command has functioned successfully in a spirit of cooperation between the United States and Canada and has pro-

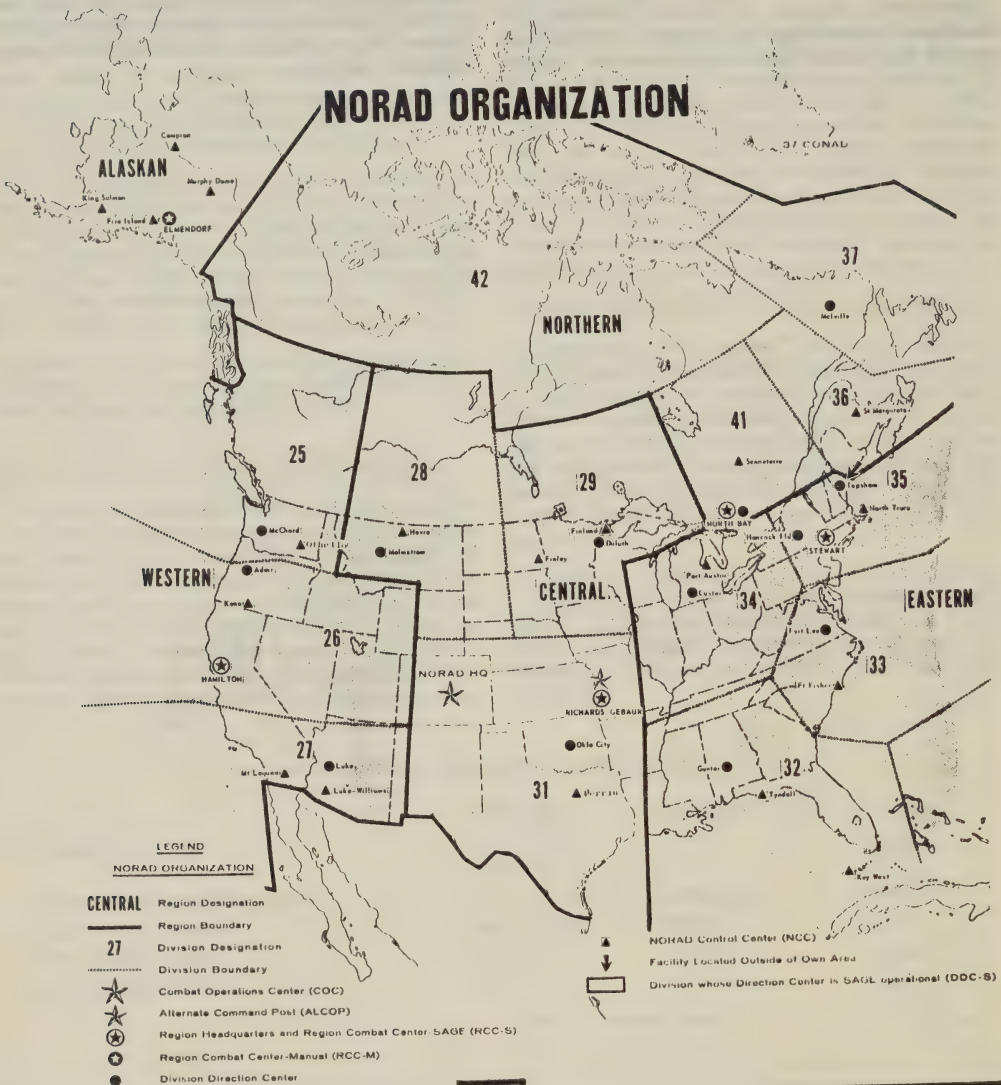

vided protection to the Western retaliatory forces which, by their strength, have prevented nuclear war. The nature and form of Canadian contribution to NORAD must be kept constantly under review.

The NORAD umbrella provides Canada with an effective air defence for a fraction of the cost of an independent defence posture. Quite obviously, Canada could not independently achieve a comparable level of defence for anything like our present level of expenditure for air defence.

(EFFECTIVE 15 AUGUST 1969)

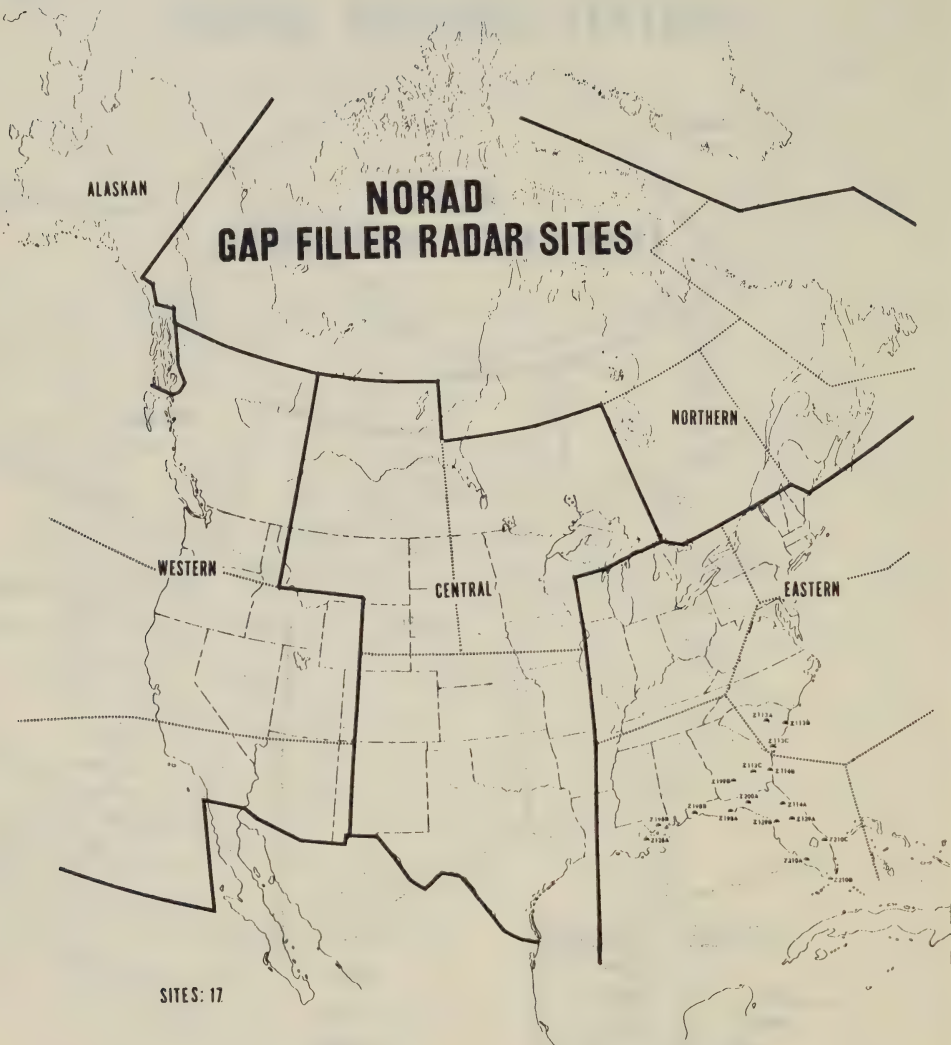

NORAD WARNING SYSTEMS

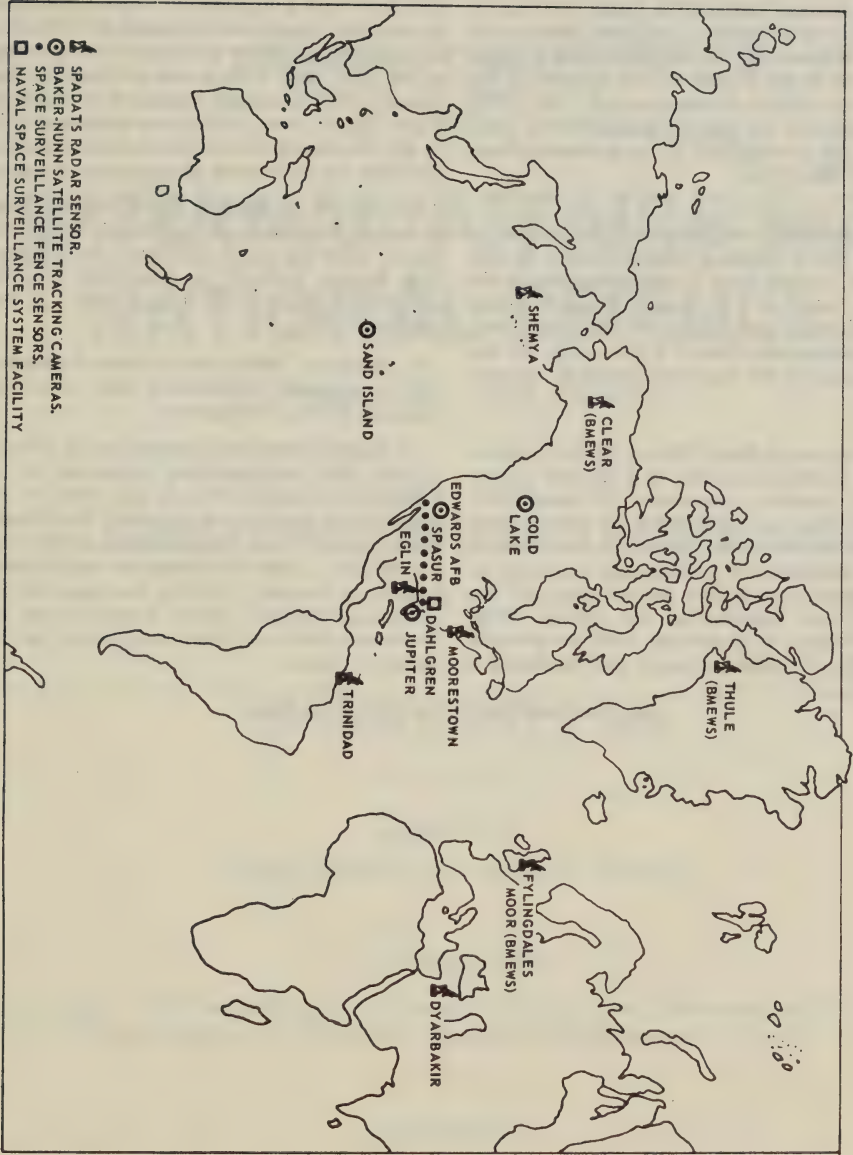

SPACE DETECTION AND TRACKING SYSTEM
(SPADATS)

APPENDIX XX—Continued

LIEUTENANT GENERAL FREDERICK RALPH SHARP, DFC, CD

Lieutenant General Frederick R. Sharp was born in December 1915 in Moosomin, Sask., and educated at Moosomin Collegiate and the Royal Military College, Kingston. While at the College he was attached to the Assiniboia Regiment in the summers of 1934, 1935 and 1936, and with the Royal Canadian Horse Artillery in 1937. He joined the RCAF on graduation from the College in July 1938.

He trained as a pilot and became a flying instructor at 3 Service Flying Training School, Calgary, in September 1940. In April 1942 he was transferred to the instructional staff of 15 Service Flying Training School, Claresholm, Alta., and in 1943 joined the staff at 2 Flying Instruction School, Vulcan, Alta. He was posted on course to the War Staff College in January, 1944.

He went overseas in March 1944 to fly heavy bombers of 408 Bomber Squadron of 6 Bomber Group, eventually as squadron commander. He completed a tour of operations and was awarded the Distinguished Flying Cross. He returned to Canada in June 1945 to serve in the directorate of postings and careers at Air Force Headquarters in Ottawa, and in April 1947 was appointed officer commanding the Central Flying School at Trenton. In September 1949 he attended the University of Western Ontario and graduated a

year later with a diploma in business administration. He was then transferred to England in November 1950 as an exchange officer attached to the directing staff of the RAF Staff College and returned to Canada in January 1953 to assume command of RCAF Station North Bay. In June 1954 he was transferred to AFHQ to the directorate of organization and establishments and later the directorate of management engineering.

He attended the National Defence College, Kingston, in August 1959, and on completion of the course in August 1960 was appointed deputy commander of the 25th Region, NORAD. In September 1962 he was named to command the Bangor Sector of the 26th Region, NORAD.

In December 1964 he was appointed director general, management engineering and automation at Canadian Forces Headquarters.

Air Marshal Sharp was promoted to Air Vice Marshal in June 1965 and appointed commander of Training Command in August 1965. In July 1966 he was promoted to air marshal and appointed Vice Chief of the defence staff. Upon reorganization of the Canadian Forces Feb. 1, 1968 he assumed the rank of lieutenant general. In January, 1969, he was appointed Deputy Commander-in-Chief, North American Air Defence Command (NORAD) with headquarters in Colorado Springs, Colorado.

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament

1968-69

STANDING COMMITTEE

ON

MINUTES OF PROCEEDINGS

THURSDAY, May 8, 1969
(66)

The Standing Committee on External Affairs and National Defence met at 8:10 p.m. this day. The Chairman, Mr. Ian Wahn, presided.

Members present: Messrs. Allmand, Brewin, Forrestall, Gibson, Howard (*Okanagan Boundary*), Laniel, Legault, Marceau, Nowlan, Prud'homme, Roberts, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (16).

Also present: Messrs. Macdonald (*Egmont*), O'Connell, M.P.'s.

Appearing: The Honourable Mitchell Sharp, Secretary of State for External Affairs and the Honourable Léo Cadieux, Minister of National Defence.

Witness: Lieutenant General F. R. Sharp, Deputy Commander of NORAD.

The Chairman introduced the Honourable Mitchell Sharp and the Honourable Léo Cadieux.

Mr. Brewin suggested that the Members should be provided with copies of the study commissioned by Senator Edward Kennedy on the ABM system, the study prepared for the American Security Council on the same subject, and the proceedings of the U.S. Senate Sub-Committee dealing with this question. The Committee agreed and the Chairman will endeavour to obtain copies of this material.

Mr. Sharp and Mr. Cadieux delivered prepared statements on the subject of North American defence. Copies were distributed, in English and French.

It was agreed to print the notes of agreement dated March 30, 1968, between the Governments of Canada and the United States of America, concerning North American Air Defence Command, as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix YY*)

Members of the Committee questioned the Ministers on current policies in relation to North American defence.

The Chairman requested a memorandum describing Command structure and procedures for the operation of Canadian and American interceptor squadrons over Canadian territory. The Minister of National Defence agreed to provide this information, subject to any security considerations which may be necessary.

At the end of the questioning, the Chairman thanked the Ministers.

The Committee adjourned at 10:30 p.m., to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, May 8, 1969.

Mr. Cadieux: I understand.

The Chairman: Gentlemen, I believe we are ready to begin.

This evening we have with us the Secretary of State for External Affairs and the Minister of National Defence. The discussion will be limited to NORAD.

The Secretary of State for External Affairs will start off and then will be followed by the Minister of National Defence. Questions can be directed to either or both of them.

Mr. Brewin: Mr. Chairman, before you ask the Minister to begin there is one thing I think the Committee would be interested in. Apparently, we will be discussing the ABM system later, and according to the press, a group of professional, scientific, and other experts in the United States prepared a report on the ABM system which they presented to Senator Kennedy. It is apparently the first non-Pentagon report that has been made on this subject. The authors include a number of very eminent scientists and experts.

I am wondering if the Committee would try to get this report and make it available to all the members of the Committee. It does not seem to be very long. They say it is an ABC and if the American legislators find it useful, we might, too.

The Chairman: Would it be agreeable that we attempt to get a sufficient number of copies, not only of the Senate Committee Hearings, but of the report that Mr. Brewin has referred to, and if possible, enough copies of the Kennedy report, if I may call it that, for each member, the senate...

Mr. Cadieux: My information is to the effect that there were two reports coming to conclusion, so maybe we should try and get the two.

Mr. Brewin: From both sides; I always prefer the opposition's side.

Mr. Brewin: I want the non-Pentagon report.

Mr. Nowlan: Mr. Chairman, I would like to have both reports including the one which is going to be published into a Kennedy book. That is what the newspapers said today. The other, as I read in the paper today, is also by eminent scientists and a former chairman of one of the reputable bodies down there that may have some associations or had some association with the Pentagon. It is a so-called independent report and in the same context as the Kennedy report. We certainly should have them both, if we are going to have one.

The Chairman: We will make arrangements to see that a sufficient number of copies are available for the convenience of the members. Mr. Sharp?

Hon. Mitchell Sharp (Secretary of State for External Affairs): Mr. Chairman and gentlemen, I wish to thank the Committee for inviting me to participate in this session, which I understand is one of several devoted to North American defence.

I should make clear at the outset, Mr. Chairman, that this is not a subject on which there is anything very new to say, particularly in terms of foreign policy. My colleague, the Minister of National Defence, will deal with matters falling within the purview of defence policy. I will take advantage of this opportunity to look again at the circumstances in which the NORAD Agreement was made, and renewed last year, and the reasons why, with regard to NORAD, this Government is continuing the policy established by its predecessors.

NORAD is purely and simply a defensive arrangement that provides for joint USA-Canadian air defence in case of an attack on North America. It is not designed for offensive purposes and has no offensive capacity. This is an important point to bear in mind, since it has been suggested that our NORAD

● 2015

Agreement with the United States in some way involves Canada in American initiatives in other parts of the world, thereby limiting our capacity for independence in foreign policy matters. I have studied this allegation very thoroughly and find it to be completely insubstantial. NORAD is a defensive arrangement and nothing more. Certainly, participation in NORAD has not inhibited us in the development of our own policy in areas where our objectives are not identical with those of the United States.

As honourable Members are aware the Government has rejected any suggestion that Canada should assume a non-aligned or neutral role in world affairs. In particular, as I have said, it has concluded that Canada should continue to cooperate closely with the United States within NORAD and in other ways in the defence of North America.

This important decision, along with others announced by the Prime Minister on April 3, marked the conclusion of the first phase of our review of defence policy which is still continuing in the broader context of an overall review of our foreign policy.

I welcome the fact that this Committee is now embarking on an examination of the problems of North American defence, and more particularly, Canada's present and future role in that defence. The Government has announced its intention to continue to cooperate with the United States in the defence of North America, but the nature and extent of our future participation remains to be determined. We will follow your proceedings with close attention.

The Government's decision announced April 3 to continue the NORAD arrangement reflects its concern with both domestic and international realities. We have a vast territory, a relatively small population, and great potential. Our domestic objectives are to promote national unity, preserve our sovereignty, and to develop our national strength through a vigorous and growing economy. The achievement of these objectives is dependent on the maintenance of a stable and peaceful world. It is in this context that NORAD should be seen.

A primary aim of our foreign policy is the prevention of war. The only real military threat to Canadian security is that of a general nuclear war. Canada lies between the two superpowers and such a war poses a particu-

larly direct and personal threat to all Canadians. Our contribution to the prevention of such a war can best be made by participation with our friends in collective security measures. These measures must be consistent with our vital interest in maintaining the peace and must not unduly impair our freedom to pursue our own foreign policy or limit our sovereignty to an unacceptable extent. NORAD, in the Government's view, is a part of such a collective security measure.

NORAD is a manifestation of effective cooperation between the United States and Canada. Ours is probably the closest and the most intricate and many-sided relationship of any two neighbouring countries in the whole world. There is hardly any field of our respective national activities which does not have a cross-border impact. The important thing is that Canada and the United States approach these problems in a spirit of friendship, trying where possible to resolve them by working together. It is surely consistent with this relationship that we should cooperate in defence matters.

In the immediate post-war period it was recognized that the air defence of Canada and the United States must be considered as a single problem. Arrangements between Canada and the United States provided for the coordination of separate Canadian and United States air defence plans, but did not provide at that time, for the joint control of the air defence system deployed in both countries for the detection and identification of and, if necessary, defence against hostile aircraft.

The advent of nuclear weapons, combined with the development of the long-range bomber made it necessary that the air defence control system be capable of quick reaction in emergencies. It was considered essential, therefore, to have in existence in peacetime an organization, including weapons, facilities, and command structure, which could carry out peacetime surveillance and operate at the outset of hostilities in accordance with a single North American air defence plan approved in advance by national authorities.

● 2020

I might interpolate here that a rather similar sort of development took place in connection with NATO, which originally was just a defence alliance and which later developed a command structure so that it could respond quickly for exactly the same reasons. It was

the development of the kind of weapons that made this kind of joint command so desirable.

With this in mind in 1958, the NORAD Agreement established an integrated system of operational command and control of the air defence forces of both countries. This command and control system is manned and operated by units made up of members of the services of both countries. Participation in NORAD does not commit either Government to a specific force contribution. The nature and extent of each Government's contribution is a matter for decision by each Government as the need arises, in consultation with the other Government.

As Members will be aware, the Governments of Canada and the United States exchanged Notes on March 30, 1968, for the purpose of renewing the NORAD Agreement for a further period of five years. Although the renewal does not change the substance of the NORAD Agreement, it does stipulate that a review of the Agreement may be undertaken at any time at the request of either party, and that it may be terminated by either Government on one year's notice following such a review. The renewal expressly states that there is no Canadian commitment to participate in any way in an active ballistic missile defence. I understand a briefing on ABM defence is to be given to the Committee at a later meeting.

Bomber defences must be kept under regular review so that modifications and improvements can be made when necessary. In response to advances in technology and to known changes in the potential threat, the United States has proposed a new concept for air defence. This involves certain ways of modernizing our defence systems which will make them more effective and less vulnerable. These proposals are under study both in the United States and Canada. The renewal of the NORAD Agreement means that close consultation of this kind, which is of great value to Canada, will continue.

The Government does not share the view of those who would leave the entire burden for North American bomber defence to the United States. This might keep the cost to Canada to a minimum but it would run counter to the aim of maintaining national identity and independence. Furthermore, the influence we have on the development of air defence policies—policies in which we have a vital interest—would be drastically reduced.

Co-operation in the NORAD partnership illustrates the soundly based friendship between our two countries which enables us to speak to each other frankly and to differ publicly on many important international issues. When two countries, however close their relations, pursue their own independent policies in international affairs, there are bound to be occasions when differences of opinion and differences of interest arise. Continuing to play our part in the defence of the continent will help to preserve the friendship and co-operation which has contributed so much to the phenomenal growth of our country. Development of a distinct Canadian identity in the shadow of the greatest power on earth offers a real challenge to the people of Canada and their Government. Success in meeting this challenge need not, I believe, jeopardize our close relationship with the United States.

The Chairman: Thank you very much, Mr. Minister. Perhaps it would be best if we deferred questions until we heard the statement from the Minister of National Defence. Is that agreed?

Some hon. Members: Agreed.

The Chairman: Mr. Cadieux.

[*Interpretation*]

• 2025

Hon. L. A. J. Cadieux (Minister of National Defence): Mr. Chairman, I think that the Secretary of State for External Affairs has given you a clear and concise exposition of why we have decided to continue to cooperate with the United States in the air defence of North America. Perhaps I might take a minute or two to expand a little on the strategic rationale underlying this decision.

First let me state what I believe to be the major functions of the present air defence system:

First, to conduct surveillance of our air space, and to quickly and accurately analyse and interpret the vast amount of data such as surveillance produces.

Second, to be able to identify beyond doubt any peculiar or suspicious element turned up in the surveillance process.

Third, to ensure that we are able to make any aircraft comply with the legitimate constraints we have imposed on the use of our air space.

Those three functions represent the minimum any modern nation does to control

activity in its own air space. If we are to make the best use of present technology in carrying out the three functions, we are led to a requirement to maintain radar coverage for surveillance, to keep high speed manned interceptors and an associated control system ready to investigate questionable air activity, and to equip the interceptors with the means to deal effectively with that activity, if necessary.

If we now add the consideration of national security, remembering that the major threat to Canada is that of global nuclear war, and remembering that long range bombers are one of several means of delivering weapons of mass destruction, the question naturally arises—can our air defence system contribute to lessening the likelihood of such a terrible event occurring? Now, in trying to find an answer to this question, we don't get very far by bringing in speculation about the futility of defence once nuclear war has been initiated. If the war ever starts, the complex structure of deterrence will have failed, and all our efforts in national security will have been in vain. The only way to get a meaningful answer is to reverse the question, that is by asking whether the likelihood of nuclear war might be increased, if air defences were not maintained. I think the answer to this is yes, the chance of nuclear war occurring would be increased, and I gave the reasons why I believe this in my speech last January on Canada's essential security requirements.

In its simplest terms, the argument is that complete dismantling of our bomber defences would very likely induce the Soviet Union and possibly others to develop and deploy an enlarged bomber force which they could contemplate using with impunity against the land-based component of the U.S. retaliatory forces. If, as is possible, such a situation were compounded with unforeseen developments which made it feasible to deploy systems to threaten the invulnerability of other components of the retaliatory forces, then the present situation of stable mutual deterrence could deteriorate into one of precarious instability.

The counter-argument goes something like this: "If the air defence system were completely dismantled, what you say is perfectly true. But that's not what we are getting at—why not just maintain the warning portion of the system?" Why not indeed? Let's see what this entails. First, you will need a surveillance system such as I described earlier;

second, you will need a capability for positive identification, as I described earlier; and, third, you might as well make the addition of the ability to deal effectively with hostile aircraft. All three elements are necessary if the system is to be sufficiently flexible to avoid having the threat of nuclear annihilation as the only response to apparent hostility. What you end up with is a system which looks very much like the air defence system we maintain today. Furthermore, a system like this not only provides warning and flexibility, but also gives us confidence that bomber aspirations of potentially hostile nations will be discouraged. It might be noted in this context that the Soviet Union does not appear to be expanding the size of its long range bomber fleet, nor to be developing a supersonic bomber.

So far I have been talking about air defence in a rather philosophical way, and I haven't said anything about NORAD. Let me put the defence rationale for NORAD in as concise terms as possible. Given that Canada and the United States need the kind of air defence system that I have been talking about, it takes little analysis to conclude that cooperation in the collection and processing of surveillance data, and joint command and

• 2030

control over the facilities both nations maintain to meet their similar objectives, is the most convenient, economical, and militarily efficient way to do the job. There are no offsetting benefits to be realized by trying to do it any other way.

As I have indicated, NORAD is the joint command and control organization whose continuation both Canada and the United States consider to be in their common interest. This is not to say, of course, that either the facilities which NORAD uses to exercise command and control, nor the forces assigned to it by the two countries, will remain indefinitely in their present form. In fact, you are well aware from statements we have made in the House, that proposals for modernizing both the NORAD command and control system and the forces assigned to NORAD are now under study.

A factual description of these proposals has been put together in a paper which I understand will be made available to you tomorrow, and will be followed next week by an appearance of Departmental officials before you to answer any questions you may have. I would

like to say two things now, however, about the proposed modernized air defence system. First, the system being studied is entirely consistent with the principles and objectives of continental air defence that I have been going over this evening. The new systems are not a reflection of a fundamental change in philosophy, nor do they require that such a change be made. Second, since our studies as to the specific ways in which we might participate in the new system are in a very early state, I regret it is just not possible to tell you how we see this participation developing. Any speculation, on our part, at this time would not be appropriate in view of the consultations with the U.S. now in progress.

The question has been raised, I understand, about the relationship between NORAD and the "Safeguard" ABM system which President Nixon recently approved. Again, speculation in this area would be very much premature. There is no need to come to an understanding about this in the immediate future, and if past experience is any indication, much could happen between now and the time a decision might have to be made. This normal uncertainty about the future would make any discussion at this time of the pros and cons of various alternative arrangements rather pointless, to say the least. You will recall, however, that during the recent debate on our NATO policy, I undertook to provide you with a full briefing on the Safeguard system, and I understand this has been arranged for later this month.

Thank you, Mr. Chairman.

[English]

The Chairman: Thank you, Mr. Minister. I believe that there might be a large number of questions. We must finish by, 10 o'clock or perhaps 10.30 p.m. at the latest. Would it be in order if we were to limit the first round of questioning to five minutes and then pick up a second round of questioning? Would that be a satisfactory way to proceed?

Mr. Brewin: I do not think that it would be satisfactory to me, Mr. Chairman. We are here to discuss NORAD, a defence arrangement, which has never been discussed by any branch of Parliament since it was renewed shortly before the last election. I think that a five minute examination might turn out to be quite a futile waste of time. I do not think that there should be any undue restrictions.

The Chairman: It was merely a suggestion. Perhaps then, if there is not unanimity, we

could proceed and see how the discussion progresses. Then if necessary, perhaps we could come to some decision.

Mr. Brewin: I did not mean that I intended to make the threat of a prolonged examination...

• 2035

Mr. Gibson: On a point of order, Mr. Chairman. I think that we ought to try the five minute plan and to see how it goes, sir. Perhaps that way, everybody will become involved in the discussion rather than just one or two.

The Chairman: Mr. Roberts?

Mr. Roberts: I sympathize with Mr. Brewin's point here. I think that it is quite a complicated arrangement and it will probably take some following up questions in order to get at some of the nuts and bolts of the issues involved. We might not be able to deal with these in five minutes.

The Chairman: Why not proceed upon the following basis: members remember that there may be others who might also have good questions, and that it is not necessary for an individual to cover the complete spectrum in their original questioning? Let us see how we get along. Mr. Allmand.

Mr. MacDonald (Egmont): Mr. Chairman. Before Mr. Allmand begins, could I ask if it would be possible for Mr. Sharp to table these notes of agreement with regard to NATO that were exchanged last March 30? If at all possible, it seems to me that it would be useful material for the Committee to have.

Mr. Sharp: I have them with me. Have we extra copies? Yes, I have copies with me.

Mr. Brewin: Mr. Chairman. I think that Mr. MacDonald has a good point. It would be useful to have them printed as appendices to our Proceedings so that someone reading this discussion can see what we are talking about.

The Chairman: Is that agreed?

Some hon. Members: Agreed.

The Chairman: Mr. Allmand.

Mr. Allmand: Mr. Chairman, I have some questions which can be answered by either the Minister of National Defence or the

Secretary of State for External Affairs. These two questions are related to each other. My first question is: why could we not have the same type or a similar type of defence of North America conducted in close co-operation between the United States and Canada, but not under a joint command? In other words, why could we not do these things through co-operation, rather than through an agreement and the joint command that we now have?

We learned the last day that of the five regions that make up NORAD, a Canadian is in command of only one of those regions, although two others include Canadian territory. This means that American commanders are making decisions relating to the type of military activity that occurs over Canadian territory. To me this appears to be open to question. Secondly, as an alternative to the first possibility—that of a defence system through co-operation—why could we not have all the Canadian territory, if it had to be under a NORAD agreement, subject to Canadian command? This means that we would make the decision as to whether or not we would launch certain counter attacks or attacks to stop foreign bomber attacks.

Mr. Cadieux: First of all, I think the Secretary of State for External Affairs explained that due to the changing nature—the technological nature—of the weapons and the narrowing gap of alert, that you would have in the event of an attack it was found necessary to have a joint command and control. He assimilated that to the necessity of being in NATO, and of having an integrated command in order to be able to respond quickly to the new kinds of attack to which you could be exposed. This is the rationale behind the joint command and control.

Now, your second question as you say...

Mr. Allmand: Concerning my first question, sir, did you say that you could not respond as quickly, unless you had a joint command? If you had a co-operative effort between Canada and the United States could you not set up something that would be as effective, but under our control?

Mr. Cadieux: If you did, you would immediately find it necessary to refine it to

• 2040

the point which amounts to the same type of operation as you now have. All the informa-

tion that is gathered by the radar system is computed and in an actual attack must be correlated in a very short time. I believe that you would reach the same conclusion that it is necessary to correlate all these efforts. This is the type of process, I imagine, that went on before they eventually found that it must be under a joint command and control.

Now, in the question of the regions, some of them overlap between the two frontiers and I do not think in this kind of over-all defence of North America you could hope to have systems separated by boundaries. It is true that some Americans have a position of command on partly Canadian territory, but also, the Second in Command in Colorado Springs is a Canadian. This is, I think, one of the best arrangements that could be worked out.

You seem to indicate that the release of weapons is the responsibility of the Commander. It is not. It is the responsibility of the governments. There is a procedure for that which I cannot elaborate on, but it is not for a commander to decide by himself.

Mr. Allmand: Is it not just the Bomarcas that require the governmental...

Mr. Cadieux: No, the release of the weapons have to be authorized by...

Mr. Allmand: The interceptors also?

Mr. Cadieux: ...by the governments.

Mr. Allmand: Is it not true when such defensive weapons are released, whether they are the Bomarcas or the interceptors, that most of the alleged enemy aircraft would be knocked down over Canadian territory? This might have been answered the last day but I cannot recall whether it was or not. Does this mean that these bombers, if they were knocked down over Canadian territory, would involve nuclear explosions and extensive fallout over Canadian territory but not over American territory?

Mr. Cadieux: I think you have to talk in terms of the level of interception. I think in the case of the Bomarc, for instance, the level of interception would be high enough for the fallout to be limited to the degree of fallout that occurred with the nuclear test explosions. It was not a significant fallout.

One has to choose, I believe, between having the bomb fall on Canada or the United

States or trying to destroy it in the atmosphere. I think the second option is obviously the one you would choose. You are trying to intercept the bombers before they really come over populated areas.

Mr. Allmand: Most of the bombs would be directed, we would expect, to the United States and not to Canada.

Mr. Cadieux: I do not know if you can assume that.

Mr. Sharp: Why would you assume that?

Mr. Allmand: Would it not seem that most of the targets would be in the United States because of the Strategic Air Command. The other day Gen. Sharp stated that the main purpose of NORAD is to protect the Strategic Air Command bases. These bases are in the United States. Therefore, if the enemy is trying to knock out these bases he is targeted for the United States.

Mr. Cadieux: We always come back to the same rationale, whether you accept or not. This is another point. We believe what you have to protect here is the deterrent, and that it is the only sensible way of approaching this problem. Whether you do it by protecting the SAC bombers or the bases, what you are trying to achieve is the protection of the deterrent. This is part of the over-all strategy.

Mr. Allmand: I will pass for the time being, Mr. Chairman.

The Chairman: I would like to make a supplementary comment directed toward the Command because I think it is important.

● 2045

According to the map which was filed as an appendix to Gen. Sharp's working paper, all British Columbia and Alberta are in the Western Region which is under American commanders—Regional and Divisional Commanders. All the Regional and Divisional Commanders in the Western Region are American.

Practically all of Manitoba and Ontario are in the Central Region, according to this map, and all the Regional and Divisional Commanders are American.

The Northwest and Yukon Territories, a very small part of Northern Manitoba and Ontario, Quebec and the Maritime Provinces,

and that very small part of Northern Maine that juts up into New Brunswick, are in the Northern Region under Canadian command.

This map would indicate that practically all of the heavily populated area of Canada is under American Commanders.

Mr. Cadieux: You always have a Canadian Deputy Commander.

The Chairman: Yes, but the question is whether or not it is desirable that the air defence of almost all of Canada should be under American commanders, and that the only area under Canadian command is the unpopulated regions of the Arctic and the Yukon Territory. Alaska, of course, has been excluded from the Northern area and put under sole American command.

In other words, although it may be hard to draw a map based upon national boundaries, the Americans seem to have done it quite successfully.

Mr. Cadieux: Yes, but when you talk of an American commander or a Canadian commander, you are always talking of an integrated command where the functions are sort of integrated in themselves. I think it is North American air defence, and it is not strictly either American or Canadian defence.

The Chairman: This is true.

Mr. Cadieux: You view this problem as being indivisible.

The Chairman: True, and as you pointed out, Mr. Cadieux, the decisions are made by governments which would indicate that there would be no reason why we should not have perhaps more Canadian commanders as well as American commanders, particularly where Canadian air space is involved.

Mr. Cadieux: The whole apparatus was designed that way and I suppose they were very good reasons. The investment that the Americans have made in this system is more than 10 times as much as Canadians have made, and I think they have certainly the right to have their share of command.

The Chairman: You are right, they certainly have. Mr. Forrestall?

Mr. Forrestall: Mr. Chairman, I only have one question and it is prompted by, for example, the most recent issue of one of the

United States Air Force journals, the *Aerospace International*, in which in a strategic survey they very strongly indicate that 1968 was the year in which many of the tensions and obscurities in Europe and other parts of the world may have become clearer to us, particularly here in Canada. The events of Viet Nam and the events of Eastern Europe, particularly in Czechoslovakia, have promoted what they describe as an increase in the tension that exists between the two super powers.

With that in mind, and coupled with the very serious concern that I sincerely believe does exist in the minds of many observers of the military scene in North America, including our own middle and senior-ranking officers, and bearing in mind the Minister of National Defence's statement—and this is not to get into the pros and cons of your defence review—may I ask you a question or two about the timing and the schedule, particularly as it applies to a final conclusion about NORAD, but more particularly, as it will relate to other major decisions; for example, Maritime Command?

Specifically, can you tell at this time approximately when a decision will be made by Cabinet on NORAD?

Mr. Sharp: Mr. Chairman, as I said in my presentation, the government has already made its decision to remain in the joint command. That decision was announced on April 3. It stated the continuation of the policy that we now have to provide for joint air defences under an integrated command. That decision, as I said in my presentation, does not in any way determine the contribution that either country will make to those defences. Each country makes its contribution and they will integrate it in the joint defence.

The decisions that we have to make which arise from our foreign policy and defence review in all fields in relation to the air defence of North America, to the defence of

ter than I do—determine the deployment of our forces. Decisions relating to the deployment of our forces will come out of this review. In connection with the NATO review, some of those decisions are now being made. The government, as you know, has announced that we will stay in NATO and have a planned and phased reduction of our contribution there. That will determine one part of the deployment of our forces.

The decisions that we make about our co-operation with the United States in the future—this depends upon the character of technical developments in which we will meet the bomber threat—will affect the deployment of our air force. It will also produce an effect upon our ground support and upon the way in which the United States and Canada will operate in one another's territory. This is the best answer that I can give you. Some of the decisions are now being made as to the NATO review. In turn this will lead—as the Prime Minister's statement indicated—to the placement of greater emphasis upon the defence of North America. This also will result in some further changes. I think that it will take quite some time before all of those changes occur. They are now in the process of being made.

Mr. Forrestall: Will it take a year or six months, Mr. Sharp?

Mr. Sharp: I do not know. Mr. Cadieux, would you care to offer an opinion, as to the length of time that it will take?

Mr. Cadieux: It will take quite some time, as we have found.

Mr. Forrestall: In other words, until such time as the individual decisions have been made, there will not be a conclusive position given on any one of our strategic roles either one way or another, or internally or externally. There will not be a final decision until an over-all decision is made.

Mr. Sharp: Yes, some decisions...

Mr. Forrestall: According to the comments of the Prime Minister about redeployment.

Mr. Sharp: My view is that decisions will appear gradually, as part of what we hope will be an over-all plan. We cannot delay every decision until we have made them all. However, we will approach a general plan for the deployment of our forces in collective security, and in our own defences here in Canada.

• 2050

our sovereignty or the surveyance of our territory, to our contribution to collective security in Europe, all relate to the contribution that we will make either under the NORAD agreement or any other arrangements that we may have for the defence of North America; for example, our naval contributions on the Atlantic and in Europe. All of these—as the Minister of National Defence knows even bet-

Mr. Forrestall: Can you indicate whether or not we could expect to have some final decision before the end of this year?

Mr. Sharp: I should think that in some fields we will have to make some decisions; for example, in connection with NATO. Our allies expect us to state exactly how we are going to be participating in the collective arrangements.

Mr. Forrestall: Like August 25?

Mr. Sharp: I beg your pardon?

Mr. Forrestall: Such as the day after August 24? Thank you.

The Chairman: Mr. Brewin.

Mr. Brewin: Mr. Chairman, à propos what the Minister has just said. The production of a White Paper was discussed at one time. I assumed that it would contain that which is contained in the White Papers of other coun-

• 2055

tries which is a total review, more or less, of the defence commitments, plans, strategies and so on. Is this objective being phased out—in this process of phased production of a policy—in these matters? Can we still hope for a White Paper in our time?

Mr. Sharp: I think that it is fair to say, Mr. Brewin, that the production of the White Paper is becoming a much more complicated question than we had originally estimated. It is certainly my objective to be working on the foreign policy side of this and on the presentation of an approach which can be placed before Parliament. Now I am not certain whether or not the White Paper will include all parts of the defence planning. I am certainly looking toward the time when I will be able to present the government with a statement that might be published on our foreign policy.

Mr. Forrestall: Could you say when?

Mr. Sharp: One should not give too many hostages to fortune, so I will just say, "As soon as possible".

Mr. Brewin: Mr. Chairman, most of the rest of my questions will be directed to the Minister of National Defence. I would like to ask him first of all—I do not wish to go into this extensively—about the ABM situation. In

the paper which the Minister presented to us, he held the view that because we are not asked to make early or immediate commitments, that any discussion would be premature. I would like to suggest the following to him and to ask his comment on it: If our allies in the United States are actively discussing this problem—which affects the defence of North America—would it not be appropriate that we formulate our own views on the matter? If, on our independent judgment, we should come to the conclusion that we do not want any part of this system, this can then be made known to our allies and they will be able to take that into account in their own discussions and debates. Is this not a matter in which we have a concern that ought to be dealt with now, instead of easily putting it off until some future date?

The Chairman: Mr. Brewin, may I interject for a moment? I gather that you are not intending to start a discussion on ABMs. We will have briefings and a full discussion in due course. If it is just a single question that you wish to ask at this point...

Mr. Brewin: The Minister made a statement which includes a proposition that we can, in a sense, afford to delay this matter and that any discussion about it would be premature. I am asking him about that.

The Chairman: I do not think that it would be in order for you to continue questioning with regard to the ABMs.

Mr. Brewin: I have not continued, but perhaps you could stop me when...

The Chairman: I was issuing a warning notice.

Mr. Brewin: I know you were.

Mr. Cadieux: My answer to that would be that initially we must know the precise kind of system and the precise type of deployment which the Americans are projecting. This has not been decided there. How can you form a rationale, posture, or policy pertaining to a decision which they have not taken themselves?

Mr. Brewin: But is it not true that the present government of the United States—subject of course to Congressional appropriation of funds—has in fact produce a very definite system, called the Sentinel system? Admittedly it may be expanded, contracted

or altered. This is a fairly definite proposal. If they can discuss it now, is there any reason why we should not discuss it?

Mr. Cadieux: Yes, they are discussing it within the context of their own parliamentary process. This could be changed, for instance, if the proposition that was approved, in principle, by the President were changed by Congress.

Mr. Brewin: It appears to me that as good allies, we should be in the planning process. We should not wait until they have produced a final plan and then say—perhaps to their disappointment in view of our co-operation in most other fields in defence—“No, we want no part of this.”

Mr. Cadieux: This is a decision that we can make, of course—as far as we are concerned—but I do not think that we can make a decision as far as they are concerned. Surely until now, this has been an internal matter of the United States. I do not think that you could now expect us to project ourselves into their discussions and state that we do not approve or something of that nature.

• 2100

Mr. Brewin: Could we not say: “We do not approve for ourselves, but you could judge for yourselves what your actions...”. Surely, this would be proper among allies.

Mr. Cadieux: You seem to have come to the conclusion that we should disapprove. I have not come to that conclusion personally. You must see...

Mr. Brewin: I am not talking about...

Mr. Cadieux: No, no.

Mr. Brewin:... the conclusion that we reach I am talking about whether the proposal to put off the discussion is reasonable in the light of our alliance with them and the fact that we are involved.

Mr. Cadieux: I should not say that we postponed discussions completely. We are briefed on what is planned, and at the research and development level, we are in constant consultation with them. We know what the concept is, but I do not think that you can postulate a policy for Canada, until they themselves have decided what the deployment is going to be; then, I think, you have to judge whether or

not you want to co-operate; will it be to the advantage of Canada. This decision, I believe, would be premature at the present time.

Mr. Brewin: It seems to me, as a Canadian, and as an ally of the United States, that it would not be premature for us to express our view on their present plans. Perhaps your view would differ from mine; I do not know, but that we should have a view, formulate it, and state it to our allies, is the duty of a good ally. Consequently they would not be misled into thinking that we would co-operate with the plan if we had formerly expressed our disapproval of it.

The Chairman: Mr. Brewin, is this not the very type of thing that this Committee is going to be investigating and making recommendations on, at a later date? This particular meeting was called for the purpose of discussing NORAD. ABM is related to it, however you have asked the Minister a question and he has answered it. I do not think that we can pursue the question of ABMs further this morning.

Mr. Brewin: If you do not wish me to pursue it, I will not pursue it.

The Chairman: But there is not any reason why you should not pursue the NORAD question.

Mr. Brewin: I think it is a perfectly proper question and I will probably save time...

The Chairman: It is a proper question.

Mr. Brewin: Instead of directing me away from the question, rule me out of order, if you think I am out of order.

The Chairman: I think you are out of order at the present time.

Mr. Brewin: I do not need shepherding or advice from the Chairman all the time, thank you.

The Chairman: I will rule you out of order on the ABM Mr. Brewin, because we are going to discuss that at a later date.

Mr. Brewin: Mr. Minister, I would like to put one or two questions to you about the NORAD matter. In preface to my question, I think that Canada should co-operate with the United States' surveillance of our air space identification; this is a matter that seems to be controversial as far as the reality of an

attack by manned bombers is concerned. I would like to ask your comment on the second paragraph of page 2 where you say:

In its simplest terms, the argument is that complete dismantling of our bomber defences would very likely induce the Soviet Union and possibly others to develop and deploy an enlarged bomber force which they could contemplate using with impunity against the land-based component of the U.S. retaliatory forces.

That seems to be very central to your strategic argument; I want to ask you whether or not it bears any relation to reality? Is it not a fact, quite apart from any bomber force, that if we had the protection of the United States, that within hours of warning of any bomber attack, that country has forces of such magnitude that she speaks about the Soviet Union launching bombers with impunity? It is just concrete to the realities and the facts of the situation.

Mr. Cadieux: Mr. Brewin, what do you think of the incident that we had last year and the last couple of years? We identified at least 36 bombers coming between 30 and 40 miles of the Canadian coasts.

Mr. Brewin: I will give you my own explanation, sir. I thought that you were giving the evidence. I think that if I were the Soviets, I would be delighted to see us take the situation so seriously; we wasted our money, I think, on defending ourselves against the possibility of a fully manned bomber force coming over to attack us. I think they know perfectly well that it would be an incredible thing for

• 2105

them to do. If they can keep us on guard by making us waste our money in that way, perhaps it would please them. I do not know.

Mr. Cadieux: That is a speculation.

Mr. Brewin: Is it your suggestion that the presence of these bombers in our air space, indicates in a casual way, the probability or even the possibility of a main attack on the SAC, by manned bombers, in this missile age?

Mr. Cadieux: You are talking of this as being casual but I have seen a picture of one Russian bomber with a missile underneath it. Do you really believe that to be casual? I suppose the same reasoning could apply to

ICBMs; you may think, would it not be irrational for the Russians to send ICBMs over North America, when they know that the Americans could retaliate and probably destroy their country? This is also irrational but this is the kind of irrationality that exists in the world; I think you have to take measures in case the irrational should overcome the rational.

Mr. Brewin: I am content to leave the discussion with the proposition that our policy in regard to defence against manned bombers, is based upon the concept, that the Government of the U.S.S.R. is going to pursue an irrational course. This is the proposition.

Mr. Cadieux: The proposition that I believe in is this: you have a deterrent which is neutralized and you want to keep it that way because you have forces to oppose; you have an interceptive system and a detection system which will allow you to react and we believe—you are entitled to your opinion—that your position is not the one that should be taken. You know we have gone over both sides of that question for a long time; what I believe is that we should neutralize the opponent by having sufficient forces to retaliate and in such magnitude, that he would not dare to attack.

Mr. Brewin: I presume, Mr. Minister, that we will resume this discussion from time to time, so I will not pursue it now. However, I would like to suggest to you that the problem you must face and that we all must face, but particularly you, because of your position, is that we have very limited resources; we should devote the ones that we have to meeting real threats and not imaginary ones.

Mr. Cadieux: It is a question of debating whether it is a real or imaginary threat. It is obvious that we certainly do not agree on that point.

The Chairman: Mr. Howard.

Mr. Roberts: Are we accepting supplementaries today? I do have a supplementary.

The Chairman: Is it a real supplementary?

Mr. Roberts: Yes, it is related to the same paragraph and to the same point. It is a real supplementary as opposed to an imaginary one.

Mr. Cadieux, disregarding the validity of the argument, what puzzles me about this

paragraph, is that the second sentence which begins, "If, as is possible" etcetera, does not, in my opinion, support the argument of the first sentence. Perhaps I could put it this way. Are you saying that we might experience unforeseen developments, which would make it feasible to deploy systems which threaten the invulnerability of the second strike missile response? If that did happen, the fact that we had or had not maintained our bomber defence would not change the situation; in other words, the situation of mutual deterrents would deteriorate into one kind of precarious instability, once that kind of defence against missiles had been developed in the Soviet Union. This would be the case whether or not we had maintained the anti-bomber defence; therefore, while the point that you make in the second sentence might be true, it is not relevant to the argument that the anti-bomber defence must be maintained in order to protect us, if that hypothetical situation should arise.

Mr. Cadieux: No, but I am trying to point out here that there is also a further development which is possible, and which is probably happening; it explains why the Americans are thinking of an ABM system as protection for their own deterrent. However, that does not remove the possibility of a bomber threat; you must also be able to react to that situation, and this is the rationale that we have for it.

Mr. Roberts: Yes but those developments . . .

• 2110

Mr. Cadieux: The Americans think that they could react to this unforeseen development by ABMs, but the bomber threat in our theory, is not dissipated. It is still there. Therefore, you should be ready to meet it.

Mr. Roberts: Since this is a supplementary, perhaps I had better defer my remaining comments.

The Chairman: Yes. I have Mr. Howard on the list, Mr. Roberts. Mr. Howard.

Mr. Howard (Okanagan Boundary): Mr. Chairman, some of the questions tonight have reminded me of that famous saying of Neville Chamberlain's. It went something like this: "There will not be any nuclear bomber incursions in our time." I feel that we are taking this possibility somewhat lightly. I am concerned with the maintenance of . . .

An hon. Member: The French had a Maginot Line.

Mr. Howard (Okanagan Boundary): Yes, the French had a Maginot Line too. That is quite correct and that is what my question is leading to. Of all our defence commitments it seems to me that our NORAD defence commitment is the one that is most justifiable. It is more clearly defensive than anything else we do. It is not a threat to other powers.

I am concerned about this matter of the political decision that is involved in the case of using the facilities that are available. I know that the Americans have a very complicated system for making that political decision, including the considerable equipment that follows the President of the United States around wherever he goes.

First, I would like to know what facilities we have that would duplicate that and make it possible to make such a decision one way or the other should the occasion arise?

Second, what would happen if it were not possible to find the Prime Minister, or whoever has to make that decision, on the required day? What would the Americans do? Would they not be able to carry out their deterrent efforts without Canada?

Mr. Cadieux: I think the general answer would be that communications are such that you could reach the Prime Minister or the Acting Prime Minister at any time instantly. That is the way it is now.

You are assuming these communications might breakdown, but I am assuming they will not.

Mr. Howard (Okanagan Boundary): I know for a fact that the Americans have complicated procedures for this communication. I am not aware of any such procedures which follow the Prime Minister of Canada around when he travels, any back-up facilities if those supposed facilities are knocked out, or any facilities that follow the Acting Prime Minister around.

Mr. Cadieux: I hope you do not complain about this secret being so well kept.

Mr. Howard (Okanagan Boundary): You are telling me that the facilities are there but they are invisible.

Mr. Cadieux: No, they are very visible when you are near them.

Mr. Sharp: I think it is also true, if I may add, that there is a difference between the President of the United States and the Prime Minister of Canada under our respective systems of government. That is, the President of the United States must exercise his power. It is very difficult to devolve it upon anyone else. In Canada this responsibility does devolve naturally upon other members of the government, who in their respective spheres have a responsibility that the Secretaries do not have within the American system.

Mr. Howard (Okanagan Boundary): As elected representatives they can make that decision?

Mr. Sharp: No, the nature of our government is quite different. The Prime Minister is *Primus inter pares*. Each of us is a Minister in his own right, responsible and sworn to discharge his responsibilities.

The President of the United States is the government of the United States and each of the Secretaries just carries out his instructions. This is not so in our system, and therefore, what happens in our system is that when the Prime Minister is not available his responsibilities devolve upon the next senior minister. If I were around they would devolve upon me.

I would support what the Minister of

• 2115

National Defence says that this contingency has been thought of.

Mr. Howard (Okanagan Boundary): All right. We require a two-key system. What happens in the event that Canada decides, no? Is the whole American system then going to be out of action?

Mr. Sharp: It is a two-key system.

Mr. Howard (Okanagan Boundary): In other words nothing happens if Canada says, no. It is a veto system, is that right?

Mr. Sharp: Yes, it would not be a veto without the use of an artifact—weapons, of course.

Mr. Howard (Okanagan Boundary): Fine. I have one other minor technical question.

Mr. Allmand: May I ask a supplementary on that question?

The Chairman: A supplementary, Mr. Allmand.

Mr. Allmand: This concerns the commanders that I was asking about. The Canadian government says, no. The Americans decide, yes, and they tell their commanders, yes. Their commanders, as the Chairman pointed out, command a lot of aircraft and so forth which fly over two-thirds of three-quarters of Canadian airspace. To follow through the scenario set up by Mr. Howard, what happens then? Do these American commanders obey their American President and launch Canadian aircraft which are under American commanders?

Mr. Cadieux: I believe in a case like that you have the two-key system again, and it is not up to a commander to release Canadian weapons without the consent of Canadian authorities.

Mr. Roberts: I have further supplementary.

The Chairman: Mr. Roberts, a supplementary.

Mr. Roberts: Canada's veto would not affect the ability of the United States to launch its thousand Minutemen in a retaliatory strike?

Mr. Sharp: That is right.

Mr. Roberts: Therefore, the Americans would have an effective response against any kind of attack whether or not we agree to do anything.

The Chairman: I have a further supplementary. Nor would it prevent the American commanders launching the American interceptor planes over the central and western regions which include most of the populated areas of Canada, because these are American weapons.

An hon. Member: Right.

Mr. Cadieux: I do not know about this. There are restrictions of the airspace. We are not going to extend to them Canadian airspace without...

Mr. Winch: Do you think they would worry about that if the bombers were flying across Canada?

The Chairman: Mr. Howard.

Mr. Howard (Okanagan Boundary): I have a minor technical question. What over-the-horizon radar equipment do we have? Are we protected against low flying aircraft on the kind of mission that our CF-104's are expected to perform?

Mr. Cadieux: The over-the-horizon radar is the future development of the defensive system which should be complimented with the AWACS system. This is the advance phase that is going to be introduced in the coming nineteen-seventies. It is not in existence yet.

Mr. Howard (Okanagan Boundary): We do not have over-the-horizon radar now?

Mr. Cadieux: No, I do not think so.

Mr. yan: I have supplementary, Mr. Chairman.

The Chairman: Mr. Ryan, on a supplementary.

The Chairman: Mr. Ryan, on a supplementary.

Mr. Cadieux: No, I do not believe so. The over-the-horizon radar would be below the aurora belt you see, and over the aurora belt you would have the AWACS to complete the system. This is the new concept.

Mr. Howard (Okanagan Boundary): In other words, we have a gap in defences in this regard?

Mr. Cadieux: No, I would not call it a gap. The over—the—horizon radar was conceived to combat Fractional Orbital Bombs. They are not considered a real threat yet, but in reaction to that possibility, this kind of radar was developed, at least theoretically, and it is going to be introduced in the nineteen seventies. This is the development that is going to take place and which you are going to hear about in the next briefing.

• 2120

Mr. Howard (Okanagan Boundary): What about the low flying aircraft?

Mr. Cadieux: What do you means exactly?

Mr. Howard (Okanagan Boundary): What radar protection have you got against aircraft flying below 300 feet?

Mr. Cadieux: You have the DEW Line, you have the Pinetree line, etc.

Mr. Howard (Okanagan Boundary): They are not capable of detecting aircraft at ground level.

Mr. Cadieux: You would not have a bomber flying at ground level.

Mr. Howard (Okanagan Boundary): I do not know. Our aircraft in Europe are programmed to do that kind of flying. Why would they not...

Mr. Cadieux: I do not know.

The Chairman: Mr. Howard?

Mr. Howard (Okanagan Boundary): That is all, thank you.

The Chairman: Mr. Thompson.

Mr. Thompson (Red Deer): Mr. Chairman, when Mr. Brewin began his questioning I found myself in the incredible position of almost agreeing with him.

Mr. Brewin: I am sorry to do that.

Mr. Thompson (Red Deer): I do not know whether I should continue this questioning at all in light of the later questions which might develop. I cannot get by the Chairman either, I do not think, in regard to a question that I have in mind, so maybe I might just make a brief statement in regard to it.

Mr. Sharp, you mentioned that on page 3 of your submission:

The important thing is that Canada and the United States approach these problems in a spirit of friendship, trying where possible to resolve them by working together.

Then, on page 5 in the middle paragraph you said:

This involves certain ways of modernizing our defence systems which will make them more effective and less vulnerable. These proposals are under study both in the United States and Canada. The renewal of the NORAD Agreement means that close consultation of this kind, which is of great value to Canada, will continue.

A little further along:

...the influence we have on the development of air defence policies—policies in which we have a vital interest—would be drastically reduced.

I find myself in difficulty, even though it has been suggested that we not discuss the ABMs here tonight, to reconcile those statements with the statement of the hon. Minister of National Defence in which he says that consideration of the ABM system is very much premature.

It seems to me that just to divorce ourselves from this consideration and take up a position in which we either accept it or reject it when the time comes and know what it actually is, is rather abdicating our responsibility to ourselves. However, I recognize the Chairman's decision that we should not be discussing it here tonight.

I think there is a very very important relationship between the potential of what might be the ABM system and NORAD as it is today. I think we ought to be considering it very very definitely in its various aspects as we understand it as it relates to our own defence.

I have just a couple of elementary questions to renew our memories and to place them on the record. Mr. Sharp, first of all, how long does the present NORAD Agreement continue as it relates to our participation in the joint command as was announced on April 3? What is the time duration of this agreement?

Mr. Sharp: Yes, the NORAD Agreement was renewed on March 30, 1968, for a period of five years, I believe, but it is subject as I said in my presentation to being cancelled on a year's notice if we decide that we no longer want to be part of it. This is the only substantial change that was made when we came to renew the agreement.

Mr. Thompson (Red Deer): Part of that agreement then was also that the degree of participation and the extent of participation by our two different governments would vary or would change as policy developed in the future?

Mr. Sharp: Yes, as I tried to make clear in my presentation, the NORAD Agreement is an agreement for joint and integrated command. It is not an agreement on our respective contributions to the air defence, which will be varied as technical changes take place. My colleague, the Minister of National Defence, was recently in Washington, and he has been there more than once recently, and...

Mr. Thompson (Red Deer): Will our contribution vary as the ABM system develops as well?

Mr. Sharp: That is not covered by the NORAD Agreement, and if we are going to co-operate on ABMs in the future that is the decision we would have to make. We have decided that we are not going to have ABMs

• 2125

and we have decided that the ABM so far is not a part of NORAD. If that policy were changed that would have to be the subject of a separate decision.

Mr. Thompson (Red Deer): What is the situation, Mr. Cadieux, relating to the Bomarc at the present time?

Mr. Cadieux: The Bomarc is, I am told, one of the last weapons that is going to be phased out of the present set up. That will be around the mid nineteen-seventies if the new system is installed; that is, the over-the-horizon radar the AWACS, and the new interceptors. The Bomarcs would go at the end.

It is, notwithstanding what some people think about it, considered as the cheapest and most accurate weapon that we have. It is being tested every year, and out of about 1,000 tests of which I am aware I do not think there were five misses. It is cheap to maintain, to survey, and to guard. Therefore, it is going to stay there until...

Mr. Thompson (Red Deer): And still have some practical use?

Mr. Cadieux: That would have to be proven in an emergency. We hope that we will not have to demonstrate that it is effective.

Mr. Prud'homme: A supplementary.

The Chairman: Mr. Prud'homme on a supplementary.

Mr. Prud'homme: Is there any discussion going on at the moment either in the government or with the United States, regarding what could happen in phase two of the government review of our defence?

Mr. Cadieux: No, what we are going to do is that I am going to Brussels in May and will start discussing with the members of the Alliance, and no doubt with the Americans there, what our plans are and how we are going to fit them in the over-all plans of NATO. This is a decision that we have to take ourselves, and after that, we have to inform our allies and discuss with them how it is going to be integrated into their own plans.

The Chairman: Mr. Nowlan, on a supplementary.

Mr. Nowlan: Yes, it is really supplementary to Mr. Thompson's earlier question about con-

tributions. The other day when General Sharp was here he gave us the paper from the Department of National Defence which described the physical contribution of Canada in squadrons, Bomarc squadrons, the DEW Line, and the Pinetree components. He was going to prepare some figures.

However, just to put this all in perspective about NORAD and our contribution in terms of annual operating cost, has the Department firmed up, and/or in your conversations in Washington have you been told, just what the ratio is? I think the figures General Sharp used were \$156 million for Canada and \$1.7 billion for the United States. Admittedly, these are approximate.

There was some discussion amongst some of the officials that day as to whether or not this is a fair assessment. If not, what is your idea of the ratio of contribution on this whole NORAD thing?

Mr. Cadieux: Yes, our ratio is less than one-tenth of the over-all cost.

Mr. Nowlan: Obviously, if we want more command, we must pay more, in effect.

Mr. Cadieux: No, I do not think you can put it that way. I do not think you would want more command. I think the way this is set up now is working pretty well.

Mr. Nowlan: I will not trespass further on command, but you say 10 per cent. If my figures are right it is much less than 10 per cent.

Mr. Cadieux: It all depends on what you include there. I think it should be around, as General Sharp said, \$156 million. My figure would have been \$138 million or \$140 million; something like that.

Mr. Nowlan: That may have been his figure. Frankly, I am just going from memory today.

Mr. Cadieux: I think the American contribution was something like \$1.6 billion last year.

Mr. Nowlan: Thank you.

The Chairman: Mr. Thompson.

Mr. Nowlan: This is annual operating expense, basically, we are talking about.

Mr. Cadieux: Yes, it is not the capital expenses, it is the operating expenses.

Mr. Thompson (Red Deer): The supplementary questions have covered part of my next question which might be summarized briefly as saying that our personnel contribution is about 10 per cent. According to these figures, our operating contribution is now 9 per cent or something like that.

• 2130

Mr. Cadieux: I do not know whether or not that ratio is still the same in the number of personnel. I know we have about 12,900.

An hon. Member: What is the American figure, do you know?

Mr. Cadieux: I am told it is 144,000 over-all, so we have about 14,000.

Mr. Thompson (Red Deer): It is approximately a population ratio then.

Mr. Cadieux: Yes.

Mr. Thompson (Red Deer): It is that rather than a gross national product ratio. I gather, Mr. Cadieux, you are genuinely concerned about the visible and known Russian surveillance of our shores.

Mr. Cadieux: Yes.

Mr. Thompson (Red Deer): This bears out General Sharp's testimony which he presented before the Committee the other day and which justified Canada's continuing participation in NORAD. Could you inform us whether or not the surveillance activity of the Russians has increased during the last year or two, as compared to say five years ago during the regime of Mr. Khrushchev? Is it holding steady, or is it on the decrease?

Mr. Cadieux: Well, I can hardly compare it to five or six years ago. I was not directly involved, but I would say that it is fairly important. Some people think that it has increased. I have no personal opinion on that. I have to rely on what I am told.

Mr. Thompson (Red Deer): Would you say...

Mr. Cadieux: I would say that it is significant.

Mr. Thompson (Red Deer): Would you say that the surveillance of our shores by the

so-called fishing trawler spy ships is on the increase?

Mr. Cadieux: Well, I must say that there is a lot of activity going on.

Mr. Thompson (Red Deer): Mr. Sharp or Mr. Cadieux, how would you interpret this in the light of some of the changes of policy under the present administration in Russia?

Mr. Cadieux: Do you assume that there is a change of policy?

Mr. Thompson (Red Deer): Oh, I think that under Brezhnev there has been a very definite change of policy.

Mr. Cadieux: Dealing which way?

An hon. Member: The invasion of Czechoslovakia.

Mr. Thompson (Red Deer): Czechoslovakia is one way. Looking at the age group of those who are in charge I find that they are all pretty much men of the Stalinist era. Those who probably favoured co-existence, have receded into the background during the last two, three or four years. I think that this is general knowledge, is it not? I think that perhaps the military situation has changed due to the death of 14 or 15 generals by tragic means during the last day or two, I do not know.

An hon. Member: I think it is only four.

Mr. Thompson (Red Deer): Oh, no, no. Today it is 14; it was four yesterday.

Mr. Cadieux: I am a little puzzled by the situation. I noticed, for instance, that the Russians cancelled the military parade on May 1. I would have been more relaxed if they had cancelled some armaments at the time. The parade, itself did not mean much to me.

Mr. Nowlan: They did not have any generals to lead the parade!

Mr. Thompson (Red Deer): Do I interpret, then, that you are convinced that it is necessary for us to keep our guard up?

Mr. Cadieux: Well, I believe so, yes.

Mr. Thompson (Red Deer): Does Mr. Sharp have anything to say in this regard?

Mr. Sharp: No, I agree with what the Minister of National Defence said. It is impossible to say what the intention of the

U.S.S.R. is. We do know something about their capabilities, and they remain extremely high.

The Chairman: Mr. Roberts.

Mr. Roberts: Mr. Chairman, I would like to ask Mr. Cadieux some simple questions—which may indicate that I am simple-minded about strategic principles. Would you agree that the present, so-called nuclear, stalemate is based on both the Soviet Union and the United States having effectiveness of the initial attack against them, they still have sufficient capacity of retaliation to effectively destroy the other side?

Mr. Cadieux: Generally, yes. Yes.

Mr. Roberts: Would you agree that—it is hard to assess degrees of stability—if we moved towards a situation in which one side had a second strike capacity, while the other had only a first strike capacity, that this would be a much less stable situation than the present one?

Mr. Cadieux: Yes.

Mr. Roberts: Therefore, we have a very strong interest in maintaining the second strike capacity of the United States since we also have a very strong interest in maintaining a Soviet Union second strike capacity, we would be ill-advised to move to a policy which through a more and more effective defence would put the second strike retaliatory capacity of the Soviet Union in doubt.

Mr. Cadieux: However, there is the possibility of the development of a new weapon. I am quite sure that both sides are trying to overcome this second strike capability. The danger then, reverts to the original situation, in which you can strike with impunity.

Mr. Roberts: Suppose that we were on the track of developing such a weapon. Would it be wise for us to pursue it, and therefore destroy the second strike capacity of the Soviet Union, and create a less stable situation?

Mr. Cadieux: What about the situation in which the other fellow is developing it?

Mr. Roberts: Well, what about that situation?

Mr. Cadieux: What about that situation? Well, it means—and this is exactly what

seems to be happening—that you must react to it in order to defend yourself. Therefore, you must consider ABMs and a few other things. We would be in the position of being able to destroy the second strike capability, and therefore, be in the position to strike with impunity.

• 2135

Mr. Roberts: Our purpose then, is really to maintain—hopefully on both sides—not a nuclear support superiority, except in the sense that each side should be able to have a sufficient capacity to destroy the other side if it were attacked. That would be the objective of our policy.

Mr. Cadieux: The purpose is to maintain the balance.

Mr. Roberts: Let me ask what I suppose will seem a bizarre question. Suppose that in the present context of weapons—I admit future developments as you have indicated could radically change it—we had no antibomber defence, so that the 150 Soviet Union bombers arrived over United States. Would this compromise our effective deterrent, in any significant way, or would the difference only be marginal? Would this tend to take our capacity to respond below the capacity to respond below the capacity to effectively destroy the Soviet Union?

Mr. Cadieux: It all depends on what the targets were, and if they hit the targets. If you had 150 bombers with nuclear warheads, I think that you can inflict quite considerable damage.

Mr. Roberts: How much damage could they then inflict? You may have seen the *New York Times*...

Mr. Cadieux: I would believe that they would kill most of the population of the United States. It is as simple as that.

Mr. Roberts: But that would not, in itself, destroy our deterrent power.

Mr. Cadieux: Suppose they hit...

Mr. Roberts: That would still not destroy our deterrent power.

Mr. Cadieux: It would not. If they did not hit them, but suppose they did hit them.

Mr. Roberts: But even if they did hit them, it would not destroy our deterrent power,

because our deterrent power is based upon the capacity of the Minutemen missiles to strike back.

Mr. Cadieux: Yes, but what makes you think that they might not hit the sites?

Mr. Roberts: How many sites could they possibly hit with 150 bombers?

Mr. Cadieux: Well, I suppose that everyone of them could be hit. Why not?

Mr. Roberts: A thousand sites?

Mr. Cadieux: Look, are you talking of a bomber coming with only one bomb?

Mr. Roberts: How many bombs can they carry? What is their capacity to destroy, on the basis of 150 bombers?

Mr. Cadieux: I am sorry, I cannot provide the answer.

Mr. Roberts: Well, perhaps you have seen the article which appeared in the *New York Times* this week-end. Could I go through some of the figures with you to see whether or not they are accurate? It says at the moment the United States have a 1,000 Minutemen in underground silos. Is the United States, or are we as part of that alliance, now preparing to equip them with multiple warheads?

Mr. Cadieux: I do not know.

Mr. Roberts: You do not know. I see. What kind of percentage of those 1,000 missiles would have to get through to inflict basically unacceptable damage on the Soviet Union?

Mr. Cadieux: Now, look! This is obviously a United States' problem. I am not provided with accurate information on problems like that.

Mr. Roberts: But, surely this kind of information is extremely relevant to the efficacy or non-efficacy of bomber defence?

Mr. Cadieux: Yes, but an ICBM with a 5 or a 25 megaton bomb may be coming. Who am I to say, ahead of time, which one is coming?

Mr. Roberts: Does not a great deal depend not only upon the size of the megaton, but the accuracy—if you are talking in terms of taking out the Minutemen?

Mr. Cadieux: Yes, both are very relevant.

Mr. Roberts: You are unable to give any conception of how many missile Minutemen, for instance, or sites would be left in operating order on the basis of an effective bomber invasion of North America.

Mr. Cadieux: Not enough to deter, certainly.

Mr. Brewin: Did you say not enough, or enough?

Mr. Cadieux: Not enough.

Mr. Roberts: We would not have enough missiles left to deter.

Mr. Cadieux: No.

• 2140

Mr. Forrestall: That is only one line of defence, Mr. Minister, is it not? Surely the United States...

Mr. Cadieux: It is one of many lines of defence; you are now getting into hypothetical areas. You can even discuss fantasy in this particular area.

Mr. Roberts: But, of course Mr. Minister that is what we must do when we are talking about the strategic doctrines of nuclear deterrents; since we have not yet tried them out in practice, we must try to make some estimation of their efficacy.

Mr. Cadieux: Mr. Roberts, you are presenting all sorts of partially hypothetical questions. For instance, you made mention of 150 bombers coming through Canada and bombing the United States. Are you assuming that they will come through?

Mr. Roberts: Yes that was the assumption that I was making, Mr. Minister.

Mr. Cadieux: Oh well, of course there is not any defence.

Mr. Roberts: According to the figures which were given by Mr. McNamara, as quoted in the *New York Times*, as long as 200 of the present 1,000 missiles, manage to reach their target, they would destroy 72 per cent of the Soviet Union's industrial capacity.

What I am trying to get at is this: would the effect of the bomber attack by the Soviet

Union, even if it were effective to the maximum degree, diminish our capacity of response to a level where we would no longer have a sufficient retaliatory power? Are you saying that that is such a hypothetical situation, that we cannot possibly come to any conclusion on it?

Mr. Cadieux: I think it is a hypothetical scenario when you talk of 150 Russian bombers coming through and delivering their bombs on target. I hope it is hypothetical.

Mr. Roberts: The question is, in that hypothesis, would it compromise our effective deterrent?

Mr. Cadieux: It all depends on how they would hit. They could be very serious. What is the rationale behind the present attempts of the Americans in installing only two ABM sites to protect the deterrent? Surely they are not going to protect 1,000 sites with two ABM's. Yet they think that number is a sufficient amount to protect the core of the deterrent.

Mr. Roberts: The Chairman would preclude me from getting into an analysis of the ABM situation, which may be beyond my knowledge in any case.

I assume that we will make some estimation as to the maximum capacity of the bombers to destroy. While of course it would be very unpleasant to lose a lot of our population, the basis of our protective strategy is to protect a retaliatory power. What I am trying to get at is whether or not our retaliatory power is compromised by that threat.

Mr. Cadieux: It certainly is, in my estimation, if you assume that 150 bombers will come through; this is why we maintain that you must be able to stop them, thereby protecting your deterrents.

Mr. Roberts: Perhaps I can return...

Mr. Cadieux: It is not only a question of deterrents in this particular case. You seem to dismiss the possibility of 75 per cent of the population being destroyed.

Mr. Roberts: I would hate to be placed in a position where it is said that I am gladly prepared to dispense with 75 per cent of North America. However, the strategic justification for our anti-bomber system has not been put in terms of defence; it has been put

in terms of deterrent. The two things are quite distinct. I admit freely that I do not want to see anyone killed, but in terms of the strategic justification, the relevance of anti-bomber defence is to the protection of nuclear deterrent, not to the number of people who may or may not be killed.

Mr. Cadieux: They hope that is not...

Mr. Roberts: Do you want to stop me now, Mr. Chairman?

The Chairman: Could I put you down for the second round?

Mr. Roberts: Certainly.

The Chairman: Mr. Nowlan, did you have a question earlier that you wanted to ask? I had you down on my list, for a question.

• 2145

Mr. Nowlan: I will pass. A lot of ground has been covered.

The Chairman: Mr. Legault.

Mr. Legault: Thank you, Mr. Chairman. I have two or three short questions. Mr. Cadieux, last Tuesday I was asking General Sharp about the Bomarc, nuclear warhead which has a range between 300 and 400 miles; Which way are these directed? Toronto, Montreal and Ottawa are all within that range and I feel it would be like killing the fly on the baby's head with a hammer, if ever it were used in those directions. Could you tell me if they are all directed towards the North. I am sure that they would not be.

Mr. Cadieux: The ones that I have seen are directed North.

Mr. Legault: Yes, but are they not tuned in on the target, and if that target is too fast could they not follow through and hit it?

Mr. Cadieux: It is a proximity bomb and a nuclear warhead is necessary because it is a proximity bomb. It is assumed that you have to destroy an atomic warhead; this is why it also must be atomic.

Mr. Legault: I have a second question, Mr. Cadieux. Do you believe that Canada should approve of the AWACS and the new manned interceptor, such as those being studied in the United States?

Mr. Cadieux: We are studying it now. If you are asking my personal opinion, I believe we should approve it. However, if we decide that we do not want to continue participating in the NORAD organization, we must make some arrangements for the use of our air-space.

Mr. Legault: I have a third question. On the first page of your presentation it is stated, [Interpretation]

I have the French document here. You talk about some of the main functions, and secondly:

to be able to identify beyond doubt any peculiar or suspicious element turned up in the surveillance process...

One of the things that worries me and which was mentioned earlier, is the Maginot Line that was absolutely useless in the last war. It was supposed to give all the protection possible to France. I can hardly believe that an aggressor would use anticipated means. I gave as an example to General Sharp an unexpected attack by, let us say, four or five commercial airplanes which could paralyse the country without knowing the origins of these planes.

Is there no way of protecting ourselves? Our airplanes are identified. I am sure that it is very difficult for our planes to penetrate Russian air space without being stopped immediately on crossing the boundaries.

Mr. Cadieux: Yes, it is the same thing here: as soon as a plane appears, it must be identified. If it is not identified, we have to be sure of its intentions and consequently we intervene with all available means. I believe that this hypothetical case has been foreseen.

Mr. Legault: Thank you.

[English]

I wonder if I could direct a question to Mr. Sharp concerning the policies and her own reaction. I am referring back to the 1962 Cuba crisis, where we were very disturbed by the events. Could the negotiation bring about a situation whereby the United States, for some reasons other than those we fear now, would be involved in a war? I think Cuba is a vivid example of this. Would Canada be implicated automatically in this war?

• 2150

Mr. Sharp: If there was an attack by bombers which threatened the security of North America, then under the two-key system, we would make our decision as to whether or not

we were going to respond. If it did not come within the compass of the NORAD agreement, then we would have the option of co-operating with the United States or doing otherwise. The NORAD agreement only relates to a particular form of attack; if it is another form of attack, then it is up to us to decide whether or not we want to proceed and co-operate with the United States in that defence. I think this is the best answer I can give you.

Mr. Legault: But the present contract does not carry this stipulation?

Mr. Sharp: The present contract is quite precise; it provides for the joint command of these facilities for a bomber attack on North America.

Mr. Legault: Thank you, Mr. Minister.

Mr. Ryan: Mr. Cadieux, do we at the present time participate in Strategic Air Command in any way, except possibly in the way that NORAD gives warning to SAC? Do we give them permission for over-flights over Canada, for instance, on practice runs and that sort of thing?

Mr. Cadieux: Oh yes, we have the flight pattern, and the flight path. This is all agreed upon ahead of time.

Mr. Ryan: Are there any other ways in which we might co-operate with SAC, other than these two?

Mr. Cadieux: Well, the question of refueling bases which did exist before, but which do not exist now has not yet been decided. There is that particular aspect of it.

Mr. Ryan: I understand from General Sharp's evidence yesterday, and from the evidence of both of you hon. Ministers today, that Canada has reasonably good defences, if not excellent defences, against manned bombers. However, this country and even the United States, for that matter, is utterly naked, defence-wise, against ICBM's, FOBS or possibly satellites. Is that the situation?

Mr. Cadieux: Well, first of all the NORAD agreement concerns bombers. It is an anti-bomber defence system. The FOBS that you are talking about is a development that represents a threat. Against that threat you have to use the over-the-horizon radar, which is now an operational radar but not in operation.

Mr. Ryan: Not deployed yet.

Mr. Cadieux: This is the next phase of the continental defence system. As far as the ICBM is concerned there is this new development in United States—this possible development.

Mr. Ryan: My question is at the present time, right now—there is nothing that can stop an ICBM, a FOB or a satellite from dropped nuclear weapons on this continent. Is there nothing?

Mr. Cadieux: No, there is nothing.

Mr. Ryan: I understand that we have a good deterrent against the reasonable men in control in Moscow. But, we have no defence whatsoever if an attack should be launched by a madman, or by accident?

Mr. Cadieux: Except the possibility of frightening them.

Mr. Ryan: The main deterrent is all that we have?

Mr. Cadieux: Yes.

The Chairman: Are there any further questions? Mr. Laniel and then Mr. Roberts.

Mr. Laniel: A couple of points, Mr. Chairman. First, I arrived late and maybe the question has been asked. Do the electronic counter-measures really affect our present system, or do they weaken the system of radar? Do we know enough of the progress that has been made in that field by the Russians?

• 2155

Mr. Cadieux: We are subjected, of course, to electronic counter-measures warfare, but we also have some of our own to neutralize them. This is part of the operation.

Mr. Laniel: In the past months or years, have we experienced any difficulty identifying aeroplanes because of the use of such electronic measures?

Mr. Cadieux: No.

Mr. Laniel: We assume that because we are doing research in that field, that they must be doing the same thing. Is this the only basis for that assumption?

Mr. Cadieux: I think it would be more so in the case of the ICBM's, in which you

would have chaff, duds, fakes, and all sorts of things. Your job would be to identify the real warhead. In the case of aeroplanes, there is no problem as they are detected and identified. The determination of intent is easy to make because interceptors can be deployed that could intervene if the bombers were to come over Canadian territory.

[Interpretation]

Mr. Laniel: In his statement, Mr. Sharp told us that the defence of North America would be dubious without the participation of Canada, without a military contribution by Canada. I think he meant the participation of our Bomarc or of our CF-101, the Voodoos.

Do you agree with him? Is the fact that we have a Bomarc base in northern Ontario at a latitude that is somewhat higher than the bases that are located in the United States in the West of any great help to the defence of North America at the present time?

Mr. Cadieux: Of course, this is the problem. If the Americans were obliged to take off from American bases to intercept over Canada, then, of course, these would be problems relating to time, fuel, and so on. If they have to go back to their own country to patrol, they are unable to do so. Strategic bombers do not have that problem because they have enough fuel. If you have an airplane, flying, let us say, near Newfoundland, and if you don't have any bases in Canada, the interceptors have to take off from the United States, and meanwhile, the bomber can travel quite a distance.

Mr. Laniel: I am asking this question, sir, precisely to know whether, for political reasons, we have not reduced our defence capacity by putting our installations too much to the South. The best way to stop an attack against North America, against Canada and the United States, would it not be by placing our defence installations as far north as possible? Isn't this something we should have done in the past?

Mr. Cadieux: They are placed as far north as possible. The DEW line is very, very far North. And there is the...

Mr. Laniel: Yes, but the interceptors...

Mr. Cadieux: The interceptors we have in Comox are quite far North!

Mr. Laniel: Nevertheless, Comox is to the east.

Mr. Cadieux: I beg your pardon, to the west.

Mr. Laniel: You are right.

Mr. Cadieux: Obviously, in case of an attack the approaches of populous cities must be protected. And here interceptors would be used. In Newfoundland, they can intervene from the base at Chatham, which would give you relatively adequate protection.

Mr. Laniel: The population, especially in the densely populated area of the south of Canada, fears that, even if we succeed in making any kind of interception, the fallout will really affect the population. I wonder if we should not be thinking about a defence that would be farther north, so that interception would occur even farther away.

Mr. Cadieux: Well, the detection is done very early by the Dew Line (Distant Early Warning System) and the interception may be carried out very far north, as soon as the detection is made. Russian bombers have never yet flown over Canadian territory. They have come close to our shores, at a distance of some thirty miles.

Mr. Laniel: Since the first objective of Norad is the protection of the American deterrent force, namely the intercontinental nuclear force, don't you agree that, if we ever decide to set up the ABM System, it should come under NORAD too, in the light of the political implications, as it is the case with the Bomarc and the Voodoo squadrons? Briefly, if we want to provide protection, the decision must be taken at the same place, instead of having some people taking decisions as to the interception of ICBMs, and others who will decide of the interception of airplanes.

Mr. Cadieux: Then the problem is to reconcile the military decision with the political decision. We have to know whether the government of Canada wishes to accept to participate in an ABM system. And if so, then there is no problem, since the military command takes over. But, if on the other hand the government of Canada decides not to take part in the operation of the ABM system, then there is a decision to be taken vis-à-vis the role of the Deputy Commander of NORAD, who is a Canadian.

• 2200

Mr. Laniel: In other words, it would mainly be a political reason that would bring about a division.

Mr. Cadieux: Yes.

Mr. Laniel: Thank you.

[English]

The Chairman: Mr. Cadieux, reverting for a moment to that question of command, would it be possible for us to obtain a memorandum clearly summarizing the command procedures which would be followed in order to put Canadian and American interceptor squadrons into operation over Canadian territory. You made a reference earlier to the two-key system and incentive governments and that sort of thing.

Mr. Cadieux: I believe there is the element of classification and...

The Chairman: This is subject to classification. Is a general description possible? I am not referring to the use of the ICBM by the Americans, just the use of the interceptor squadrons.

Mr. Cadieux: Yes.

The Chairman: We have three Canadian interceptor squadrons. Could you tell the Committee to what regions these three squadrons are assigned: the Western, Central or Northern?

Mr. Cadieux: There are two Northern, I believe.

The Chairman: There is one squadron for the Western region and two squadrons for the Northern region.

Mr. Cadieux: I think the East is covered by the Americans.

The Chairman: Thank you very much, sir. Mr. Roberts.

Mr. Roberts: I would like to ask a procedural question first, Mr. Chairman. The other day when we had General Sharp before us, I asked some questions about the interception rates that we could expect through bomber defence at the moment, and I was told that we could not have this information in open committee. I wonder if perhaps this evening just at the close of our session we might meet

briefly in camera and see if it is possible to answer some of those questions. Would that be procedurally possible?

The Chairman: General Sharp is here this evening but I do not know whether that would be possible or not. Apparently, the information is not yet available, but we will if brought to the necessity of a closed session, Mr. Roberts.

Mr. Roberts: Thank you. I do not think I have too many more questions, Mr. Chairman. Perhaps with your permission I could read one paragraph—it is only four sentences long—from Mr. Yarmolinsky's testimony to the Committee. I think it puts in a nutshell the strategic problem. I was hoping that I would get Mr. Cadieux or Mr. Sharp, or both, to comment on it to see whether they agreed with it or not.

One consequence of this nuclear standoff is to make the idea of nuclear superiority irrelevant. If each side has enough weapons, well-enough protected, to inflict unacceptable damage in a second strike, it doesn't do either side any good to acquire more. The arithmetic of this situation is that one attacking missile is not enough to be sure of destroying each missile reserved for a retaliatory strike, provided the retaliatory missiles are adequately protected and dispersed. In any nuclear arms race, therefore, the retaliatory force can keep ahead of the first strike force.

Is that statement of Mr. Yarmolinsky's one with which you would agree?

Mr. Cadieux: What was the last sentence, please?

Mr. Roberts: In any nuclear arms race the retaliatory force can keep ahead of the first strike force.

Mr. Cadieux: Yes. That is to the effect that you should de-escalate, and this is the attempt that is being made now.

Mr. Roberts: His argument is, I think, that at a certain stage it does not do any good. Perhaps the image might be of two men standing with machine guns looking at each other and one has 25 bullets in his gun and the other has 40 bullets in the gun. It does not matter to either one of them whether they increase the number of bullets in the gun.

Mr. Cadieux: You may be right but this is the kind of exercise that NATO itself is going through now and has been trying to go through for the last two or three years.

Mr. Roberts: And can we apply the same argument. . .

Mr. Sharp: This is the reason why Canada has been so strongly in favour of negotiations, because we agree entirely that there is no
• 2205

point in over-kill. Indeed you can achieve the same deterrent results at a much lower level of over-all armaments.

Mr. Roberts: Could we then reverse this argument and say it does not do either side any good to defend itself any longer, unless by defending itself it could protect itself below the level of nuclear destruction? That is to say, if you are protecting yourself at the level of intercepting 25 per cent of what is coming your way, it does not really matter whether you improve your defensive batting average to 35 per cent because the difference between 75 per cent of the missiles arriving and 65 per cent of the missiles arriving makes no difference in terms of destruction.

So, at a certain stage it does not really pay you to protect yourself more effectively than at the present level, unless your protection went down so far that your retaliatory force is compromised.

Mr. Cadieux: You might devise a system that could protect you 75 or 80 or 90 per cent.

Mr. Roberts: I have just one other question, Mr. Chairman. Again it relates to Mr. Cadieux's statement. I did not grasp the logic of the first full sentence on page three in which he is talking about surveillance and interception systems and describes the three elements that are in it to make it effective. It says that:

All three elements are necessary if the system is to be sufficiently flexible to avoid having the threat of nuclear annihilation as the only response to apparent hostility.

It that not a contradiction, in fact, of our present position, which states that the system we have today does not permit us to avoid the threat of nuclear annihilation, but invokes the threat of nuclear annihilation against the other side? That is, the system today does not

permit us, if there is an over-all bomber attack coming at us, with or without a missile attack, to avoid the threat of nuclear annihilation. What our present system does is invoke our threat of nuclear annihilation in return.

Mr. Cadieux: No, I believe the system we have could destroy the bombers if they came.

Mr. Roberts: I see. Would the bombers ever come without also missiles being fired?

Mr. Cadieux: We are dealing with bomber defence. As I said before, we have no defence against missiles.

Mr. Roberts: We do not, in fact, at the moment, looking at it from the over-all point of view of missile and bomber defence, have a system which avoids the threat of nuclear annihilation. What we have is a system which invokes the threat of nuclear annihilation to the other side.

Mr. Cadieux: Except that the rest is the deterrent, and this is the rational. . .

Mr. Roberts: Indeed our objective is not to go to a system where we can avoid the threat of nuclear annihilation. Our objective is to maintain a system where both sides can invoke the threat of nuclear annihilation against the other side.

Mr. Sharp: I was just going to say that if you follow this logic through, you would then come to the conclusion that you should never have any defences except the deterrent. However, this is not a very sound argument because it means that the only weapon you can use is the threat of nuclear annihilation against any sort of an attack at all.

Mr. Roberts: What other weapon can we use at the present time?

Mr. Sharp: No, I am talking about the over-all system. This is the Maginot Line of defence. It is always a mistake to depend upon what seems to be the final destructive or defensive power. You must be able to have a flexible response, otherwise you are open to the terrible risk that all you can do is respond massively.

Mr. Roberts: Is that not all we can do at the present time to respond to an all out attack by the Soviet Union?

Mr. Sharp: No, . . .

Mr. Roberts: We do not have in this sense any flexible response at the present time because there is no defence against missiles.

Mr. Sharp: We could shoot down a few bombers.

Mr. Roberts: If you are looking at the system globally, missiles and bombers, we do not at the moment have any system of flexible response. All we have is the threat of nuclear annihilation for the other side. It is not a nice situation to be in, but is that not the present situation?

Mr. Sharp: It depends on how wide you are casting your net. If you are talking about the over-all system of collective defence, there are other means of flexible defence which might avoid the escalation to nuclear war. You cannot, I think, just look at NORAD alone. You have got to look at the over-all collective defence including NATO. The place

• 2210

where the risk of a confrontation might arise is in Europe, and it is there that it is most important to be able to meet an attack by accident, miscalculation, or somethin like that, which would not require you to go in for nuclear arms.

Mr. Roberts: Within the context of the North American defence...

The Chairman: Would you permit a supplementary, Mr. Roberts?

Mr. Roberts: I will after I have asked this question. Within the context of the present NORAD system, I am leaving aside NATO and conflicts below the nuclear level, is it possible to conceive of a bomber attack which does not also involve at the present time a nuclear attack? In this context, considering missiles and bombers together, we are dependent upon the threat of nuclear annihilation to the other side, and we have no flexible response within that system.

Mr. Cadieux: Did you not give yourself the example a moment ago of 150 Russian bombers coming through?

Mr. Roberts: Can you imagine any circumstance, Mr. Cadieux, in which that would happen without missiles being fired at the same time?

Mr. Cadieux: Why could I not imagine it? You can imagine that 150 bombers come through.

Mr. Roberts: Do you think that is a likelihood?

Mr. Cadieux: No, but I can have that scenario too. I think the problem is simply this: Can I quote this as the six objectives for an improved, and continued air defence program? "(a) Peace time identification to prohibit unopposed access to North America by unauthorized foreign aircraft." Surely you will agree with that, whether or not they are bombers.

Mr. Roberts: To be frank, I do not think that it matters, Mr. Cadieux. It is of no greater concern than having a nuclear missile submarine 20 miles off the coast of the United States.

Mr. Cadieux: We are citizens who do not think the same way. "(b) Limiting the damage could be done to the urban-industrial complex by Soviet bombers in the event that deterrence should fail." I think that this is a very important point... "(c) preventing damage from a bomber attack by any other country". Cuba is specifically mentioned.

Mr. Roberts: You are now talking in terms of defence. We have been talking in terms of deterrence.

Mr. Cadieux: I am talking about a bomber attack. "Precluding a bomber attack from strategic missile forces that are being intentionally withheld." This is, also, a possibility. "Discouraging the Soviet Union from developing and introducing new bomber threats which would be too costly to neutralize." I think that this is a valid rationale.

The Chairman: There is a supplementary for Mr. Laniel, and for Mr. Brewin.

Mr. Roberts: I have finished, Mr. Chairman.

The Chairman: Mr. Laniel.

Mr. Laniel: Do we have a bomber response available in North America under SAC, or do we depend on interceptors that...?

Mr. Cadieux: We do not have a bomber response within NORAD.

Mr. Laniel: Not within NORAD. I mean in North America.

Mr. Cadieux: Yes, of course.

Mr. Laniel: Do we have a bomber force that could be used—let us say in the same way as the bomber force was used in the Cuba affair—to turn them back?

Mr. Cadieux: Not ours, but it does exist.

The Chairman: Mr. Brewin, then Mr. Prud'homme on a supplementary.

Mr. Brewin: My question should be addressed to Mr. Sharp because, I think that he was discussing this matter with Mr. Roberts. He suggested that the doctrine of flexible response required us to maintain the type of defences, specifically the anti-bomber defences, that are in NORAD. I want to suggest to him that the flexible response doctrine has no application whatsoever, to a situation in which your defence is, by definition, not against a small or casual attack, but rather an all-out attack. 160 bombers is a fairly substantial attack, according to the Minister of National Defence. I am sure that it could be. This, surely, is the type of attack that must inevitably trigger a retaliatory response. I suggest that the only defence against an attack of that sort is, in fact, the threat of massive retaliation. Furthermore, it is a sufficiently affective deterrent. Under no imaginable circumstance—short of complete insanity on the part of the people controlling the situation in Russia—will they launch such an attack when faced with the quite fantastic result of retaliation.

Mr. Sharp: May I ask you a question in return, Mr. Brewin? Why then, does the Soviet Union maintain such a large bomber fleet that is capable of doing this?

Mr. Brewin: I am game. I am not privy as to why they started. I think that they are capable of doing stupid things just as we are.

• 2215

I suggest that they have very little maintenance of that. They have kept a fairly small force, and have concentrated all their major efforts on the ICBM's. If by maintaining this force, they are able to keep our attention directed to meeting a non-existent threat, then I think that, perhaps, from the military point of view, it might be a useful objective. Short of insanity, I still challenge anybody to explain to me the scenario of the Russians deciding to launch an attack with manned bombers on the North American continent. If that is the case, I do not know why we waste money defending ourselves against it.

The Chairman: Do you care to comment on that?

Mr. Cadieux: Yes. My only comment is that you must defend yourself against any possibility of a threat. You must prepare, for instance, defensive measures and go through exercises to defend yourself against biological and chemical warfare, even though your assumption is that it will not happen. It did not happen in the last war, although everyone was prepared to waste money on that kind of warfare. However, they were all scared, so eventually it became a conventional war. You certainly must be ready in case it is used. In the case of NORAD, which is an anti-bomber defence, you are diverting \$138 million out of \$1.8 billion. You are not putting all your eggs in that particular basket. However, there is a threat.

Mr. Brewin: I could suggest a more useful purpose for the \$138 million.

Mr. Cadieux: I know that you can. But, you must live to do it.

Mr. Brewin: I do not think your force is helping me live one little bit.

Mr. Cadieux: I hope that we do not have to demonstrate it, sir.

The Chairman: Are you finished with your supplementary, Mr. Brewin?

Mr. Brewin: Yes, thank you.

The Chairman: Mr. Prud'homme on a supplementary.

Mr. Prud'homme: Mr. Sharp, I would like to have a comment from you and Mr. Cadieux. In your discussion with Mr. Roberts, you said that that kind of attack could also occur in Europe. Is that why NATO is still very vital in importance?

Mr. Sharp: Yes. I have no doubt about the importance of the NATO alliance.

The Chairman: That is almost as relevant as the ABM question that arose earlier.

Mr. Prud'homme: I believe that NATO is an important question.

The Chairman: Do you have a question on the NORAD issue Mr. Prud'homme?

Mr. Prud'homme: No.

The Chairman: Mr. Forrestall.

Mr. Forrestall: I wonder if Mr. Sharp or Mr. Cadieux would care to comment, a little further, on the question of whether or not we have a defence. Based on the comments that have been made, it seems incredible. I thought that the United States concept of the defence aspect of the deterrent lay in the existence, and in the strength of the hardened containers. I believe that there are allocations this year further to harden the installation and increase their dispersal throughout the country. Viewing the concept in the light of the bomber, brings it into perspective. The credibility of a bomber threat—as I understand it—is that the bomber still remains as the only instrument of accuracy. Under the extended hardening, it would require an absolute, direct hit in order to wipe out the deterrent, which Mr. Brewin was discussing. Is my assessment of that incorrect?

Mr. Cadieux: I do not believe that it is quite correct to say that the only accurate weapon is the bomber. I believe that some ICBM's are now fairly accurate.

Mr. Forrestall: In an hour long program carried on American television networks less than two weeks ago, the observers all commented that the degree of accuracy was not known and therefore, was not reliable over the long range.

Mr. Cadieux: Reacting to the accuracy of the Russian ICBM's, the Americans have now decided to shift the emphasis from protection of the populated areas to the protection of the deterrents, using the ABM. The Russian ICBM's are considered accurate enough to hit the deterrent.

Mr. Forrestall: A near hit?

Mr. Cadieux: I do not know.

Mr. Forrestall: Near enough to knock it out?

Mr. Cadieux: With the 25 megaton bomb, even if it is a near miss, you really destroy.

• 2220

Mr. Forrestall: Yes. Of course. This is an argument that is raging in the United States. I am wrong then, in assuming—and I have not seen anything to indicate that they are building up their bomber fleet, which has been in existence for quite a while now, and which does not even have replacement aircraft—that the maintenance of the existing Russian fleet was for the purpose of ensuring accuracy.

Mr. Cadieux: It may be...

Mr. Forrestall: Or greater accuracy.

Mr. Cadieux: I question—without being more accurate myself than you—the proposition that the ICBM's are not accurate. I think that at least, some of them are very accurate.

The Chairman: Mr. Ryan.

Mr. Ryan: Mr. Chairman I would like to make a comment on the point which Mr. Brewin brought up and also on Mr. Forrestall's discussion. When General Clark was our witness, it seems to me that he indicated that the ICBM's would come in probably within 15 minutes to half an hour. Then the manned bombers would come in two hours or so later. The Russians now have them so sophisticated that they can stand off 200 or 300 miles and pick off sites that have not been eliminated by the first strike. The bombers would be very useful to give a second, third or fourth bomb, if necessary, on these hardened silos. Apparently you can get to them, if you repeat the bomb two, three or four times as may be necessary. As I gathered from General Sharp, there is quite a role for a manned bomber backup. He is here tonight. I may be wrong on this.

Mr. Cadieux: I think the general idea is that the Russians have not increased their bomber fleet, but as our intelligence tells us, I think, they have improved the quality of the bomber. They have been improved, and are now more sophisticated.

Mr. Ryan: Yes, they have a better ability to stand off and hit the target. They probably have more decoys aboard ship and so on, to make it difficult to discriminate what kind of...

The Chairman: Material given to us at the last hearing indicated that our DEW Line facilities can track manned bombers and air breathing missiles, as contrasted with the BMEWS system which was used to track the ICBM's. What is the difference between an air breathing missile and an ICBM. Which is which?

Lt. Gen. Sharp: Basically, one is an airplane and the other is a missile. It is similar to a satellite in that it goes up and comes down.

The Chairman: The air breathing missile that they refer to in this air space defence information on page 9...

Lt. Gen. Sharp: Yes, they can launch some missiles that use engines which require oxygen in order to operate.

The Chairman: Would this be a short range missile, then?

Lt. Gen. Sharp: Yes.

The Chairman: How short?

Lt. Gen. Sharp: There are several kinds. The types that the bombers carry have air-to-surface-missiles. There are, also, sublaunched air breathing missiles as opposed to ICBM's, which go way up and come down.

The Chairman: Thank you very much, General Sharp.

Mr. Forrestall: Are these intermediate range?

Lt. Gen. Sharp: The sub-launched ballistic missile? Yes, they are.

Mr. Forrestall: The air breathing one?

Lt. Gen. Sharp: Yes.

The Chairman: My second question, Mr. Minister, is; Has any costing study ever been undertaken to determine whether or not we are paying more or less than our fair share of NORAD defence costs? Can it be done?

Mr. Cadieux: Yes, it can be done, but only by comparison of what the other fellow is paying, and on the basis that we are now—I think if you take the population, not the gross national product, of course; that is a different proposition.

The Chairman: How do you decide what is the right basis?

Mr. Cadieux: That is the problem. We contribute deployment forces which we think are adequate. The bill happens to be what it is. We have a lot of co-operation from the Americans on that. For instance, the operation of the Bomarc does not cost us very much; the operation of the DEW Line is paid entirely by the Americans, although 95 per cent of it is manned by Canadians. We have all sorts of varying things like that because even in Canada we do not pay for everything that is going on.

• 2225

The Chairman: I was merely wondering whether or not we had ever asked ourselves the specific questions; Are we paying our fair

share, or more or less than our fair share of joint defence costs, and Have we made a specific computation and study, or have we just gone along and done what we thought was right?

Mr. Cadieux: I think that you would have to define your criterion. First of all what is your "fair share"?

The Chairman: Has that been defined? If it has not been, then I presume that no such study was been made.

Mr. Cadieux: We have, I think, had the arrangement by which we were required to do some specific things which we thought were adequate. We said that we would take our share of that. We have been negotiating many times, as a matter of fact, for the manning of the radar stations. At times we have different trading arrangements with the Americans.

The Chairman: I understand then, that over-all, there have not been any studies made really to determine what should be the basis for the determination of what the American's and our own fair share should be. We have just gone along and...

Mr. Cadieux: I would be afraid of doing that because I have noted, in the past three years, that the Americans' share has been increasing and yet ours has been stable. Therefore, if you apply a type rational in which you establish that we should spend, let us say 10 per cent, since the Americans are spending \$1.7 billion we should then be contributing \$170 million. In four or five years the projection of their share will be \$2.5 billion. I do not think that it would be in our interest to raise that question and establish...

The Chairman: This is one incident in which it is to our benefit to be unbusinesslike.

Mr. Cadieux: Yes.

Mr. Ryan: Mr. Chairman, did we not have a witness who told us that we were getting a cheap ride? Not a free one, but a cheap one.

Mr. Forrestall: Mr. Sharp, surely, we have asked ourselves the question in terms of NORAD, NATO, Maritime Command and so on and so forth. Perhaps we applied the test to it, rather than asked the question. Are we getting a benefit both politically and militarily from the amount of money in relationship to one command or function to the other? Are we getting out of these our fullest measure of

political and military return for the dollars which we are investing?

Lt. Gen. Sharp: Perhaps I can answer it this way. Both Mr. Cadieux and I, in the discussions on our foreign and defence policy review, were asked this question over and over again by our colleagues.

Mr. Forrestall: I hope that Maritime Command comes up heads, and not tails.

Mr. Roberts: Perhaps, I can stop being argumentative, and end on a happy, constructive note. In view of all the concern about accuracy, I can contribute the Pentagon's figures as quoted in *The New York Times*

Magazine. You must get 25 megaton missiles within 1.1 miles of the site, and if you are dealing with 4 megatons, you must get within $\frac{5}{8}$ of a mile of the site. The Pentagon's estimation is that 20 per cent of the Russian missiles would fail at take off and that 20 per cent more would be intercepted, so that 16/25 or 64 per cent of them would arrive sufficiently close to the Minuteman to render them inoperative.

The Chairman: Are there any further questions? If not, on your behalf, I would like to thank the Secretary of State for External Affairs and the Minister of National Defence for their very helpful evidence, and for their patience.

APPENDIX YY

Agreement to extend for a period of five years the agreement between the Government of Canada and the Government of the United States of America concerning the organization and operation of the North American Air Defence Command signed at Washington, D.C., May 12, 1958.

Washington, D.C. March 30, 1968
Entered into force March 30, 1968

Accord prorogeant pour une période de cinq ans l'accord entre le Gouvernement du Canada et le Gouvernement des États-Unis d'Amérique concernant l'organisation et le fonctionnement du Commandement de la Défense Aérienne de l'Amérique du Nord signé à Washington, D.C., le 12 mai 1958.

Washington, D.C., le 30 mars 1968
Entré en vigueur le 30 mars 1968

DEPARTMENT OF STATE
WASHINGTON

March 30, 1968

His Excellency

A. E. Ritchie,
Ambassador of Canada.

Excellency:

I have the honor to refer to discussions in the Permanent Joint Board on Defense and elsewhere regarding the mutual interest of the United States and Canada in the continued cooperation between the two countries in the strategic defense of the North American continent. In particular, these discussions have concerned themselves with the North American Air Defense Command established on August 1, 1957 in recognition of the desirability of an integrated headquarters exercising operational control over assigned air defense forces. The principles governing the organization and operation of this Command were set forth in the Agreement between our two Governments dated May 12, 1958. That Agreement provided that the North American Air Defense Command was to be maintained in operation for a period of ten years.

The discussions recently held between the representatives of our two Governments have confirmed the need for the continued existence in peacetime of an organization, including the weapons, facilities and command

structure, which could operate at the outset of hostilities in accordance with a single air defense plan approved in advance by the national authorities of both our countries. In the view of the Government of the United States, this function has been exercised effectively by the North American Air Defense Command.

My Government, therefore, proposes that the Agreement on the North American Air Defense Command effected by the exchange of notes, signed at Washington, D.C. on May 12, 1958, be continued for a period of five years, from May 12, 1968, it being understood that a review of the Agreement may be undertaken at any time at the request of either party and that the Agreement may be terminated by either Government after such review following a period of notice of one year.

It is also agreed by my Government that this Agreement will not involve in any way a Canadian commitment to participate in an active ballistic missile defense.

If the Government of Canada concurs in the considerations and provisions set out above, I propose that this note and your reply to that effect shall constitute an agreement between our two Governments, effective from the date of your reply.

Accept, Excellency, the renewed assurances of my highest consideration.

For the Secretary of State:
Sgd. JOHN M. LEDDY

CANADIAN EMBASSY
AMBASSADE DU CANADA

Washington, D.C.,
March 30, 1968.

No. 115

Sir,

I have the honour to refer to your note of March 30, 1968 setting out certain considerations and provisions concerning the continuation of the agreement between our two Governments on the North American Air Defence Command effected by the exchange of notes of May 12, 1958.

I am pleased to inform you that my Government concurs in the considerations and provisions set out in your note, and further agrees with your proposal that your note and

this reply, which is authentic in English and French, shall constitute an agreement between our two Governments effective today.

Accept, Sir, the renewed assurances of my highest consideration.

(Signed) "A. E. RITCHIE"

The Honourable
Dean Rusk,

The Secretary of State,
Washington, D.C.

(Traduction)

Excellence,

J'ai l'honneur de me référer aux entretiens des membres de la Commission permanente canado-américaine de défense et d'autres organismes sur l'intérêt mutuel qu'il y a pour les États-Unis et le Canada de continuer à collaborer en vue de la défense stratégique du continent de l'Amérique du Nord. Plus précisément, ces entretiens ont porté sur le Commandement de la défense aérienne de l'Amérique du Nord, créé le 1^{er} août 1957 en raison de l'avantage qu'il y avait à former un commandement unifié qui serait chargé des opérations des forces aériennes de défense affectées à cette région. Les principes régissant l'organisation et le fonctionnement de ce Commandement ont été tracés dans l'Accord conclu entre nos deux Gouvernements le 12 mai 1958. L'Accord stipulait que le Commandement de la défense aérienne de l'Amérique du Nord devait être maintenu en fonctionnement pendant une période de dix ans.

Les entretiens qui ont eu lieu récemment entre les représentants de nos deux Gouvernements ont confirmé la nécessité de prolonger la vie, en temps de paix, d'une organisation dotée des armes, des installations et des rouages de commandement qui lui permettent de passer à l'action dès le déclenchement des hostilités en exécutant un plan unique de défense aérienne, approuvé à l'avance par les autorités nationales de nos deux pays. Selon l'avis du Gouvernement des États-Unis, cette tâche a été remplie de façon efficace par le Commandement de la défense aérienne de l'Amérique du Nord.

En conséquence, mon Gouvernement propose que l'Accord sur le Commandement de la défense aérienne de l'Amérique du Nord, effectué par un échange de Notes et signé à Washington (D.C.) le 12 mai 1958, soit maintenu en vigueur pour une période de cinq ans à compter du 12 mai 1968, étant entendu que les termes du présent Accord pourront être révisés en tout temps à la demande de l'une ou l'autre partie et que l'Accord pourra être résilié par l'un ou l'autre Gouvernement à la suite d'une telle révision après un préavis d'un an.

En outre, mon Gouvernement consent que le présent Accord ne puisse en aucune façon lier le Canada à participer à des opérations de défense au moyen de missiles balistiques.

Si le Gouvernement du Canada donne son accord aux dispositions énoncées plus haut, je propose que la présente Note et votre réponse constituent, entre nos deux Gouvernements, un accord qui entrera en vigueur à la date de votre réponse.

Si le Gouvernement du Canada donne son accord aux dispositions énoncées plus haut, je propose que la présente Note et votre réponse constituent, entre nos deux Gouvernements, un accord qui entrera en vigueur à la date de votre réponse.

Veuillez agréer, Excellence, les assurances de ma très haute considération.

pour le Secrétaire d'État
John M. Leddy

le 30 mars 1968.

MINUTES OF PROCEEDINGS

[Text]

TUESDAY, May 13, 1969.
(67)

The Standing Committee on External Affairs and National Defence met at 11.10 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Brewin, Cafik, Fairweather, Forrestall, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Legault, Lewis, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Roberts, Stewart (*Cochrane*) Thompson (*Red Deer*), Wahn—(21).

Witnesses: From the Department of National Defence: Dr. George R. Lindsey, Chief, Defence Research Analysis Establishment, Defence Research Board and Dr. J. C. Arnell, Assistant Deputy Minister/Finance.

The Chairman introduced Dr. George Lindsey and explained the nature of the briefing which the Committee would receive.

Dr. Lindsey made an introductory statement, dealing with the question of strategic balance and new developments in the field of air defence. Dr. Lindsey illustrated his comments with a number of slides.

The Committee agreed to incorporate the slides used by Dr. Lindsey in his introductory remarks as part of the Evidence of this morning's sitting.

The Committee also agreed to print Dr. Lindsey's advance presentation to the Committee and his biography as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix ZZ*).

On motion of Mr. Brewin,

Agreed,—That the Clerk be authorized to obtain, for members of the Committee, copies of the Proceedings relating to Strategic and Foreign Policy Implications of ABM Systems, as contained in the hearing before the Subcommittee on International Organization and Disarmament Affairs of the Committee on Foreign Relations, United States Senate.

On motion of Mr. Laniel,

Agreed,—That the Committee commission two detailed working papers, one to be prepared by Mr. John Gellner on North American defence, the other by Mr. Michael Sherman on the ABM question; the total cost of each to be paid to the respective authors, not to exceed five hundred dollars (\$500.).

The Committee agreed to print the Agreement between the Government of Canada and the Government of the United States of America concerning the Organization and Operation of the North American Air Defence Command (NORAD) as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix AAA*).

Dr. Lindsey and Dr. Arnell answered questioned for the remainder of this morning's sitting.

At 12.35 p.m., with the questioning continuing, the Committee adjourned until 3.30 p.m. this day.

AFTERNOON SITTING

(68)

The Standing Committee on External Affairs and National Defence met at 3.35 p.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Allmand, Anderson, Brewin, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Laniel, Legault, Nowlan, Penner, Ryan, Roberts, Thompson (*Red Deer*), Wahn, Winch—(17).

Witnesses: Same as the morning sitting.

Members of the Committee continued their questioning, which began during the morning sitting.

The Chairman took the Chair at approximately 4.25 p.m.

The Department of National Defence will provide additional information concerning the composition and functions of the Permanent Joint Board on Defense, as suggested by Mr. Ryan.

On completion of the questioning, the Chairman thanked Dr. Lindsey and Dr. Arnell for their testimony.

The Committee adjourned at 5.10 p.m., until Thursday, May 15, 1969 at 11.00 a.m., when Members will resume their consideration of the Estimates of the Department of External Affairs.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, May 13, 1969

The Chairman: Gentlemen, we are ready to begin. I would like to welcome to this hearing Dr. George R. Lindsey, the Chief of the Defence Research Analysis Establishment of the Defence Research Board. Dr. Lindsey will also be appearing before the Committee on May 22 when he will deal more specifically with the ABM question.

Dr. Lindsey's presentation deals with the question of the strategic balance, stability, and the prevention of nuclear war, and with new developments in the field of air defence: AWACS, improved interceptor systems, and over-the-horizon radar. It goes without saying that these subjects are very relevant to the Committee's deliberations on NORAD.

Dr. Lindsey, whose biography has been circulated, is without doubt highly qualified to testify on these subjects. He has indicated that he will try to be as explicit as possible in giving evidence, but it should be noted that he may not be able to give precise information in all instances due to the classified nature of much of the information. One particular concern here is that much of the relevant information originates from non-Canadian sources and its divulgence in detail might prejudice further provision of such information.

I understand with respect to AWACS and other technical innovations the testimony will be in the main an exposition of the features and capabilities of the proposed systems. Members will know that, although the system has been proposed, the United States Government has not yet made a decision as to whether the proposal will, in fact, be adopted as a defence system.

As has been the case with other witnesses, Dr. Lindsey is a public servant and I am sure members will respect his position as they have with other witnesses.

Also I draw members' attention to the warning note which appears at the bottom of the second page of the written presentation which reads:

This paper has been prepared by officials of the Department of National Defence for the information of the members of the Standing Committee on External Affairs and National Defence. In order to elucidate fully the issues involved it has been necessary to touch on matters which are still under review. Therefore, the Committee's attention is drawn to the fact that this does not necessarily represent the policy or views of the Government of Canada nor the Department of National Defence.

It is on the bottom of the second page of the presentation, just under the index.

A written statement prepared by Dr. Lindsey has already been circulated in advance, but he also wishes to make an introductory statement before questioning begins. This will be illustrated by slides. Those members who have studied the paper realize that it is divided into two parts. The first part deals with strategic weapon systems, stability, and the prevention of nuclear war. This is designed to give an essential general background for Parts II and III. Part II is included in the written paper which members have and deals specifically with AWACS and possible future developments in North American air defence.

Part III which has not yet been received, but which will be distributed as soon as it is received, will deal specifically with ABMs. Part I which does refer to ABMs and other matters is really just in here for the purpose of giving the Committee background information for the purpose of discussing Part II dealing primarily with AWACS and future developments in North American air defence. On Part III dealing with ABMs we will get more information later.

It probably would be most logical and most helpful and most beneficial from the Committee's point of view if questioning could be concentrated this morning on AWACS and possible future development in North American air defence and leave for our later meeting detailed questioning with regard to ABMs. Dr. Lindsey.

Dr. George R. Lindsey (Chief, Defence Research Department of National Defence) Analysis Establishment, Defence Research Board: Thank you, Mr. Chairman. Both subjects that we are planning to discuss in the next two sessions are terribly complicated. Either air defence or ballistic missile defence are subjects of such complexity that one could spend a great deal of time talking about them in themselves, but you cannot really do that very sensibly if you are trying to get down to the basic purpose of the two. One has to consider them as part of an even bigger system, and an even more complicated one. Perhaps, in these days of systems analysis, we are dealing with one of the biggest and most important systems that has ever been created by men, and it is a terribly dangerous one. That is why in the written material a certain degree of space was taken to discuss the strategic background and the whole question of stability and the possibility of nuclear war.

• 1115

The third part, about the implications to Canada of ballistic missile defence, will be distributed before the next meeting, and we will talk mostly today, I hope, about the air defence problem.

Slide 1 shows the titles, including Part III that you have not received yet.

(Interpretation)

I think that the first two parts of the report have been distributed to the members of the Committee. It took a lot of work in order to have them ready by Friday last, and unfortunately, it was too late to have the translation in French. This is a pity, but indeed in order to discuss the matter we have used several new words in the odd terminology of the American nuclear strategists, and I have great sympathy for the translators.

[English]

Stable Mutual Deterrence

In the first part of the written text, the subject to which the most attention was paid was the one of stable mutual deterrence. It is believed by a great many responsible people that this does come as close to a solution of the difficult problems of the world as we are liable to find for many years.

Stable mutual deterrence is imperfect, it costs a lot of money, and it is fashionable to cast aspersions on it. But it really has served us very well, and I think it behooves us to

study it pretty carefully before we consider trying to replace it by something else.

I would like to say a little bit about each word, "stable" "mutual" and "deterrence". By deterrence, we mean the ability of one country to be able to punish its adversary no matter what the adversary may do to it. If we want to talk about A and B, to prevent specific names from being mentioned, A deters B if B recognizes that no matter what B does to A, A can still reply and mete out a dreadful punishment on B. In that case we say we have deterrence.

The word "stable" is very important, and by stability we have tried to imply in our paper two different features of deterrence. First of all, to be stable it is important that the ability to meet out the retaliation should not depend on having what is sometimes called the hair trigger response. That is to say, if A wishes to be able to reply to B for something that B has done to him, it is highly desirable that A should not have to act in a big hurry; or to have to set all his degrees of response to a level where he would have to reply violently to a dangerous situation, or what looks to him like an attack, although it has not actually been confirmed.

He should be able to reply deliberately, involving all the processes of consideration that one would wish to exercise with a terribly important thing like this. He should not have to reply in a hurry, if necessary he should be prepared to let the attack fall, to ride it out, and to have available to him, hours later if necessary, (conceivably even more than that), sufficient deterrence that he could still punish the attacker for everything he had done. One of the features of stability is that you should not have to reply in a hair-trigger way.

The other feature of stability is that it should not be sensitive to the exact numbers of weapons held by the two superpowers. In other words, if the deterrence were stable today, then if one side hears that the other side has developed a few more weapons of

• 1120

one kind or another, it should still be stable tomorrow. This should not cause either side to panic and have to take some immense reaction. So stable implies both of those things, as used in the paper.

SLIDE 1

STRATEGIC WEAPON SYSTEMS, STABILITY,
AND THE POSSIBLE CONTRIBUTIONS BY CANADA

PART 1

STRATEGIC WEAPON SYSTEMS, STABILITY, AND
THE PREVENTION OF NUCLEAR WAR

PART II

POSSIBLE FUTURE DEVELOPMENTS TO NORTH
AMERICAN AIR DEFENCE

PART III

THE IMPLICATIONS FOR CANADA OF
BALLISTIC MISSILE DEFENCE

The third word, "mutual" is fairly explanatory in itself. It just means that whatever applies in one direction, from one superpower to the other, applies equally in the other direction. In discussing this sort of thing I think we have to be rather nonpartisan, talk about A and B, and treat the two superpowers equally. We do not want either one to start a nuclear exchange.

The Interaction of Strategic Offensive and Defensive Systems.

In order to talk in a little more detail about these systems we have to discuss something of the technical features of the offensive and defensive systems that form part of the mutual deterrent.

On Slide 2, we have shown the United States at the top, the Soviet Union at the bottom, we have grouped the United States offensive weapons at the upper left, the Soviet defensive weapons below them, and the Soviet cities and rural population on the lower left. Then on the right side we have the Soviet offensive weapons, the American defensive weapons, and the American cities.

We will discuss these blocks in a bit more detail. Let us start with one of the United States offensive weapons, the bombers. The main features of bomber aircraft are as follows. They are very vulnerable on the ground. Once they are in the air they are not subject to bombing by other aircraft or to attack by strategic missiles. They can carry a large payload and deliver it very accurately, but it takes them quite a few hours to fly from their home bases in North America to their targets in the Soviet Union. They may have to penetrate air defences. They are effective in bombing missile sites or bomber bases, provided the missiles and bombers are still there to be attacked when they arrive, and they are very effective in attacking cities.

The second weapon is the ballistic missile submarine. The better ones today have nuclear propulsion, and they fire submarine launched ballistic missiles-SLBMs. To carry out their task they have to penetrate an anti-submarine defence which is directed against the submarine itself, and if they fire their missiles the missiles may be intercepted by a ballistic missile defence system. When we put an anti-ballistic missile system here on the diagram we are assuming that if it is able to

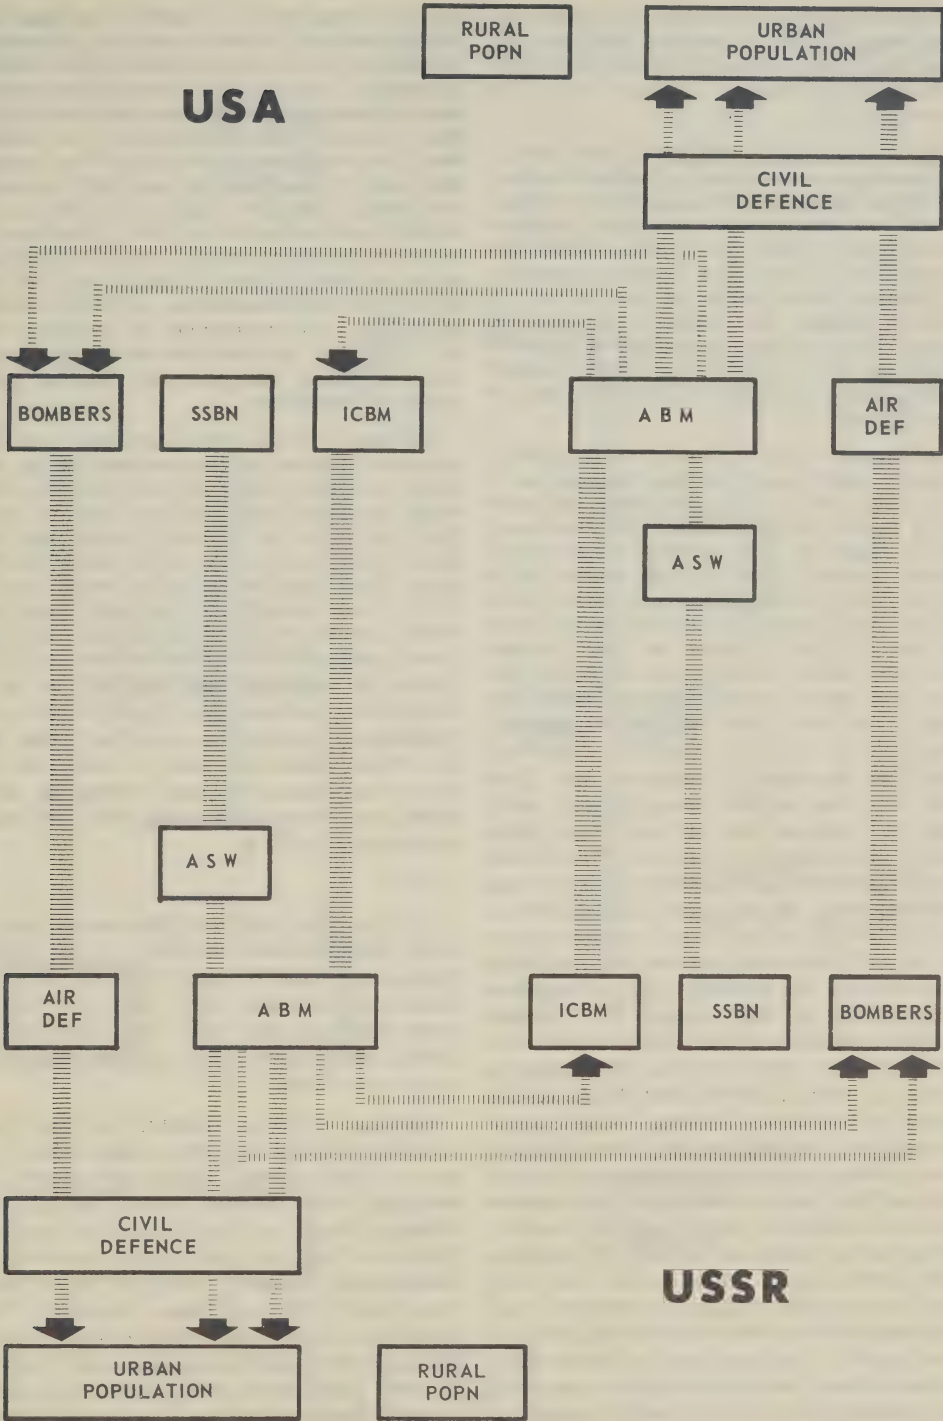

intercept an ICBM in flight it can probably also intercept an SLBM in flight. Because the weapons carried by the submarines are somewhat less accurate and somewhat smaller than the ICBMs they are not likely to be effective in attacking ballistic missile sites if the sites have been hardened. They would be very effective in attacking bomber bases and very effective in attacking cities. The SLBMs that one hears about today are the Polaris and Poseidon of the U.S. Navy.

Then the third and perhaps the most important element in the offensive system is the intercontinental ballistic missile. It can be made comparatively invulnerable by burying it deep in a hardened silo, and both sides have done that with practically all of their ICBMs. It is very accurate, carries a large payload, may have to penetrate a ballistic missile defence, and has a certain effectiveness in attacking the opposing ICBMs, but that depends very much on technical features like accuracy, weapon yield and the hardness of the targets. It would be very effective in attacking bomber bases if it could catch the bombers on the ground. It would be no good for attacking submarines at sea, which are practically invulnerable once they have left port, and of course very effective in attacking cities.

As far as defensive systems go, air defence opposes the manned bomber, anti-submarine defence opposes the submarine itself, and ballistic missile defence opposes intercontinental ballistic missiles and also submarine launched ballistic missiles. Then we have civil defence, which will reduce the casualties, and perhaps save property by stopping fire spreading in the cities.

• 1125

One of the advantages of civil defence is that it applies against all these weapons, and if somebody invents a new way of delivering nuclear weapons on cities it is very likely that civil defence would help to save the city against that one too. We should remember that both countries also have a very large fraction of their population outside the larger cities, and they are generally not endangered by this sort of exchange nearly as much as the people in the large cities. The only condition under which they would get in serious danger would be if there were dangerous fallout spread widely around whole areas of the country.

The bottom half of slide 2 is really just the mirror image of the top, and we could say the whole thing again, although some of the labels on the national weapon systems would be different.

There is a certain jargon which one finds in the literature on this sort of subject today, and I think we will have to use some of those words if we are going to understand it thoroughly. Also, it helps us to comprehend the literature that comes out today. Generally, the Counter Force Strike is one which is delivered against the offensive systems. A Counter Value Strike is delivered against population, but it could also include other valuable assets of a country like a big dam or power station.

What we have tried to show you on Slide 3 is a very rough picture of the situation as it exists today, and to illustrate why we have mutual stable deterrence in 1969. The way that we illustrate it is to show what would probably happen if the Soviets should try a Counter Force First Strike, say, today. Suppose, for the purpose of the argument, that they use all their ICBMs on this Counter Force First Strike. The American anti-ballistic missile box is empty, because today the United States has no ballistic missile defence. Therefore the ICBMs could be directed against the American Minutemen and Titan ICBMs and the bomber bases. If they were caught by surprise and did not react fairly quickly, undoubtedly a number of bombers, and also a number of ICBMs would be lost. However, today, knowing the vulnerability of these, we would assume that the vast majority of the ICBMs would survive and probably quite a few of the bombers. The submarines are really not at risk against the Counter Force First Strike—at least not the ones that have put to sea. They are not vulnerable to this sort of thing. If the United States wishes to make a Retaliatory Counter Value Second Strike against the Russians they have the survivors of these systems, and there are lots of them, but they have to cope with the Russian air defence, which is quite good, the Russian anti-submarine defence, which is probably not as good as the western one, and they would have to cope with an anti-ballistic missile system which is not a very thick one. It is almost certain that each one of these three weapon systems would be able to penetrate these defences and would be able to wreak on

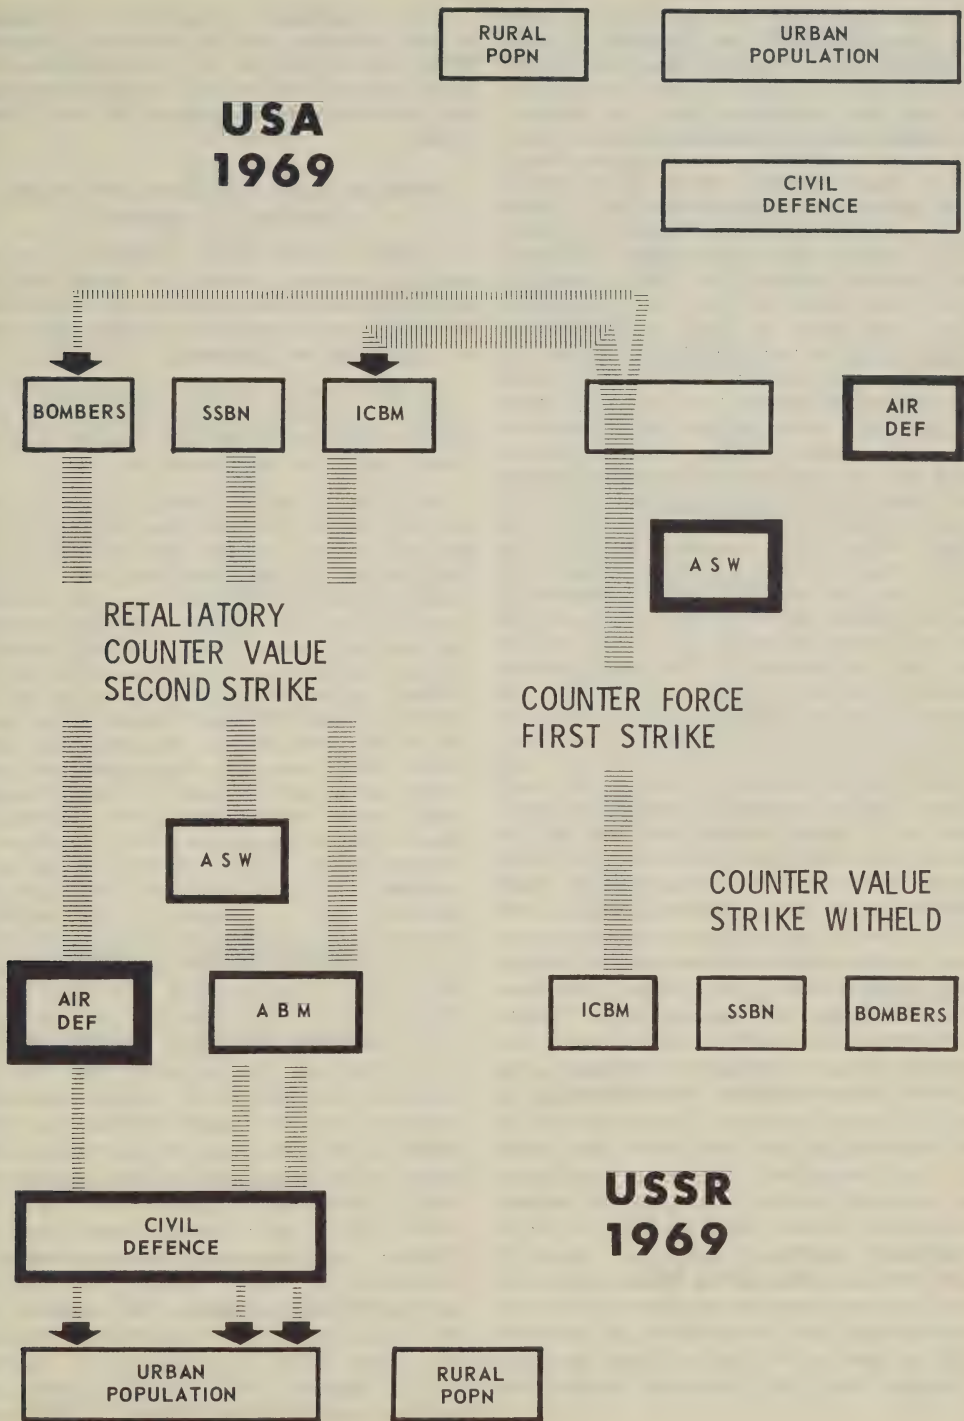

the urban population, in spite of the best that the Russian civil defence could do, a dreadful punishment. That is why we say that there is deterrence. It is stable because these systems are sufficiently invulnerable that they do not have to start the second strike the minute they think the first strike might be coming; they can sit and take it, and still deliver a completely adequate reply. Therefore it is stable from that point of view. It is also stable from the other point of view. If there are perhaps 1,000 of these ICBMs today, but if it went up to 1,100 tomorrow, or if the number of SLBMs and the number of bombers went up a little bit, the condition would still apply, and we would still have the mutual stable deterrent tomorrow.

In slide 3 I did not show the submarine launched missiles and the bombers taking part in the Counter Force First Strike. But they could do that. They very well might, but if they did, it is not believed today that even that would enable them to be successful. The other thing that they might do with some or all of these weapons is to save them as a threat against the cities. Presumably what the first strike man would like to do would be to disarm his opponent and then tell him in the subsequent confrontation, "I still have enough weapons to murder you—you had better give in." They could save any of these for that rather unpleasant purpose. Today, if all of them were in the first strike, they still would not get away with it.

• 1130

A lot of the plans and discussions that we have heard about recently in the United States on strengthening of defenses are being considered because there is a real fear in some quarters that this desirable state of mutual stable deterrence might not last very many more years.

So what we have indicated on Slide 4 is a possible development that might lead to the loss of the mutual stable deterrence. For example, if by 1974 the Soviets increase their offensive force by having 500 of these big SS-9 very large payload rockets with multiple independent re-entry vehicles, they would then have 1,500 of those warheads. They would also have their other 800-odd ICBMs. Perhaps, their submarine fleet will build up to have 1,000 deliverable warheads, probably from SLBMs with multiple warheads. Finally,

they may keep their 150 bombers, or even build some additional ones. In order to upset this balance, they would also have to do something on the defensive side. Let us suppose that they strengthen their air defence, and build a thick anti-ballistic-missile system. Now what could happen? Supposing they deliver their Counter Force First Strike which is based primarily on the missile attack, and that the United States has done little or nothing to change what it has today. The ICBM's would not have a ballistic-missile defence with which to cope. The submarines would still have to face anti-submarine defence, which is not as effective against the first strike as the second. The SLBM's would have nothing to oppose them, so they could deliver a very heavy attack on the Minutemen and bomber fields. The submarines would still be invulnerable, except the ones which were left in port. Now the U.S. have a greatly weakened ability to reply in the second strike. The number of surviving ICBM's might be only a small fraction of the ones before the attack. A certain number of bombers would probably escape, but perhaps not very many. However, all of the SLBM's would still be available. This very reduced number of bombers would have to cope with a strengthened air and civil defence. The submarines would have to cope with an anti-submarine defence of an unknown strength, and a strong ballistic-missile defence. The very greatly reduced number of ICBM's would be faced by a ballistic-missile defence. By the time that the strength of the attack had been filtered down to this comparatively weak degree, and the civil defence had had some effect as well, perhaps the resulting punishment which could be inflicted on the Russian cities would be too little to deter them from initially carrying out the operation. That is what people are afraid of. Of course, if this situation arose, we would have lost our mutual stable deterrence. The bombers might be used in this sort of attack. If the air defence had lost both its' eyes and teeth, this would be a very important addition to the threat. For example, if there were no air defence warning, all of the bombers could be added to the short warning counterforce attack. If there were no teeth in the system then they could use more bombers and they could carry a heavier pay load. Alternately, the bombers might be used as the threat to hold the cities to ransom after the disarming process had occurred.

That is, perhaps, enough about the details of the offensive and the defensive systems. What I have tried to do is to underline the importance of the mutual stable deterrence and to explain the importance of those three words.

Possible Future Development in North American Air Defence.

I think that we might discuss the second part of the paper. Indeed, this means that we are now moving into the area of study which is mainly on the agenda for today, that is to say, anti bomber defence.

What we have attempted in this part of the study is to make special reference to the future developments in anti bomber defence which might be of interest to Canada.

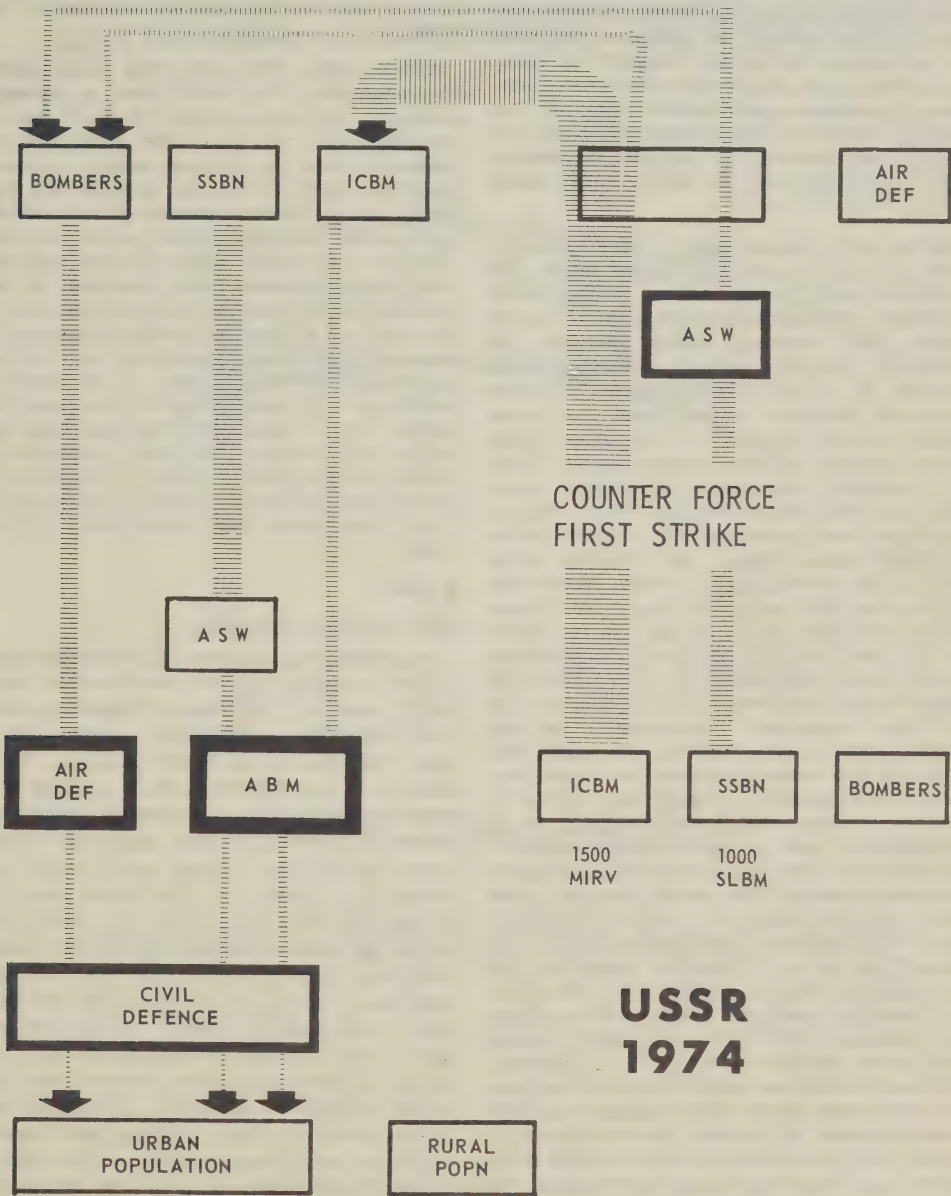

Next, let us make a brief review of anti bomber defence in North America starting in its early years, around 1950 building up to 1962 where it had stabilized into a form which is not too different from the present time. The outlines in those early twelve years are that the deterrent was horribly vulnerable. It consisted, at first, of bombers on the ground, which were not able to get off on very short notice. Toward the end of the period, a few soft ballistic missiles, were produced which were also very vulnerable, and which could not be used in a hurry. Quite rightly, there was a genuine fear of surprise attack. One of the things which was done in the face of this hazard was to build up early warning. The DEW Line was built along the northern coast of Canada. It was actually designed and financed by the United States but a good deal of its' length was in Canadian territory. It also extended into Alaska, and Greenland. The Mid-Canada Line was built along the fifty-fifth parallel. This was entirely in Canada and was designed and built by Canadians and paid for by the Canadian government. Then the Pinetree System was built, which is the outer layer of the solid ground based control cover used to direct fighter aircraft in interceptions, as well as to control air traffic. There were several layers, but the Pinetree was the outer layer, and was in Canada. It was jointly financed and manned, but Canadian servicemen did provide the greater proportion of the manning of the system. Then there were Interceptor Aircraft which included the CF-100 which was designed and built in Canada. It was later

CIVIL
DEFENCE

replaced by the Voodoo. There were Bomarc Surface-to-air missiles, in both countries. In the United States, there were two other surface-to-air missiles, Nike-Hercules and Hawk, but Canada elected not to procure or deplore those weapons.

• 1135

That is a quick summary of the early build-up of the air defence system. It would be possible if we wished, to continue with this type of system for quite a long time. However, certain elements would require replacements. It seems a good idea—when we are deciding whether or not to continue it—to also decide if improvement is required, instead of simply replacing items by things of the same kind.

Let us now discuss some of the problems which will face us in the future years. We should remember when we are talking about air defence, and perhaps when some of us are making rude remarks about it—that 100 unopposed bombers could destroy North America. It is also most unlikely that 100 unopposed bombers would come by themselves. However, they are a very lethal weapon and should not be underestimated. They have equipped themselves, in recent years, with an air-to-surface missile which enables them to deliver a weapon onto a target without coming closer than a few hundred miles from it. This makes them a much more difficult weapon with which to deal. The air-to-surface missiles will probably be too small and fly too fast to be easily intercepted. Another thing that has come about since the ICBMs were installed in great numbers is that the important installations for air defense, such as the airfields, the radar stations and the control centres are now very vulnerable to attack by missiles as well as by bombers, so that the vulnerability is much worse than it used to be. An option which is available to us would be to continue the present type of system. This would give us a good defense against 100 or 150 high-altitude aircraft, with bombs that simply fall freely through the action of gravity. However, it is now unlikely that an attack would be delivered from high altitude, because the bombers have learned to fly quite low, which makes them much harder to detect. It is unlikely that they would use free-falling bombs, now that they have these air-to-surface missiles. If we continue the present type of system, it would be weak against the low-altitude penetration and the air-to-surface missile. In

short, if we are going to continue air defence, we should try to make it more widely dispersed to reduce its vulnerability, and should try to extend its' cover downwards so that it can catch the low flyer. It should also be extended outwards so that it can catch the bomber, even if he does not have to penetrate right into the target. These are the improvements which we would like to bring about, if we intend to stay in the air defence business.

Let us talk a little bit about these types of improvements. We would like to extend it outwards and downwards to make it less vulnerable. Now we will talk about ways of extending the air defence system outwards. One way to do that is to improve the radar cover, and in these questions of long distance radar cover we will find we are always dealing with the curved earth. We are talking of quite long distances now, hundreds or thousands of miles, and on this scale the fact that the earth is curved is a very important fact indeed. If we have a transmitter and a receiver roughly on the surface of the earth, its radiations will have to go out horizontally or higher. They cannot bend around and come below the horizon. So that, normally one would not be able to detect an aircraft if it were below the horizon, and if it is flying low it will stay below the horizon until it is very close.

• 1140

Over-the-Horizon Radar

A system that attempts to overcome this is called "over the horizon back scatter radar" and it uses an effect that is known to everybody who has a shortwave radio and has communicated with radio stations on the other side of the earth. This is done by making use of the ionosphere, which is a series of layers of ionized gas some distance above the surface of the earth, and I have shown it on Slide 5 by the dotted zone. This ionized gas will reflect or turn back radio-waves of certain frequencies and it depends somewhat on the time of day. You will know that too, if you have worked with shortwave radio. It is possible, then, if we use the right sort of radiowaves, to send them up to the ionosphere and have them bounce back again to the surface of the earth. If we send them almost vertically they will go right through, but if we send them on this angle they will bounce down here, or about at the horizon

EXTENDING COVERAGE OUTWARDS

OTH BACK SCATTER

DETECTING AIRCRAFT

AWACS INTERCEPTOR RANGE BASES

they will come back to earth at a great distance away, many hundreds of miles.

It is possible to make a radar work on that principle and that implies, if a bomber is approaching, that anywhere between here and here, which would represent many many hundreds of miles—and it does not matter whether it is low down or at high altitude—it can be detected by this radar because it is bouncing signals off the ionosphere.

Here on Slide 5 I have shown the ionosphere disturbed, because in the polar regions, including a good deal of northern Canada, we have the northern lights or aurora borealis, and that represents a disturbance of the ionosphere. When the ionosphere is disturbed it is as if the mirror that we were using to reflect our signals here had been broken. If the disturbance has occurred in this zone then the OTH radar would not work. So there are some doubts about the effectiveness of the device in Canada although it would probably be quite good in other parts of the world where they do not have these disturbances.

We were talking about extending our radar cover and our air defence outwards. Obviously, one very good way to do it is by using OTH for detecting aircraft at long range.

Another way of extending it outwards, which we will talk about in a minute, is to put some of the control and warning radar into aircraft, the AWACS (Airborne Warning and Control System) but there are other ways of extending cover outwards and that is to use interceptors with longer range or to put interceptors on bases that are farther forward. So, we have several ways of extending the cover outwards, the OTH back scatter radar being only one of them.

The Airborne Warning and Control System (AWACS)

On the next slide, number 6, we talk about ways of extending the cover downwards, which was another of the important improvements that was needed. Here we have the curved earth and here we have a radar on the ground which can only see above the horizon in this blue zone. If an aircraft were approaching at high altitude, it would be picked up at a considerable range, say, 200 or 300 miles from the station. However, if it were approaching at low altitude, say, 500 feet above the earth, it would come right in

very close to the station, perhaps 25 or 50 miles away, before it came above the horizon and could not be detected until that had happened. So that, a radar on the ground, unless it uses the OTH principle, is bound to give rather poor warning of a low-flying approaching aircraft. A rather extraordinary thing is that if the radar is moved just a few miles up in the air, say six or eight miles, that it drives the horizon away a distance of some hundreds of miles. Of course, you know very well that if you climb a high mountain or go up in an aircraft you can see a tremendous area underneath you, far far more than you ever could from ground level. This is simply a manifestation of the same principle. The thing that I always find surprising is that by just going up six miles you can see hundreds and hundreds of miles farther.

● 1145

If we have this radar in an aircraft, then, just a few miles up, he can see into this shaded zone on slide 6, which is very much greater than the other one. A high-altitude aircraft might be picked up 500 miles away and a low-altitude aircraft would be picked up still, say, 200 or 300 miles away. This seems pretty easy: why did we not think of it years ago? We did think of it years ago, but there is a catch to the method of solution and that is that when the radar is looking down at the ground, naturally enough it receives a tremendous amount of energy reflected back from the ground. After all, a radar works by detecting a tiny quantity of energy that is bounced back from the surface of the aircraft target. Obviously mountains and other objects on the surface of the earth are going to return far more energy than that, and normally return so much more that they create ground clutter which completely obscures the aircraft, so that it is practically impossible to see the aircraft because of the ground clutter.

The improvement in electronic technology that has made this thing possible is a method of distinguishing the moving target of the low altitude aircraft against the much greater clutter from the ground, and if this technique turns out to be completely successful, then in the AWACS aircraft we would expect to be able to pick up all these low flying aircraft and to have solved the problem of the low altitude tracking and detection.

However, if we are going to do that, it will take a big airplane with long endurance and

EXTENDING COVERAGE DOWNWARDS

COVERAGE OF GROUND BASED AND AIRBORNE RADARS

AWACS

A.I.

A.A.M.

it will have to fly at high altitudes. Since it is a big airplane with all those features, we might as well ask it to do the other things which we do in a radar station as well as simply detect distant aircraft. So that is why it is called an AWACS—an airborne warning and control system. The control implies that we would put into the aircraft the personnel, the displays, the computers and the data handling that would enable it to control the air defence system as well as simply performing the detection. It would be able to carry out identification, to match aircraft echoes with flight plans, and to control interceptors if necessary.

Improved Interceptors

That, then, is part of the scheme to extend the coverage downward and it involves the airborne warning and control system. But if we are going to be able to intercept low flying bombers, the AWACS will not do the whole job by itself. There has to be an interceptor that can operate against the low-flying bomber, and that means that the radar in the interceptor aircraft has got to work in spite of ground clutter. If there is an air-to-air missile controlled by radar, it has got to work in spite of the ground clutter as well. Fortunately the electronic techniques, that look as if they are going to solve the problem for the warning radar, can also be applied to the airborne intercept radar in the interceptor, and to whatever sort of guidance of a radar type there is in the air-to-air missile. So the coverage extending downward is largely to be solved by the successful application of this radar technique that enables a low-flying airplane to be detected against the ground.

Reduction of Vulnerability

I said there were three weaknesses to the present system and they were that the coverage should be extended farther out and lower down, but also that we were very vulnerable. I have not said very much about vulnerability here, but obviously if the radar is in an AWACS airplane it is not going to be at risk to a missile. So that one way of reducing vulnerability is to put our radars into the air.

Another way of reducing the vulnerability would be to disperse the units more completely. The fighter bases are vulnerable but if we were to increase the number of fighter bases and distribute the aircraft more widely we would have reduced our vulnerability. If we did that by simply setting up more per-

manent bases it would be a very expensive undertaking. A much more cost-effective solution seems to be to have a small fleet of maintenance aircraft that would carry the men, the instruments, the spare parts, the reload missiles, and everything else needed to keep a fighter squadron going, and fly them to these dispersed bases. That is another means of reducing the vulnerability.

I think the OTH radar will be vulnerable and not very much can be done about that.

U.S. Objectives for Air Defence

Those, then, are three ways in which it is hoped to reduce the weaknesses of the air defence system.

• 1150

We should say something, I think, about the overall objectives of continuing this improved air defence system and this is a problem that has been thought about very carefully in the United States over the last few years. On Slide 7 we have summarized the exact statement of the U.S. Secretary of Defence when he was explaining what he hoped to achieve by improving and continuing the air defence system. This was a statement made by Mr. Clifford early in 1969. The first objective was peacetime identification. They want to be able to keep track of aircraft flying over North America and identify those that have come in without permission. They would like to be able to limit damage to our—and that means American—cities from a Soviet manned bomber attack, but they are quite modest in their claims in this regard and they state elsewhere that they realize they cannot do that to a very great extent without having a comparable defence against missile attack. They would like to be able to prevent damage from air attack by other countries, and in the case of the United States they have Cuba very much in mind.

They would like to preclude a manned bomber attack on the withheld strategic missile forces, and this bears on the point I mentioned earlier. They do not want to have to save their missiles by firing them at the first sign of trouble. They would like to be absolutely certain that they really want to fire them, and this means being able to take their time and be deliberate and not be panicked by the approach of manned bombers.

They wish to discourage the Soviet Union from developing and introducing new bomber

SLIDE 7

U.S. OBJECTIVES FOR AIR DEFENCE (1969)

- "1. PEACETIME IDENTIFICATION
2. LIMITING DAMAGE TO OUR CITIES FROM
A SOVIET MANNED BOMBER ATTACK
3. PREVENTING DAMAGE FROM AN AIR
ATTACK BY OTHER COUNTRIES, E.G. CUBA
4. PRECLUDING A MANNED BOMBER ATTACK ON
OUR WITHHELD STRATEGIC MISSILE FORCES
5. DISCOURAGING THE SOVIET UNION FROM
DEVELOPING AND INTRODUCING NEW BOMBER
THREATS WHICH COULD BE COSTLY TO
NEUTRALIZE
6. PROVIDING A COMPLETE MOBILE "AIR
DEFENSE PACKAGE" "

threats which could be costly to neutralize. They feel that if they show that they are going to continue to oppose the present type of bomber, perhaps they will not get into a large increase in the anti-bomber competition.

They would like to provide a completely mobile air defence package, and this is primarily because the United States wishes to be able to conduct air defence operations in other parts of the world on fairly short notice and to be able to deploy the system widely.

The importance of Canadian Geography

I think in completing this briefing I should say something about the peculiar advantages of Canadian real estate in air defence of North America. It has been fairly clear from what has been said, I think, that it is important to extend this system outwards. As far as the inhabited area of North America is concerned, outwards means east over the Atlantic and west over the Pacific, but northward has to be over Canada. Many square miles of real estate or of air space are needed in order to make a system like this work. It cannot be done in a thin layer.

If we are going to have aircraft operating many miles to the north, it is, of course, more efficient to have them based fairly near the operating area, otherwise they expend a good deal of their fuel and endurance time in simply flying out to the job rather than doing it. I think it is clear that Canadian geography would have an important part to play in a really efficient deep air defence system.

As far as the positioning of radars goes, there is this problem about the Aurora and whether a certain type of radar would work as well in Canada as elsewhere, and I think research is needed to find out more about that.

When we are discussing the North American air defence problem, we have to realize that we do own a good deal of the territory over which it will have to be done if it is going to be done very well. That, I think, is a fact that is unlikely to change as long as there is an air defence.

Sir, I think I have talked enough about this. There is a great deal of material in the brief that I have not covered, but perhaps we should go over to the questions now.

The Chairman: Thank you very much, Dr. Lindsey. Before calling questioners there are

one or two procedural items to be dealt with. First, would the Committee agree to incorporate Dr. Lindsey's written presentation and the slides used this morning as part of the evidence of this morning's sitting. Is that agreed?

Some hon. Members: Agreed.

The Chairman: At the last meeting I was asked to make arrangements to obtain copies of the Senate Committee hearings in the United States and also copies of the reports prepared for Senator Kennedy's committee. The Clerk advises me we should have a formal motion for this purpose.

Mr. Brewin: I move that the Clerk be authorized to obtain, for members of the Committee, copies of the Proceedings relating to Strategic and Foreign Policy Implications of ABM Systems, as contained in the hearings before the Subcommittee on International Organization and Disarmament Affairs of the Committee on Foreign Relations, United States Senate. Also copies of the reports prepared for Senator Kennedy's group.

Mr. Laniel: I second the motion.

• 1155

Motion agreed to.

The Chairman: Also arrangements are being made, as we had previously been informed, to obtain detailed working papers from Mr. John Gellner on North American defence and also from Mr. Michael Sherman on the ABM question. Could we have a motion to authorize this?

Mr. Laniel: I move that the Committee commission two detailed working papers, one to be prepared by Mr. John Gellner on North American defence, the other by Mr. Michael Sherman on the ABM question; the total cost of each to be paid to the respective authors, not to exceed five hundred dollars (\$500).

Mr. Thompson (Red Deer): I second the motion.

Motion agreed to.

Mr. Allmand: Mr. Chairman, was this proposal agreed to by the steering committee?

The Chairman: Yes. I discussed it with party representatives on the steering committee.

Mr. Cafik: Mr. Chairman, I thought there had been some discussion as to whether Mr. Gellner should be asked to prepare a paper in view of the fact that many other people in Canada might feel that they also should be preparing papers and be treated in the same manner. I did not know that that had been resolved.

The Chairman: I spoke to representatives of each of the parties and they felt that this was a reasonable suggestion.

Mr. Allmand: During the first round of our hearings on NATO, did we pay anybody to present papers to this Committee?

The Chairman: No, just their expenses.

Mr. Allmand: All I can say, Mr. Chairman, is that I was not too impressed with the paper that Mr. Gellner gave us on NATO. But if the majority of the Committee feels it is worth \$500 ...

The Chairman: It is a maximum of \$500. I believe it is on a per diem basis but with a maximum of \$500.

Mr. Lewis: Mr. Chairman, I am sorry I was not here. I was not on the steering committee, but perhaps the other members know and therefore will answer my questions at the present time. What is the particular purpose of commissioning these papers from these particular men?

The Chairman: We have had a departmental paper prepared on North American defence. It was felt we should have a paper prepared by an outsider as well for the use of the Committee to help to ensure the greatest possible degree of objectivity. As I think I indicated at earlier hearings, we felt perhaps by way of an experiment, rather than calling a large number of witnesses as we did on the NATO inquiry with each one presenting a personal point of view, we would try this time to have working papers prepared, first of all on a departmental basis, but then have someone outside review them and make any comments and also add anything which might be considered relevant.

Mr. Lewis: Perhaps this is a good idea if Mr. Gellner and Mr. Sherman produce papers that some of us would like to see contradicted by equally distinguished experts. What is to

prevent us from insisting at that point that the other people we suggest also be commissioned to prepare working papers?

The Chairman: There would be nothing to prevent it if this was considered desirable. As I say, this is a new procedure and somewhat experimental, but we have emphasized in speaking to both Mr. Gellner and Mr. Sherman that the object is not to present an argument in favour of a particular point of view. The object is to review the departmental working papers, comment on them, and also to present on an objective basis any additional information which may be considered desirable. If members of the Committee feel that additional information should be obtained after these papers have been reviewed, then of course we can proceed on that basis.

Mr. Cafik: Mr. Chairman, I think frankly it may be a good idea, but I do not think we can very well go into this business of setting a precedent in this particular way of paying for papers and confining it to two people. I think it has certain dangers and I agree with Mr. Lewis that anyone could come to this Committee afterwards and say, "My particular pet view on this has not been expressed in a working paper and therefore we should commission someone to do it". I do not know what we as a Committee could say to offset that kind of argument when arbitrarily two others have been chosen to give what may well be an objective view. I think it is something that perhaps deserves a little more careful consideration before voting on.

• 1200

The Chairman: If there is any inclination not to pass this motion at the present time, it could be deferred. We could discuss it further in the steering subcommittee.

It is not a new procedure to commission papers. This was done by the Defence Committee a number of years ago. Timing requires that if we are going to have papers commissioned at all, we have to inform those who are going to do the work promptly. I have already spoken to Mr. Gellner and Mr. Sherman, but they can be told to defer their efforts if this is the wish of the Committee. However, I really think as an experiment it would be desirable to proceed and not to delay, otherwise the papers are just not going to be ready in time.

Mr. Harkness: Who is Mr. Sherman?

The Chairman: Mr. Michael Sherman is a Canadian, as I understand it, with the Hudson Institute who has done a great deal of specialized work on this subject. He is a man who was recommended by Mr. Dobell who is an adviser to the Committee. I have also discussed his qualifications with Dr. Lindsey who spoke very highly of him and it seems he is about the only man in the field who could do the type of work that we want done.

Mr. Guay (St. Boniface): Do you have reason to believe Mr. Chairman, they would not do it without payment or is this something that you want to offer them, or have they requested it?

The Chairman: It was thought it was only fair if they were asked to present an objective study requiring time that they should be paid at least a nominal amount for their work. It is on a very reasonable basis, I might say, it is a maximum of \$500. As I say, parliamentary committees before have very often retained counsel to assist them in their deliberations and also have reached agreement on paying them.

Mr. Laniel: On this point, Mr. Chairman actually we want to keep in mind that this is not an opinion paper that we are asking from them, we are asking them to go deep into the subject matter.

The Chairman: It is basically a research paper. Mr. Brewin?

Mr. Brewin: Mr. Chairman, I personally favour the idea of this Committee seeing fit to get outside consultants on subjects as technical and difficult as this. The only thing I have in mind is that we all know that there has been a great controversy in the United States, which is primarily concerned with the antiballistic missile system; we are indirectly very much concerned. The only thing I would be worried about in this proposal is that if it turned out—I do not know what their views are—that both Mr. Gellner and Mr. Sherman were strong advocates of the system, I would certainly want to urge that we have some equally qualified people and there are very highly qualified people, like Professor Wiesner, for example, in the United States, who would give the other side of the story. That is the only note of warning I sound, that if we are going to have a presentation at all, we cannot hear all the experts, but at least we want to hear experts who can present, perhaps, two contrasting points of view.

The Chairman: I think that is a very reasonable attitude, Mr. Brewin. As I say, we did have a problem of timing. If we are to end our investigation within a reasonable length of time, we felt we could not possibly hear all the witnesses, or a large number of witnesses, as we did on NATO, as I say this procedure is experimental. Mr. Roberts?

Mr. Roberts: I think this is an interesting experiment, Mr. Chairman, I think we should proceed with this. I hope it would be one step along the path to developing more expert assistance for the Committee. I think we should go ahead on the basis that you suggested, but I do feel quite strongly that the steering committee should not make the decision about who should be invited then and there. I think those people to be invited to work in this way should, in future, be discussed by the Committee as a whole rather than decided upon by the steering committee.

The Chairman: That was one purpose of bringing this motion before the Committee. As I say, in all frankness I have to tell you that in order to get the papers done in time, I asked Mr. Gellner and Mr. Sherman to proceed, but they have not gone so far that it cannot be stopped if this Committee feels strongly about it.

Mr. Roberts: My recommendation about that was simply for the future. In future when we get into this kind of thing really the people to do the papers should be discussed in the whole Committee before we proceed. However, I think given the present circumstances we should go along on the basis that you have described.

The Chairman: Then subject to all these qualifications and warning notices, is this agreed by the Committee?

Some hon. Members: Agreed.

● 1205

Mr. Ryan: Mr. Chairman, before you proceed may I speak on a point of order? I wonder if it would not be possible to have the NORAD agreements distributed amongst the Committee, not only the original agreement, but the rearrangements made a year or so ago.

The Chairman: That would be the renewal of the NORAD.

Mr. Ryan: Yes, I understand that there is nothing classified about them, that they have already been tabled in the House and that

there would be no reason why they could not be distributed. I think it would be very helpful if we could read them over and then consider what future changes may be required.

The Chairman: The Clerk points out that the notes of the agreement are printed as an appendix to our last hearing.

Mr. Ryan: Is this in full, or just notes?

Dr. Arnell: I understand there is a complete note.

The Chairman: If that is not so it is agreed that we should make arrangements to have those delivered to the members.

Mr. Ryan: When could we expect the printing of these notes to be at hand?

The Chairman: We are not in a position to tell you.

Mr. Lewis: Does that include the original agreement or the notes of changes made last year?

The Chairman: Those would just be the changes, would they not?

Dr. Arnell: They were actually handed to the Clerk by Mr. Robinson of External Affairs when we were here last Thursday night. I am not sure just how much he did give to the Clerk.

The Chairman: If not, the original agreement should be included as well. If the printing has gone too far we will make arrangements to have this printed as an appendix to the proceedings of this meeting. Is that agreed?

Some hon. Members: Agreed.

The Chairman: Mr. Brewin some questioning?

Mr. Brewin: Mr. Chairman I would like to compliment Dr. Lindsey on his very clear exposition of a difficult subject. One of the objectives he listed that the United States have must be limiting the damage that could be done to the urban industrial complex by communist bombers in the event that deterrence should fail. I would like to call Dr. Lindsey's attention to a statement made in his report on the previous page, taken from Secretary McNamara's statement in 1968:

...No air defense system can provide significant "Damage Limiting" capabilities against the U.S.S.R. unless accompanied by a strong, effective ABM, a capability which is at present unattainable.

I am speaking of the situation in 1968. It is still correct though, is it not, that no one has suggested it is possible under the present technology to have a strong effective ABM capability against all-out ICBM attack even with what the Soviet has now let alone looking forward.

Dr. Lindsey: I believe that is exactly true, sir. It was pointed out that if the ICBMs could destroy all the cities it does not really make much difference whether you can stop bombers from destroying them. So they do not make a big claim for the value of "damage limiting" in the absence of ballistic missile defence.

Mr. Brewin: Ballistic missile defence not being attainable it is perhaps good reasoning to say that they do not make any great claims about the damage limiting feasibility of any air defence system.

Dr. Lindsey: I do not think they do. I think the most important reasons for continuing it are the other five.

Mr. Brewin: May I ask you about the AWACS? As I understand it, its main objective is to give better detection through putting your radar screens, or whatever they are, into an airplane so that they can be higher up. Is that correct?

Dr. Lindsey: Yes, sir.

Mr. Brewin: I take it that provision of a new series of interceptors, is an independent

• 1210

proposition altogether. In other words, you could have new interceptors theoretically without AWACS, although that might be foolish, but you could have AWACS without the provision of the whole new series of interceptors; could you not?

Dr. Lindsey: If your only object were to extend the warning feature of the air defence system you could indeed do that with AWACS and no interceptors, but if you want to be able to identify, and if necessary chase away, or destroy, aircraft then of course you have to have the interceptor. If you want

them to go farther away from their present homes than they can today you either have to have more range or move their homes farther forward.

Mr. Brewin: Am I not right in assuming that the ability to detect manned bombers at least a matter of hours before they appear over their targets, or even near their targets—even near enough to use the air-to-surface missile—is in itself a tremendous element of protection against the use of such manned bombers? As I think you suggested in your talk, it would enable the targets to be off the ground to a very large extent and, therefore, the purpose of the attack to be frustrated before it has been made. Is that not correct?

Dr. Lindsey: That is particularly true in the case of the manned bombers that might be attacked by the approaching bombers. You can send your bombers into the air, if necessary armed, and you can either have them orbit overhead for self-protection, or you can send them part way towards their target. But that is done today on the fail-safe principle, so that they will not complete their attack unless the orders are confirmed later.

But in the case of the ballistic missile, as I was trying to explain when I spoke of stability, you do not want to have to save them by firing them. It is true that you can save them by firing them, but you would like to be able to use them when you want to, if you want to, and not when the enemy forces you to use them because he has appeared on your radar screen.

Therefore, I think that early warning does provide good protection for your bombers; but the protection it provides for your missiles comes with the provision that it obliges you to shoot them quickly, and you do not want to have to do that.

Mr. Brewin: I just have two further questions. I am not sure whether it appears in your paper—if it does I did not grasp it particularly—and I know that the AWACS system is still for the future and is still under investigation rather than deployment—but can you give any indication of what I might call the price tag? How many of these large airplanes would be required to provide an effective AWACS system for the North American continent?

Dr. Lindsey: Plans have been made. It is a very expensive airplane. I would say that

they would need several dozen, and the price tag would probably run \$1 billion or \$2 billion. It is a big, expensive program. There is no doubt about that.

Mr. Brewin: This is my final question. I understood you to say that our present interceptors are highly vulnerable, certainly to missile attack, and that this might be dealt with to some extent by dispersing them more. I am not sure that I understood that.

When do you start the dispersal? If you start the dispersal at an early stage does it not acquire a degree of permanence and therefore a degree of vulnerability? Does not dispersal at the last minute present quite a problem?

Dr. Lindsey: The probable use of the ability to disperse the aircraft would be that you would keep a certain fraction of them dispersed all the time. And if the situation appeared to be becoming more dangerous, and you were bringing your defences to a higher state of readiness before any hostilities had commenced, you would increase the degree of dispersal.

Mr. Brewin: Would not the sites of the dispersed interceptors be a matter for the intelligence people on the other side?

• 1215

Dr. Lindsey: It is quite possible they would, and it would at least mean there were far more targets that the other side would have to find.

Dispersal could be changed. You would not have to leave everybody in his dispersal field all the time. The fact that you have these transport aircraft around, would to some extent show that something was happening, but you can move the transport aircraft, and the ability to maintain the interceptors, almost as quickly as you can the interceptors themselves.

You have not absolutely removed your vulnerability, but you have given the attacker dozens of targets, and he is not sure which are the right ones, instead of perhaps a dozen targets. It has reduced the vulnerability. I do not suppose you can say you have absolutely eliminated it.

Mr. Brewin: Thank you very much.

The Chairman: Because of the number of questioners I have made arrangements to continue our hearing this afternoon in room 112N in the Centre Block at 3.30 p.m. and, if necessary, this evening in the same room at 8 p.m. We therefore have adequate time for questioning.

In view of the discussion on this working paper I should inform the Committee that we have asked the Department to prepare the working paper on Maritime Command which, as was mentioned, is to be investigated by a subcommittee in the first instance. This may not be ready until the end of this month.

We should also give consideration to the desirability of having some outside source prepare, on much the same basis as I have outlined, a critique of the departmental paper. If any member has any suggestions about who that expert might be, perhaps he would pass them on to his party representative so that they can be considered by the steering committee and approved by the Committee, as was suggested earlier.

The next questioner is Mr. Cafik.

Mr. Cafik: Dr. Lindsey, when we were discussing AWACS I had to step out of the room for a moment. I hope I am not asking something that has already been explained. Is there no possibility of performing this function through satellites as opposed to aircraft?

Dr. Lindsey: I do not think it would be nearly as attractive a proposition. For one thing, the satellite would have to be 22,000 miles up, hovering over North America. An aircraft is a very small target and there could be an awful lot of aircraft in the little eyeful that it would see from that height.

I also think the difficulties of putting a very large radar with very high discrimination into a satellite are extreme. An airplane is big enough for a high-definition radar, but without very much to spare. From the picture one sees of the mock-ups of the AWACS, it appears to be a very distorted sort of airplane. It has an enormous lump on top of it. I think it is a bigger thing than one could put easily into a satellite. It is also a delicate sort of mechanism. I do not think it would be easy to launch it in a satellite. I doubt very much that it would be either as cheap or as effective to put that type of thing into a satellite.

Mr. Cafik: Dr. Lindsey, to pursue the argument for the satellite, I understand from previous discussions and information I have and I may not use exactly the right term—that the Russians have orbiting multiple head missiles either on the drawing board or in existence. Do we have any kind of defence for this?

Dr. Lindsey: Here we come into a subject that I think we will discuss in more detail at the second meeting. I do not believe there are such objects in orbit today. I think what you are speaking of is described as the fractional orbital bombardment system, or the multiple orbital bombardment system. They are indeed practical. Many people think they are not as effective as a simple ICBM.

The defence against them poses certain problems. They would be detected later than an ICBM because they keep lower. It is not believed that such objects are ready to be used today, but it could be done.

Mr. Cafik: In your view, Dr. Lindsey, to have effective deterrence and defence do you feel it is essential that the United States involve itself in an ABM system? Or do you think we can maintain the deterrence without their doing so?

Dr. Lindsey: It depends very much on what the other side does. If the picture illustrated by my Slide 4 were to arise, where the Soviet Union greatly increases their offence and puts in a strong defence, then I would hope that the West would react in such a way as to retain stability.

There are two general ways in which they can do that: by making their offence stronger, or by making their offence less vulnerable. One way to make it less vulnerable is to put in a ballistic missile system.

I think it is very important for the safety to the world that stability be maintained. I think we have stability today. If one side does something very strong in the direction of taking stability away, one hopes the other side will do something to retain the stability. Perhaps it will cost a lot of money, but they will still retain stability.

Mr. Cafik: The Russians, in fact, do have ABM at the moment do they not?

Dr. Lindsey: We believe so, yes, although not a very thick or effective system, perhaps.

Mr. Cafik: I would presume that one would draw the conclusion that they intend to continue with their ABM system. If this is so, do you feel it is essential that the Americans proceed with their system along the same lines?

Dr. Lindsey: I do not think you want to simply match system for system. What seems to me important for the West as a whole is that we are sure we have mutual stable deterrence. We have it today. Let us keep it. There are different ways of trying to keep it, and of course it depends perhaps more on the opponent than it does on one's own side.

The Chairman: I would remind members on this question of ABMs that we are going to deal with that more specifically next week. For that reason I suggest that possibly at today's meeting we should limit any detailed enquiry to the AWACS and improvements in North American air defence.

Mr. Cafik: That is fine Mr. Chairman. I have concluded my questioning, anyway. Thank you.

Mr. Lewis: May I ask a supplementary question that has nothing to do with the ABM but a general theoretical one that bothers me very much.

The Chairman: Mr. Lewis on a supplementary.

Mr. Lewis: You talked, Dr. Lindsey, about the stable deterrence. At the moment somebody else has substantially more; you have to get substantially more in order to retain the stability, if I understood you correctly. My mind boggles at that. If you have the capacity to over-kill, as have both the USSR and the USA, do you not retain stability for a very long time, no matter what the other side does, because you will always retain a capacity for some very damaging second strike. Why do you constantly say, "Every time the other fellow goes up here I have to go up here, despite the fact that I may still retain, after the first strike, quite a lot of capability of damaging the other guy pretty seriously." How far does this thing go? Forever? Every time you make a new technological discovery and somebody pushes it up, the other fellow has to push it up and you just keep on keeping level: is that the theory of the mutual deterrent that you have, if I may say so, preached? That was my impression of what you said.

Dr. Lindsey: I think that is a fair comment, sir. I would like to say that the question really comes down to "How much is enough?"

Mr. Lewis: Exactly.

Dr. Lindsey: You said that today we have over-kill and I think you are quite right. We have enough today and we have mutual stable deterrence, and if no more weapons were built the problem would be solved. I think because it is stable that if one side does a little more, the other side does not have to react; but if the other side, as you said, does a lot more, then there is the question of whether the stability will be retained. If one side would have a little less, perhaps the other side could have a little less. But the really important thing is to not let the balance fail. Unfortunately it is quite true that there can be no balance if one side loads his end more and more and more because then the other people have to react or stability is lost.

Mr. Lewis: I do not agree with you.

The Chairman: Mr. Harkness.

Mr. Harkness: Dr. Lindsey, first I would like to ask in connection with the anti bomber defence of North America, what would be the most effective areas for these AWACS planes to fly in as far as securing warning is concerned?

Dr. Lindsey: That depends largely on the other instrument that I described—the over-the-horizon radar. If the over-the-horizon radar turns out to be very successful, and if it is not disturbed by the northern lights and that sort of thing, perhaps the AWACS would

• 1225

only be needed at the time that you wished to control interceptors. On the other hand if the OTH has gaps in it, or if it does not work when the sun spots are out, or something like that, you might have to fill in the gaps with the AWACS.

So it is hard to give a numerical answer, but I would imagine that AWACS would not be needed very often in normal peace time operations, but in the event of emergency you would deploy far more of the AWACS and you would put them at the distance where you expect to make your first detections and where you could carry out an interception. In

other words, they must be close enough to home that the interceptors can come within their radius without running out of fuel.

Mr. Harkness: Geographically, where would those most effective areas for the deployment of the AWACS be?

Dr. Lindsey: Over the Atlantic and Pacific coast and over Canada, probably a bit to the north of the Pine tree Line.

Mr. Harkness: In other words, you say roughly along the line of Edmonton, Saskatoon and so forth.

Dr. Lindsey: I think there, or perhaps a little farther north; something like that. Probably a bit farther north than that. They could always go out and then fly back. If the bomber is subsonic and the AWACS is in large jet aircraft, it will be nearly as fast as the bomber, so it could go out and on first detection fall back almost as fast as the bomber was moving.

Dr. J. C. Arnell (Assistant Deputy Minister (Finance) Department of National Defence): On your other point, Mr. Harkness, to help you visualize this, as Dr. Lindsey pointed out in the briefing, the section detection range of one of these aircraft is so vastly increased over the ground station that the number that it takes to cover a given area is reduced to just a handful. The result is that you have a fairly wide choice of just exactly where you might orbit or, in fact, operate one in order to cover quite a wide area. As I recall from his slide, I think he referred to being able to detect the high flying bomber—was it 500 miles?

Dr. Lindsey: Something like that.

Dr. Arnell: Something like this, which is quite a different order of magnitude then we think of in ground stations. So that, one must not think of AWACS being positioned in the air at distances similar to the Pine tree.

Mr. Harkness: My original question was really as to where the most effective areas were for AWACS to be deployed if this system comes into operation. I would take it, it is roughly in the area of possibly 400 miles north of the Canadian Border, something in that area.

My next question, then, would be, to what extent would the effectiveness of the AWACS

system be degraded if Canadian air space was not being made use of and they were positioned roughly along the Canadian-American Border.

Dr. Lindsey: I think it would be seriously degraded because the desire to push the system outward would be utterly frustrated. It would make the contribution, of course, of allowing tracking to occur down to low altitudes, and it would reduce the vulnerability of the system and it would give flexibility because if a ground radar were to go unserviceable you could perhaps fill the gap with an airborne one. But one of the most valuable assets of the system, the ability to fly it forward, would be denied.

Mr. Harkness: In other words, the essential effectiveness of this system would depend on the use of Canadian air space.

Dr. Lindsey: For defence from the north, yes.

Mr. Harkness: That is what I mean, as far as defence from the north is concerned, which, of course, is much the most likely area or direction of any bomber attack.

Dr. Lindsey: So we believe.

Mr. Harkness: As to how many of these AWACS planes would be required, I gather from what you have said that in peace time very few would be required, but in the event of threatened attack, you would need a very considerable increase, particularly for control purposes, rather than for warning purposes.

• 1230

Are you in a position to give us any general idea as to the numbers that might be required in peace time?

Dr. Lindsey: I do not think you could say that you had to keep a certain number on station permanently in peace time. If the OTH is completely successful, you might not have to station any permanently in position in peace time. That does depend on the OTH very much.

Mr. Harkness: In the event of the OTH not being very successful, what would be the answer?

Dr. Lindsey: Then if you wished to thicken up the long-range cover over the ocean you

would have to have, I suppose, one or two on station in each direction. If there were some suggestion that the AWACS would be used instead of the DEW Line you would have to have, I suppose, two or three in that area. Perhaps you would only put them there at random rather than continuously on station. It is very hard to give an exact number.

Mr. Harkness: In view of what has just been said, to what extent is the effective air defence of the whole North American Continent dependent more or less on the same amount of participation as we have been giving to the whole NORAD system if this new system comes in? In other words, what effect would it make on the necessity for Canadian participation?

Dr. Lindsey: I think the use of Canadian airspace would be essential. The AWACS could be based in the United States and fly out and do its operational mission and fly back to the United States. The interceptors could be based in the United States and fly out but they would not get nearly as far as if they were based in Canada. With the OTH we do not know.

I think the biggest contribution that we can make, since interceptors have shorter range and less endurance than AWACS, would be to allow interceptors to be based in Canada. Now, that does not say they have to be Canadian interceptors with Canadian airmen on board. However, if there are no interceptors on Canadian bases then the system would be considerably weakened in its ability to intercept before targets were reached.

Mr. Harkness: Would it be a fair statement as a summary to say that the change from the present system of the DEW Line, the Pinetree Line, the Mid-Canada Line and so forth and the present system of interceptors, Bomarc and other ground-to-air missiles, if it is changed to this projected AWACS system, would not make any material difference as far as the importance of Canadian participation is concerned.

Dr. Lindsey: I think that is so.

Mr. Harkness: All right, thank you.

Mr. Guay (St. Boniface): On a point of order, many of the members have been sitting on the various committees since 9:30 this morning, and due to the fact that we have two additional sittings today, could we not

adjourn now and then carry on with our work in the two other meetings that we have today?

The Vice-Chairman: Mr. Guay, I have a note from Mr. Thompson suggesting that we adjourn after the next questioner for the same reason. What is the wish of the Committee? Mr. Laniel is the next questioner.

Mr. Laniel: I can wait until after.

The Vice-Chairman: Is it agreed that we adjourn now?

Some hon. Members: Agreed.

The Vice-Chairman: All right, we will adjourn until 3:30 p.m. The meeting this afternoon as will be noted, is in room 112N in the Centre Block.

AFTERNOON SITTING

Tuesday, May 20, 1969.

The Vice-Chairman: I call the meeting to order. If we can have some order we will get back to the questioning. Next on my list are Mr. Laniel and Mr. Thompson. They are not here. The next two on my list are not yet here either.

An hon. Member: We are making lots of progress.

The Vice-Chairman: Is it the wish of the Committee that we wait for another five minutes or is there anyone who would like to go ahead with some questions in the interim?

Mr. Legault: I think that we should go on with the questions that other members have. When those members arrive whom you have mentioned perhaps we could return to them.

• 1540

The Vice-Chairman: All right. Is there any member signifying that he would like to ask questions now? Mr. Anderson.

Mr. Anderson: No, I do not think so, sir.

Mr. Winch: I am sorry, sir, I have another commitment this morning, so I am not in a position to question.

The Vice-Chairman: Mr. Roberts.

Mr. Roberts: Perhaps I could start. To be absolutely honest I have not had time to finish reading the paper. What I had read of it impresses me very much. I was rather hop-

ing that some other of the four questioners would be here to ask some questions before you got to me, but perhaps I can start with one or two things which may be elementary and which may have already been covered. If so I apologize for redundancy.

I think it is a first rate paper; at least, the first part that I read.

Assuming the airborne radar detection system was in the complete control of the United States, would we be able to link that with a control or an interception function which was entirely in the hands of Canadian armed forces? In other words, I am making a distinction between detection and the interception of hostile aircraft. Are there insuperable technical difficulties why these two functions of warning and control cannot be separated?

Dr. Lindsey: It does not make any difference which air force uniform is being worn, of course, either by the flyers or by the people on the ground. I think if one is going to go to the expense of putting this large radar into the air in a big aircraft with lots of endurance it probably is quite efficient to add other functions to it as well and, of course, the control is the thing that was planned. However, I think the answer to your question is that it would be technically possible to have the warning in AWACS aircraft and the control on the ground but, of course, the area in which the interceptors could go would then be limited by the present cover of the ground-based radar. That is not too bad, but it would mean you would not have the ability to go farther forward.

Mr. Roberts: The interceptors would then be dependent upon the ground-based radar. There is no way of linking the interceptors, as it were, to the airborne radar.

Dr. Lindsey: Oh yes, there is. I thought you were postulating that the AWACS aircraft were only used for warning and not for control. It is intended that they be used for both. In the big AWACS aircraft you have radar that enables you to detect a bomber and you have computers, personnel and display facilities that enables the crew to control interceptors to make identification runs on the bomber or to attack him if necessary, and they will have all the information they need to identify by flight plan correlation. Indeed, the intention is that in the AWACS aircraft you can carry out all the functions that are done on

the ground today, so I think you can do everything in the air that is done on the ground.

Mr. Roberts: You may have answered my second question already, but perhaps I will put it in any case. I am puzzled why we need both defensive missiles as well as interceptor aircraft to bring down aircraft. I wonder, for instance, if it would not be possible to abandon interceptor aircraft and rely entirely upon missiles to bring down hostile airplanes. Is the answer that you need the interceptors in order to make identification? Is it to make assurance doubly sure, or would it not be technically feasible to simply rely upon a missile defence rather than using manned aircraft as well?

Dr. Lindsey: One of the functions that are carried out in peacetime is the identification of incoming air traffic. The first step in that connection is to compare their position and their track with flight plans, and virtually all of the tracks are identified in this way. However, once in a while you will find an aircraft that does not meet up with any flight plans and an attempt is made to contact them on the radio. If he cannot satisfy the people on the ground as to who he is, the next step is to send up a manned interceptor. The manned interceptor is not going to attack him, he is there to identify him, and in order to do that he has to fly close to him and, if possible, read his tail number and find out exactly who he is so that he can be punished by some sort of legal means later on for breaking the rules. Of course, you must have a manned interceptor to be able to do that. A missile could not do that for you.

Mr. Roberts: Right. Could I perhaps turn the tables a bit and ask if we could rely entirely on manned interceptors and do away with a missile defence, or is that again not feasible?

Dr. Lindsey: Yes, you could do that. Of course, for many years that was the basis of all air defence. There are several reasons for having two or three different sorts of weapon systems. It complicates the problem for the attacker. It is a type of insurance against some unexpected catastrophic failure. Actually, it is probable that the surface-to-air missile would be more efficient against a highly concentrated attack. You could get along with

• 1545

manned interceptors only, but I suspect it is

not as efficient if you are going to have a fairly strong defence.

Dr. Arnell: It has been brought out a number of times that it is much cheaper from the cost-effectiveness point of view but it does not have the identification capability. So, you can cheapen your defence by having some for the kill but you have to have your interceptors for identification.

Mr. Roberts: Is it possible to say if this identification function is one which is often exercised? Does it happen often or is it a very rare occurrence?

Dr. Lindsey: On the average, it happens several times every day—today and yesterday.

Mr. Roberts: To go on to a slightly different point...

Mr. Winch: Before you leave that subject, may I ask if a manned interceptor also has a kill capability?

Dr. Lindsey: Yes, he does. Having given him the performance necessary to make one of these identification passes, it does not require a great deal of additional weight in the airframe to give him a weapon he could use if he ever had to. I believe all of the interceptors we use for identification are also armed, and they could kill if necessary.

Mr. Winch: They are even armed in peacetime?

Dr. Lindsey: Yes, they are.

Mr. Brewin: May I ask a supplementary?

The Vice-Chairman: A supplementary, Mr. Brewin.

Mr. Brewin: As I understand it, the using of the Bomarc or other missiles from the ground would be appropriate to a fairly large scale attack but it would not be appropriate to an incidental invasion of Canada's air space. Is that right? In order to justify the use of a full scale missile response or defence you would have to be reasonably assured there was going to be a fairly large scale invasion of the North American air space with hostile intent, would you not?

Dr. Lindsey: I think if a small number of unidentified aircraft appeared and you were

not quite sure whether they were bent on mischief or not, you would almost certainly cope with them by manned interceptors. This is partly because you could call them back right up until the last moment if you found you did not want to attack them.

The Vice-Chairman: Mr. Harkness on a supplementary.

Mr. Harkness: Is it not also a fact, as far as the Bomarcs are concerned, that as they are only armed with a nuclear weapon they could not be used until authority had first been secured from the President of the United States and then from the Government of Canada.

Dr. Lindsey: That is a very pertinent point, sir, and you are absolutely right.

Mr. Harkness: So it is only under these circumstances that the missiles would ever be used.

Dr. Lindsey: That is so.

The Vice-Chairman: Are you finished, Mr. Roberts?

Mr. Roberts: No.

The Vice-Chairman: Go ahead, then.

Mr. Roberts: I appreciate that obviously it is more efficient if the necessary facilities for an AWACS system are based in Canada as well as outside Canadian territorial limits, although you mentioned this morning that it would certainly be feasible, though more expensive and more inconvenient, to organize the airborne warning and control system entirely from United States territory. I realize this is a hypothetical and difficult kind of question, but could you give any kind of estimate of how inconvenient it would be? What would the increase in cost or expense be of providing a system entirely from American territory, perhaps with the use of Canadian air space but without the necessity of using Canadian-based ground installations.

Dr. Lindsey: One way to give a rough numerical answer to that would be to say that if the aircraft had an endurance time of 16 hours and it took him three hours to fly from the northern United States to his operational station, then six of his 16 hours would be fruitlessly spent in transit and 10 of them would be usefully spent on task, so I suppose it would have cost you sixteen-tenths as much

as if he had lived right at his operational station. Simply in terms of flying time that sort of ratio would apply. Of course, it might be more expensive to build and maintain an air base in the North than it would be in the South.

• 1550

Mr. Roberts: I certainly do not want to provoke a debate but I wonder how important that kind of a consideration is. I know the United States sends countless training flights and exercise flights all over the world, but would an increase of 10 hours of time necessarily be a very expensive factor in the over-all operation of such a detection system?

Dr. Lindsey: I think it would be because it would be reflected in the number of aircraft you would have to buy to carry out your task. If you had to buy 60 per cent more of these very expensive aircraft, then the bill would be substantially increased.

Mr. Roberts: Did you give us a cost estimate of each aircraft this morning? Perhaps I missed it.

Dr. Lindsey: No, I did not. I said it was very expensive and the total bill for a few dozen would probably run \$1 billion to \$2 billion. Somebody told me afterwards that this was based on an estimate of 45 AWACS aircraft.

Mr. Roberts: Forty-five for \$2 billion.

Dr. Lindsey: Well, it is somewhere between \$1 million and \$2 billion; it is somewhere in that region. They are very expensive.

Mr. Roberts: Well, that makes it what?

Dr. Lindsey: You should not just divide.

Mr. Roberts: They are about \$40 million each on the average.

Dr. Lindsey: Yes, but this would include the maintenance and the personnel and all the backup and overhead costs. This is an expensive program without question.

Dr. Arnell: There is another point I would just like to add, Mr. Roberts. You have been raising questions on the control aspect. As I think Dr. Lindsey brought out this morning, the AWACS airplane really produces a more versatile ground control radar set-up and because of its range it really does the equivalent

you might say, just to use an analogy, of a sector of radar; it is where there are a number of radars. While within a sector on the ground you have to provide another level of controls in order to pass from radar to radar, within the AWAC System there still has to be a higher level of control in the same sense that we have within NORAD the northern regions and so on.

So one could still envisage an upper level of control above the AWACS airplane because there is still going to be the problem of handing over, if you like, from one sector as represented by one aircraft to another one. Although this has not been analysed through to this point yet, you could, in fact, say that the northern NORAD region would still be retained as the top control level being passed to a particular aircraft to exercise the control of interceptors within it. I think you should look more at the tactical control of the interceptor rather than the over-all control.

Mr. Roberts: What I am trying to get at in my stumbling fashion is the extent of the increased costs of this AWAC System. What it provides for us that is not provided otherwise and how important that is to us. I, at one time, had almost hoped it might cost us a lot less than the present system. Could we have some estimation? The over-all estimate we have received for NORAD at the present time, I think, is \$2 billion a year, of which Canada's percentage runs roughly between 8 to 10 per cent or I think the figure was \$135 million or \$136 million. If Canada and the United States went into the AWAC System, what kind of costs would we be looking at in comparison with that present \$2 billion figure?

Dr. Lindsey: I think we can answer that one, yes. If the American plan is carried out for the next 10 years, they estimate that the total cost over the 10 years would be \$12.3 billion. If they keep the present scheme going for 10 years, it is somewhat less than that \$11 point something billion. However, the \$12.3 billion would involve heavier than average expenditure in the early years for buying the capital equipment like the AWACS aircraft. Toward the end of the 10 years there would be far less people in the system, and people are very expensive these days. The annual personnel operations and maintenance bill for the last few years of the 10 years was estimated at \$690 million and that is a lot less than the annual cost today. So, you are right; in

the end once you had spent the capital costs you would have made the system cheaper to operate on a straight maintenance basis.

• 1555

Dr. Arnell: I think it was really said at the time that this new program was designed to provide the whole new system and taking the 10-year cost it was essentially the same as would have gone into the present system. However, by gradually running down the present system and using that money for capital you ended up with a system whose operation and maintenance costs would be something in the order of 60 to 65 per cent of what the present system was.

Mr. Roberts: I really was asking questions along that line because I was encouraged by page 7 of the brief which expressed very clearly some of the things I was trying to get at the other day. It makes the point which is paradoxical, but I think true, that increased defence is an extremely dangerous thing if it brings into discredit the other side's effective deterrent and that leads to a less stable situation than we have at the moment when each side has an effective second strike deterrent against the other.

I wondered, therefore, whether these changes which are being considered were going to increase our defence or whether they were simply going to provide us with roughly the same kind of defence we have had in the past, but do it more efficiently and more effectively. If the argument were that this system were going to radically improve our defence posture rather than our deterrent posture, it might run into criticism along the line of the arguments that you have presented on page 7?

Dr. Lindsey: I think the total ability of the improved and modified defence would really just be to cope with about the sort of attack that we might get today, except that, if it were to come in low or to use the air-to-surface missile we would then be able to cope with it. If we do not make these improvements we would then be open and less effective against that sort of attack. The total number of interceptors in the modified plan is quite a lot less than we have today. I do not think it really gives us very much more capability. It is rather more a matter of plugging the holes that there are and not paying any more for it either, making it in the end a little cheaper.

Mr. Roberts: May I ask one further question, Mr. Chairman, along these lines? We had a discussion the other night in the Committee and I had been taking the point of view that essentially bomber defence was irrelevant because the bomber threat was irrelevant to our present situation of nuclear deterrence which is based on the intercontinental ballistic missile. An argument was presented which I think is worth considering; that is, if in fact you do develop some kind of safeguard or control system or defence system against ballistic missiles then the manned bomber would come back into its own as a threat. Then it would have been unwise to dismantle the bomber defence system in view of the fact that a bomber attack system could be easily mounted again.

Would you agree in the present situation of mutual deterrence which depends upon the ability of both sides to deliver effectively intercontinental ballistic missiles that what we are talking about when we talk about the maintenance or the improvement of bomber defence is the maintenance of a defence effort which is not crucial at the moment but conceivably could become crucial in the future if there were effective missile defence systems developed?

Dr. Lindsey: I think that is true in terms of the major strategic balance which is what we are discussing today, but also a modest air defence capability does useful things for you in peacetime as well, such as identifying air traffic and policing airspace. We do want to continue that as well. However, it is quite true that if we suddenly wanted a good bomber defence in 1978 it would be much harder to create it out of nothing than to have maintained something and then make it a bit stronger.

Mr. Roberts: Perhaps some of your other questioners have arrived by now, Mr. Chairman, and I could come back later if there are other questioners.

The Vice-Chairman: Thank you, Mr. Roberts, that is the case. Mr. Allmand.

Mr. Allmand: Mr. Chairman, the questions I wanted to ask were more or less the same as Mr. Roberts'; therefore, I will only ask a supplementary question.

• 1600

On page 21, your brief states that the total cost of the program is \$12.3 billion. I under-

stand this to cover both the AWACS and the modified interceptors, as a matter of fact to cover the whole program. Is it contemplated that if Canada were to participate in this new program it would share in that total amount or would its expenditures be in addition to that amount?

Dr. Lindsey: This cost estimate was made by the United States and it was only the expenses they expected to pay for their part of the system. If we used some of their equipment, then I suppose it would all come under the same total cost. If we bought some additional equipment of our own I suppose it would have to be added. Do not forget, though, that we now maintain quite a substantial part of the air defence system; the Pinetree radar line and the interceptor squadrons, and they had assumed that we would continue to do that.

Mr. Allmand: You have stated that the purchase of approximately 45 AWACS aircraft would cost between \$1 billion and \$2 billion. What about the interceptor side of the program? What sort of interceptor would Canada use? I notice you mention that the Americans contemplate modifying certain aircraft that they have. Would we be required to purchase those aircraft? Or do we have any aircraft on the horizon that could be used in this interceptor role? I was going to ask if the CF-5 was appropriate, although I do not think it is. I was going to ask you that question further on, Dr. Lindsey.

Dr. Lindsey: We do not have the answer to your question. Presumably if some of these aircraft are operated in Canada they should take advantage of these new abilities to operate at low altitude and to work with the AWACS. And we do not know yet what fighters we would like to buy or modify if we were going to do that.

I do not think the CF-5 would be up to this job. I think you would have to have a rather bigger aircraft than that, able to carry a larger radar and a larger air-to-air missile. But there are studies underway to see what would be the best solution to that problem.

Mr. Allmand: So we would probably have to purchase new interceptor aircraft for which we have not yet made any estimates or proposals?

Dr. Lindsey: I think that is true.

20374—3

Mr. Allmand: So that if we purchased these 45 AWACS which would cost approximately \$1 to \$2 billion, we would also have to purchase interceptor aircraft. We have no aircraft to modify.

Dr. Lindsey: There is no expectation that Canada would be footing this bill of \$1 to \$2 billions for the 45 AWACS. This would be the rement for the entire system.

Mr. Allmand: Oh, I see.

Dr. Lindsey: It would be either all or mostly an American purchase.

Mr. Allmand: It is good that you clarified that.

Dr. Lindsey: I am sorry. I did not mean to . . .

Mr. Allmand: Maybe it is my fault. Would Canada be obliged to purchase any of the AWAC aircraft?

Dr. Lindsey: Canada would not be obliged to do anything. That is really our business what we decide to do.

Mr. Allmand: I realize that, but if we were to co-operate in the program, is it suggested that we share in the cost of the program?

Dr. Lindsey: There has not been discussion down to the level of deciding who would pay for what yet. That problem has not been faced yet.

Mr. Allmand: I see. In the Department of National Defence, do they use the standard or methods that I am led to believe are used in other departments, the cost benefit ratio?

Dr. Lindsey: Oh, that is one of the ways that we try to judge what we should do. Yes, indeed.

Mr. Allmand: Dr. Lindsey, this morning when you were describing the possibilities for attack by the Soviet Union, in preparing a scenario for that attack you did not contemplate the use of bombers. The first line of attack you thought would be the ICBMs, and the next line of attack by the Soviet Union would be the missiles from submarines. You yourself said it was unlikely that there would be a bomber attack. With this great expenditure of \$12.3 billion for anti-bomber attack, it would occur to me that if you use a cost

benefit ratio, there are high, high costs with very little benefits if you expect that there would be very little likelihood of a bomber attack. You are spending an awful large sum of money with very little expectation that there will be that type of attack.

Dr. Lindsey: It is true that on the chart we discussed this morning, we did not have the bomber partaking in the counterforce first strike, and I thought I tried to explain afterwards that indeed the bomber would play some part in this exchange. It might partake in that first strike along with the ICBMs or it might be withheld for the threat against the cities if the first strike had disarmed the opposition.

• 1605

I think the bomber would be used. But one of the things about a bomber attack is that even after it is on its way you cannot tell whether it is coming to forces or cities. It does not have a ballistic path that can be foreseen and it can be used in either way. If I left the impression that I did not think the bomber would be used at all, then, I am sorry. I did not mean to.

Mr. Allmand: I think you made it clear that it might be used, but I got the impression that its use would be very marginal, that our expectation of its use would be very small compared to the expectation with respect to the ICBM and the submarine-based missiles. Therefore I asked myself the question whether a \$12.3 billion program is worth it in view of the expectations which are very marginal.

Dr. Lindsey: Well, I do not think the expectations really are marginal. I think that if the enemy has provided himself with 150 intercontinental bombers, he would use them and he would use them in a way that would hurt us. There is no doubt about that. But it is difficult to forecast right now whether they would be used in a counterforce or a counter-value attack, and whether they would be used first or withheld.

I think before one gets too concerned over the \$12 billion, one should try to think where we would be if we did not spend a nickel on air defence. First of all we would not be able to police our airspace; we would not be able to know whether we were being overflown in peacetime; we would not be able to discipline intruding air traffic. We would be inviting the 150 bombers to exchange all of

their expensive penetration aids like air-to-surface missiles and ECM jamming equipment and the extra fuel they have to carry if they are going to come in low and take evasive routing—to exchange all of that payload for more bombs. So that, in effect, the 150 bombers would probably arrive with the payload that it would have taken twice as many bombers to deliver if they were opposed. So, if we have no air defence we are in bad shape in many ways.

Mr. Allmand: Yes, but with respect to some of the things, the roles that you have mentioned, we have already decided to purchase so many CF-5s which perhaps could be used for some of the things that you stage, although they could not be used in this new program. They could be used for identification; they could be used for a certain type of interception, I understand, and a certain type of strike role. But they cannot be used, I do not think, with the AWACs in the type of interceptor role that is contemplated in this program.

Dr. Lindsey: No.

Mr. Allmand: Another type of aircraft would have to be used by the Canadian forces if they co-operated in this program. It seems to me that the possibilities of a bomber attack are very marginal. I am open to be convinced, but I still cannot seem to be convinced that it is a strong possibility.

How far, Dr. Lindsey, has the United States proceeded in trying to introduce this program? How far have they advanced in getting their own Congress to approve of it, and so forth?

Dr. Lindsey: They still have a long way to go and I do not think Congress has authorized all of the money that was requested for the research program on the F106X. The AWACS still has to undergo a great deal of development and trials. The OTH is still in the experimental stage, so it is only a plan. It is not on the air yet and it is not intended that it would be for several years, perhaps 1974 or 1975 for the complete system. In 1969 it is really just an idea on paper with some research and development going on. It is not fully authorized today.

Mr. Allmand: Yes. From what you told us before, I get the impression that the plan necessarily includes the use of Canadian airspace and land space. Could the program be

used, the AWACS and the modified interceptors, if we refused to allow use of our air-space and land space?

Dr. Lindsey: I do not think it would be very effective without the use of Canadian airspace. I think it could work if all the bases were south of the border, but it would not work very effectively. It would not be nearly as cost-effective. But it would probably still be worth trying from their point of view.

• 1610

Mr. Allmand: Could they operate out of Alaska and their bases in Greenland?

Dr. Lindsey: Well, that would be a different type of scheme from the one that they have proposed.

Dr. Arnell: I think the answer to that, Mr. Allmand, is that it would be basically an ineffective scheme. After all, there are not that many airfields, particularly in Greenland—and that is a long way from anywhere.

Mr. Allmand: That is all, Mr. Chairman.

The Chairman: Mr. Forrestall.

Mr. Forrestall: Can we assume from your comments this afternoon and this morning that if the United States decides to eventually go ahead with this system that we would, first of all, continue with roughly the same proportional arrangements and, if so, would this conceivably be minus the capital costs to the equipment? Do I understand you correctly, that if you take the capital costs and some of the other expenses out of that \$12 to \$15 billion program Canada's ultimate share in this in terms of dollars and cents would be less than what we are paying today?

Dr. Arnell: I think, Mr. Forrestall, that Dr. Lindsey really answered that question earlier—that the studies as to just where Canada would participate in this have not reached a point where one could even start to predict what sort of hardware we will be involved with. I think one of the problems of trying to anticipate this was really reflected when Dr. Lindsey in his briefing this morning outlined to you what was the essence of this new system, namely the ability of a radar to look down and see the moving object in the background clutter. This was really the key element, as he brought out this morning, between—between...

Mr. Forrestall: I am sorry, in relationship to what we might ultimately have to pay?

20374—3j

Dr. Arnell: Well, to this whole new system. The question now as to just how you use this one piece of new technology, we call it the downward looking radar, is by no means finalized, as he indicated a minute ago. The AWACS aircraft, as a final piece of hardware, has not been decided yet.

Mr. Forrestall: Surely we would not participate in the capital cost of that?

Dr. Arnell: No. I mean the question of an interceptor also involves this radar and other sort of new black box development, if you like.

It is really too soon to be able to predict how these particular developments can be incorporated into existing platforms, if you like—available aircraft. The American program, as was just brought out, involves modifying the F-106 interceptor. One of the things that has not really been worked out at all is whether the total available number of 106s, because there is a finite number of them, would be in fact available to meet the entire interceptor needs of the entire continent or whether in fact it needs some augmentation. These are things that are still under study and it is just too soon even to be able to forecast whether we could share in the 106s or whether we would have to get another aircraft. There are just so many unknowns that one cannot say today that there is a particular capital program that one must think about say three years from now.

Mr. Forrestall: Then you cannot at this point in time, because of the nature of the discussions and so on, say whether or not we would participate in the interceptor aspect of this program?

• 1615

Dr. Arnell: As long as there is to be operation in Canadian air space we have the freedom to say that we will take care of that part of the operation, as was brought out last week. The whole concept of joint air defence of North America is one of an integrated command and control organization that commands and controls the forces that each individual component contributes to it. And Canada has a wide freedom of choice as to whether it wants to offer its air space to somebody else or in fact take over all operations.

Mr. Forrestall: If we did that we would have to get out of everything else, would we not?

Dr. Arnell: It is obvious, I think, that the two extremes are completely impractical.

Mr. Forrestall: You would suggest that it might be as much as two to three years before we could determine finally what roles, first of all, Canada would ultimately play if the United States go ahead and if we decide to stay in it.

Dr. Arnell: I would suggest that the roles are not that much different. I think it was brought out this morning that this is essentially an updating of equipments to do certain things. There is at the present time the ground-controlled radar in the various radar lines, there is at the present time interceptors in the various configurations. The equipments that are being designed at the present time that Dr. Lindsey went through this morning are in fact the next generation of doing the same things. To my mind the roles for Canada in air defence are basically the same ones. We are interested in identification in peacetime. In order to have identification you have to have some kind of warning capability that tells you there is an unknown in your system and you have to have the ability of flying and looking at it to see what it is. So you begin from there and you come to the conclusion that by some method or other—and I think we feel that the cheapest way is a joint system with the Americans—you take part in early warning, in a controlled thing, in interceptors and so on. I would say that probably the easiest way to look at it is that we hopefully will continue to run along at about the same percentage, which is a kind of a per capita cost.

Mr. Forrestall: With the spin-out and given the assumption that the Americans bore the burden of the capital cost of a new interceptor or, for example, the modified 106 that you mentioned a moment or two ago and that Canada did not replace the 104 then, presumably—

Dr. Arnell: No, the 101.

Mr. Forrestall: Yes, the 101. Then in order to maintain in the order of 8 to 10 per cent of the program we would either have to get involved in hardware or pay a substantially less amount of money than we are paying today.

Dr. Arnell: To do the things that we would want to do, like identification in air space, I think we would have to have some hardware.

Mr. Harkness: I have a supplementary, Mr. Chairman. What is the estimated continued life-span of the 101?

Dr. Arnell: About the mid-70s. I am not sure whether we have a precise date, but 1974 or 1975. It goes out at about the time that this system will be coming in.

Mr. Harkness: Approximately another five years.

Dr. Arnell: That is right.

Mr. Forrestall: Dr. Lindsey, getting back to the \$12.3 billion that the Americans have estimated that this program would cost, given your background, technical experience and undoubted expertise in this field, sir, are you satisfied with that as an estimate, and can you break down that \$12.3 billion in rough percentages—how much for capital equipment, how much for men, and how much for air bases if that were necessary?

• 1620

Dr. Lindsey: I could not do that very well. I suppose the biggest capital item would be the AWACS which I think could run to \$2 billions. I think replacing the F106 by the F106X would probably be somewhat under \$1 billion. The OTH's would be \$100 million or \$200 million, I would think—perhaps a little more but certainly less than half a billion. All the rest of it would be personnel, operating and maintenance for ten years. The vast majority of it would be paying people's salaries, buying fuel, replacing worn out equipment and that sort of thing.

Mr. Forrestall: With your very deep knowledge of this type of a program, would you think the \$12.3 billion would hold very firmly or would it accelerate to a substantially greater amount?

Dr. Lindsey: Whatever knowledge I have of these matters does not run very deep in the financial end. I would not like to say; I am not much of a judge of these things.

Mr. Forrestall: Thank you very much.

The Chairman: Mr. Thompson.

Mr. Thompson (Red Deer): Mr. Chairman, I would like to ask Dr. Lindsey some questions

that relate to background information rather than to the type of questioning we have just had. Insofar as you are aware is the U.S.S.R. planning the development of a new supersonic bomber that would replace the existing force and might change the bomber threat?

Dr. Lindsey: The only activity that we know about that the Soviets are engaging in with regard to supersonic aircraft is for civilian transport—a supersonic transport. It is true that the lessons they learn in the supersonic transport would make it a lot easier to make a supersonic bomber. But I do not know of any evidence that says they are actually starting to do it.

Mr. Thompson (Red Deer): What you are saying, then, is that the existing bomber force is the known quantity or the known force as far as the future is concerned of the Soviet program?

Dr. Lindsey: The hundred and fifty odd bombers of the type that they have had for several years are all that we foresee being against us in the immediate future. They will be slightly improved by things like the air-to-surface missile. I do not think a huge fleet of supersonic bombers is likely to appear next year. But who knows what will happen several years hence? We really could not say about that.

Mr. Thompson (Red Deer): A second question relating to the SLBM's. What significance do you place on the tremendous expanding program of the Russian nuclear submarine force? I base that on reports that I have seen in the public press.

Dr. Lindsey: I think their submarine force has always been a big one, for the last 15 or 20 years.

Mr. Thompson (Red Deer): No, their missile force.

Dr. Lindsey: It does look as if they are going to put a much larger fraction of their submarine fleet to the ballistic missile role than they ever have before, and that could effect the strategic balance if carried out to a very large degree. At the moment, of course, the American ballistic missile submarine fleet is very much bigger than the Russian one. I think in the paper we said that the Americans had 41 ballistic missile submarines each carrying 16 missiles which adds up to 656 Polaris, and they will soon be replaced by a

better missile, the Poseidon, and I think we gave the Russians today only 45 SLBM's. However, that number will certainly increase quite sharply in the next few years if their present rate of building persists, but it would be some time before it got up to 600.

Mr. Thompson (Red Deer): I am referring to a report which appeared in the press, other than the one I think you referred to, that says it is only a matter of two or three years until the Russian submarine missile force will pass or will equal the Americans, and only a matter of a few years beyond that until it will exceed it. My question is based on that.

• 1625

Dr. Lindsey: Yes I think if we go back to the mutual stable deterrent, if the Russian force built up to the point where it was roughly equal to the American one I would assume that would make for a fairly stable situation and we would not have to be terrified. If it starts to go far beyond it, then we should be worried about stability. But as they are building up from a position of inferiority towards one of equality, I do not think that in itself is a terribly dangerous sign. However, if it goes far beyond equality then it could be worrisome.

Mr. Thompson (Red Deer): Is the detection and the interception of a submarine ballistic missile similar to that required for an intercontinental land-based missile.

Dr. Lindsey: Roughly, yes. In some ways it is a little more difficult because the missile will not be in flight for as long and it will not rise to such a high altitude, so that the radar might not detect it until it came a lot closer than an ICBM. But then, it is going slower which makes it correspondingly a little easier to intercept. I think a system that was really good at intercepting ICBM's would have at least a fair capability against SLBM's and perhaps a very good one.

Mr. Thompson (Red Deer): Do you regard the OTHB important in relation to this type of missile threat as well as to the intercontinental? I am speaking now of submarines, the SLBM.

Dr. Lindsey: Yes, I think the OTHB radar would have some ability to detect missiles in flight. But I think if there were to be a serious effort to build an anti-SLBM system, probably some special radars would be provided for just that role.

Mr. Thompson (Red Deer): What does this all say of our own anti-submarine effort as far as detection is concerned?

Dr. Lindsey: Our anti-submarine effort is, of course, devoted to the submarine and not its missile.

Mr. Thompson (Red Deer): Yes, I understand that.

Dr. Lindsey: If an enemy missile-firing submarine succeeded in firing a missile, we have no way of preventing the missile from completing its trajectory today. Our ASW effort is entirely against the submarine itself.

Mr. Thompson (Red Deer): The range of the Russian ballistic submarine, as far as the missile itself is concerned, keeps it out and beyond our normal detection area as far as the submarine itself is concerned, does it? It keeps the submarine out of range?

Dr. Lindsey: No, not necessarily. Our anti-submarine forces can go right across the Atlantic if necessary. If you are speaking of the area of responsibility SACLANT has divided up the Atlantic Ocean into zones and the CANLANT zone does extend some distance out to sea and, of course, that is where most of our patrols are done. If you like, we are responsible for that piece of ocean, as much as one can be. I am sure the Russian SLBM's could be fired from either inside or outside that zone and reach shore.

Mr. Thompson (Red Deer): Are you satisfied with our present anti-submarine detection as far as the immediate future is concerned? Are you satisfied that it is adequate, let me put it that way?

Dr. Lindsey: I do not think anybody in the anti-submarine business is ever satisfied that he has reached the ultimate. It is a very difficult art and we are not perfect at it; nobody in the world is now ever will be, I suspect.

Mr. Thompson (Red Deer): I did not mean it exactly in that way. I meant as an effective detecting system.

Dr. Arnell: I think the answer is yes. I think we are satisfied with the detection system. There are a number of inherent questions in the total anti-submarine warfare picture.

Coming back to your earlier question, I think in large measure the operation of these

types of ballistic missiles and submarines would tend to be outside the actual CANLANT area, because if you look at the map of North America the optimum positions are really to the south of us where one would tend to sit in order to look at the heartland of Canada. People forget that the nearest salt water to Montreal is off Maine, not off the Canadian coast. It is only a couple of hundred miles from Montreal to salt water if you go south-east.

• 1630

Mr. Thompson (Red Deer): This morning in your presentation, Dr. Lindsey...

Mr. Roberts: Mr. Chairman, may I ask one supplementary before we leave anti-submarine warfare?

The Chairman: Are they extensive supplementaries? If so, your name is down for other questions.

Mr. Roberts: I do not think that they are very extensive, but when I ask them perhaps you may want to rule me out.

The Chairman: Do you have a number of supplementaries?

Mr. Roberts: I just have two: First, is present anti-submarine detection based upon acoustical devices; second, with the development of submarines is this whole system of detection through acoustics likely to become archaic or outmoded by present technological developments?

Dr. Lindsey: The present systems do depend primarily on acoustic means and as submarines become quieter the systems will become less effective. As technology improves we hope that they will become more sensitive and it will be one of these measure versus countermeasure and offence versus defence contests. Certainly, as the submarines become quieter they are going to be more difficult to detect.

Mr. Roberts: Thank you.

Mr. Thompson (Red Deer): My last question, Mr. Chairman, refers to a point in the presentation this morning where Dr. Lindsey pointed out the fact that any intercontinental ballistic missiles coming from a source at this end run directly into an ABM system on the other end. You tended to say that this might not be so dense or so completely capable as

what might be the hope for an ABM system over here. However, you left that similar place on the chart of any ICBM coming from the other direction completely open at this end. Just how extensive is the ABM system that Russia has developed and how far advanced and how thorough is it?

Dr. Lindsey: There is a lot of controversy about that and I only know what people who have studied it tell me, and they do not agree with each other. I think it is fairly clear that the Russians have built some sort of a system that was supposed to have an ABM capability but they have not gone ahead and thickened it up in the way that you would have expected them to do if it had been brilliantly successful, and if they had been aiming at a thick system. Perhaps they have run into technical difficulties and are improving their equipment. I do not think today that it is really a very effective thick system, but whether it is the base that they will build on, or whether they are going to stop, or start all over again, I do not know.

Mr. Thompson (Red Deer): Is not one of the arguments in favour of the development of an ABM system over here that the Russians already have such a system in effect there?

Dr. Lindsey: I do not think it is very good strategy to just match something your opponent did with something similar on your side. I think what you do should be matched to an obvious need that you have, and I do not think just because...

Mr. Thompson (Red Deer): You cannot disrelate those two points.

Dr. Lindsey: No, but you have to ask why did he build his ABM, and why did he put it where he did, and does it fit in with his strategic problem? It could be that good strategy would advise the Russians to build one and the Americans to not build one, or build a bigger one, or put it there for a different purpose. I do not know how much influence the fact that the Russians were building one had on the Americans. It is very difficult to say.

Mr. Thompson (Red Deer): As I listened to you this morning it seemed to me that you were saying to us that any missiles that might originate in this direction going that way faced an obstacle that missiles originating over there coming this way would not face?

Dr. Lindsey: That is true today.

Mr. Thompson (Red Deer): If that is so then it seems to me you are also saying that the ABM system is necessary. At least one of the reasons for it being necessary is that very lack in the defensive posture here.

Dr. Lindsey: I would rather make the reasons for and against an American ABM system on the threat that they face, and their vulnerability, as opposed to whether the Russians have one, and they just want to equal the score board on both sides.

Mr. Laniel: Dr. Lindsey, first I want to start with the SLBM's. You did not say what the range of the missile was that you find in the Russian submarine. How close do they have to come to the American coast really? I am trying to establish the value of our anti-submarine warfare role right now.

• 1635

Dr. Lindsey: The SLBM's listed in the military balance for 1968-69 show one Russian SLBM with a range of 400 miles and one of them with 650 mile range. So we are dealing with something of a few hundred miles range. I believe that the one that they expect to come in the next few years will be more than that, perhaps over 1,000 miles.

Mr. Laniel: You said this morning the submarines actually were practically invulnerable as a second strike force, I imagine, once they had left port. What did you mean by that? Do you only mean that they could not easily receive a direct hit from our ICBMs or does this include the contribution of our anti-submarine force?

Dr. Lindsey: I meant that the counter force effort by one side's offence could not be used against the other's submarines. I meant that they could not be engaged with bombers, ICBMs, or SLBMs. They are, of course, vulnerable to an effective ASW system.

Mr. Laniel: Yes, but you said that the ASW role would not be as effective on the first strike.

Dr. Lindsey: Yes, I did, and it is for this reason. If the war has not started, and we, for example, have a good ASW system, we perhaps can track the other submarines and perhaps even come quite close to them, but we cannot attack them. The war has not started. If the way we learn that the war has started is by their launching missiles, then we cannot prevent them from at least launching

the first few missiles, and these missiles could be launched in very short sequence.

Mr. Laniel: Do you know if right now we succeed in tracking them?

Dr. Lindsey: On occasion we do, yes.

Mr. Laniel: On occasion.

Dr. Lindsey: Yes, not always.

Mr. Laniel: Why? Is it because we are just playing war in the Atlantic or is it because the ASW role is not as effective as it should be or as we say it is?

Dr. Arnell: I think the real answer here is the one I gave in attempting to answer Mr. Thompson earlier. They do not come into our area very often. I mean this is the real answer from the Canadian point of view. They really go outside and south and this does not really get us intimately involved operationally unless we happen to be...

Mr. Laniel: Yes, but are you aware of whether or not Americans succeed in tracking them?

Dr. Arnell: I think they have a fairly reasonable success level.

Mr. Laniel: Would you not think that this would be a priority—to know where they are in case of an emergency?

Dr. Arnell: I think perhaps what you are reaching for is a slightly different aspect of the problem which was something in the early days of our air defence system that prompted us to put in the Mid-Canada Line. You can detect something and lose it and then need to detect it again. One of the concepts of the Mid-Canada Line was that you could detect anything that came over the DEW Line.

However, something could cross a certain point in northern Canada, it could then disappear out of all the surveillance system for a long time and you would have absolutely no way of knowing whether it had flown south-east, south-west or due south. We conceived the Mid-Canada Line as being a way of spotting it to determine just which part of the mainland it was aiming for.

There is not any real answer to your question. There will be a certain point at which detection is high. There may be another area

where, in fact, you have lost them for a while and then you find them again. So that detection by itself does not really mean anything.

Mr. Laniel: From the impression that I got this morning from Dr. Lindsey when he did speak of the possibility of an attack, he seemed to leave out this element of the Russian forces because of a lack of accuracy. Is it of little importance in comparison to the accuracy of the ICBM and to the threat of supersonic bombers?

● 1640

Dr. Lindsey: The missiles that can be carried by a submarine are, not surprisingly, rather smaller than those that can be launched from land or than can be carried by a bomber, and they are not quite as accurate. For that reason, if the one side has only a small force of ballistic missile submarines it may be that he would prefer to use them in the second strike role rather than in the first strike role because they would be very effective against cities.

Mr. Laniel: The reason why I asked this is because we are repeatedly told that the first purpose of NORAD is the protection of the deterrent.

Dr. Lindsey: Yes.

Mr. Laniel: I am trying to evaluate as to where is the best place to spend money; that is why I asked this question.

Dr. Lindsey: I think that the submarine launched ballistic missile would be used most effectively against the deterrent by bombarding airfields, especially ones that are near the coast; so that they could catch them with very short warning and destroy the bombers on the ground. I do not think that they could be used against ICBM sites; they are not accurate enough. Also, most of the ICBM sites are far inland.

Mr. Laniel: I will leave the ICBMs for now. I just have a question or two about the BMEWS. Are they the same type of radar as the other lines that we have, or have they not any over-the-horizon capacity?

Dr. Lindsey: No, and they do not have any capacity for spotting aircraft. The BMEWS can only detect missiles and space objects.

Mr. Laniel: They are not used at all for aircraft.

Dr. Lindsey: No.

Mr. Laniel: They will not pick them up. What is their range?

Dr. Lindsey: The BMEWS range is very long and effective; it can detect anything above the horizon, and it picks up many objects in space orbit; it would spot anything in a ballistic course.

Mr. Laniel: Are they affected by the atmosphere or any of the things that you have mentioned?

Dr. Lindsey: No.

Mr. Laniel: They are not reflected?

Dr. Lindsey: It is a direct radar which sends out a pulse which is reflected off the objects in space and then comes directly back again. This is the sort of thing which we will be talking about on May 22.

Mr. Laniel: When we speak of electronic counter measures, do we only mean measures that are there to disturb the defence system, the radar or other such things? Is there anything that has come out of the possibility of using electronic measures to off-balance the controls of ICBMs? Could you one day disturb the control of the electronic machinery so that an attack would be set-off on North America with ICBMs?

Dr. Lindsey: Most ICBMs have what is called inertial guidance; it is only applied during the first few minutes of their flight; after their rockets have burned out, which is within five minutes after launch, when they are still close to home, they become literally a ballistic object; all the rest of the flight is simply coasting, so there is not any more guidance. The chances of upsetting the guidance are really very limited; they would have to be applied during the first few minutes while it is still being boosted. That is very difficult to do of course.

Mr. Laniel: Yes. What do you think would happen if Canada decided not to contribute or participate in the defence of North America? What could the United States do by themselves really to protect...

Dr. Lindsey: Are you speaking of antibomber or antimissile defence?

Mr. Laniel: I am speaking of NORAD.

Dr. Lindsey: If the United States were unable to fly aircraft over Canada, they could not provide a very good air defence for many of their own important areas. They could defend themselves against attacks from the East and the West, but it would be very hard for them to make a good defence against the North, if it started right at the border.

Dr. Arnell: I think one must say that they could not do it, because with the air-to-surface missile, a Russian bomber could in fact stay north of the border and launch onto a large part of the American heartland.

• 1645

Mr. Brewin: I have a supplementary. They would not do it against the ICBMs now, would they?

Dr. Lindsey: No.

The Chairman: Mr. Laniel.

Mr. Laniel: Thank you.

The Chairman: Mr. Guay.

Mr. Guay (St. Boniface): My question, Mr. Chairman, is really a supplementary to Mr. Brewin's of this morning, when he questioned the AWACS. My question is, Dr. Lindsey, if they were to implement the new system of AWACS would you then delete or do without the radar ground stations, or could you do without them?

Dr. Lindsey: The Americans have considered this. One must remember the peacetime as well as the wartime role of the air defence system. We do intend to identify aircraft, make them obey their flight plans and identify those that disobey them; this would mean that we would have to have an identification and control system working at all times. It is questionable whether that could be done very efficiently from AWACS aircraft. There is also, of course, the possibility of using the civilian traffic control radars for many of these functions; the Americans are hoping to do that to a large extent.

It is too early to say whether or not the AWACS will enable the replacement of many ground control stations. I think that some of them could be replaced. Perhaps they could be thinned out a little, and the AWACS could then be used to fill in gaps. However, we really do not know yet.

If the AWACS fulfils the most optimistic hopes and it turns out to be fairly efficient

economically, it might well be able to replace a number of the activities on the ground; on the other hand, it may be a very expensive way of doing it.

Dr. Arnell: May I add some information to this, Mr. Guay? There are two things. One is the over-the-horizon radar; when it comes in, it will in fact be involved in a part of this early warning. For the second part, I will expand on what Dr. Lindsey said about the inter-relationship between the civilian traffic control and the military control in peacetime.

In a recent press release the Americans have announced that the FAA will be taking over three military radar sites within the next fiscal year. This is in the beginning of a program—I do not know how complete it will be in the end, and I am not sure that they themselves really know—of really integrating wherever possible, the civilian and military use of the same equipment. I think that when many of the present radars become obsolete and have to be replaced, they will undoubtedly be replaced by a radar which meets those needs, rather than continue having any double radar system which does, in a sense, exist today.

In Canada we do have DOT radars, which are essentially based along the main airline traffic routes. In other places they use some of our materials, or at least some of our information. This is part of the future; whether the military radar stays or whether it can be integrated with the civilian radar is something that is actively under study for the whole concept. This is being viewed, I believe, by all of us, as a possible way of reducing the over-all cost of the system.

Mr. Guay (St. Boniface): Mr. Chairman, may I ask Dr. Arnell a question? To your knowledge, have any studies been made with regard to the possibility of establishing the cost of the implementation of the AWACS program? Also, would the difference of this particular program extend to the ground radar as well? In view of what you have just told me, it appears that they would retain certain ground stations. Have any studies taken place at all, to your knowledge, in regard to the AWACS program and its cost?

• 1650

Dr. Arnell: I think Dr. Lindsey touched on the general cost figures earlier; perhaps that was before you came in. However, in attempting to answer your question more directly, the ground radar is in essence a

peacetime operation. As Dr. Lindsey mentioned this morning during his brief, and in the questions afterwards, AWACS is essentially a control system for an emergency. The question of whether or not AWACS aircraft are used operationally in peacetime, is a matter that has not yet been finalized, and will be the result of future studies. The peacetime need is essentially one of identification of unknown aircraft. This does not need control, in the military sense, in an emergency. A civilian traffic control radar can identify the location of an aircraft of which you have no identification, because at the moment, the identification on the civilian side is a voluntary one. The man on the ground calls up and says: "Will you identify who you are?" If the fellow does not hear the message and does not reply, you do not know who he is. This is one who does not have a flight plan. In this situation, as we answered earlier, an airplane is sent up a couple of times a day to have a look. The airplane is not sent up because you believe that he is an enemy, it is just that you have an unknown in the system. He has not answered, so you want to see who he is. You do not need the kind of control we keep talking about in the military sense, because an interceptor can find that airplane and look at it, without having a very elaborate control system. An elaborate control system is needed when the first pass is aimed at being a kill, and you must get that interceptor lined up because you may not get a second chance. Here, you get into a different order of controls. The ground radar refers to what I was saying earlier, that is, the national need that we have—and the Americans have a national need—of identifying aircraft in our own air space. There will be a continuing need for this. By the time we finish all our studies, we might find that our present Pinetree line or an integration of our present DOT system and that, or a combined new system if radars wear out, might be the cheapest solution for the long haul of updating that. These are things which will come out in the course of the next year or two. Precisely what the answer is to that, I do not know. I can say that as long as there are airplanes we must have ground radars in Canada for peacetime identification.

Mr. Guay (St. Boniface): Even though you may have the AWACS?

Dr. Arnell: There may be no peacetime use for AWACS. It may be essentially for emergency use.

Mr. Guay (St. Boniface): This part intrigues me because you keep saying that the ground radar is peacetime, and AWACS is really emergency time. Since you are using the peacetime radar, it could very well be that by the time you are aware of an emergency it would be too darn late to use the AWACS system.

Dr. Arnell: Here we are only talking of the days when there would be Over-The-Horizon Radar. This Over-The-Horizon Radar will tell you that there is a flock of airplanes, perhaps a thousand miles away. If you get six or eight airplanes that have no flight plan at all, and that are coming from an unusual direction, no military commander will sit quietly and say: "I do not believe that there is any need to go into an emergency." In this situation, the AWACS, if it is not on operational duty at that particular moment, will be airborne and put into position to take over control and to bring interceptors in at a chosen point.

Mr. Guay (St. Boniface): Dr. Arnell the other part of my question—which I do not believe you have answered, or at least, I did not hear you—is Has any studies been made to determine the approximate cost of the implementation of AWACS, if we were to use them? What is involved in the cost?

The Chairman: This question has been answered.

Mr. Guay: I was not here, I guess, at the time. I am sorry.

Dr. Lindsey: What I was able to say was that one of the American plans, which we have seen, involves the purchase of about 45 of these AWACS aircraft. The cost was something between \$1 billion and \$2 billion for the total cost of procuring and operating this fleet for 10 years or so. They are a very expensive aircraft, but they are able to do many things.

• 1655

Mr. Guay (St. Boniface): Thank you, Mr. Chairman.

Mr. Ryan: Mr. Chairman, first I would like to clear up a matter with Dr. Arnell, and then I have a few questions for Dr. Lindsey. I would like to direct your attention, Dr. Arnell, to the agreement to extend the NORAD arrangements for a period of five years, and particularly to the note sent to our ambassador at Washington which was written by Mr. John M. Leddy for the Secretary of

State on March 30, 1968. The beginning of that note says:

I have the honor to refer to discussions in the Permanent Joint Board on Defense and elsewhere regarding the mutual interest of the United States and Canada in the continued cooperation between the two countries in the Strategic defense of the North American continent.

After reading this, I thought that we should have, on the record of this Committee, details about the Permanent Joint Board on Defense. What is it? Who does it discuss? How long has it been in existence? Why is it called "Permanent"? Has it more relation to NATO or to NORAD? How does it fit into the whole picture?

Dr. Arnell: I would suggest, Mr. Chairman,—as I know that you are going to be seeing the Department of External Affairs either on Thursday or at the beginning of next week—that you ask them for a more complete story on this. In general terms, the Permanent Joint Board of Defense was the result of the Ogdensburg Agreement between President Roosevelt and Prime Minister Mackenzie King in 1940. It was 1940 was it not, Mr. Brewin?

The Chairman: May I interject for just a second, Dr. Arnell? Does it still exist, or was it replaced by the Joint Command?

Dr. Arnell: The Permanent Joint Board of Defense is a creature of that earlier agreement and—

The Chairman: Does it exist now, Dr. Arnell?

Dr. Arnell: Yes, it exists now. I am afraid I cannot tell you who is on it, but External Affairs could give you this directly. It is the oldest consultative body, in defence, that exists between the two countries. It meets every three months or something of that nature. As it is essentially an external matter, it is managed by the Department of External Affairs with the U.S. State Department, but it has military representation. I suggest that the question be put to the Department of External Affairs and then they could provide the details. I am sure that if the Clerk asked the officials from the Department of External Affairs they could prepare the information and give it to you when they appear before the Committee.

Mr. Ryan: Thank you very much, Dr. Arnell.

Dr. Lindsey, with respect to the Cover-the-horizon" radar, is this really proven at this moment? Is there a pilot project in which we have confidence? Is there any development of it anywhere in North America, or anywhere else?

Mr. Lindsey: It is not operationally deployed. The plan which the United States government has, at the moment, will not be in service for several years. It still has some tests to pass.

Mr. Ryan: We do not know whether or not it will work for us?

Dr. Lindsey: I think the principle is well established, but it is not yet clear just how effective it will be when the Northern lights are active, and that sort of thing, so there is still a lot to learn about it.

Mr. Ryan: I understand that the downward radar which is airborne by this AWACS system has a lot of kinks which must be ironed out. With regard to that is it in a better or worse position than the Over-The-Horizon, at the moment?

Dr. Lindsey: I think the best authority on that subject is Clark Clifford's statement which occurred earlier this year in the U.S. defence budget—and I may have put it in the paper that we have—but he says:

The over-land radar technology program is progressing satisfactorily, and the tests to date have been encouraging.

Then, he continues and says that they will allot money to see how it passes its' test. They will then give them more money—to make sure that they do not bet their shirt on the thing until it has passed a few more tests. He goes on to say:

We intend to pursue this program with great prudence, holding our investment to the lowest practicable level until the prime contractor selected has successfully demonstrated by actual flight tests a useable radar detection and tracking system. If all goes well, the first of these aircraft should enter the force in the mid-1970s.

It still has to prove itself, and be bought. It has not yet reached that stage.

Mr. Ryan: Dr. Lindsey, Are there any Canadians participating in the development of

this radar capability, such as you have yourself? Have you been given an opportunity to study this development, as it progresses?

Dr. Lindsey: I do not believe there are any Canadians involved in the development of it. From time to time, we are given progress reports by the United States. I do not think that we are actively involved, in the form of any actual Canadian participants.

• 1700

Mr. Ryan: You are not personally in a position to evaluate it for us?

Dr. Lindsey: No.

Mr. Ryan: And there is no other Canadian, I take it, that would be?

Dr. Lindsey: I do not think so.

Mr. Ryan: This is pretty well true of both radar systems, the downward as well as the Over-the-Horizon, is it?

Dr. Lindsey: I think we are perhaps more closely involved in the research on the Over-the-Horizon radar, partly because for many years Canada has been doing work on propagation of radio signals in the ionosphere, and some of our laboratories, I suppose, are the most knowledgeable in the world about the conditions of radio propagation in the auroral zone. So our people are consulted on this, and they are probably closer to the progress on the OTH type of work than on the AWACS type.

Mr. Ryan: Doctor, I note with great interest that you have been personally associated with anti-submarine warfare in a major way, as you were the chief of the operational research group at the anti-submarine warfare research centre of NATO in La Spezia, Italy, for three years. During that time, you would be involved very deeply with radar and sonar in a downward respect and would become quite familiar, I would think, with the bottom of the Mediterranean Sea. What problems would you run into in anti-submarine warfare detection? Is it a great deal more difficult to detect a submarine than it would be a plane flying low?

Dr. Lindsey: I think it is more difficult to detect a submarine. The ocean is a more complicated medium than the atmosphere. There are layers of water of different temperatures that bend the rays. A submarine can measure

these temperature differentials and can find shadow zones and hide in them. The sea is full of fish and layers of small marine plant life. I think in many ways the problems are considerably more difficult than with radar. After all, an aircraft has to move quite fast in order to stay up and it is very different from the surrounding air. A submarine can go very slowly and to a sonar it looks very much like a whale.

Mr. Ryan: I take it you have every confidence that the downward radar will likely develop and be a great asset in the defense against manned bombers coming in.

Dr. Lindsey: I think the prospects for it are very good, but I would not say that it was absolutely proven and certain yet.

Mr. Ryan: Have you, personally, investigated our effort on our Eastern Seaboard with respect to antisubmarine methods of detection? Have you familiarized yourself with it as a result of your experience in the Mediterranean?

Dr. Lindsey: I have not been personally connected very closely with the work of our Maritime Command. Strangely enough, most of my anti-submarine experience was in the Mediterranean and not in the Atlantic.

Mr. Ryan: Yes, that is what I thought, but you might have been sent there just to take a look at what we were doing on our Atlantic Seaboard.

Dr. Arnell: Are you not going to have an opportunity to get into that later this month?

Mr. Ryan: Yes, but maybe not with Dr. Lindsey. Thank you, Mr. Chairman.

The Chairman: If I may ask a supplementary question on costs, are these not dealt with, Dr. Lindsey, on page 31 of your working paper under the heading "Estimated Cost

• 1705

of U.S. Program", where you say the estimated total cost of the U.S. Program over 10 years is \$12.3 billion? We have been talking about our Canadian contribution as 10 per cent of the total cost. Is that the total cost of U.S. and Canadian, or is that just the U.S. program?

Dr. Lindsey: It is the U.S. only.

The Chairman: It is the U.S. only, so the Canadian program would be in addition to that?

Dr. Lindsey: Yes, it would.

The Chairman: Similarly, the figure down below of \$.69 billion as maintenance cost is just the U.S. cost?

Dr. Lindsey: That is right.

Dr. Arnell: I believe that really this first figure, with perhaps a slight inflation, is what the Americans really figure they are spending per year at the moment, multiplied by 10. I think before you came back this afternoon, Mr. Chairman, I pointed out in attempting to answer a question earlier that the present annual cost of air defence in the United States is very largely made up of operations and maintenance. Within this total there is a small amount of new capital but not very much.

The present scheme is to try and reduce O and M costs by various economies and to divert the money into a major capital program. At the end of ten years, the capital having been procured, they anticipate a drop in annual operating costs from something of the order of \$1.1 billion or \$1.2 billion down to this \$.7 billion. In other words, it is an attempt to reduce annual costs to increase effectiveness against new threats and include a capital program in doing so.

The Chairman: Dr. Lindsey, the paper points out reasons why we should have an anti-bomber defence to defend us against a possible bomber attack, although no one knows whether it will actually come or be effective if it does come. You pointed out in your certain disadvantages with our existing bomber defence and suggested a new system which might conceivably overcome some of those disadvantages. On the other hand, the paper indicates that there is no indication that the Russians are improving their bomber technology.

Now, if our present methods of defence are successful as the paper indicates they have been, and if the Russians are not making any substantial change in their bomber technology, what is the real reason to suggest that we should consider improving defences against a threat which may or may not come and which would involve substantial capital expenditure?

Dr. Lindsey: I think when you say that the Russians are not improving their bomber technology we should make two caveats: First, we believe they are fitting this air-to-surface missile, which means they would not have to penetrate as deeply into the system; second, we believe they are able and ready to fly very much lower than bombers used to do some years ago.

There are two things this improvement in the system will do to enable us to cope with these two changes; that is, firstly, to be able to intercept a bomber before he launches this missile some hundreds of miles from his target; secondly to be able to intercept him if he chooses to come in very low.

The Chairman: I see. Thank you very much, Dr. Lindsey. Mr. Roberts.

Mr. Roberts: No, I asked my question earlier, Mr. Chairman, and I do not have any further questions.

The Chairman: Are there any other questions?

Mr. Ryan: Mr. Harkness asked his on a supplementary, Mr. Chairman.

The Chairman: If there are no other questions on your behalf I would like to thank Dr. Lindsey and Dr. Arnell for the information they have given us this afternoon. We will be seeing Dr. Lindsey again next week. Thank you very much, Dr. Lindsey and Dr. Arnell.

There will be no meeting tonight and on Thursday we will have a meeting on the Estimates of the Department of External Affairs and the International Joint Commission in

• 1710

this room at 11 a.m. On the following Tuesday we will be on the CIDA Estimates, the Canadian International Development Agency.

Mr. Roberts: Do you have any idea, roughly, when we will have Mr. Cadieux, the Under Secretary of State for External Affairs back? We had interrupted testimony from him, I guess two weeks ago now.

The Chairman: The Under Secretary of State will be here on Thursday of this week.

Mr. Roberts: Thank you, very much.

The Chairman: The meeting is adjourned.

REFERENCES	1515

This paper has been prepared by officials of the Department of National Defence for the information of the members of the Standing Committee on External Affairs and National Defence. In order to elucidate fully the issues involved it has been necessary to touch on matters which are still under review. Therefore, the Committee's attention is drawn to the fact that this does not necessarily represent the policy or views of the Government of Canada nor the Department of National Defence.

INTRODUCTION

A searching analysis of the means of defending North America against missile and bomber attack must be undertaken against the background of the strategic balance between the United States and the Soviet Union.

In seeking to ensure its national security, Canada must be concerned with questions of stability and the prevention of nuclear war on the international scene. However, the part that Canada can play in the maintenance of the strategic balance is necessarily a limited one.

Consequently, this paper is presented in two parts. The first concerns strategic offence and defence in general, and the strategic balance between the two Superpowers. The second part discusses in more detail those bomber defence activities in which Canada might engage in the future. Prior to a subsequent meeting of this Committee, a third part will be distributed which will describe the implications for Canada of defence against ballistic missiles.

There are important questions relating to the prevention of nuclear war that are not touched in this paper, such as arms control, the non-proliferation treaty, and the comprehensive test ban, as well as international relations in general.

PART I: STRATEGIC WEAPON SYSTEMS, STABILITY, AND THE PREVENTION OF NUCLEAR WAR

Nuclear War Avoided for Fifteen Years

In the early nineteen-fifties, with the Superpowers developing thermonuclear bombs and intercontinental bombers, a war in Korea, and extreme tension in Europe, the outlook for the world appeared extremely ominous. The larger Western countries were spending over 10 per cent of their GNP on defence (1953¹: USA, 14.8 per cent; UK, 11.3 per cent; France, 10.9 per cent; Canada 9.0 per cent) and exhorting one another to raise rifle divisions for the NATO central front. If a "solution" had been offered that would guarantee existing frontiers and prevent the use of nuclear weapons, at an annual

cost of 10 per cent of the GNP in perpetuity, it would have been seized with gratitude and alacrity.

In fact, by halting and irregular steps, a "solution" has been found, which has not only preserved frontiers and prevented the use of nuclear weapons, but has permitted a considerable degree of detente, and all at an annual cost of less than 10 per cent of the GNP (1967²: USA, 9.8 per cent; UK, 5.7 per cent; France, 5.3 per cent; Canada, 2.7 per cent).

Before the West alters this "solution" for the sake of change per se, or allows it to slip away through neglect and preoccupation with other problems, it should reflect on the 15 years of peace, consider how badly it wants another 15 years of peace, and what risks it is prepared to accept that an abandonment of a successful "solution" could lead to the loss of peace.

Mutual Deterrence at the Strategic Level

In the years immediately following World War II, the US had a large force of long range bombers (built for the strategic offensive against Japan) and a small but growing stock of nuclear weapons. No other country had such a capability. Had an enemy taken sufficiently provocative action against the West, the US could have inflicted "massive retaliation" by striking his major cities and other assets of value (known as a "counter-value strike"). Since the US did not risk similar punishment in return, their threat was "credible". A state of "deterrence" prevailed, but it was not "mutual".

The Soviet Union made haste to offset this asymmetry as soon as it could. By the mid-1950s, it had built a fleet of intercontinental bombers and armed them with thermonuclear bombs. Had the bombers on each side been practically invulnerable, the main result of this development would have been to produce a state of mutual deterrence. However, a new and extremely dangerous factor was introduced by reason of the vulnerability of the bombers to attack by the opposing bombers (known as a "counterforce strike"). The bombers were concentrated on a few major

air bases, and the destructive power of the thermonuclear ("hydrogen") bombs was so great that, if one attacking bomber could catch several dozen opposing bombers on the ground, he had a very good chance of destroying them all. Thus, there arose the temptation to make a surprise "counterforce first strike", directed against weapons rather than population, in the expectation that its success would leave the opponent disarmed and unable to retaliate. The frightening feature of this situation was that it promised a decisive advantage to the side which struck first. It was well described in Wohlstetter's telling phrase³ "The Delicate Balance of Terror". In the terminology to be employed in this paper, this situation is labelled as "unstable".

The advent of the first Intercontinental Ballistic Missiles (ICBM's) rendered the situation even more unstable. The missiles were vulnerable and unreliable, and required a long preparation time before they could be launched. Even more then was the case for bombers, there was a strong incentive to fire them quickly, before they were destroyed. Each adversary felt obliged to maintain a high state of alert, and one heard of "the hair-trigger response".

The two Superpowers were well aware of the unstable nature of their mutual deterrence, and took urgent steps to correct it. Great qualitative improvements were made in the ICBMs, which were buried in dispersed and hardened underground silos, were made much more reliable, and had their preparation time before launch reduced to a very few minutes. The number of ICBMs was increased to the point that the probability of losing all but a very few of them to a surprise counterforce first strike became negligible. Ballistic missiles were fitted into submarines, which were able to remain submerged for weeks and to launch the missiles from below the surface. To prevent the possibility of losing all bombers on the ground, some were kept armed and airborne at all times, and radar detection lines were deployed to give early warning of attack.

In order for Country A to be deterred by Country B, it is necessary that A must believe that, no matter what A does, B will retain the means and the will to be able to destroy A's cities. B must maintain a capability for "assured destruction". Assured destruction has been defined⁴ as the ability to inflict at all times and under all foreseeable conditions an unacceptable degree of damage upon any sin-

gle aggressor, or combination of aggressors, even after absorbing a surprise attack.

To quote Secretary of Defense Clark Clifford⁵, discussing the difficulty of defending against nuclear-armed missiles,

"Many knowledgeable Americans, both within and without the Government, have wrestled with this problem over the years. There is now a very broad consensus that until a truly safeguarded nuclear disarmament agreement is achieved in the context of viable world wide security arrangements, the only realistic policy we can pursue at this particular juncture is one of deterrence. In other words, we must be prepared to maintain at all times strategic forces of such size and character, and exhibit so unquestionable a will to use them in retaliation if needed, that no nation could ever conceivably deem it to its advantage to launch a deliberate nuclear attack on the United States or its allies".

Deterrence through assured destruction is the cornerstone of US defence policy, and Soviet actions suggest that it is also their prime objective.

These measures to increase the numerical strength and decrease the vulnerability of the deterrent forces created a condition which can be described as "stable" inasmuch as:

- (a) neither adversary felt a compelling urge to fire first (before his forces were destroyed), and
- (b) neither needed to gauge the size of the opposing force with great precision, or to feel unduly menaced if he learned of a modest increase in the opponent's strength.

For the last few years, this stable balance has been maintained. It depends on both adversaries having the capability for "assured destruction". If it is still a "Balance of Terror", it is no longer a "Delicate Balance". In the US, and very probably also in the Soviet Union, the hair-trigger response has been replaced by a system of technical and organizational safeguards ensuring that no weapons will be launched under extreme urgency of time or before thorough assessment by the highest authorities, and certainly not by a computer, or as a result of an accidental firing by the opponent. A very considerable change in the offensive or defensive power of one or both Superpowers would be required in order to alter the situation so that one

Superpower felt that he must fire first (or even respond very quickly to what he judged to be an attack). Neither does either opponent need to view a small increase in the other's force as likely to endanger the credibility of his own deterrent.

How Much Deterrence is Enough?

In his statement before the Senate Armed Services Committee^a in January, 1968, Secretary of Defense Robert McNamara explained that,

"Even if the Soviet strategic forces by 1972 reach the higher end of the range of estimates projected in the latest National Intelligence Estimates and even if they were to assign their entire available missile force to attacks on our strategic forces (reserving only refire missiles and bomber-delivered weapons for urban targets) about one-half of our forces programmed for 1972 would survive and remain effective... Even if the Soviets deploy a substantial number of ABM interceptors by 1972, our strategic missile forces alone could still destroy... more than 100 million people, and over three-quarters of their industrial capacity".

In the same statements^b, he estimated that in the mid 70's each country could inflict 120 million fatalities on the other in retaliation.

Presenting the 1970-74 Defense Program in January, 1969, Secretary Clark Clifford¹⁰ said,

"While numbers of Soviet and US warheads, delivery systems, megatons and many other factors are taken into account in the analysis of our strategic forces requirements, the soundest measure of the effectiveness of these forces in the "Assured Destruction" role is their ability, even after absorbing a well-coordinated surprise strike, to inflict unacceptable damage on the attacker... Our calculations indicate that the US strategic forces programmed over the next few years, even against the highest Soviet threat projected in the National Intelligence Estimates, would be able to destroy in a second strike more than two fifths of the Soviet population and about three-quarters of their industrial capacity".

Calculations of this type indicate how much deterrence is enough. It appears clear that for the conditions of 1969, the US has more than enough. The USSR, with approximate parity

in ICBMs, also has enough in 1969. We have mutual deterrence and the balance is a stable and robust one. This is the "solution". It has worked. Its cost to the US for strategic forces, both offensive and defensive, since 1965 has averaged about one percent of the Gross National Product.

Damage Limiting

Once mutual deterrence has been assured, further strategic objectives can be sought. One of these is "damage limiting", the capability to reduce the damage that can be inflicted on one's cities in the event that deterrence fails, and a counter-value attack is actually delivered by the enemy. Damage limiting depends primarily on defensive systems sited for protection of cities, but it is also possible to reduce damage by using offensive weapons in a counterforce role, provided that the enemy weapons are still there to be hit.

In a sense, damage limiting can be regarded as superfluous, in that it will not be needed if deterrence (due to the existence of assured destruction) is successful. However, there can be a more serious objection to damage limiting if it is carried to such a degree that it drastically reduces the ability of the opponent to inflict damage in a retaliatory countervalue second strike. In this case, it would be weakening the basis of mutual deterrence and moving the balance away from stability. It is a strange twist of logic, that a defensive move to save lives can be dangerous. To quote from Professor Rathjens recent paper on "The Future of the Strategic Arms Race"¹²

"The second policy dilemma—the incompatibility of a 'damage limiting' policy with other US objectives—is more difficult to deal with... there is the possibility that certain actions taken by the Superpowers to reduce damage, should deterrence fail, may lead to an increase in the probability that it will fail, particularly if the adversary should fail to modify his force posture in response to those actions..."

In short, there is an inherent inconsonance in the objectives spelled out in our basic military policy, namely, "to deter aggression at any level, and should deterrence fail, to terminate hostilities in concert with our allies under conditions of relative advantage while limiting damage to the United States and allied interests"⁽⁴⁾. Hard choices must be made

between attempting to minimize the chance of escalation and attempting to minimize the consequences if it does occur".

The Main Strategic Offensive Systems

The most important strategic weapon system today is based on Intercontinental Ballistic Missiles. The US and the USSR each have about one thousand. The larger ones can reach any point on earth, and no point in the territory of either Superpower is beyond the range of hundreds of the opponent's missiles. The size of the warheads and the accuracy of delivery are sufficient to enable one missile to have a high probability of destroying a medium-sized city or all of the aircraft on a large air base. However, ICBMs buried in underground silos are tougher targets, and they are sited too far apart for simultaneous destruction by a single warhead. An attacker would have to allot several missiles against one hardened silo in order to achieve a high probability of destroying it.

ICBMs can be used against any type of fixed target small ("point") or large ("area"), military or civil. If they are used in a surprise first strike, they would be targeted mainly against the enemy's fixed missile silos and bomber airfields. In this sense, the first strike is counterforce, and its objective is "damage limiting" since the enemy missiles and bombers destroyed would have been targeted as a retaliatory force against one's own cities.

Ballistic missiles in nuclear-powered submarines are virtually invulnerable to enemy missiles. The submarine-launched missiles have less range, inferior accuracy, and smaller warheads than land-based ICBMs. All of these characteristics make the SLBM particularly well suited to the second strike counterforce role for assured destruction. However, SLBMs could be used in a counterforce first strike against airfields.

The US have 41 ballistic missile submarines, each nuclear-powered, and each carrying 16 Polaris missiles. 31 boats will be converted for Poseidon missiles, with a greater payload*. The Soviet Union has about as many submarines which are able to launch ballistic missiles, but most of them are conventionally-powered and most carry only a few missiles. The number of SLBMs which could be brought to bear against North America is probably of the order of 45 as compared to 656 for the US.

Manned bomber aircraft are vulnerable on the ground and take a number of hours to reach targets at intercontinental ranges. They can carry a very large payload and, in the absence of effective defence, deliver it with great accuracy. With a sacrifice in payload and accuracy the warheads can be delivered by air-to-surface missiles, making it unnecessary for the mother aircraft to penetrate right to the target.

Bombers can be used against control centres and pinpoint targets, but are of little value in a counterforce role against targets which are likely to be gone with adequate warning. They are very effective countervalue weapons, and those that survived and attack could be used in a countervalue second strike. Of course, in the absence of an effective air defence system on one side, the other side's bombers would be very potent first strike weapons.

The USAF have about 600 long-range bombers, compared to the Soviet total of about 150.

The Main Strategic Defensive Systems

Although much is being said about anti-ballistic missile (ABM) systems, very little exists in an operational state today. The Soviets have deployed a thin system in the vicinity of Moscow, but the planned US system will not have the first units in the field until 1973.

If an effective ABM system were deployed, it would probably be able to intercept SLBMs as well as ICBMs, and it is conceivable that it could have some capability against high altitude bombers. If it were of the "point-defence" type, the owners would have the option of defending cities, weapon sites, or other valuable targets. If each unit defended a large area, there would still be some choice in both the deployment and the firing doctrine as to the kinds of targets selected for defence.

If the ABM system were able to protect ICBMs and bomber bases from attack, it would contribute to assured destruction (and to stability). If it protected cities, it would contribute to damage limiting. As mentioned earlier, this could be considered as destabilizing.

Present day anti-submarine systems are directed against the submarine rather than its missiles in flight. If the submarines participate in a surprise first strike, all launching at

a pre-arranged time co-ordinated with the ICMB launchings, the defence may not know that the war has started until the missiles are on their way. Submarines can launch their missiles at very short intervals, so that the anti-submarine system has no time to prevent the first launching and very little before all the others have gone.

If a mounting period of tension preceded the first strike, it might be possible to take action against unidentified submerged submarines within a declared zone. Or, if the SLBMs were allotted a second strike role, which fits more exactly to their technical capabilities, submarine defences might have enough time to hunt them down.

Submarine defence contributes to damage limiting if the SLBMs are used against cities, but to assured destruction if the SLBMs are used against bomber airfields in a first strike.

The air defence systems protecting North America and the Communist portions of the Eurasian land mass have been essential elements in the maintenance of stability since the advent of the manned bomber threat. True, the relative importance of air defence has decreased as the offensive emphasis has shifted from the manner bomber to the ICMB and its variants. However, as long as each side maintains a bomber fleet capable of striking at the other, both must operate air defence systems to maintain the balance of stability. If one side were to eliminate its air defence system or reduce it below an effective level, this would remove the requirement for the opposing bomber force to carry defensive armament, electronic warfare equipment, or the extra fuel necessary for evasive routing and low altitude penetration. Even comparatively low performance aircraft could be used to carry heavy bomb loads. Furthermore, the side without an air defence system would find itself unable to police its own airspace from the peacetime probes and penetrations conducted by unknown parties.

A fourth strategic defensive system is passive defence, often called Civil Defence when referring to the measures taken to protect civilian population. Many of the steps such as the construction of blast or fallout shelters or the preparation for evacuation or rescue are equally valuable against nuclear weapons delivered by any of the various means, pres-

ent or future. Civil defence contributes to damage limiting. In the odd logic of deterrence, it could be considered as destabilizing.

Possible Future Developments in Offensive Systems

It is obvious that a country which has rockets big enough to propel manned capsules into earth orbit can deliver very large payloads in an intercontinental ballistic trajectory. Considerable interest has been shown in the Soviet SS-9 ICMB with a warhead in excess of 20 megatons. Such a warhead is bigger than needed to obliterate any but the largest cities. It would increase the probability of being able to destroy an underground control centre.

More sophisticated, and probably more effective, than sheer weight of payload is the capability for delivery of several separate warheads. Alternatively, the large "throw-weight" of the SS-9, the Titan 2, or other large booster rockets can be used for propulsion into complicated trajectories other than the simple ballistic path.

A large payload can contain several warheads which separate and re-enter independently. If these have no propulsion or guidance, but merely scatter (like buckshot) at random on paths slightly diverging from the mother vehicle, they are called Multiple Re-entry Vehicles (MRVs). It is probable that the total megatonnage of the set of MRVs would be considerably less than yield which could be obtained from a single warhead of the same total weight. The total damage done to a very extended target (such as Los Angeles) could be greater for the MRV payload, but it is unlikely that it would be as effective as the single large warhead for the destruction of a small hard target. The main advantage of MRV would be for the penetration of an ABM system, if a separate interception by a separate anti-missile missile were required for each re-entry vehicle.

A more sophisticated threat than MRV is MIRV—the Multiple Independently Targeted Re-entry Vehicle. It has also been called "Space Bus". Each of several independent warheads is provided with individual guidance to its own target. The extra weight for propulsion and guidance would be at the expense of the warhead, but the effectiveness of the system is likely to be much greater. It is conceivable that a large ICMB could deliver 10 MIRVs aimed at 10 of the

opponent's ICBM silos, and expect to destroy several of them.

Another way to exploit a large "throw weight" is by means of the "Fractional Orbital Bombardment System (FOBS)". This consists of boosting the payload plus the last stage into a low circular earth orbit (at an altitude of perhaps 100 miles) and then deboosting it to descend on its first approach to the target. The time of flight would be less than for an ICBM, and the trajectory would be considerably lower, which would delay or prevent the detection by ground-based radars. Instead of launching in the direction of the target, it would be just as easy to choose the opposite direction, go more than half way around the earth, and descend on the target "from behind". If all the defences were pointing toward the launch site, the defenders would be struck "in the back of the head" without warning. FOBS could be a good weapon for a surprise first strike against airfields.

Simpler than FOBS is the Depressed Trajectory ICBM (DICBM). This simply follows a ballistic path that is faster and lower than the one requiring the least burnout velocity.

A variant of FOBS is the Multiple Orbital Bombardment System (MOBS). In this application, the payload plus last stage is boosted into an earth orbit and allowed to circle the earth several (perhaps many) times before being deboosted to descend onto the target.

The developments described above are intended to increase the probability that the launched missile will reach its target. All are likely to be less accurate than the simple direct trajectory. Other developments can be foreseen to improve the probability that the missile will survive attack before it is launched. The main methods of reducing vulnerability are dispersion, hardening, concealment, and mobility. The first two have already been exploited, and concealment of a fixed land installation is difficult in these days of reconnaissance satellites. However, it is quite possible that ICBM launchers can be made mobile, on railway cars, or road vehicles, canal barges, or ships. It is also possible to mount them on underwater launchers resting on the bottom of lakes or the sea.

It is not certain what the future holds for manned bombers. The US have encountered difficulties with the FB-111, and are planning to extend the useful life of the much larger B-52 by adding penetration aids and improved air-to-surface missiles. The pro-

gram to replace the B-52 with an Advanced Manned Strategic Aircraft (AMSA) has been confined so far to design and development studies. The Soviet aviation industry is pursuing the advanced technology for a supersonic transport aircraft, but it is not known whether they intend to build another bomber.

The "Safeguard" ABM System

The US Department of Defense pursued an active program of research and development in the area of anti-ballistic missile technology for many years, but it was not until September, 1967 that the Secretary of Defense, Mr. McNamara, announced that a "light" ABM system, later called "Sentinel", would be deployed in the US. The Sentinel program encountered considerable opposition, and in February, 1969, the Nixon administration suspended the program pending a review. In March, 1969, however, President Nixon announced that a modified system called "Safeguard" would proceed, subject to Congressional approval and an annual review.

The three objectives of "Safeguard", as stated by the President are,

- "(a) Protection of our land-based retaliatory forces against a direct attack by the Soviet Union.
- (b) Defense of the American people against the kind of nuclear attack which Communist China is likely to be able to mount within the decade.
- (c) Protection against the possibility of accidental attack from any source."

The Safeguard system has the same components as Sentinel: Perimeter Acquisition Radars (PARs), Missile Site Radars (MSRs), and two anti-missile weapons: Spartan and Sprint.

The first warning of possible ICBM attack could come from one of several types of long range detection systems. Ballistic missiles on a direct trajectory toward North America will be detected over the polar regions by the Ballistic Missile Early Warning System (BMEWS). PARs installed in the northern US will detect and track approaching missiles over Canada, at a range in excess of 1000 miles. Information from these radars is passed to control posts where computers process the data, and, on receipt of a firing order, the MSR guides the Spartan missile to make its intercept.

The Spartan missile has a range of several hundred miles. Its effectiveness depends on

the detonation of a very large nuclear warhead in the near-vacuum of outer space. It is expected that most decoys accompanying the ICBM warhead would be cleared out of a large volume by the explosion of the Spartan.

The Sprint missile complements the Spartan by intercepting at lower altitudes those missiles not destroyed by Spartan. It is hoped that most decoys not destroyed by Spartan will be distinguishable from the ICBM warhead when they begin to experience air drag on penetrating into the atmosphere. Sprint has a much shorter range than Spartan, about 25 miles. Since it is designed to be used at low altitude, the Sprint has a very much smaller warhead yield than the Spartan.

The plan for "Safeguard" is in phased steps. The first step involves only two PARs, with associated MSRs, Spartans, and Sprints, planned to be operational in 1974. The sites which are near Great Falls, Montana, and Grand Forks, North Dakota, are intended for the protection of ICBM and bomber bases in those areas. Subsequent options, as described by the United States Deputy Secretary of Defense, Packard, could be:

- (a) to extend the defence of the deterrent forces against ICBM attack,
- (b) to provide defence against submarine-launched missiles (SLBMs),
- (c) to provide light area protection for all of the US, including population.

The totality of these options, labelled "full deployment", include 12 sites in the continental US. A further possible extension is to add sites in Alaska and Hawaii. President Nixon has stated that Safeguard "will be reviewed annually from the point of view of (a) technical developments; (b) the threat; (c) the diplomatic context including any talks on arms limitation".

If the "full deployment" plan involving 12 sites is carried out, the estimated cost is \$7.8 billion (including the cost of the warheads). At this level, it might hope to provide a meaningful defence against the size of attack that China could mount in the mid-1970s. It might also be able to preserve a significant proportion of the ICBM and bomber strength against Soviet attack, but would not be able to prevent the USSR from being able to destroy most of the urban population.

Possible Future Developments in Defensive Systems

Safeguard represents a selection from a set of ABM components designed under a large

research and development program known as "NIKE X". All components followed the principle of "terminal defence", that is to intercept the incoming ICBM near the end of its intended trajectory. If a much thicker and heavier terminal defence system were desired by the US, it would very likely be based on a further selection of the NIKE X design.

In principle, interception could be attempted in midcourse, or even in the launch phase of the ICBM trajectory. There are advantages to the latter, since the ICBM is moving more slowly, is advertising its presence by radiating a tremendous flux of heat energy, and is still under guidance, and is, therefore, vulnerable to damage to its control or propulsion system. However, to be able to deliver an anti-missile missile to the appropriate location, it would probably be necessary to mount it in a satellite, ship, or aircraft.

Although it can be concluded that it is technically possible for a defensive missile to intercept and destroy an ICBM, it does not necessarily follow that an ABM system is an effective and advisable system to construct. By the use of penetration aids (such as decoys, multiple warheads, or jamming or indirect trajectories (depressed, extended range, fractional or multiple orbital), the offence may be able to overcome the defence. Although it may be technically possible for the defence to defeat the measures mentioned above, the cost of such countermeasures may be much greater than that required for the offensive measures.

American military satellites are for reconnaissance, for missile-launch warning, for communication, for precise navigation, and for weather reconnaissance. Thus, as far as United States satellites are concerned, they are all defensive; none are offensive.¹⁵ The Soviets have made threatening statements regarding an orbital bomb. Both powers use satellites for collection of intelligence. To date, neither has felt a need to destroy satellites in orbit, and it may well be that they never will wish to do so. The technical problems of intercepting and destroying a satellite would be comparable to those of intercepting a ballistic missile. Interception would be most difficult for satellites in highly elliptical orbits, or if it were necessary to complete the interception very soon after launch.

In summary, the state of technology in missiles, radars, and warheads is so advanced that it may well be physically possible for engineers to do almost anything in the offence

vs defence or measure vs countermeasure context, but economic and strategic factors are likely to determine what is, in fact, practicable to undertake.

Dangers to Stability in the Future

As has been discussed earlier, the two Superpowers have a stable state of mutual deterrence today. Neither feels impelled to strike first, or to reply instantaneously to a perceived threat. Neither need to be unduly disturbed if the opponent makes modest improvements to his weapon system. If the systems could be "frozen" in their present state, the stability could be preserved for the indefinite future, and at a very modest cost of maintenance.

Both the United States and the Soviet Union have been reducing their long range bomber fleets as their ICBM strength built up. The United States inventory of ICBMs and SLBMs rose to 1054 and 656 in 1967, and has not changed since. The USSR added ICBMs quite slowly up to 1967, but have increased from 300 up to 1000 in the last two years. They still are well behind in SLBMs. Thus, in terms of recent changes in numbers of offensive weapons, there does not appear to be any trend away from stability.

Two ways in which stability could be endangered would be (a) if one of the adversaries were to improve the capability of his offensive weapons to the point that he could destroy practically all of the opponent's weapons in a counterforce first strike, or (b) if one were to devise and deploy a defensive system so effective that he could withstand a countervalue second strike by the surviving weapons of the opponent. Both of these amount to the creation of a very high degree of damage limitation.

It seems most improbable that either of these destabilizing changes could be brought about by quantitative increases to defensive weapons of the types deployed today. It would require a qualitative improvement of considerable magnitude to shift the present stable balance into a state of real danger.

The qualitative improvements to offensive systems foreseeable today have been described. They include very large ICBM warheads, MRV, MIRV, FOBS, MOBS, DICBM, supersonic manned bombers, and bombers with long range accurate air-to-surface missiles (ASMs). Of these, MIRV has the greatest potential for a counterforce strike, against ICBM sites and airfields.

The most important improvement to defensive capabilities would be to have ballistic missile defence where virtually none exists today. A light defence such as Safeguard cannot have a really significant effect on stability. However, if a heavy ballistic missile defence were able to intercept large numbers of ICBMs and SLBMs aimed at cities, the result could be to reduce deterrence and, according to the definitions adopted here, shift the balance in the direction of instability. Both submarine and air defence have been the subject of intense research and development for many years, and have introduced a long succession of weapons and equipments without ever really reaching a state of dominance over the submarine or the bomber. Were either or both to do so, they would probably contribute more to damage limiting than to assured destruction, but this would depend on the targets which the opponent chose for his SLBMs and bombers to attack.

It has already become evident that the potential effects of changes to the defensive systems cannot be analyzed one at a time, in isolation. There are many important interactions, between the various related families of offensive and defensive weapon systems.

Because of these interactions, a strengthening (real or imagined) in one system can stimulate increases to several of the opponent's systems. For example, if the US fits MIRV, the Soviets might feel that their ICBMs were threatened and build more of them, harden them further, make them mobile, or put MIRV into them. But they might elect to build more BM submarines instead, since they are not vulnerable to MIRV. Or, if the US puts up an ABM system the Soviets might build more ICBMs, equip their ICBMs with better penetration aids, or fit them with MIRV. Or they might build a new generation of bombers, or match system for system with an ABM of their own.

Because the more advanced techniques of both offence and defence are very complex, it takes several years to develop them and put them into operational status. Even though the balance is stable, and robust rather than delicate at the moment, it is natural for each Superpower to look several years ahead and to ensure that it will not find itself with its assured destruction gone as a result of substantial changes. It is difficult for each adversary to assess far in advance what the effectiveness of the opponent's moves are going to be. Consequently, there is a natural tendency

for each side to take steps now to prepare for the worst that the opponent might have ready for him a few years hence.

As described by Professor Rathjens¹², a combination of developments which could be quite serious would be for one Superpower to put effective MIRV into its ICBMs and SLBMs, and at the same time build a heavy ABM system which could defend its cities against SLBMs and ICBMs. This could enable it to destroy a very large proportion of the opponent's ICBMs and bombers in a counter-force first strike, and then defend its cities against the weakened retaliatory countervalue second strike. However, the opponent would probably react before the new systems were operational perhaps by building more bombers, dispersing them to many bases, keeping some airborne alert, and protecting those on the ground in shelters. This would probably stimulate the first Superpower to increase his air defence. The second could then move his BM submarines close inshore, to fire under the cover of the ABM system. This could be countered by more anti-submarine defence. It is easy to see how the arms race can accelerate in such circumstances.

It seems probable that both Superpowers will always react in such a way as to maintain stability. They have too much at stake to do otherwise. The unfortunate situation into which they may be drawn is that each spends a great deal of money reacting to the other, with the only result being that a new stable balance is struck.

What could be very dangerous is a situation where Superpower A makes changes to disturb the balance and Superpower B does NOT react to restore it. As the certainty of B's assured destruction begins to deteriorate, a succession of increasingly dangerous possibilities could develop:

(a) With stable mutual deterrence, neither A nor B have to set their second strike for a hairtrigger response; they can be willing to face a threat or even a real attack without feeling forced to retaliate in haste;

(b) if B becomes doubtful of the certainty of his second strike after receipt of a heavy blow from A, he will be motivated to respond with less provocation, lowering the threshold and introducing the possibility of striking in response to an accident or false warning;

(c) if B perceives that A will soon reach a state where A could destroy B's power to

retaliate, B will be tempted to strike first, in the hope that the advantage of surprise and the initiative offers him his last chance;

(d) at this stage and subsequently, A will feel tempted to strike first in order to pre-empt B.

In the enthusiasm for ending the arms race and saving money, it is important not to be too simplistic. The stability of mutual deterrence is not to be abolished without fearful risk to the whole world. It would be best to retain it at a modest cost, unfortunate if a lack of co-operation drives the cost higher than necessary, but terribly dangerous if it is lost by the development of a serious imbalance.

PART II: POSSIBLE FUTURE DEVELOPMENTS IN NORTH AMERICAN AIR DEFENCE

Past and Present Air Defence in Canada

When air defence was being built up in the 1950s, the only strategic offensive weapon was the bomber aircraft. The USAF had many of these stationed on overseas airfields, but the main forces with the longest range aircraft were based in the United States. Canada had no bombers of intercontinental range.

The Soviet bombers of those days did not have sufficient radius of action to fly a return mission without at least one mid-air refuelling, and it was clear that they would be obliged to follow routes that kept their mileage close to a minimum. This meant that the routes to the air bases or cities of the United States came across Canada or close to her coasts. Canada felt that her cities were just as much threatened as those in the US. Consequently, the system of interceptor aircraft, warning and control radars, and anti-aircraft artillery was gradually extended to cover virtually all of the US, the inhabited portion of eastern Canada, Labrador, Alaska, and southern British Columbia. Some of the radars and interceptor bases in Canada were manned by the USAF.

When the Soviets built faster bombers, and the importance of early warning began to be appreciated for purposes such as saving of bombers by flying them off their fields as well as to bring the active and passive defences to readiness, the Distant Early Warning (DEW) Line was built, extending along the northern

edge of the continent from Alaska through Canada to Greenland. To prevent it from being by-passed, airborne early warning patrols were flown over both North Pacific and North Atlantic. In addition, the Mid-Canada Line, particularly sensitive to low altitude aircraft and requiring a minimum of personnel, was built along the 55th parallel from British Columbia to Labrador.

Because the approaches to Canadian cities lay over land, it was possible to extend our defences by building radar stations some few hundred miles north of the border. Off their coasts, the US used Texas Towers and radar picket ships.

After detecting aircraft entering the continent, the radar warning and control system attempts to identify them by comparing their position and course with flight plans. Incoming aircraft not identified by flight plan correlation or satisfactory radio authentication are intercepted for visual identification. If destruction had ever been necessary, this could have been done by interceptors or surface-to-air missiles, under the control of the ground radar.

Before the NORAD agreement was signed in 1958, there was an increasing degree of co-operation between the USAF and RCAF, including many joint exercises, with frequent hand-over of interceptors in flight from the control of a US to a Canadian radar or vice versa. As the capability of the Soviet bomber force improved, the need for integrated control, with a high degree of automation, led to the formation of NORAD. Operational co-operation became complete with its advent.

Although NORAD is a joint command for operational control of the forces assigned to it, the selection and procurement of equipment is a national matter. Canada elected to design and build the CF-100 all weather interceptor, later replaced by the CF-101 Voodoo, build in the US. Both countries procured the SAGE computer and the BOMARC long range surface-to-air missile. Only the US elected to deploy Nike Ajax, Nike Hercules, and Hawk short range surface-to-air missiles around their cities and other vital targets.

Subsequent to 1963, as it became clear that the preponderance of Soviet strategic offensive power was being assumed by ICBMs instead of bombers, the numerical strength of the NORAD interceptor and surface-to-air missile forces has been reduced by about one-third. The present force of 48 Canadian CF-

101 interceptors represents a numerical reduction to 30% of the peak value of 162 CF-100 aircraft; although the CF-101 is a more effective aircraft.

Air defence of a target area requires radar control cover and weapons to operate in an active defence belt outside of the target area, and warning radar beyond the active defence belt. A summary of the present air defence activities in North America is that Canada mans and operates the active defence belt to the north of the populated area, while the US mans and operates the active defence belts to the east and west, and in the inner zone. The US finances the contractor-manned outer warning system.

Weaknesses in the Present Air Defence System

A serious weakness of today's air defence system is its vulnerability. ICBMs could destroy any of the installations before the bombers arrived. Bombers with radar-homing missiles could destroy the control radars.

Any system depending on ground-based radars is limited in its ability to track aircraft flying at low altitude, simply because the line-of-sight from radar to target is cut off at the horizon. Tracking can be improved by the addition of a large number of small gap filler radars, but this is an expensive solution. Flying at low altitude will increase the fuel consumption of bombers, thus reducing their payload and/or range, but it is quite feasible as a means of penetrating the defences.

Fixed radars determine the active defence belt in which interceptors and missiles can be controlled. If the bomber were equipped with a long range air-to-surface missile, he might be able to launch it from just outside the active defence belt. The ASM would be a much smaller and faster target than the bomber, although it would have less accuracy or payload.

These three weaknesses in air defence could be overcome by extending the system outwards and downwards, and making its components less vulnerable.

The Airborne Warning and Control System

If a large radar is mounted in an aircraft and flown at an altitude of a few miles above the earth, the horizon recedes to a distance of hundreds of miles. This is evident from the enormous area that can be seen from a high-flying aircraft as compared to any place on the ground other than a mountain peak.

However, a radar normally shows as a "target" any object which reflects energy back to it, and the vast area of earth visible from the high aircraft will reflect so much energy that the comparatively small reflection from another aircraft flying close to the ground will be obliterated by the "ground clutter".

New radar technology has been developed, which offers promise of separating the wanted echo of the low-flying aircraft from the unwanted (larger) echo from the ground. If this is successful, an "Airborne Warning and Control System" (AWACS) could be built which would be free of all three of the weaknesses listed above. It could fly outwards to detect and track the bomber before he released his ASM, it could track bombers attempting to fly under the coverage of ground-based radar and, once airborne, it would escape destruction if its airfield was bombed.

To be able to control interceptors and missiles, carry out identification of unknown aircraft by flight plan correlation or ratio contact, and conduct the other functions normally performed in a ground radar, the AWACS aircraft requires sophisticated equipment for communication, computing, data storage, and display. It will need a large crew and long endurance. It will be a large and expensive aircraft. However, in addition to the advantages already described, it will add a great measure of flexibility to the air defence system, permitting detection, tracking, and control to be carried out anywhere, over land, sea, ice, or snow.

To quote Secretary Clifford in January, 1969¹,

"The over-land radar technology program is progressing satisfactorily and the tests to date have been encouraging. Contract definition has been initiated and engineering development of the AWACS system can be started in Fiscal Year 1970. About \$40 million is available for this purpose in FY 1969, and an additional \$75 million is requested in the FY 1970 Budget. We intend to pursue this program with great prudence, holding our investment to the lowest practicable level until the prime contractor selected has successfully demonstrated by actual flight tests a useable radar detection and tracking system. If all goes well, the first of these aircraft should enter the force in the mid-1970s".

Over-The-Horizon Radar

The limitation which the horizon imposes on the range of ground-based radar has already been mentioned. The same limitation applies to television or microwave relay transmission, for which transmitter and receiver have to be virtually intervisible. However, long-distance wireless communication has been effected ever since the time of Marconi, by making use of reflections from the ionosphere, the layers of ionized gas 40 to 400 miles above the surface of the earth. If a radar uses high transmitter power, and one of the longer wavelengths which are reflected by the ionosphere, it is possible to obtain echoes from an aircraft at a range many hundreds of miles beyond the horizon. Since the energy detected in the receiver has been scattered back from the target, this type of radar is called Over-The-Horizon-Backscatter (OTHB).

A few OTHB radars would allow very long range detection of aircraft far from the target areas, and thus supply early warning and a good peacetime surveillance at a relatively modest cost. Because the energy is reflected over the horizon, aircraft could not avoid detection by flying low. Hence a system based on OTHB radars would overcome two of the weaknesses in the present system. The sites would, however, be vulnerable to destruction by ICBM, SLBM, or air-to-surface radar homing missiles, and could not be relied upon in wartime. Their coverage would be filled in by AWACS.

Since the OTHB radars depend on reflection from the ionosphere, they may be subject to the same disturbances over the northern regions which produce the Aurora Borealis (Northern Lights). Therefore, their operation in Canada could pose special problems.

Improved Interceptor Aircraft

A modern interceptor is a complex weapon system, in which the air-to-air missile and the fire control system are just as important as the basic airframe. The present "century series" interceptors (of which the main examples in North American air defence are the F-101 and the F-106) are quite effective against subsonic bombers at high altitude. However, the radar display is obscured by "ground clutter", especially when flying at low altitude, and radar-guided air-to-air missiles are likely to be misdirected because of reflections from the ground.

A new interceptor could be designed to incorporate the same type of radar technology that shows promise of making AWACS possible, so that the interceptor could fly high, look down, and "see" a bomber at low altitude. It could be armed with a longrange high performance air-to-air missile, able to close on a target at low altitude. The aircraft could be built to have a long radius of action at supersonic speed. This is the concept of the F-12. It would be a very expensive undertaking.

A somewhat less ambitious course of action would be to incorporate the improved radar and air-to-air missile into the F-106 airframe. This concept, labelled "F-106x", would allow the interceptor to fly high, look down, and shoot down. Although it would not have the range or speed of the F-12, it would be able to work under the control of ground radar or AWACS to extend the zone of active defence outwards and downwards. Comparing the two proposals, Secretary McNamara⁷ stated in 1968 that,

"The F-12 would be superior in discouraging such future threats as very long range ASMs and supersonic bombers, whereas the F-106x would be superior in discouraging short range ASMs, decoys and self-defense missiles. The F-106x would be best in the mobile air defense role. No air defense system can provide significant "Damage Limiting" capabilities against the USSR unless accompanied by a strong, effective ABM, a capability which is present unattainable. Our analysis also showed that (both) alternatives... provide a good capability against Nth (i.e. other) countries. On balance, the AWACS/F-106x force seems to be the proper choice at this time".

Reduction to Vulnerability of Aircraft

Airfields are vulnerable to attack by ICBM and SLBM as well as bombers. However, it is possible to reduce the risk that a substantial proportion of the interceptors may be destroyed on the ground, by dispersing them to many airfields, and changing the dispersal pattern continuously. Advanced interceptors require complex maintenance facilities, and it would be expensive to provide these, spare parts, reload missiles, and the skilled technicians at a large number of airfields on a permanent basis. Instead, the mobility can be achieved by providing a fleet of cargo-type aircraft (such as The Hercules) able to trans-

port the maintenance personnel, parts, tools, test equipment, and weapons to any airfield which has the necessary runways and traffic handling facilities.

Stated US Objectives for Modernized Air Defence Program

The US have stated six objectives for an improved and continued air defence program.⁸ These are:

- (a) Peacetime identification, to prohibit unopposed access to North America by unauthorized foreign aircraft;
- (b) limiting the damage that could be done to the urban-industrial complex by Soviet bombers, in the event that deterrence should fail;
- (c) preventing damage from a bomber attack by any other country (Cuba is mentioned specifically);
- (d) precluding a bomber attack on strategic missile forces that are being intentionally withheld;
- (e) discouraging the Soviet Union from developing and introducing new bomber threats which would be costly to neutralize;
- (f) providing a complete mobile "air defence package" which could be employed in an overseas theatre.

These are comparatively modest objectives. It is admitted that (b), damage limiting, will not make a significant contribution unless an effective ABM defence is installed. (d) and (e) are in support of strategic deterrence and stability. (a) applies to peacetime, but is particularly important in the uncertain stages of an international crisis or at the beginning of hostilities. (c) and (f) do not involve the direct balance between the two Superpowers.

Estimated Cost of US Program

The estimated total cost of the US program over 10 years is \$12.3 billion. The rate of expenditure would be heaviest in the earlier years while AWACS was being purchased and the interceptors modified. It is expected that AWACS will allow a reduction in the SAGE system and the ground-based radars, some being transferred to civil authority for air traffic control. There will be fewer interceptor squadrons to maintain. Once the new equipment has been procured, the annual cost for personnel, operation, and maintenance is estimated at \$0.69 billion, substantially less

than would be required to continue operation of the present system.

The Significance of Canadian Geography for the Proposed Plan

It was explained in earlier sections that the vital requirement for anti-bomber defence is space: space for interception well before the targets, and space beyond this for early warning. If the bombers must be intercepted before they launch an ASM, the requirement for space is correspondingly extended. The most likely routes of approach to targets in either Canada or the US are from the northern periphery. AWACS and OTH allow the defences to be extended outwards. If the plan is to be put into effect, it is evident that AWACS aircraft and the interceptors will need to fly over Canada.

If the AWACS and the interceptors conduct operations over Canada, far north of the US border, it would be much more efficient to have them fly from airfields in Canada rather than to expend a large portion of their fuel in transit from and back to the USA on every mission.

It is considered that most, if not all, of the present Pinetree radars will continue to be required until the advent of AWACS. When AWACS has attained full operational capability, it is possible that major reductions in the Pinetree line can be effected. A joint DND/DOT working group has been established to determine the civil/military requirement for ground surveillance radars in the post AWACS era.

In summary, Canadian airspace, Canadian airfields, and Canadian communications would all be very valuable assets in the efficient operation of the modernized air defence plan.

ANNOUNCEMENT BY THE DEFENCE RESEARCH BOARD

January 24, 1967

Dr. George R. Lindsey, 46, formerly of Toronto, Senior Operational Research Scientist at the Defence Research Board's Operational Research Establishment, Ottawa, has been appointed Chief Superintendent, succeeding the late Dr. R. J. Sutherland. He also assumed the position of Director General of Operational Research at Canadian Forces Headquarters.

Dr. Lindsey, one of the World War 2 operational research pioneers, joined the DRB professional staff in 1959 and has a wide and varied background in his scientific specialty.*

* In August 1968 the Defence Research Board was re-organized and Dr. Lindsey was appointed Chief, Defence Research Analysis Establishment.

DR. GEORGE R. LINDSEY

Dr. George R. Lindsey was born in Toronto in June, 1920, where he received his primary education and obtained an Honours B.A. in Mathematics and Physics at the University of Toronto in 1942.

He then joined the Royal Canadian Artillery and served in Canada, with the Canadian Army Operational Research Group, and over-

seas with the British Army Operational Research Group.

Following his retirement from the Canadian Army in 1945, he resumed his studies and obtained a Master's degree in Physics at Queen's University in 1946. The following four years were spent in the Cavendish Laboratory at Cambridge, England, as an Overseas Research Scholar of the Exhibition of 1851 and he obtained the degree of Doctor of philosophy in 1950.

Dr. Lindsey joined the staff of the Defence Research Board's Operational Research Group in 1950. Two years later, he was appointed Chief of the Weapons Systems Evaluation Section. Then posted to RCAF Air Defence Command at St. Hubert, Que., he was Senior Operational Research Officer and Scientific Adviser to the Air Officer Commanding until July, 1959, when he assumed the position of Director of the Defence Systems Analysis Group for the Canadian Chiefs of Staff.

In September, 1961, he became Chief of the Operational Research Group at the Anti-Submarine Warfare Research Centre of the Supreme Allied Commander, Atlantic, a NATO establishment in La Spezia, Italy. On his return to Canada in September, 1964, he was appointed Deputy Chief of Operational Research and subsequently, Senior Operational Research Scientist in the Operational Research Division, Canadian Forces Headquarters. During the period 1965-66, he

attended the National Defence College at Kingston.

He returned to the Defence Operational Research Establishment in 1966, became its Chief Superintendent in 1967, and after its reorganization in 1968 was made chief of the Defence Research Analysis Establishment of the Defence Research Board.

Dr. Lindsey won numerous scholarships and awards both as an undergraduate and graduate student. His research in nuclear physics includes investigations relative to artificial radioactivity and radiation from light nuclei under proton bombardment. Most of his studies during recent years have related to air defence, strategic, missile, and naval problems. Among his many scientific papers are several prepared as a spare-time activity, which concern the analysis of the strategy of baseball games.

Dr. Lindsey is a Member of the Canadian Institute of International Affairs, the American Statistical Association, the Royal Astronomical Society of Canada, the Institute for Strategic Studies, the U.S. Naval Institute, and the Operational Research Society of America. He is a past president of the Canadian Operational Research Society.

His great grandfather was William Lyon Mackenzie and another great grandfather was Sir Casimir Gzowski, a famous Canadian engineer and personality in Canada's early history.

CANADIAN EMBASSY
WASHINGTON, D.C.

May 12, 1958.

No. 263

Sir,

I have the honour to refer to discussions which have taken place between the Canadian and the United States authorities concerning the necessity for integration of operational control of Canadian and United States Air Defences and, in particular, to the study and recommendations of the Canada-United States Military Study Group. These studies led to the joint announcement of August 1, 1957, by the Minister of National Defence of Canada and the Secretary of Defense of the United States, indicating that our two Governments had agreed to the setting up of a system of integrated operational control for the air defences in the continental United States, Canada and Alaska under an integrated command responsible to the Chiefs of Staff of both countries. Pursuant to the announcement of August 1, 1957, an integrated headquarters known as the North American Air Defence Command (NORAD) has been established on an interim basis at Colorado Springs, Colorado.

For some years prior to the establishment of NORAD, it had been recognized that the air defence of Canada and the United States must be considered as a single problem. However, arrangements which existed between Canada and the United States provided only for the coordination of separate Canadian and United States air defence plans, but did not provide for the authoritative control of all air defence weapons which must be employed against an attacker.

The advent of nuclear weapons, the great improvements in the means of effecting their delivery, and the requirements of the air defence control systems demand rapid decisions to keep pace with the speed and tempo of technological developments. To counter the threat and to achieve maximum effectiveness of the air defence system, defensive operations must commence as early as possible and enemy forces must be kept constantly engaged. Arrangements for the coordination of national plans requiring consultation between national commanders before implementation had become inadequate in the face of a possible sudden attack, with little or no warning. It was essential, therefore, to

have in existence in peacetime an organization, including the weapons, facilities and command structure which could operate at the outset of hostilities in accordance with a single air defence plan approved in advance by national authorities.

Studies made by representatives of our two Governments led to the conclusion that the problem of the air defence of our two countries could best be met by delegating to an integrated headquarters, the task of exercising operational control over combat units of the national forces made available for the air defence of the two countries. Furthermore, the principle of an integrated headquarters exercising operational control over assigned forces has been well established in various parts of the North Atlantic Treaty area. The Canada-United States region is an integral part of the NATO area. In support of the strategic objectives established in NATO for the Canada-United States region and in accordance with the provisions of the North Atlantic Treaty, our two Governments have, by establishing the North American Air Defence Command recognized the desirability of integrating headquarters exercising operational control over assigned air defence forces. The agreed integration is intended to assist the two Governments to develop and maintain their individual and collective capacity to resist air attack on their territories in North America in mutual self-defence.

The two Governments consider that the establishment of integrated air defence arrangements of the nature described increases the importance of the fullest possible consultation between the two Governments on all matters affecting the joint defence of North America, and that defence cooperation between them can be worked out on a mutually satisfactory basis only if such consultation is regularly and consistently undertaken.

In view of the foregoing considerations and on the basis of the experience gained in the operation on an interim basis of the North American Air Defence Command, my Government proposes that the following principles should govern the future organization and operations of the North American Air Defence Command.

- (1) The Commander-in-Chief NORAD (CINCNORAD) will be responsible to the Chiefs of Staff Committee of Canada and the Joint Chiefs of Staff of the United States, who in turn are responsible to their respective Governments. He will

operate within a concept of air defence approved by the appropriate authorities of our two Governments, who will bear in mind their objectives in the defence of the Canada-United States region of the NATO area.

(2) The North American Air Defence Command will include such combat units and individuals as are specifically allocated to it by the two Governments. The jurisdiction of the Commander-in-Chief, NORAD, over those units and individuals is limited to operational control as herein-after defined.

(3) "Operational Control" is the power to direct, coordinate, and control the operational activities of forces assigned, attached or otherwise made available. No permanent changes of station would be made without approval of the higher national authority concerned. Temporary reinforcement from one area to another, including the crossing of the international boundary, to meet operational requirements will be within the authority of commanders having operational control. The basic command organization for the air defence forces of the two countries, including administration, discipline, internal organization and unit training, shall be exercised by national commanders responsible to their national authorities.

(4) The appointment of CINCNORAD and his Deputy must be approved by the Canadian and United States Governments. They will not be from the same country, and CINCNORAD staff shall be an integrated joint staff composed of officers of both countries. During the absence of CINCNORAD, command will pass to the Deputy Commander.

(5) The North Atlantic Treaty Organization will continue to be kept informed through the Canada-United States Regional Planning Group of arrangements for the air defence of North America.

(6) The plans and procedures to be followed by NORAD in wartime shall be formulated and approved in peacetime by appropriate national authorities and shall be capable of rapid implementation in an emergency. Any plans or procedures recommended by NORAD which bear on the responsibilities of civilian departments or agencies of the two Governments

shall be referred for decision by the appropriate military authorities to those agencies and departments and may be the subject of inter-governmental coordination.

(7) Terms of reference for CINCNORAD and his Deputy will be consistent with the foregoing principles. Changes in these terms of reference may be made by agreement between the Canadian Chiefs of Staff Committee and the United States Joint Chiefs of Staff, with approval of higher authority as appropriate, provided that these changes are in consonance with the principles set out in this Note.

(8) The question of the financing of expenditures connected with the operation of the integrated headquarters of the North American Air Defence Command will be settled by mutual agreement between appropriate agencies of the two Governments.

(9) The North American Air Defence Command shall be maintained in operation for a period of ten years or such shorter period as shall be agreed by both countries in the light of their mutual defence interests, and their objectives under the terms of the North Atlantic Treaty. The terms of this Agreement may be reviewed upon request of either country at any time.

(10) The Agreement between parties to the North Atlantic Treaty regarding the status of their forces signed in London on June 19, 1951, shall apply.

(11) The release to the public of information by CINCNORAD on matters of interest to Canada and the United States of America will in all cases be the subject of prior consultation and agreement between appropriate agencies of the two Governments.

If the United States Government concurs in the principles set out above, I propose that this Note and your reply should constitute an Agreement between our two Governments effective from the date of your reply.

Accept, Sir, the renewed assurances of my highest consideration.

"N.A. Robertson"
Ambassador of Canada.

The Honourable John Foster Dulles,
Secretary of State of the United
States, Washington, D.C.

DEPARTMENT OF STATE
WASHINGTON, D.C.

May 12, 1958.

Excellency,

I have the honour to refer to Your Excellency's Note No. 263 of May 12, 1958, proposing on behalf of the Canadian Government certain principles to govern the future organization and operation of the North American Air Defence Command (NORAD).

I am pleased to inform you that my Government concurs in the principles set forth in your Note. My Government further agrees with your proposal that your Note and this reply shall constitute an agreement between the two Governments, effective today.

Accept, Excellency, the renewed assurances of my highest consideration.

"Christian A. Herter"
for the Secretary of State.

His Excellency Norman Robertson,
Ambassador of Canada.

AMBASSADE DU CANADA
WASHINGTON

N° 263 le 12 mai 1958

Monsieur le Secrétaire d'État,

J'ai l'honneur de me référer aux entretiens qui ont eu lieu entre les autorités du Canada et celles des États-Unis au sujet de la nécessité d'unifier la direction des opérations de défense aérienne du Canada et des États-Unis et, en particulier, aux études effectuées par le Groupe d'études militaires du Canada et des États-Unis et aux recommandations qu'il a formulées. Ces études ont abouti, le 1^{er} août 1957, à un communiqué du ministre de la Défense nationale du Canada et du secrétaire à la Défense des États-Unis annonçant que nos deux Gouvernements avaient décidé de mettre sur pied un système de direction unifiée des opérations de défense aérienne des États-Unis métropolitains, du Canada et de l'Alaska, sous les ordres d'un commandement unifié relevant directement des chefs d'état-major des deux pays. En conformité du communiqué du 1^{er} août 1957, il a été établi à titre provisoire, à Colorado-Springs (Colorado), un quartier général unifié désigné sous le nom de Commandement de la défense aérienne de l'Amérique du Nord (NORAD).

Depuis un certain nombre d'années, avant la création du NORAD, on reconnaissait déjà

que la défense aérienne du Canada et des États-Unis doit être considérée comme un seul tout. Or les arrangements conclus jusque-là entre le Canada et les États-Unis, s'ils permettaient de coordonner les plans distincts de défense aérienne des deux pays, ne rendaient pas possible l'exercice d'une autorité de contrôle sur tous les engins de défense qu'il y aurait lieu de mettre en œuvre contre un assaillant éventuel.

L'avènement des armes nucléaires, le développement remarquable des moyens dont on dispose pour les porter à leurs cibles, ainsi que les exigences des systèmes de direction de la défense aérienne, nécessitent une promptitude de décision du même ordre que le rythme rapide des perfectionnements technologiques. Pour parer à la menace et pour assurer le maximum d'efficacité à la défense aérienne, les opérations défensives doivent être lancées le plus immédiatement possible et il importe que les forces ennemies restent ensuite soumises à des attaques sans répit. Les arrangements prévoyant la coordination des plans nationaux de défense aérienne, qui nécessitaient une consultation entre les deux commandants nationaux avant toute mise à exécution de ces plans, ne répondaient plus à la possibilité d'attaques soudaines ne laissant à peu près pas le temps de réfléchir. Il devenait donc indispensable de créer, dès le temps de paix, une organisation dotée des armes, des installations et des rouages de commandement qui lui seraient nécessaires pour passer à l'action dès le déclenchement des hostilités en exécutant un plan unique de défense aérienne, approuvé à l'avance par les autorités nationales.

Les études effectuées par les représentants de nos deux Gouvernements ont abouti à la conclusion que la meilleure solution du problème de la défense aérienne de nos deux pays consisterait à déléguer à un quartier général unifié la direction des opérations de toutes les unités de combat des forces nationales affectées à la défense aérienne des deux pays. D'ailleurs, il existe déjà pour divers secteurs de la zone du Traité de l'Atlantique Nord des quartiers généraux unifiés dirigeant les opérations de forces qui leur sont affectées. La région Canada-États-Unis fait partie intégrante de la zone de l'OTAN. Dans le sens des objectifs stratégiques fixés par l'OTAN pour la région Canada-États-Unis et en conformité des dispositions du Traité de l'Atlantique Nord, nos deux Gouvernements ont reconnu, en créant le Commandement de la

défense aérienne de l'Amérique du Nord (NORAD), l'utilité de l'unification des quartiers généraux qui dirigent les opérations de forces de défense aérienne leur étant assignées. L'unification dont les deux Gouvernements sont convenus a pour but de les aider à développer et à entretenir leur aptitude individuelle et commune à résister à toute attaque aérienne lancée contre leurs territoires, en Amérique du Nord, en conjugant leur défense.

Les deux Gouvernements estiment que l'adoption des arrangements de défense aérienne unifiée ici prévus augmente l'importance de consultations aussi étroites que possible entre les deux Gouvernements sur les questions intéressant la défense commune de l'Amérique du Nord et que la coopération en matière de défense pourra être mise en œuvre de façon satisfaisante pour les deux pays, seulement si ces consultations se poursuivent régulièrement et constamment.

En considération de ce qui précède, et compte tenu de l'expérience acquise au cours du fonctionnement provisoire du Commandement de la défense aérienne de l'Amérique du Nord, mon Gouvernement propose que les principes suivants devraient régir l'organisation qui sera établie, ainsi que les opérations du Commandement de la défense aérienne de l'Amérique du Nord.

1. Le Commandant en chef du NORAD (CINCNORAD) relèvera directement du Comité des chefs d'état-major du Canada et de celui des États-Unis, lesquels relèveront directement de leur Gouvernement respectif. Il obéira à un plan général de défense aérienne approuvé par les autorités compétentes de nos deux Gouvernements, lesquelles devront tenir compte de leurs objectifs en ce qui concerne la défense de la région Canada-États-Unis de la zone de l'OTAN.

2. Le Commandement de la défense aérienne de l'Amérique du Nord comprendra les unités de combat et les personnes que leur affecteront expressément les deux Gouvernements. L'autorité du Commandant en chef du NORAD sur ces unités et ces personnes se limitera à la direction des opérations définie ci-dessous.

3. «Direction des opérations» désigne ici le pouvoir donné à une autorité de diriger, de coordonner et de contrôler les activités «opérationnelles» de forces affectées, attachées ou autrement confiées à cette autorité. Aucun changement permanent d'affectation ne serait effectué sans l'approbation de la

haute autorité nationale intéressée. Les commandants dont relèvera la direction des opérations pourront envoyer des renforts provisoires d'une région à l'autre, même au delà de la frontière, si les opérations l'exigent. L'organisation de base des commandements des forces aériennes des deux pays, notamment en matière d'administration, de discipline, de régie interne et d'instruction des unités, sera placée sous l'autorité des commandants nationaux qui relèveront de leurs autorités nationales.

4. La nomination du CINCNORAD et de son suppléant devra être approuvée par les Gouvernements du Canada et des États-Unis. Ils ne devront pas venir l'un et l'autre du même pays. Le Commandant en chef aura à son service un état-major unifié se composant d'officiers des deux pays. En l'absence du Commandant en chef, l'autorité sera exercée par son suppléant.

5. L'Organisation du Traité de l'Atlantique Nord continuera d'être tenue, par le Groupe stratégique régional Canada-États-Unis, au courant des mesures adoptées pour la défense aérienne de l'Amérique du Nord.

6. Les plans et les méthodes que le NORAD devra suivre en temps de guerre seront conçus et approuvés en temps de paix par les autorités nationales compétentes et devront être susceptibles d'une mise en œuvre rapide en cas d'urgence. S'ils ont trait aux responsabilités des organismes ou des ministères civils des deux Gouvernements, les plans et les méthodes recommandés par le NORAD devront être soumis par les autorités militaires compétentes à la décision de ces ministères et de ces organismes et pourront faire l'objet d'une coordination intergouvernementale.

7. Les attributions du Commandant en chef et de son suppléant seront compatibles avec les principes exposés ci-dessus. Elles pourront être modifiées par voie d'accord entre le Comité canadien des chefs d'état-major et l'état-major interarmes des États-Unis, avec l'approbation de la haute autorité compétente et pourvu que les changements soient en harmonie avec les principes énoncés dans la présente Note.

8. Le financement des dépenses relatives au fonctionnement du quartier général unifié du Commandement de la défense aérienne de l'Amérique du Nord fera l'objet d'un accord entre les organismes compétents des deux Gouvernements.

9. Le Commandement de la défense aérienne de l'Amérique du Nord sera maintenu en fonctionnement pendant dix années

ou pendant une période moindre dont les deux pays pourraient convenir en ayant égard aux intérêts de leur défense commune et aux objectifs fixés en conformité du Traité de l'Atlantique Nord. Les termes du présent Accord pourront être être révisés en tout temps à la demande de l'un ou de l'autre pays.

10. L'Accord que les parties au Traité de l'Atlantique Nord ont signé à Londres, le 19 juin 1951, au sujet du statut de leurs forces, s'appliquera en l'occurrence.

11. Le Commandant en chef du NORAD ne communiquera des renseignements au public sur des questions intéressant le Canada et les États-Unis qu'après consultation et entente, dans chaque cas, entre les organismes compétents des deux Gouvernements.

Si le Gouvernement des États-Unis donne son accord aux principes énoncés plus haut, je propose que la présente Note et votre réponse constituent, entre nos deux Gouvernements, un accord qui entrera en vigueur à la date de votre réponse.

Veuillez agréer, Monsieur le Secrétaire d'État, les assurances de ma très haute considération.

L'honorable John Foster Dulles
Secrétaire d'État des États-Unis
Washington, (D.C.)

"N. A. Robertson"
Ambassadeur du Canada

DÉPARTEMENT D'ÉTAT
WASHINGTON

Le 12 mai 1958

Monsieur l'Ambassadeur,

J'ai l'honneur de me référer à la Note n° 263 de Votre Excellence, en date du 12 mai 1958, proposant au nom du Gouvernement canadien certains principes devant régir à l'avenir l'organisation et le fonctionnement du Commandement de la défense aérienne de l'Amérique du Nord (NORAD).

J'ai le plaisir de vous faire connaître que mon Gouvernement donne son plein accord aux principes énoncés dans votre Note. Mon Gouvernement est en outre d'accord avec votre proposition aux termes de laquelle votre Note et la présente réponse constitueront entre nos deux Gouvernements un accord entrant en vigueur aujourd'hui même.

Veuillez agréer, Monsieur l'Ambassadeur, les assurances renouvelées de ma très haute considération.

pour le Secrétaire d'État
"Christian A. Herter"

MINUTES OF PROCEEDINGS

THURSDAY, May 15, 1969.

(69)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Legault, Marceau, Nowlan, Penner, Prud'homme, Roberts, Ryan, Stewart (*Marquette*), Thompson (*Red Deer*), Wahn, Winch (21).

Witnesses: From the Department of External Affairs: Mr. M. Cadieux, Under Secretary of State for External Affairs; Mr. David Wilson, Staff Relations and Compensation Division; Mr. A. J. Matheson, Finance Division; Mr. W. S. Durdin, Chief Passport Officer.

Resuming consideration of the Estimates 1969-70, Department of External Affairs, Members questioned the officials of the Department under Items 1, 10 and 15 as previously called.

Mr. Cadieux will provide additional information to the Committee concerning military attachés, as requested by Mr. Winch.

At 12:40 p.m., with the questioning continuing, the Committee adjourned until Tuesday, May 20, 1969, at 11:00 a.m.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, May 15, 1969.

The Vice-Chairman: The meeting is now called to order.

This morning the Committee is to consider again the estimates of the Department of External Affairs and the International Joint Commission. We have Mr. Cadieux with us again and various members of his staff.

You will recall that we were interrupted by a House vote on April 22 and at that time all three items of the External Affairs Department estimates had been open for discussion; Votes 1, 10 and 15. The idea is to continue with discussion on these items now and subsequently to go into the estimates of the International Joint Commission.

Our first questioner this morning is Mr. Roberts.

Mr. Roberts: Thank you, Mr. Chairman. Perhaps I could be allowed to welcome Mr. Cadieux, but when I first arrived in Ottawa in 1963. I was under his control or aegis and I was intimidated by him then and I may perhaps still be intimidated by him today.

I wanted to ask a whole series of questions which relate to the implementation of the Glassco Commission recommendations concerning the Department. I suspect that not all of these recommendations were ones with which the Department agreed and they may have been right not to agree with them. I would like to get some idea of the extent to which they have been implemented and where they have not been implemented, the reasons or the explanation for that.

Perhaps I could start off on the general question of recruitment and training. The Glassco Commission suggested on page 106:

Relatively few advanced students are now entering the foreign service, a consequence being that an increasing proportion of the entrants possess a Canadian university B.A. only.

Is that still the case, or can one give some estimation of the number of entrants or the proportion of entrants who have only first

university degrees rather than graduate degrees.

Mr. M. Cadieux Q.C. (Under-Secretary of State for External Affairs): My impression is that we would have to document this and not having the specific figures with me it is rather difficult for me to give as satisfactory an answer from your point of view as I would like. The impression I have from my conversations with the Director of Personnel and Staff is that more and more of the people who are joining the Department have more than their B.A.'s and that the tendency now is to get people who have done not only graduate, but postgraduate work and who come with Ph.D.s

We also have provision to recruit occasionally above the Grade 2 level; therefore, we bring in people who have had advanced university education in some cases, or who have had the combination of more university education and practical experience. I would say that the tendency has been to achieve this recommendation.

Mr. Roberts: Perhaps you could get some figures for me over the past five years of the proportion. Your comment leads me to the second question, that of lateral entry, which is something the Commission did recommend. I know that you have instituted procedures to enable this. Has the Department taken advantage of this? Would there be, say, a few people coming each year on lateral entry or a significant proportion?

• 1110

Mr. Cadieux: Yes, there is some movement. Again, I think we can produce the statistics for you. The movement works both ways. There is some movement outside the Department to other departments and with us I think it is a very significant factor. In some cases it is permanent; that is, people at some stage in their career seek further advancement or satisfaction in other types of government employment, or they move outside government service. Others, outside as part of the technique of keeping in touch with

developments of other branches of government, are loaned to other agencies. They are loaned to such agencies as Treasury Board or the Privy Council office, the Minister's office, and we deploy a considerable range of personnel to achieve this. They are loaned also to the Aid office. But, generally speaking, we always have outside the department a fair proportion of our personnel.

Then, the other way is that we have students who come in for temporary employment during the summer: these are students who we hope to interest in a career in the service. Then there are more advanced and more qualified personnel: these are the researchers. We employ some on projects nearly every year; I think in some cases it is three or four. Also on ad hoc projects there is an arrangement with the Canadian Institute of International Affairs to recruit people. We also have competitions above the grade 2 level.

The problem we get into here, which I am not sure was foreseen by the Glassco Commission, is that four or five years ago there was a considerable amount of recruiting in the Department. People came in at the rate of 50, 55, 60 a year. These people are moving up the ladder in the Department, and the problem is that it may not be desirable to bring in too many people in the lower middle level where the number is already adequate. You have to be a little more selective and find the places where there is a lack of suitably qualified people.

Last fall and well into the new year we had a group of experts, in partnership with the Department, study precisely this problem. They were trying to answer a simple question: what are the personnel policies that the Department should adopt hopefully to always be in a position to have the kind of people at the right level with the kind of qualifications that would meet the requirements of the Department? The difficulty is to project this in the years ahead because the requirements are not always easy to foresee and one must take into account that sometimes unexpected requirements may develop, not only in geographical terms but in terms of special skills, in terms of research, in terms of planning. This is not the kind of thing that universities and the current competitions necessarily bring out. These are the general factors.

Mr. Roberts: Undoubtedly too, you have a pressure: I suspect you are short staffed and therefore it may often be difficult to free

officers to take a seconding to another department.

Mr. Cadieux: Yes, this is always a problem for us. We tend to run lean: there is a requirement to be as economical as we can on staff, and in the end we can only do our work with the people who are with us in the Department. The problem is to define what is our work. Our work has to involve co-ordination with other departments that are closely related with us and do work which requires a good deal of co-ordination.

Mr. Roberts: I have, nevertheless, the impression from the outside that one of the areas which is not as strong as it might be in the Department is that of economic policy, and when the Department of Finance officials were before the Finance Committee, after some questioning on my part they did indicate that they would be quite prepared to have a greater exchange of officers between your Department and Finance on, say, a two-

• 1115

year basis in order to give on both sides a bit more experience and background with problems which are of mutual concern.

Is any plan or any discussions going on which might lead to some kind of exchange in an orderly way between these two key departments?

Mr. Cadieux: We have recently developed proposals and suggested that there ought to be a deployment of officers of middle rank from our Department to a number of other departments including Finance, to achieve exactly what you have in mind.

Mr. Roberts: Good.

Mr. Cadieux: But this is the sort of thing that calls for careful planning and for a kind of co-ordination as between a number of departments in recruiting and career development. It can only be done with the consent of the officers. It is not a matter where you can sort of force the pace, otherwise the officers are less than happy in employment that does not correspond to their own ideas as to what their careers would seem to call for. This is something we have very much in mind and I am glad to hear that you confirm that this is also the view of the department of Finance.

Years ago, at the time when Mr. Hardy, who is now the Deputy High Commissioner in London, was a junior officer in the Department, we initiated this policy of exchanging

officers with Finance and he was the first one to do that. That was, I think, some 16 years ago. We were conscious then of the need to do that. The difficulty is that you do not always have the personnel to implement it or you do not always have the suitable types of people who are interested in this kind of co-ordination. Our experience is, as you suggest, that this is valuable; it makes for better co-ordination between departments. But it can only work if it is two-way street. If the Department sends somebody, it is more interested in the operation if it gets someone in return so that at the end of the operation each department has officers who have established personal contacts, who have familiar with the problems of the other department and can work more effectively together.

Mr. Roberts: I am delighted to hear of the developments which you describe.

Mr. Cadieux: We are thinking of something that would be fairly big and would involve dozens of officers. It would not be a small scale operation, considering the number of officers we have in our Department.

Mr. Roberts: So that the phrase in the Glassco Commission Report that it is not the practice to second foreign service officers to key departments for experience is certainly no longer true?

Mr. Cadieux: It is no longer true. In the Aid office, for instance, we are seconding a large number of officers, and we have a considerable number of officers in the Privy Council office all the time.

Mr. Roberts: Is it now a condition of permanent employment in the Department that an officer have a working knowledge of both French and English?

Mr. Cadieux: In effect, it works out that way because we generally do not allow them to move to something else until they have acquired proficiency in the other language. That is the first thing they do. If they do not know the other language they are sent to the language school. So that, in effect, by the time consideration has to be given as to whether they will be confirmed in their position, they have already been exposed to this if they did not have it when they came.

Mr. Roberts: It may be somewhere in one of the papers that we have been provided with, but could you give me now the salary range for a starting officer in External Affairs

and the salary range roughly of someone who had been in the Department for 10 years?

Mr. Cadieux: They have been increased lately and I will have to check with some of my colleagues here who may have the figures with them.

• 1120

The Vice-chairman: Have you finished, Mr. Roberts?

Mr. Roberts: No, I have a lot more but if you wish me to break off and come back later on, Mr. Chairman, I am prepared to do that.

The Vice-Chairman: I do not have many names so I think you might as well continue, Mr. Roberts.

Mr. Roberts: Having said that I think that the salaries are discouraging, I would like to go on to the question of allowances and regulations. I think that unless things have changed drastically over recent years, this is one of the areas where the department are still operating on a slightly archaic basis and, I suspect, through no fault of their own.

First of all, I would like to talk about the allowances or the way in which they are administered in transfer from one post to another. I think at least up until about five years ago, it was the practice to make the officers rigidly accountable for every expense that was involved. It required an enormous amount of regulation, an enormous amount of filling out of forms and must have involved a considerable number of people.

Some of the regulations are pretty bizarre or were pretty bizarre and led to some strange results. There was one regulation, if I remember correctly, where an officer could only have brought back free from his posting abroad a cargo space or weight one-quarter more in weight than the weight that he had taken out with him when he went on the posting, the result of which was to lead enormous numbers of young diplomatic officers to pack up their bricks and boards used as bookcases, which would increase their weight as they went out, and to throw the bricks and boards away whenever they arrived at where they were going so that they would have an increased weight allowance to bring back.

There were regulations providing for compensation for taking your automobile to your posting, but you could not receive compensation for bringing it back and so on. There were many other regulations which were

extremely detailed and in some cases rather bizarre. This seemed to me to use a lot of energy and time. I would say that when you establish regulations in such a detailed way you really are encouraging people to find as many ways around them as they can.

Surely it would be a lot easier simply to establish for any transfer of post from A to B for a certain sized family at a certain level in the service an over-all sum which would be generally adequate to cover that kind of transfer rather than to go through a detailed accounting, which takes a lot of time and leaves a lot of frustration. It should be possible to establish some kind of blanket covering charge for a transfer between two points for a family at a certain level in the service. Would that not save a lot in terms of administrative frustration and annoyance?

Mr. Cadieux: If you will allow me, Mr. Chairman, I would like to make a few comments on the general points raised by the honourable member and then to invite my colleague, Mr. Wilson, who has been involved in detailed negotiations with Treasury officials on these problems, to give detailed answers to the specific points raised.

The first thing that I think has to be pointed out is that we are not the only department involved in external operations and here we are not free agents. We are very much involved in negotiations with the control agency and can only hope for the best and make the best case we can for our employees, bearing in mind that resources have to be

• 1125

handled carefully because they are not unlimited. There is always the argument for being generous as against the argument for being tight or being careful with public money.

The other point is that you have to bear in mind that any concessions that you make to one department apply across the board to thousands of people who serve abroad. That, in the end, makes for a very substantial sum and we are dealing here with figures which are not inconsiderable.

Another point I wish to make is that at the moment this whole system is under review. I think that in the fairly near future we may have a new system, so that in many ways, we are conscious of the fact that the present arrangements are obsolete or inadequate and we have been trying to improve them.

Having said this, I think that I must thank you very much for having brought up the general point. I think it is very relevant in this sense: that the employees of the government who go abroad in one way or another will not serve effectively unless the financing is adequate to give them a feeling that they are being given a fair deal. This is the problem. If they are hampered by regulations at every turn, and if it is always heads the government wins, tails the government wins and they always end up carrying the red accounts, then after two or three postings the employees may become disillusioned. They may become cynical about going abroad. They may say there is a lack of understanding of the risks associated with serving abroad. This I think, affects their disposition to give to the country and to the department the kind of service that we all want to achieve. This is something that is of the essence in this system of allowances. Unless there is enough, somehow, unless the details relate to the central objective of achieving what it is that these people are sent abroad to do, I think that the purpose is lost. This is very important.

Mr. Roberts: With that I would agree.

Mr. Cadieux: Now perhaps Mr. Wilson would comment on the specific points you have raised.

Mr. David B. Wilson (Head, Staff Relations and Compensation Division, Department of External Affairs): Yes, sir. The first point you made, I believe, was that there was in force sometime ago a rather cumbersome and administratively inconvenient system for determining how much out-of-pocket expenses should be compensated for when people move.

This was indeed recognized as one of the less sensible features of the previous system and in 1962, when the Foreign Service Regulations as they now exist came into effect—on May 1, in fact—there was brought into play a new thing called a transfer allowance which was non-accountable. I blush to tell you how little it is, but I have it in front of me. A transfer allowance of \$50 in the case of a single employee and \$100 in the case of a married employee may be paid when the employee is transferred and so on. This is completely non-accountable. The non-accountability of it was intended to meet the point that it is absurd to submit claims in quadruplicate for garbage cans you throw out and

light bulbs that do not work because of different voltage and that sort of thing. But the principle was established and it was in fact, I think, certainly a step in the direction that you are suggesting.

There are, of course, many other kinds of expenses and you mentioned car shipment expenses. Perhaps I could take a moment and speak to that point. This is rather a larger issue because in fact at present only Foreign Service officers have the privilege of having cars shipped to their post at public expense. There is a limit on the cost of shipment; that is, it is limited to the cost of shipping a car from Canada to the post, but this is one of the many areas of the Foreign Service system of compensation and benefits undergoing thorough review right now.

I might just mention, Mr. Chairman, that I came from a meeting in the Treasury Board before this meeting at which we are continuing meeting several times a week, in fact, and sometimes in the evening, to carry out consultations within the National Joint Council. The Public Service Alliance of Canada, the Professional Institute of the Public Service, and the Professional Association of Foreign Service Officers are all represented and, together with officials of Treasury Board and departments, they are looking at a whole new system of benefits and allowances which we hope will be put into place in the coming months and which will eliminate many of the anomalies and imperfections of the present system. I do not want to go beyond that because it is, of course, a matter of confidentiality within the National Joint Council.

• 1130

However, the car shipment benefit very specifically is one which in many ways has to be looked at as some kind of fringe benefit, particularly if you look at the question of the possible extension of the car shipment privilege to non-officer people. You do not necessarily have a justification for shipping a car to a post and bringing it back. There may be some case of an option to the employee but these are things where there are, as the Under Secretary has said, thousands of people who may be affected. There is the collective bargaining aspect of the whole thing and there is, finally, the question of budgetary control and effectiveness. I would like to say that we are hoping, speaking as departmental management, to have in the not too distant future a substantially better system than, in fact, we have now. The points you have made

in criticism of the old system are well taken and I can only say that they were dealt with in 1962 on the transfer allowances.

Mr. Roberis: There have been several mentions of the Professional Association of Foreign Service Officers and I think there are some difficulties in that area as well. The primary difficulty that I have heard a great deal of comment upon is that many of the foreign service officers are prevented from holding at least executive positions in the professional association because they are considered to be managerial staff.

The application of this particular principle operates in an extremely bizarre fashion in External Affairs and, in effect, I think to some extent creams off most of the people that you would really want running the association. Again, I suspect here the problem is not with you but with the Treasury Board, I suppose?

Mr. Cadieux: The problem is partly Treasury Board and partly the joint boards. There has to be arbitration on this and I think we are bound by a ruling. PAFSO, that is the Professional Association of Foreign Service Officers, felt that the ruling excluded too many people. This was arbitrated and the decision was that the management's ruling or suggestion was essentially sustained for reasons that have to do with the structure, with the kind of operations that the service must conduct.

In the nature of things we have a fairly large establishment in Ottawa which is broken up in divisions. This is the unit here that manages the affairs. It means that a certain number of people must run your division.

Abroad you have 85 posts and people rotate between Ottawa and abroad and when they take charge of a post they become managers. It means that if you have 85 posts you have a large proportion of your people who suddenly become managers, but the minute they become managers, by the definitions accepted under the rules that are the basis of the game, they are excluded from membership in this thing.

Mr. Roberts: So this is not a decision of the department?

Mr. Cadieux: No, the Department had to accept the decisions of the arbitration board bearing in mind the structure that it has to live with. It is related to the function it must carry on with.

Mr. Roberts: Did they support the PAFSO position before the board?

Mr. Cadieux: It was not a position of supporting, really, because what we had to do as a Department was to explain the functions we carry, how we are organized, and what it is that has to be done. It was in the light of these representations on the part of the Department of how we function that a decision was arrived at that had the effect.

There is no doubt that the effect in terms of membership of PAFSO is that they are deprived of a large proportion of people who normally would be members of the association. These are in some cases the older ones, the more experienced ones, and it is for that reason, in fact, that they have the confidence of management and they become managers.

There is a compensatory element that in some cases they may go to a larger mission where they then can resume their role in the ranks of PAFSO. The point is well taken it is true that PAFSO does not have as many members as it would have if the Department was not organized, as it is, to serve abroad in small little pockets distributed all over the world.

Mr. Roberts: Mr. Chairman, I have gone about half way through the questions I have but I really think it would be unfair for me to preempt so much time from the other members.

The Vice-Chairman: I will put you down for the second round.

Mr. Roberts: If you would put me down again I will come back to some other questions I have.

The Vice-Chairman: Thank you, Mr. Roberts. Mr. Fairweather.

• 1135

Mr. Fairweather: One or two of my question I think are really supplementaries to Mr. Roberts. I am interested in senior people abroad and what opportunities they are given for what in the universities is known as a sabbatical, or after senior people have had a certain number of years abroad is there an opportunity for them to return to Canada, to travel in Canada, and hopefully spend some time in, let us say, a university somewhere?

Mr. Cadieux: We have some provisions. They do not go very far. First, every three and a half years or two and a half years,

depending on the nature of the post, there is provision for home leave and therefore they can come back to Canada and re-establish contacts with the academic community, with their families, and with their headquarters in the Department. This is one provision that is relevant.

Second, more recently we have developed an academic liaison unit in the Department and we are now beginning to develop an arrangement whereby we hope to post to universities diplomats who will act perhaps as professors or in other capacities as will be determined by the university. This will give officers who will be in the senior ranks and who will have been in our service for a good many years an opportunity to live in universities for a period of at least one year.

Third, we have on occasion sent some of our senior officers to such institutions as the National Defence College where they get a training that is of an intellectual nature and enables them really to withdraw from current operations and reflect on national problems. We have done the same thing for some other officers at advanced institutions, such as Harvard for instance, where they study international relations, but there our problem is really a problem of resources and a problem of being able to spare some of the very good people that we have.

What we are trying to do is not really to dispose of officers who may have become tired and send them to pasture for a year or two. We consider this an investment and what we like to do is to send to these institutions, or to enable those who benefit from these opportunities, those who are more promising in terms of the future.

Another thing that is related, I think, to the question you mention is this question of bilingualism where, for instance, very senior officers, those who will remain in the service for hopefully another 10 years, are given a year's break from current assignments to go to Quebec and to concentrate on learning not only the French language but to take an interest in some academic subjects that enable them to become familiar with French culture and institutions.

We have been very directly involved in all these things. We have always had people in this and considering the number of officers that we have, we have made an effort. Whether it is enough, I do not know. We would have liked to do more, and I think we have stated certainly that we would have

liked to do more, but considering our means it has been difficult.

Mr. Fairweather: I just do not understand the mechanics. Would a person of the rank of ambassador have some facility and money on returning home from countries to the west to be able to cross the country, and in reverse, if he is coming from the Pacific, or do they just come home to where they joined the service?

Mr. Cadieux: We do two or three things possibly. The first thing is that normally they come to their home. Their expenses are paid to their home, but there is more than just their salary. First, there is what we call a home leave allowance which gives them a little more mobility and they can use that to travel and become acquainted with the country.

Second, in very many cases we arrange for them to come to Ottawa for consultations because this is an opportunity for us to get a personal indication of what is going on in their country and this gives them a chance I think to re-establish contact with a number of departments, old friends, and institutions.

Third, and this has been very useful when it is not in the middle of the summer, when the season is appropriate, thanks to the Canadian Institute of International Affairs, many of our returning heads of missions have undertaken tours in the country of the insti-

• 1140

tute branches and this has been very valuable for them in terms of renewing friendship, finding out more about the country, and also explaining to fellow Canadians a little of their experience in other parts of the world.

Mr. Fairweather: I think, if it is fair to observe, that public people as well as the public service are sometimes restricted if it is only to Ottawa that they come for the source of refreshment. I will speak about the transport of dependents and then I will get off this topic. I do not want to classify this at the ambassador level because surely the problems are the same with other people too, but is there a cut-off date when dependents who are in Canada for education can return to their parents wherever they are posted abroad?

Mr. Cadieux: I think Mr. Wilson who is more familiar with the details than I am can deal with this.

Mr. Wilson: Yes, it is age 21 now, but I may say that this age limit, this cut-off point, is itself one of the things that is being looked at very carefully in the National Joint Council Committee on Foreign Service Regulations. There is a limit now.

Mr. Fairweather: Really, people might be right in the middle of university and they are suddenly cut adrift in a sense and in normal circumstances would be returning to their "home".

Mr. Wilson: I do not want to mislead you; perhaps I misunderstood you. If you are talking about students at the post at the university level, we can always bring them back to Canada at any age but normally this does not happen. By the time they are at the two or three level they are normally back in North America, in Canada. I was referring to the benefit. To try to make it clear, it is really a family reunion, a school holiday travel benefit. It is the privilege at public expense for the child to travel from the school or from the university out to the city where the parents are for the summer holidays, let us say, and then back.

Mr. Fairweather: That is the point I was making but it is rather arbitrary if it is 21 because you might be in the middle of a university course at age 21.

Mr. Wilson: In effect, yes, but without defending the present system I can explain the rationale. There was an arbitrary decision that at some point in time a child ceases to be dependent and beyond that point the taxpayer should not really be expected to subvention the annual holiday trip. This is, however, being looked at again very carefully by the unions as well as management.

Mr. Cadieux: Perhaps I could add a word to this. This is one of the risks of Canadian foreign service and having allowances that are more than just absolutely related to detailed expenditures. If a man is serving his country very far from home and he learns that his son at university is very sick, for instance, there would be expenditures for going there to visit him, either he or his wife will go. This is one thing.

Then a man is away. He is away for two years and he hears that his father is dying. Again he will go and there again this is an expenditure that is connected with service abroad. I realize that people who serve in Ottawa may have similar expenditures but this

hits the foreign service officer repeatedly over his career. These are just examples of the kind of things that keep hitting foreign service officers that cannot be covered in advance by regulations that are too tight. Unless these things are done with regard to the normal complexity of life, in the end people who are in the foreign service are going to find it is no deal and it is not worth it.

Mr. Fairweather: I have one last question on this aspect. What about subscriptions to Canadian journals, not particularly newspapers—of course there are not too many of them—is there a reasonably generous allowance?

Mr. Cadieux: All missions, I think, can subscribe to a fair number of periodicals of their choice. I think it is eight Canadian periodicals. They can receive by mail eight and in some cases even more periodicals. In addition they can subscribe to local publications and then some of the internationally-known publications. We make an effort to provide them with the tools of their trade.

• 1145

Mr. Allmand: May I ask a supplementary on that?

The Vice-Chairman: A supplementary, Mr. Allmand.

Mr. Allmand: You will recall, Mr. Cadieux, there was a question about the newspapers received by Canadian embassies abroad, I stated that I found it strange that in New York at the United Nations and at other places you received the newspapers so late and also that you only received two newspapers on a regular basis *Le Devoir* and *The Globe and Mail*. I felt this was not really adequate to keep people informed about Canada and up-to-date. Has anything been done to change that? Do they still only get *Le Devoir* and *The Globe and Mail* as late as they do?

Mr. Cadieux: We are studying the problem as I said at the time. The time elapsed since then has not been sufficient to enable us really to make a very great many additional provisions. The system that exists now is that they get these two newspapers by airmail and then they get the CBC bulletin every day.

Mr. Allmand: That is edited though?

Mr. Cadieux: Yes, it is prepared by the CBC and gives them the news every day. On

top of this each time there is an important governmental announcement, if the Prime Minister or a minister makes a statement on an important policy question, then this is sent by telegram to all our missions for their information. This is essential to keep them going. On top of that they get the weekly bulletin which covers a fair amount of Canadian news. All these things come in. On top of that they receive these Canadian magazines to which they subscribe.

A number of the missions, the more important ones, get some newspapers by airmail but the cost of these things is one of the limiting factors. It is one of the problems. Many of these newspapers have a very little part that is not repetitive. If you were to send five newspapers much of this is advertisement, much of it is news that you would find in all newspapers, and we would be subsidizing, at high cost by sending that by airplane, material that would be covered five times in each of these publications. This is one of our difficulties when we have to economize. However, we are trying to find ways of improving the flow of information to missions.

We were giving thought to this question that you have raised and one of the problems we have to look at—I would be very grateful for your comments on this—is what are the objectives that we are seeking in very much increasing this at considerable expense. These newspapers are heavy to send by airmail and therefore costly. If we were to send 10 papers by airmail to all our missions this would cost us \$400,000 a year which would be far more than all that we spend now for all publications and a great deal more than we think that we can afford at the moment.

Is it to keep the mission informed? Is it for the convenience of visiting tourists? Is it for the local visitors at the embassy? These are some of the things that we have to explore to try to decide what the target is we are aiming at.

There are not many Canadians who have come back from visiting posts abroad who have told us, "I come from this city and I was astonished that at the embassy I did not have yesterday's issue of my newspaper". Nor the Canadian members of the staff who are there whose main responsibility is to keep in touch with what is happening in Canada, although undoubtedly their chief responsibility is to follow the local scene and keep us informed. If they need instructions on a point we give them advice in telegraphic form on

the basis of the best political authority we have. We go to our political masters and we say, "What do you tell your ambassadors in this country to tell the foreign minister of that country about this or that problem". It is not his interpretation of what is in Canadian papers that would be the decisive character.

I must say that the Canadian members of our embassies are not really agitating very much to get more material. If you can enlighten me on what you think the essential purpose is that would be served by increasing very considerably our expenses in this sector it would help us to carry the case.

• 1150

The Vice-Chairman: Gentlemen, we now have five more questioners on our list. You are second, Mr. Allmand. You have already asked two or three supplementaries. We will be coming to you in a little while. I think you are pressing a little too hard there.

Mr. Allmand: All right, I will return to it later.

The Vice-Chairman: You will be second on my list. Mr. Fairweather I believe has another question or two.

Mr. Fairweather: Yes. I have in front of me and just by coincidence today's British papers and the British weeklies prepared by the BBC and distributed by the British information service. They come airmail for a dime. They cover the spectrum of opinion in Britain from the *Daily Telegraph* to the *Daily Worker*. This is what I mean, is there that type of thing? I do not only want *The Globe and Mail*. Are we getting the *Calgary Herald*. I do not care about the ads and the news, but editorial opinion; opinion in a very simple cheap form. Is there that equivalent? I do not know whether Mr. Allmand means that but this is what I am talking about.

Mr. Allmand: Partly, yes.

Mr. Cadieux: The CBC news bulletin is really our equivalent for this.

Mr. Fairweather: Perhaps you have never seen the CBC bulletin that comes to MP's on trips, with the hockey scores, and who fell off a cliff, and whether the Prime Minister answered the Leader of the Opposition. It is quite inadequate. There is no clash of opinion. I would like to think that our services abroad are aware of some of the problems that confront politicians at home because of different opinions in the country.

That is all. I will not labour it at all.

Mr. Cadieux: We have this news thing, which is the equivalent. I am not making an argument that what we send is as good as this. My opinion is that it is slightly different. It serves a different purpose. We are not taking the responsibility, as a Department, for the selection. There is a little problem here in evaluation, and in deciding what goes in. This is a problem that we have avoided by asking the CBC to give us this bulletin. It is a judgment that is made about what is newsworthy.

As I said, any important statements in the House we are very careful to send immediately to our missions. We think that in the House many important events affecting our national life are taking place, and the missions get this. Admittedly, this is not all, but it covers part of it.

Another relevant factor that I think I should mention is that at the moment the government has appointed a group of people to examine the whole matter of information. We have been hesitant to move very fast in this sector until we know what they are going to recommend and what decisions are going to be made.

What I have in mind is that it is conceivable—although I have no way of knowing this—that they might say that the Department of External Affairs should develop more elaborate services to provide exactly the kind of thing that you have shown me now. If that were the case, this would be one situation. Or they could say: "what we need is a central unit to produce this for all agencies operating abroad", and we would rely on that and distribute it. This has been a factor that I think has slightly inhibited us about starting any new ventures lately.

But we would like to give more and make sure that our embassies get it in condensed form. Because there is a danger venture that the flow may be too much, and sending them too many bulky newspapers at great expense may not provide the answer.

The Vice-Chairman: Mr. Fairweather passes until the second round. Mr. Anderson?

Mr. Anderson: Thank you, Mr. Chairman. I must say, as did Mr. Roberts, that I am very pleased that Mr. Cadieux is before us today. Like Mr. Roberts, I also am a former foreign service officer. Mr. Cadieux's reputation is very high among the foreign service officers and professional people in the field.

I would like to follow up one of Mr. Fairweather's questions on the subject of home leave. I am a little diffident about doing this. I did attempt to get more information by way of a question on the Order Paper but two months is evidently not enough time for the

• 1155

Department to send a reply. Therefore, I do not know very much about the particular area. And perhaps you will not have the exact details that I am seeking.

You mentioned that home leave is given to people on their return from tours abroad. I know that in my own case I attempted to get it three times and failed on each occasion indeed, until I left the service.

Could you give me some indication of how often it is possible for people to take advantage of these very excellent regulations which allow home leave? Is it a question of home leave being granted every second time, or is it that nine out of ten offices get it on their return from abroad?

This is the type of question I put on the Order Paper. I apologize for putting you on the spot right now, but I would like to know whether this actually takes place very frequently?

Mr. Cadieux: Again, I will call on Mr. Wilson, out of his familiarity with the subject, to give you the best answer he can.

I speak with some feeling on the subject myself. I have been in the service for 28 years and I have never had home leave.

I can well see your point. It is nice to have, but you do not always manage to get it. Why? It is for the reason that it is intended to be given when, say, an officer goes abroad and serves for a period of time. The period of time is longer or shorter, depending on how the post is classified. If you go to a post where conditions are roughly similar to those in Canada, you are not intended to have home leave before about three and a half years. For instance, if you go to France, or to Belgium, and you leave now, a period of about three and a half years would have to elapse before you could claim your home leave.

If you went to a country with a more difficult climate, such as Indochina, or Indonesia, the period would be much shorter. It would be about two years. You could ask for your home leave and come back at government expense at the end of that period.

In the case of certain categories of employees serving in the United States, they are not entitled to home leave because conditions there are deemed to be so similar to those in Canada that the feeling is that there should be no entitlement.

Beyond that, perhaps Mr. Wilson may want to elaborate.

Mr. Wilson: The real question that Mr. Anderson has posed is not so much on the theory, or the policy, or the intention, as on the practice. I have to apologize for our not having been able to answer your question yet. I would have hoped that by now we would have been able to. The fact is that a few years ago we switched over to a system of keeping leave records for people abroad only at the post. We have to wait until the end of the fiscal year to get all their reports and these have been a little slow in coming in; but we should have it very soon.

But on your specific question about how often they do get it and whether it is every other term, or every third term, the answer is that it really depends very much on the employee and on whether or not he can be spared at the time he should come back. Foreign service officers, as a category, tend to suffer very much because there is always more work to be done than there are people around to do it. This is one reason that one has in the past often seen cases of people being asked to defer their home leave. They do not lose it; it does not lapse; it is not something that if they do not take it they do not get when they go abroad again.

There is not only the home leave benefit available to people abroad but there also accrues one extra week of vacation leave a year. If they have not been taking all their leave as they have earned it at their post, they may come back with anything up to 40, 50 or 60 days' leave. This creates problems for the Department in deploying its manpower resources in the most effective way. And this is really the explanation of why so often we have tried, in fact to inflate our establishment by the device of overtime and by deferring leave, simply to try to meet the challenge presented by the tasks that are before us.

I think I should mention that in future, under the recently negotiated collective agreement with PAFSO, there will be provision, after two or three years, for a cash compensation to be paid for unused leave credits. The effect of this, because of the

budgetary restrictions upon us, will be to compel managers in future to be very much more deliberate in making the hard choice between getting a job done and giving an employee leave. I would not like to make any predictions, because this will depend very much, of course, on how much is approved in estimates in future years, but I would expect that we will be found to be taking very much harder looks at the priorities of the departmental operations and very specifically at how they relate to the granting or deferring of leave.

•1200

Therefore, to sum up, the personnel policy intention is that employees should get leave in the year it is earned; and that when they come back from a post abroad with home leave credits they should be entitled to take it within a reasonable time, and, if possible, at a time convenient to the employee.

We have to think of fair weather and school holiday leave, and that sort of thing. Very often foreign service officers have asked not to have to take their home leave in the winter when they come back. This sort of thing tends to lock them into situations where they go back to work at a desk job and it becomes very much more difficult after that for the division heads to release them. This has been so in the past but we hope it will be less so in future.

Mr. Guay (St. Boniface): I have a short supplementary question.

The Vice-Chairman: Mr. Guay, on a supplementary.

Mr. Guay (St. Boniface): Does this leave that you are speaking of involve their families? In other words, are the families allowed to go on leave with them on these holidays?

Mr. Cadieux: The main benefit in the home leave area is in fact the transportation benefit. That is where the big money is involved—bringing them back with all their dependents, every two years from their post and taking them right to their home leave centre. In French it is called, “congé de foyer”—back to their home towns as it were, with all their families. It is not the cost of the man's salary while he is on leave that is the big item in the long run, it tends to be the shipping expenses. But the answer to your question is yes, the dependents are all included on the home leave benefit.

Mr. Guay (St. Boniface): Thank you.

Mr. Anderson: It appears then that the purpose of the leave is not as Mr. Fairweather suggested—an opportunity to see Canada or to get to know Canada better following their return from a post abroad or prior to a departure abroad; it is basically some sort of a rest and recuperation period after a period in a country with a difficult climate.

Mr. Cadieux: Not necessarily. After all, leave is at the disposal of the officer. He comes back and if he wants to go to his home town he is free to do that. On top of that, if he wants to divide his time between his home town and Ottawa to re-establish contacts with people in headquarters, he is free to do that, or if he wants to return to where he received his university education and visit his old professor, he has that freedom. In other words we do not try to prescribe how he uses his time.

Mr. Anderson: That is true and it is very curious that you would permit, as Mr. Wilson has mentioned, payment in lieu of this leave—because it would appear that what you are giving in that case is not an opportunity for the man to re-establish contact with either his home area or with some other area of Canada but simply paying him sort of like an extra allowance in return for service abroad.

Mr. Cadieux: You have to bear in mind that there are two possible circumstances involved here. I think it was originally conceived as a kind of break at home between one foreign post and another. If a man is taken out of Indonesia and sent to Belgrade, it sort of makes sense to say to him, “Look, you go home for a little while. Do what you want, but then you will be gone for another two and a half or three years. So make sure that you do whatever you want to do at home.” But there is another situation.

The other situation is when you say to this man, “You have been two years in Indonesia. You have earned home leave credits. Your next post is not going to be outside but back home in Ottawa.” At that point you have a choice. You may say to this fellow, “Theoretically you can go to your home town, which is 500 miles from Ottawa, and you will be gone for two months.” This is one choice. On the other hand you could say, “The man who has replaced you at the post you came from has left. We are short one man. Would you consider going to work right now and either deferring your leave or taking some money in-

stead?" Because he is in Canada he will gradually re-establish his contacts and soon, and this should help us. This is really what happens.

Mr. Anderson: I could agree with you, sir, that your theory of home leave is excellent, however, it does appear to me that the principle of making payment in lieu thereof for the convenience of the Department, which is basically what this would work out to be, is in direct conflict with the policy that you have outlined, which would be for people to come home and to have an opportunity to regain contacts. I am quite sure, in view of your shorthanded problem, that there will be more and more pressure upon officers not to take home leave but to take money instead. In view of the fact that they are returning to a lower standard of living in as much as they are not getting their foreign allowances, it is quite possible the officers themselves would prefer to take money instead to allow them perhaps to make a bigger downpayment on a home or something of that nature.

• 1205

It appears that this particular provision flies directly in the face of the logic of granting leave in the first place.

Mr. Cadieux: I do not want to be contentious about this, but Mr. Fairweather was asking me whether we were making provisions whereby people had the opportunity to renew their contacts at home. I said that home leave was one of the ways by which we were doing this. I do not want to push it beyond that, but I think that for those who want to do it it can serve that purpose.

Mr. Anderson: Perhaps we will come back to that when my question on the Order Paper has been answered. I do have the information on amounts and numbers of people.

I would like now to turn directly to the estimates themselves. Could you briefly comment why under Vote 1, on page 87 of the estimates the number of Scientific and Professional personnel employed in the Department's administration has doubled? Is there any significance to this doubling from 20 people last year to 41 this year? Does this indicate any new responsibility?...

Mr. Cadieux: Yes, we have absorbed the SRB, the Special Research Bureau.

Mr. Anderson: Similarly, is there anything significant in the accommodation costs dou-

bling, presumably for Ottawa accommodation provided by the Department of Public Works? Is this strictly an accounting device?

Mr. Cadieux: Yes.

Mr. Anderson: That is just an accounting question. Having cleared up those couple of points could we perhaps turn to some of the costs of missions abroad.

There is no doubt that the Department has done very well to keep its increases in expenditure to approximately 8 per cent this year. I am sure all members of the Committee congratulate you on preparing a budget which is so modest in its increase. However, it may be that in future there will be no increase money available. In the light of the Prime Minister's recent statement to this effect, apparently we are entering a period of austerity.

I wonder how you justify some of your missions abroad. I am thinking in particular of some of the missions overseas which apparently cost a minimum of very close to \$100,000 each in countries where we apparently have little trade, few Canadians resident, and no direct Canadian contact. An example is Ecuador. We do not have much trade with Ecuador and there are few Canadians living there. Uruguay would be another one. How do you determine whether those countries will have a mission? Also and I am not pushing the case of this country—how does it happen that a country such as Korea, which has I think a \$40 million trade with Canada every year and a fair number of Canadians resident there, is not entitled to a Canadian mission? Could you give me some indication of how these decisions are made?

Mr. Cadieux: This is something I could discuss very easily but I feel inhibited because these are essentially governmental decisions. Ultimately the decision to open or to close or not to open or not to close are made by the government for political reasons and I think that as a civil servant it is very awkward for me to comment on this.

I could add that in a country where you have a mission the people who are there perform the usual tasks connected with the maintenance of a mission. They provide consular services, they try to promote trade, they do information work, and they report to the Canadian government on what is happening. But where the government wishes to decide, say, whether to send a mission to Latin America to emphasize our interest there, it is a matter for consideration at that very

moment whether the decision to close or to open posts would or would not be compatible with the objectives. That again is an indication of how political that could be. Beyond that I prefer not to go.

Mr. Anderson: Yes, in the particular case of Latin America it appears to me that we are not using very much of a scatter-gun technique. Many missions are probably understaffed and representation probably takes up a far greater proportion of the officers time than it would if you had more concentrated missions.

• 1210

Perhaps I could just deal with a few specific items. Could you explain why there has been such a substantial increase in the operating expenses of the mission in Australia where there is no increase in staff. The operating expenses have gone up by 33 per cent.

Mr. Cadieux: I think that Mr. Matheson can explain the details of that. I suspect that this increase in operating expenditures relates to the cost of living.

Mr. A. J. Matheson (Finance Division, Department of External Affairs): The fluctuations in the figures shown under various missions include repair and upkeep of buildings and whether new communication facilities have been added in addition to the salaries and allowances.

Mr. Cadieux: But what about Australia? Is there any special reason that there was an increase of 33 per cent?

Mr. Matheson: We would have to examine that in detail.

Mr. Anderson: Excuse me, one moment sir: repair, upkeep and expansion does not come under capital items. It is not a capital expense?

Mr. Cadieux: No, it is not.

Mr. Anderson: That may well explain that one.

There is a similar question for Uruguay: the personnel has remained the same and roughly the same type of increase has taken place. However if we have to wait until we have the Minister before us before we can ask questions as to what missions should be closed in the interest of economy, I will pass until the Minister is before us, Mr. Chairman.

The Chairman: Thank you, Mr. Anderson. Mr. Allmand?

Mr. Allmand: Mr. Chairman, first of all, I want to return to this matter of news and editorial information for the embassies abroad. The reason I ask this question in the first place, is that, whereas I found our foreign officers abroad, in places that I visited, very well informed about the countries where they were, I found them rather poorly informed about what was going on in Canada. As a matter of fact, often they seemed to be more at home and belong more to the country where they were than Canada. They seemed like expatriates. Often they asked me about this and that. I may be wrong as I am not an expert on external affairs, but it appears to me as a Member of Parliament that our officers abroad should be like a bridge and should bring information from that country back to Canada and also inform that country of what was going on in Canada in some way or other, and understand what the people in Canada were thinking and what was going on in Canada.

I do not know how it can be done but there should be some method of information better than the CBC news bulletin which I think is quite inadequate. There are those two newspapers that are good, but I still feel this is inadequate—not just with news, Mr. Cadieux, but also with editorial opinion, and several young officers have expressed this to me too. You said you have not had many complaints; maybe I just ran into people who did. In private sessions that I had with several young officers they told me that they felt quite out of touch with editorial opinion in Canada, and what people were thinking about things. I just put the problem to you. I do not know whether the solution would be to send more bulky newspapers or to make a better compilation of news and editorial opinion, but I think in some way or other more information has to be brought to our embassies.

I compared this by the way, with what was done in some other embassies, and I found that they had much more. Some other countries felt they should airmail more newspapers and news magazines and so forth. If it costs \$400,000, I think it might be worth it.

You asked me the questions, are we to have these things there for the foreign services officers or just for tourists? I say, first of all, I think it might help the foreign services officers, but in addition to tourists, I also have the impression that an embassy abroad should be there as sort of a centre of Canada for those people in that country including businessmen, students, government officials

who may have to travel to France or England and that there should be some place in these countries where they can go and get up-to-the-minute information as to what is happening in Canada. This is again my impression as an amateur. Sometimes one cannot get that information. I personally feel that old news is not worth very much. If news magazines or newspapers arrive two weeks late, they are good from an historical point of view, but for business decisions or certain other decisions that require quick information, I do not know if they are worth that much. Anyway, I put the problem to you, and I do not have the full solution.

• 1215

Mr. Cadieux: As I indicated before, I think there is a task force that is studying the problem of how we should handle governmentally the problem of information. This will have an effect on the projection of Canada abroad and will undoubtedly concern the missions abroad. There may, as a consequence, be a good deal more of the kind of material that you think is going to be helpful, such as the collection of editorial comments and interpretation of news; this may become available and would meet the requirements that you had in mind.

Another thing that may be relevant to what you mentioned, I think is that in the future, under the new financial management regulations, missions will be given a good deal more leeway than they had before. They will be given control of a budget and they will spend it as they see fit, keeping the central office informed. At that point, if they wish to use some of that money to get some particular newspapers by airmail, it will be open to them to do that. From that point of view, it will be interesting to see if they wish to do it. This will be open to them.

Thirdly, I am very grateful to you for the comments you have made. We will study this and we will earnestly seek ways of improving the present system. I certainly agree that they do not get enough. Our whole concern is to find ways of doing it within our means and trying to be as effective as we can.

Mr. Allmand: On an other matter, I would like to know how many foreign service officers or how many diplomats you have in Stockholm carrying on negotiations with China?

Mr. Cadieux: How many we have?

Mr. Allmand: Yes, how many officers both within Stockholm and outside of Stockholm are working on this problem of establishing diplomatic relations with China?

Mr. Cadieux: There is the ambassador, and, as required, he is supplemented by experts who are sent from Ottawa at the direction of the Secretary of State for External Affairs. At the moment this is one officer. There may be more in the future, but at the moment, one.

Mr. Allmand: What level of officials are we dealing with on China? Are we dealing with men at an ambassadorial level there in trying to negotiate these relations, or are we dealing with other levels?

Mr. Cadieux: At the moment the People's Republic of China do not have an ambassador in Stockholm so that our ambassador is dealing with the *chargé d'affaires* there.

Mr. Allmand: I see. Are these negotiations basically taking place in our embassy and in the Chinese embassy? Are they continuing or do they intend . . .

Mr. Cadieux: They are taking place in the embassy premises.

Mr. Allmand: Can you tell us, or is it for the Minister to tell us, if these negotiations are proceeding satisfactorily?

Mr. Cadieux: I do not think I am in a position to add anything to what the Minister said recently, that he expected there would be another contract about the middle of May, I think he said I cannot add anything to that.

Mr. Allmand: All right. My final question deals with languages. Mr. Cadieux, could you tell us what provisions you make in the department for instructing your officers in foreign languages, other than French and English, so that they can deal with the people in the countries where they are stationed?

Mr. Cadieux: The general regulation is that when it is in the department's interest for an employee to learn the language of the host country, the department is in a position to authorize payment of tuition fees up to \$600 per annum. The same authority exists for the wives of officers, where the wives assist their husbands in their representational or promotional work. We give special training in difficult languages and at the moment we have authorized 14 people.

• 1220

Mr. Allmand: What would be considered difficult languages, Mr. Cadieux?

Mr. Cadieux: For instance difficult languages would be Arabic, Chinese, Japanese, Serbo-Croat, Polish, Czech; these are the more difficult languages. Authorities are issued for training in some 26 foreign languages all told, but they are not considered difficult. For example, Portuguese and Spanish are considered to be less difficult. All told we have authorized 500 of our employees to study foreign languages.

Mr. Allmand: So if you have a young officer in the Soviet Union, he can be given an authorization for courses in the Russian language.

Mr. Cadieux: Yes, he and his wife, and in some cases—it is a matter of availability of personnel—we would like to give him training in the language before he leaves, so that hopefully when he gets there, he has a knowledge of the language.

Mr. Allmand: Yes, I would expect that too. Do you do that?

Mr. Cadieux: It is a matter of how much staff we have. If we had, we would. We are short of personnel, but to the extent that it is possible, we do it. If the choice is not to have an officer on the spot, or to have an officer sent there with authority to learn the language, then this is the second solution. It is not as good as the first one, but sometimes we are driven to that, because we do not have enough staff.

The Vice-Chairman: Mr. Stewart would like to ask a supplementary.

Mr. Stewart (Marquette): Thank you, Mr. Chairman. Earlier you mentioned that you sent personnel to language schools here in Canada. I wondered what facilities you had for teaching English as well as French where it is necessary. I understand that some time ago facilities were not available. Are they now available to your Department?

Mr. Cadieux: You mean the bilingual facilities?

Mr. Stewart (Marquette): Yes, that is right.

Mr. Cadieux: Well, we find that most of the people who join our Department have a fair knowledge of English. I do not recall that

there has been a problem. Most of them have university education. It is a requirement and in most cases they are capable of getting along. If this was a problem we would make arrangements through the Civil Service Commission to arrange for them to be given additional tuition in the English language.

Mr. Stewart (Marquette): These facilities are available if a person wants to learn English?

Mr. Cadieux: In the Public Service Commission.

Mr. Stewart (Marquette): Very good, thank you.

Mr. Allmand: Returning to the foreign languages, if I understand you correctly, you do not think what you have now is really adequate for providing training in foreign languages for these officers before they go away. You seem to indicate that it could be much better than it is now.

Mr. Cadieux: This is all very relative. It all depends on the pressure on certain posts at certain times. In some cases, the post may be low in personnel and you may not be able to afford to send a man for a year to learn the language. You may have to move more quickly. But at times the post may be well up on personnel and then it may be easier to train a man and to send him there at a more leisurely pace. This is why I do not feel it is possible to generalize. In principle I think that as often as we can, we ought to send people to their posts with as much knowledge of the local language as it is possible to give them.

Mr. Guay (St. Boniface): Mr. Chairman, I have a supplementary question. Do other nations have a similar policy of giving an opportunity to their embassy staffs to learn the language?

Mr. Cadieux: I do not have the facts with me, but I know that many other foreign services have entrance requirements that are higher than our own. We encourage people to know French and English, but in some countries one has to know three languages before one can apply. You must know that many and then you are encouraged to pick up one or two afterwards. In many European countries, knowledge of three, four or five languages is not unusual. We in Canada at the moment are concentrating on getting the two official languages and then depending on the requirements in certain countries, we encourage people to learn languages as they go along.

• 1225

Mr. Guay (St. Boniface): So I take it that these other countries—and I am putting them all in the same category—have similar programs giving an opportunity to their embassy to have someone teach the staff.

Mr. Cadieux: As far as I know, other countries do that, yes.

Mr. Guay (St. Boniface): Thank you.

Mr. Allmand: The reason I asked that question, Mr. Cadieux, was when we did our tour on the NATO study I found that some of the Canadian officers in these foreign countries could hardly speak the language of the country at all. I was just wondering what steps are being taken so that our officers do speak German or Swedish or whatever it might be?

Mr. Cadieux: The ideal is that they should know it, but operational requirements must come first. It has not been possible in every case to sent people who have been fully trained in these languages.

The Vice-Chairman: Mr. Winch is the last on my list for the first round. I then have Mr. Roberts and Mr. Fairweather with questions on the second round. I hope we can terminate the questioning, and then next Tuesday morning at 11 o'clock we could arrange for a quorum and pass these estimates. Perhaps we could sit for a few minutes past 12.30 to clear this up.

Mr. Winch: Mr. Chairman, may I first of all apologize for being 40 minutes late, but like other members I have not yet discovered the secret of how to be in two places at the same time. My questions will be in order and I will be as brief as possible.

Mr. Cadieux, I believe the first inquiry on this must come to the Department of External Affairs. Could you tell us how you reach a decision as to where and in what numbers military attaches shall be posted to our various embassies and whether or not there has been any reduction in the number of military attaches in view of the very strong criticism that was expressed, about two years ago I believe, when a number of members thought that we were overstaffed with military attaches?

Mr. Cadieux: As to how we reach a decision on military attaches, my impression would be that this would be a question for National Defence to deal with. But I could

make some comments which I hope will be useful.

Mr. Winch: The first inquiry comes to you at External Affairs?

Mr. Cadieux: Yes. This is something we discuss with the Department of National Defence and this is something about which we would ask the views of the head of mission, as to whether it would be helpful and desirable to have a military attache somewhere.

Some of the considerations that enter into the picture are that the military attache, in terms of reporting, in terms of liaison, in terms of representation, covers some of the duties that the other officers of the embassy cover in other fields. Then you have to ask yourself about the role that the defence forces play in a particular community. For some countries you may reach the conclusion that the armed forces are important, and in some cases you may even think that there are possible outlets in terms of defence production. It could be that in some countries we may have expectations that we could sell military equipment. This could be an additional factor, apart from the others, in arranging for the posting of a military officer to serve at a diplomatic post as a military attache.

• 1230

Ultimately the decision as to how many is made by the Department of National Defence, but as I say the decision is not made without consultations with and ultimately the approval of the Department of External Affairs and consultation in each case with the head of the diplomatic mission.

Mr. Winch: I think it was about two years ago that there was very strong criticism of the numbers. Has there been any reduction? Are they the same, or have you increased the number?

Mr. Cadieux: At the moment I do not have the figures in my head.

Mr. Winch: Would you mind getting them for us?

Mr. Cadieux: I think we can.

Mr. Winch: Thank you. I will now move along to my second question. This again is in view of the fact that I think it must come to External Affairs first. Would you be good enough, Mr. Cadieux, to explain how, in co-operation with the Department of National

Defence, a decision is made to supply the cadre of military officers to train, for example, a navy in Nigeria, the army in Ghana and in other countries. I think this is rather an important matter. Just how do you decide. In many cases we do the training where there are trouble spots in the world today.

Mr. Cadieux: Let me hasten to relieve what seems to be the concern in your mind. I think the decision in every case is made by the Canadian government. What happens is that the government in country "X" calls in our ambassador and says: "We would like to have some training for the officers in our navy and we would like your country to provide us with assistance in this field." Well, the ambassador as it is his duty, will first consult with his military officer or military adviser as to what may be the implications of this order, and he will then send an assessment of this to the Canadian government here.

Mr. Winch: It comes to you first at the Department of External Affairs.

Mr. Cadieux: It comes to the Department of External Affairs first and then there is a Committee, External Affairs and National Defence, where this will be analyzed between the two departments. If National Defence says that we do not have any officers we can spare, that we have no experience in this field, and are incapable of handling this, that is the end of the matter. But we would not give the answer.

Mr. Winch: No, but I am not going on that. I am going on the basis that we do have an army, a navy and an air force. How do you decide that we are going to send men overseas for the training of navies and armies?

Mr. Cadieux: The policy considerations plus the technical considerations are put together in an assessment with an indication of the costs and the duration of the possible involvement. This is submitted to the defence and external affairs committee of the government. They report favourably or otherwise. It goes to full Cabinet and they decide favourably or otherwise. In the end a communication is sent to the requesting government and this is the way it works.

Mr. Winch: Am I out of order if I ask you, although the decision is made on a political level by the Cabinet, I presume they get a policy recommendation from yourself and External Affairs, do they not?

Mr. Cadieux: That depends on the circumstances. It is conceivable that in some cases on the External Affairs side the experts, the ambassador himself may say, "From the point of view of my role here, I think this would be an opportunity", or the ambassador may say, "If we get involved here this may be very difficult", or there may be a situation where there are considerations in favour, there are considerations on the other side. It may be very difficult on purely foreign policy grounds to decide. There may be military considerations that might be the decisive factor, or you may have the impression that if you were to provide naval training that this could lead to contracts later on that could be significant in terms of activities in our shipyards and that the Department of Industry might say, "It may not be very good politically because there are no great profits this way or that way, or it may be very interesting militarily, but if it leads to further contracts in terms of our industry in Canada, perhaps this is an agreement that should be considered and given appropriate weight". So in every case the Department of External Affairs would not be in the position of beating the drum and saying, "You go ahead; you do it; it is a good thing; we think it should be done".

Mr. Winch: That leaves me with one further question on that phase before I hit my third. If we have a cadre of officers and NCO's trainers of a military nature in a country overseas and that country gets involved, such as Nigeria or anywhere else, in a brush war or a civil war, then do you pull out our Canadian training staff?

Mr. Cadieux: My understanding of the situation is that there is a uniform rule each time Canadian military personnel are sent on these military assistance assignments that they have no operational responsibilities; that is the first thing. Then, if there is any physical danger, the problem gets to be a purely consular problem of protecting their lives and evacuating them with all other Canadians.

• 1235

Mr. Winch: I am sorry, that is not my point, although I admit their lives are very important. If a country in which we have been doing the training gets involved, for instance, Nigeria or anywhere else, from a policy point of view do we pull our people out?

Mr. Cadieux: Again, in each case that is a decision the government has to make. It

depends on what you mean by involved, involved in what?

Mr. Winch: We are training while they are involved in a war, like in Nigeria today. We trained their navy. Did we pull our men out or were they out before?

Mr. Cadieux: My impression is that we do not have anybody there at the moment. I do not think we have anybody there.

Mr. Winch: You pulled them out before?

Mr. Cadieux: Before the secession started.

Mr. Winch: Now, Mr. Chairman, in view of what you just said that you hope at the next meeting we will be passing the estimates, do you mean all estimates?

The Chairman: All the External Affairs estimates plus the estimates of CIDA and the International Joint Commission.

Mr. Winch: May I ask then, because it does come under External Affairs, for some explanation of the policy thinking and the administrative action taken before leading up to this extraordinary position with regard to the issuance of passports. It has been raised in the House often. I know that I am not alone, that many, many members of the House of Commons have spent two-thirds, if not of our own time then of our secretaries' time during this past three weeks accepting responsibility for trying to get emergency passports out.

Perhaps I can put it another way, to make it brief. How did you arrive, admitting the need for tightening at some of the extraordinary conclusions that were reached. Perhaps I can explain it briefly by giving an example. I am going to use my own case, not that I want a passport right now, but just to explain this, Mr. Chairman. I had the privilege of being born in England because my mother was there. However, my parents came to Canada while I was at an early age, so I have lived in British Columbia for 59 years. I voted in every election since the age of 21. I served four years in the last war in the armed forces. I have been an elected member of Parliament, provincial and federal for almost 36 years now. I have had a passport for a great many years, but it has just now run out and I cannot get it renewed because I have to prove that I am a Canadian citizen. The only way, sir, that I can prove it is 3,000 miles away in my safety deposit box. I have to get my birth certificate from England; I have to send it to the citizenship branch; I have to get from

them the admission that I am a Canadian citizen before I can get a new passport because there are no renewals. Does that just give you an example of what these darn regulations are. Can you give us an explanation.

Mr. Cadieux: The general explanation is that not so long ago I remember, I am sure that you remember, there was a general feeling in the House that the security regulations had to be tightened, that the passports were issued too freely...

Mr. Winch: I have no disagreement on that.

Mr. Cadieux: ...and that that should be done.

Mr. Winch: But why did you go to this damn ridiculous extent that we are facing now.

Mr. Cadieux: One of the means that were adopted by the government to produce this tightening up was an insistence that the proofs of identity and the proofs of birth had to be in the form of these birth certificates. This was, I think, the connection between the tightening up of security and the proofs about birth. I think I will ask Mr. Durdin, who is the Head of the Passport Office, to give you more indications about why we ask for the birth certificates.

Mr. Winch: I want to make it clear, because I said it in the House the day before; I complimented the officials that I had worked with for their courtesy and their co-operation.

The Vice-Chairman: Mr. Winch, you advised us that you had three questions; you are now on your fifth or sixth and it seems to me we are taking a lot longer than we intended to.

Mr. Winch: Would it be possible for us to go on with questions before we deal with the passport issue?

The Vice-Chairman: We are going to have to do that anyway. Would you be present at 11 o'clock on Tuesday to continue your questioning?

Mr. Winch: As long as I am allowed about 10 minutes to get over from Public Accounts Committee meeting.

The Vice-Chairman: We could call somebody else in the interim. We have Mr. Roberts on the second round of questioning, and Mr. Fairweather as well. Then we have to

consider the CIDA estimates and Mr. M. Strong will be present. I suggest to the Committee that we adjourn now and continue with the estimates on Tuesday morning at 11 o'clock.

Mr. Guay (St. Boniface): In support of Mr. Winch, the reason he took a little time with his questioning today was the fact that you made the statement that the next meeting would be for the estimates.

The Vice-Chairman: It will be later in the morning, but we will have time.

• 1240

Mr. Fairweather: Could we get the special number we are to call at the passport office which is available to some members of Parliament. I called six people yesterday and I am told that if I am on the right side of the House there is a number and I would like to have it.

Mr. W. S. Durdin (Chief Passport office): The phones are being installed today. You

will be advised as soon as the numbers are known.

Mr. Fairweather: Does every member of the House have the same telephone number? I am told that government members—I am not making a charge—have a number to call in order to expedite matters. If so, I would like to know what that number is. It is a disgrace, I will tell you that.

Mr. Guay (St. Boniface): It is not a disgrace because we are on the same level as you are. I would like to say this, Mr. Chairman, in view of the statement that has been made. If there is such a number, as suggested by Mr. Fairweather, then I also would side with him and say that I would like to know that number and I am a member of the government side.

Mr. Fairweather: You cannot get it.

The Vice-Chairman: I would like to know it myself, but he is just saying that it is hearsay he has not made any charge about the matter. The meeting is adjourned.

MINUTES OF PROCEEDINGS

[Text]

TUESDAY, May 20, 1969.

(70)

The Standing Committee on External Affairs and National Defence met at 11.05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Brewin, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Legault, Lewis, Marceau, Nowlan, Penner, Ryan, Roberts, Stewart (*Marquette*), Stewart (*Cochrane*), Wahn, Winch (19).

Witnesses: From the Canadian International Development Agency: Mr. M. F. Strong, President; Mr. G. P. Kidd, Vice-President, Operations Branch; Mr. J. D. Miller, Director General, Project Development and Co-ordination Division; Mr. D. R. McLellan, Director, Finance Division. From the International Joint Commission: Mr. J. L. MacCallum, Assistant to Chairman and Legal Adviser.

The Committee resumed its consideration of Items 30, 35 and L35 pertaining to the Canadian International Development Agency, in the Estimates 1969-70 of the Department of External Affairs.

The Chairman introduced Mr. Strong and he introduced the officials of CIDA who were present.

Members questioned Mr. Strong and the officials. Mr. Strong agreed to provide further information on the major special studies which CIDA has commissioned and the reports of its consultants thereon, as requested by Mr. Lewis. Mr. Strong will also provide additional information on the problem of concrete dust in certain buildings constructed in South Vietnam, as requested by Mr. Ryan.

Items 30, 35 and L35 were severally carried.

The Chairman thanked Mr. Strong and his officials and the witnesses retired.

The Chairman called Item 40 pertaining to the *International Joint Commission, Salaries and Expenses etc. \$481,700*. He introduced Mr. J. L. MacCallum, Assistant to the Chairman and Legal Adviser; and Mr. M. W. Thompson, Engineering Adviser.

Mr. MacCallum answered questions for the remainder of the sitting. Mr. Thompson distributed copies of an article entitled *Along the Common Frontier The International Joint Commission*, by A. D. P. Heeney, in a pamphlet prepared for the Canadian Institute of International Affairs, July, 1967, Volume XXVI, No. 5.

Mr. MacCallum will provide additional information on subjects mentioned by Mr. Nowlan and Mr. Howard (*Okanagan Boundary*).

The Vice-Chairman took the Chair at approximately 12.40 p.m.

On completion of the questioning, the Vice-Chairman thanked the IJC officials and the witnesses retired.

Item 40 was allowed to stand.

At 1.10 p.m. the Committee adjourned, until 3.30 p.m. this day.

AFTERNOON SITTING

(71)

The Standing Committee on External Affairs and National Defence met at 3.35 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Brewin, Forrestall, Goyer, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Marceau, Penner, Prud'homme, Ryan, Roberts, Stewart (*Marquette*), Wahn, Winch—(18).

Witnesses: Mr. M. Cadieux, Under Secretary of State for External Affairs and Mr. W. S. Durdin, Chief Passport Officer.

The Committee resumed its consideration of Items 1, 10 and 15 of the Estimates 1967-70, relating to the Department of External Affairs.

Mr. Cadieux and Mr. Durdin answered questions relating to these items.

The Committee agreed to print as an appendix to this day's Minutes of Proceedings and Evidence, the answers to three questions asked at a previous sitting by Messrs. Roberts and Winch respectively. (*See Appendix BBB*).

The Vice-Chairman took the Chair at approximately 4.25 p.m.

At 4.50 p.m., the questioning was completed and the witnesses retired. Items 1, 10 and 15 were allowed to stand.

The Committee recessed until 5.00 p.m. At 5.00 p.m. the Chairman took the Chair.

The Chairman called Items 40, 10, 15 and 1 which were severally carried.

It was agreed that the Chairman should report Items 1, 10, 15, 30, 35, 40 and L35 of the Estimates 1969-70 relating to the Department of External Affairs, the Canadian International Development Agency and the International Joint Commission, to the House.

Members discussed the possibility of visits to North Bay, Colorado Springs and SACLANT headquarters; the formation of the Sub-Committee on Maritime Forces, and the calling of additional witnesses in connection with NORAD and the ABM question.

At 5.10 p.m., the Committee adjourned until Wednesday, May 21, 1969 at 3.30 p.m., when the witness will be Dr. G. R. Lindsey.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, May 20, 1969.

The Chairman: Gentlemen, we have with us again this morning, Mr. Maurice Strong. We are ready to begin. We have called the estimates of the Canadian International Development Agency Votes 30, 35 and 35L in the Blue Book. Vote 35L appears on page 462 of the Blue Book. The other votes, 30 and 35, appear on pages 101 and 102.

Mr. Strong has a number of his assistants with him this morning and I think he will introduce them to the members of the Committee. Mr. Strong?

Mr. M. F. Strong (President, Canadian International Development Agency): Thank you very much, Mr. Chairman and hon. members. I would like to introduce to you various members of our personnel who would be associated with me here this morning. On my immediate right is Mr. Kidd, Vice-President of our Agency; on his right, Dr. Gaudet, Director General, Liaison and Evaluation; behind me on the left, Mr. Ross McLellan, Deputy Director General, Finance and Administration; Dr. Fergus Chambers who is Director of our Planning and Economics Division; Mr. Jim Miller, who is Director General of Operations, and sitting over at the far table on the end, Mr. Lionel Bonnell, Director General of Finance and Administration; Mr. Robert McLaren, who is Acting Director of the Advisers Division, and Mr. Neil Overend who looks after the Colombo Plan in the Planning and Economics Division.

The Chairman: Did you have any further statement that you wished to make at this time, Mr. Strong, or are you available for questioning now.

Mr. Strong: With your permission, Mr. Chairman, I felt that it would be best for me to simply make myself available for questioning. I have no particular statement that I came prepared to make.

Mr. Lewis: I have not a copy of the Blue Book here, I do not know whether I am in order on these votes or not, Mr. Chairman.

The Chairman: We are dealing with all the votes at the same time, Mr. Lewis. It makes it more convenient in questioning so that any questions on the general subject will be in order.

Mr. Lewis: I understand, Mr. Strong, that you had a pretty fundamental review of the External Aid policies and that you commissioned a number of special consultants to make some studies for you. Could you tell us about that?

Mr. Strong: Yes, Mr. Lewis. Really there are two main streams in which we have been reviewing our activities. One is a review of what you might call our operating policies, our program policies, as distinct from those over-all issues that are more fundamental to government policy. The government has, as you know, launched an intensive review of its over-all policies. As part of that we have been reviewing some of the basic policies affecting aid and development.

Prior to that and over the period of the last two years we have been engaged in an intensive internal review of what you might call our operating and our program policies and procedures. This latter exercise has involved the use of outside consultants in a number of capacities. For example, the Association of Universities and Colleges of Canada has for over a year been engaged on our behalf in an intensive review of the role of the Canadian universities in respect of our aid and development programs. In particular, a review of the kind of resources that the universities can make available and are willing to make available for use in programs in the developing countries and the ways in which these resources can best be mobilized and utilized under our programs.

We have had studies of the role of agriculture in our programs and the role of forestry. I think I reported at the last meeting of this Committee that we have, in fact, in some of these fields appointed full-time special advisers. We had a special working or advisory group last summer conducting an intensive

program of instruction in cost benefit analysis. We found that the application of cost benefit techniques to our old process of pro-

• 1110

ject and program evaluation required a great deal of specialized training of our planning staff. We felt that we had some very high grade and some very high quality planning officers and that it was not going to be feasible or even in some respects desirable to simply bring in a lot of new people who knew the cost benefit techniques. It was much better to devise a set of techniques that were particularly appropriate for the job that we have to do in our operation. Therefore, we brought in people like Professor Harberger from the University of Chicago and Professor Reuber of the University of Western Ontario and a team of economists who were also from the University of Western Ontario. They conducted a program extending over a period of seven or eight months in total, in which many of our officers, on their own time for the most part, worked on the week-ends and evenings. This was integrated with their normal work pattern so that they were using real current cases to assist them in the developing of these techniques. This program has really enabled us, to put into place, a systematic process of application of cost benefit analysis techniques to our projects and programs. Now I could go on, as there are a great many other...

Mr. Lewis: Mr. Strong, you could either now or later, give us a list of the major special studies which you have commissioned either inside or outside. I was also wondering whether or not some of those studies could be made available to members of the Committee, at least the results of those studies.

Mr. Strong: A lot of these are working studies in the sense that they are not really designed to produce a report. Now the report of the Association of Universities and Colleges of Canada is the kind that lends itself to a report. The report of the University of Ottawa Development, Centre for International Co-operation, will come to us in the form of a report. Other exercises, of the kind to which I referred, are really internal exercises that are designed to accomplish a purpose as part of a process. These are not pointed to the preparation of a report as such.

Mr. Lewis: Let me try to illustrate what I have in mind. This is in the form of education, not of implied criticism or anything of that nature. While reading about external aid, one is struck by the divergence of view that there is regarding the value of certain types of aid. Decisions arise such as whether the aid is related to capital development in the recipient country, whether it should be advanced in order to start the ball rolling or, whether the aid should be concentrated where the ball is already rolling but in speeded up form. The various points, which are being discussed by students of external aid, and by economists in particular, concerning the best use or the best way in which developed countries can aid developing countries in their progress towards economic self-reliance always arise. I was wondering whether any of your studies deal, in that theoretical but very practical sphere, as to the type the kind, and the class of aid which is best. Have such studies been made or are they being made? I am sure other members of the Committee would be as interested, as I am, in knowing what their conclusions are in respect of the programs we have already had, and the programs you are projecting for the future.

Mr. Strong: Mr. Chairman, the kind of fundamental questions to which Mr. Lewis points, have been the subject of rather intensive discussion and review, principally as part of the process of reviewing our over-all policies. In reviewing the operating procedures and policies, one naturally takes into account these issues. You cannot separate your operation from some of these fundamental consid-

• 1115

erations that you have raised. However, our agency is preparing a report for the government on the review process, which we have conducted, and which involved the preparation and consideration of very substantive reports from a number of outside experts on some of these varied points. Now, whether or not the government releases these reports to this Committee is not in my control.

Mr. Winch: I have just one question. When do you anticipate that the report will be received by the government?

Mr. Strong: The report will be received by the government within the next month. The reports of the individual consultants have

been completed. The gathering of those reports into a suitable individual paper showed the policy issues which were raised in the reports. The various alternative courses of action that are open for consideration by the government is now in the process of being prepared. When it is prepared, it will be delivered to the Secretary of State for External Affairs and it will, of course, be up to him to distribute them.

Mr. Winch: Mr. Strong I would like to make one brief supplementary.

The Chairman: Mr. Winch on a supplementary.

Mr. Winch: In your submission to the government, on the basis of what you are receiving, could I ask whether or not you are making recommendations or merely putting the basis before the government without recommendations, so that the decision would be made by the Cabinet and not on your recommendations?

Mr. Strong: Yes, you certainly can. As far as I am concerned, we put a paper in the hands of the government which seeks to identify the policy issues, about which they will be called upon to make decisions, seeks to evaluate the range of alternatives available to them in making those decisions, and seeks to provide them with all the supporting data which they require for that purpose. Whether or not we are asked to make specific recommendations is completely up to the government.

Mr. Lewis: I appreciate that the report that you give to the government you cannot tell us about. Could you give us the names of the consultants and the subjects that you asked them to deal with in this area? This would give us an idea as to the area which you are covering.

Mr. Strong: I am certainly prepared to give you the names of the consultants. However, I do not think I could usefully give you the names of the topics because they overlap so much and get so much into the process itself. I do not really think I could give you that information, in meaningful form, without going beyond the limits that it would be appropriate for me to go, at this point in time.

Mr. Lewis: Why do you not let us decide whether or not they are meaningful, Mr. Strong? I would be very interested to know

whom you consulted and what you consulted about.

Mr. Strong: As I have not reported to my Minister on this subject, Mr. Chairman, I am not prepared to give the names of the consultants. I should not give information to this Committee which has not yet been made available to him.

Mr. Lewis: I can appreciate that also but I must admit only with some difficulty. Could you give us the names of the consultants now, and later let us have the subjects if the Minister has no objection?

Mr. Strong: Yes. If I miss one out, Dr. Chambers you might remind me. They include: Professor Grant Reuber, University of Western Ontario, Professor Steve Triantis, University of Toronto; Professor Usher of Queen's University, Mr. Roy Matthews of the Private Planning Association of Canada, Professor Fernand Fontaine, Sir George Williams University, Mr. Fernand Cadieux of Sir George Williams University a sociologist consultant, Professor Louis Sabourin, University of Ottawa, and Professor Benjamin Higgins of the University of Montreal, who was a very important member of the team.

• 1120

Mr. Lewis: Is that the Higgins who used to be at McGill and then went out to Asia and later came back?

Mr. Strong: Yes. He has a very wide experience in the development field.

Mr. Lewis: Have all of these people had experience in external aid either as students of it or as advisors to recipient governments and so on?

Mr. Strong: In one way or another, they are all people whom we consider experienced.

Mr. Lewis: Would you undertake to inquire from the Minister whether or not he would have any objection in providing us with the subject that they discussed. I do not see how, as a member of the Committee, I can understand what your review is aiming at, or what it is our external aid policy is aiming at or hopes to aim at, without knowing what it is you are reviewing.

Mr. Strong: With great respect, Mr. Chairman, I had rather understood that I had to come to discuss the Estimates. My unders-

standing was that there would be a further and a more appropriate occasion for the Committee to consider the review. This was my understanding. Really, I find it difficult to discuss a policy review that has not yet been presented to the government. I hope the honourable members can understand the position I am in as an official when I am asked to do that.

Mr. Winch: Mr. Chairman, if I may, I understand what has been said by Mr. Strong, but what I, as an individual member of the Committee, cannot understand is that as you have named these people,—not the report—why you cannot tell us what they set out to study.

The Chairman: I gather Mr. Strong feels that if he indicated the subject matters of their investigation this perhaps would give some idea of the fields which were under review, and until such time as the report has gone to the Minister, this might be undesirable.

The question I think Mr. Lewis has put is, if the Minister indicates he has no objection, then would you undertake to take it up with him and give us a list of subjects. I think that was your question, was it not, Mr. Lewis?

Mr. Strong: Absolutely.

Mr. Lewis: Yes, I cannot press Mr. Strong to do something which he feels his duty prevents him from doing. If you feel you cannot give us the information without first having given it to the Minister, I cannot say you have got to, obviously, but I am concerned that we are not getting the information that would enable us to understand exactly what it is you are dissatisfied with, or what it is you are searching for, what improvements you seek to bring in, what new policies you are considering. If you cannot do it today, that is all right, but I hope, Mr. Chairman, we will have an opportunity later. I have one other line of questioning I would like to pursue.

Mr. Winch: May I make one comment here, if you do not mind?

The Chairman: Mr. Winch.

Mr. Winch: In view of the fact that we are considering the estimates for this fiscal year, they must be estimates—and you are using these people and I cannot quite understand why we cannot be told in the estimates for this fiscal year, which ends March 31 of next

year, what job they are doing.

Mr. Strong: Mr. Chairman, I have said that they are consulting on the review of total Canadian policies in this field. I have no reluctance to discuss any matter that is proper for me to discuss. I just am concerned about the propriety of my discussing something in this Committee that I have not yet...

Mr. Lewis: You will discuss it with the Minister?

Mr. Strong: Yes, indeed.

Mr. Lewis: Presumably you are paying these consultants out of the budget and presumably we have a right to know what it is you are paying them for.

Mr. Strong: Oh yes.

Mr. Lewis: But if you will not tell us today, that is a judgment you have to make. Whether I agree with the judgment or not is immaterial. Will you undertake to discuss it with the Minister, and either in person or in writing let us know what those men have been asked to do?

Mr. Strong: Indeed, I will, Mr. Chairman. I might explain that the process itself was not so highly compartmentalized that it lends itself to this sort of simple breakdown. This is really my problem, that the group acted as a group as well as individually, and it is very difficult without really disclosing the whole thing, which I understand will be done in due course, to really give you meaningful information just by naming a number of topics.

• 1125

Mr. Lewis: Mr. Strong, you are doing yourself an injustice: you did not ask Mr. X "Would you please do me a paper on External Aid?" You said to Mr. X "Will you please give me your views on A, B, C or D?" or perhaps all four.

Mr. Strong: It is a little more complicated than that.

Mr. Lewis: "A" and little "a" and "a³" and "a" or whatever it is, you gave these people instructions as to what you wanted from them.

Mr. Strong: That is right.

Mr. Lewis: It is those instructions, I think, we are entitled to have so as to know what it is you asked them to do.

Mr. Strong: Oh, yes.

The Chairman: I think we are agreed that Mr. Strong will consult with the Minister and, if there is no objection, will file with the Clerk a list of the subject matters as requested by Mr. Lewis.

Mr. Lewis: Right. I do not know whether other members are interested, but I would like to know how the cost benefit analysis applies to your kind of program. How do you quantify the benefits to compare them with the cost?

Mr. Strong: In every project there are elements which can be quantified and elements which cannot be quantified. Cost benefit analysis is simply a tool that is used for guidance. There is no single project I can think of where cost benefit analysis alone, applied in an automatic fashion, would predetermine the answer. It is simply a guide to your judgment.

For example, if you have a budget for a particular country of \$10 million: you receive from them \$20 million worth of requests; you are concerned with the relative merits of these requests. One of the important factors to be able to measure is the amount of economic benefit that will be generated by the particular project in relation to the amount of cost of that project. Economic benefit generated is not alone the basis for your judgment; there are many other factors. But in order to help you make relative judgments, you really have to know the answer to the economic part of the question.

Mr. Lewis: Excuse my ignorance, but how do you even quantify that? Suppose you have a request to build a power generating plant, how do you quantify that in relation to the economic development of the recipient country? How do you quantify the possibilities of industrial development, the value of electrifying communities, the value of the comfort given to the people who are the recipients of electricity? This cost benefit thing, which has now become the in-thing in economic analysis, which I probably do not understand despite trying to do so, has me personally completely bewildered. I just do not know how in heaven's name you quantify the benefits of anything you do, even in the economic sense?

Mr. Strong: Perhaps, Mr. Chairman, I can ask Dr. Chambers to give you a more sophisticated presentation.

Mr. Lewis: You mean more incomprehensible?

Mr. Strong: I could give you a very rudimentary one that I have given to my wife, for example.

Mr. Lewis: She is probably more intelligent than I am.

Mr. Strong: When we are trying to decide whether to heat our home with fuel oil or with natural gas, or with electricity, we know that it will be more comfortable in winter if our home is heated. We do not try and put a number on how much more that is worth to us. We know we feel better when it is heated than when it is not heated. However, we can say that if we have to put in oil it costs so much for the furnace and so much for servicing and so much for the oil itself, and the furnace only lasts so long, and we have to take that into account, and besides, we do not like the noise; that gas has certain advantages that you quantify too. So that, it has a place in making your decision.

• 1130

Mr. Lewis: Even this rudimentary example, Mr. Strong, points up the difficulties I have in my mind and the suspicion I have got that in the cost benefit analysis there is a great deal of personal prejudice and predilection and decisions which are made before the analysis is completed. How do you quantify the comfort you get out of having a heated home, and, Mr. Strong, may not that be by far the most important part of the benefit that is received? Whether the particular instrument you use for heating your home is A, B or C, the fact of your home being heated, which is not subject, it seems to me, to quantification...

Mr. Strong: Exactly.

Mr. Lewis: But that surely may be the very basis of the entire exercise and far outweighs the fact that doing it by oil may cost you \$5 a year more than by doing it by electricity.

Mr. Strong: Mr. Chairman, I would be the last person to claim that cost benefit analysis is an answer to everything. I would certainly consider it wrong when it is carried to the extreme where you tend to try and put your whole decision-making process on an automatic quantitative basis. It would be an abuse

of the technique. I think that it is a logical and necessary method of trying to evaluate those factors in any decision which are subject within reason to quantification. There are many factors which I would readily admit are not so subject. If you can modify and evaluate those things that are subject to modification, it leaves you more room in your mind to devote your attention to making judgments on policy.

Mr. Strong: Yes.

Mr. Lewis: You would be able to attend to judgments on social benefits.

Mr. Strong: Yes.

Mr. Lewis: Therefore, your cost benefit analysis is not an automatic guide to your decision.

Mr. Strong: Oh no. It is simply one of many tools. I think it is a very useful one. The jargon cost benefit analysis is simply used to describe a very logical process; in one form or another, even the old horse trader used to go through such a process. However, the elements now involved in a decision are more complex than they used to be; the techniques for evaluating them are equally more complicated; at their root, however, they are still pretty simple logic.

Mr. Lewis: Excuse me. Could you also discuss with the minister whether or not he would permit you to make some of the reports of the special consultants available? I do not only mean the subject matter with which they dealt but also what they said to you on those subjects.

Mr. Strong: Indeed, I would be very happy to do that.

The Chairman: Thank you, Mr. Lewis. Mr. Ryan.

Mr. Ryan: Dr. Strong, in January I had the opportunity to visit Saigon for a couple of days; due to the good auspices of Mr. Paul Laberge of External Affairs and Brigadier McCoy of the Joint Commission, I employed my time quite usefully. I had the opportunity of inspecting your new project on the site that was levelled by the tenth offensive. I was very proud to see that Canada was the first there with a new 75 suite apartment building for the refugees. It was nice to see this pretty well completed and the Canadian flag flying there, even as sewers were still being dug through the area in amongst the boxes of

crated Hondas which were coming into Saigon by the thousands.

I was very much impressed with this particular development of yours. I wondered who the architect was, how you went about developing your plans for this, why it was built of concrete, and why the refugees are left to do their own interior decorating when they move into these fine quarters. Also, why is nothing being done by the contractor to seal off the concrete dust that will arise in a building of this kind? It seemed to me to be extremely well designed and laid out with the purposes of the people very much in mind; in my opinion, it is a real leader as a pilot project except in this one respect.

• 1135

Mr. Strong: I very much appreciate the hon. member's remarks, Mr. Chairman. I can say in general that this project was very cost sensitive. We were very anxious to have it done quickly because the needs were very urgent. We weighed most of the normal rules in terms of procurement of this kind of thing. We got it done quickly and inexpensively; I have not seen it but I have heard other reports to the effect that it was well done.

There are 10 or 12 people to be accommodated in each one of these units. I really did not know of the problem that you have mentioned. It may be that one of my colleagues who has been more directly related to this project will be able to answer the problem in brief. I do not know. Mr. Miller, do you have more to add?

Mr. J. D. Miller (Director General, Project Development and Co-ordination Division, Canadian International Development Agency): I do not know the specific answers but I would like to explain that the specifications of such structures normally call for the finishing of concrete. There is normally a water repellent on the inside walls. Should the occupant wish to paint them, that would be his prerogative; it would not be normal for us to prepare such decorations. It is a lowcost housing unit and it is intended for refugee purposes. In all of the reports which we have received, it has been extremely well thought of and we have not been made aware of any observation such as yours until now.

Mr. Ryan: It has occurred to me that I was told that, it was almost ready for occupation. I could see that the floor, the walls of concrete, and the balconies and passageways on the outside were giving off a little bit of the

fine concrete dust. It was the only thing to which I thought attention should have been given. It may have been done since then but that did not appear to be the intention. The message I received was that the refugees went in there, took it the way it was and made the best of it. I thought that because of all the traffic that there would be, that a dust problem was inevitable.

Mr. Miller: Yes. May I ask sir, when were you there?

Mr. Ryan: I was there from January 10 to 12.

Mr. Miller: I am not sure of the exact date but I believe it was inaugurated some time in May. Possibly some of this work was done between January and May. I will be very happy to check and see when the first occupants moved in. Again I am sure that there were many occupants who were prepared to move in without these refinements being completed. I will be glad to find out this information for you.

Mr. Ryan: Do you know if it was a Canadian architect or a local architect who designed it?

Mr. Miller: It was a local architect. It was based on a plan which had already been developed for the area and it was simply adopted to the Canadian project.

Mr. Ryan: Who will manage the building in the future?

Mr. Miller: I am not exactly certain, however, I believe it will be a department of the Vietnamese Government; possibly it will be the Department of Rehabilitation of Refugees.

Mr. Ryan: Will we continue to take an interest in this particular project?

Mr. Miller: Yes. We have recently agreed to build additional accommodation very similar to that which we built earlier. I believe that it is getting under way at the present time.

Mr. Ryan: Would we continue to subsidize the upkeep and maintenance of a development of this kind in future?

Mr. Miller: No. We have agreed to the financing of a similar project. We have not to my knowledge been approached for additional units.

Mr. Ryan: We simply build them and when they have been completed, we turn them over

to the South Vietnamese Government or to some local agency of it.

Mr. Miller: Yes.

Mr. Ryan: Are you familiar with the airport in Colombo, Ceylon?

Mr. Miller: Yes. I am aware of it.

Mr. Ryan: Are there any problems with that air terminal that have not been cleared up?

Mr. Miller: There are none to my knowledge. We had some problems with maintenance of equipment but we have sent out advisors to act as maintenance personnel to upgrade the quality of the selling. I am not aware of any problems that are not in hand.

Mr. Ryan: I agree that you have done a wonderful job there as well. The airport and

• 1140

the terminals are certainly fine facilities; the people in Ceylon certainly regard it as a wonder; they come there by the thousands to see it.

The Chairman: Are we clear then on where we stand regarding that first project, Mr. Ryan? You would like Mr. Strong to look into the concrete dust problem which may have existed originally.

Mr. Ryan: Yes, I would like to be reassured on that point.

The Chairman: The declaration apparently is not a problem.

Mr. Ryan: That is not the problem, no. I think it should be left up to the individual families to put the tapestries on the walls or to put in whatever beds they like. However, it does seem to me that it may be a problem in a development of that kind.

Mr. Strong: Mr. Chairman, we will certainly undertake to look into this, to provide the hon. member directly with the information.

Mr. Ryan: Thank you.

Mr. Strong: I take it it would not be necessary to file this with the Committee?

The Chairman: Could you give a copy to the Clerk as well just to have it on the record.

Mr. Ryan: Thank you, Mr. Miller, thank you, Mr. Strong.

The Chairman: Mr. Allmand?

Mr. Allmand: Mr. Strong, recently there have been some reports that your Agency was considering an increase in the living allowances to students studying in Canada with scholarships from your Agency. Is this being actively considered now?

Mr. Strong: I think I would prefer to ask Mr. Kidd, who is responsible for this area of operations, to answer this question.

Mr. G. P. Kidd (Vice-President (Operations); Canadian International Development Agency): Yes, sir, we undertake periodic review of the allowance structure for the CIDA trainees and one is just approaching completion at the present moment. We will very shortly have recommendations to put forward.

Mr. Allmand: In the present estimates before the Committee there are no provisions for increased living allowances, are there?

Mr. Kidd: Yes, there are.

Mr. Allmand: In the estimates that we are considering now there are provisions for these increased living allowances?

Mr. Strong: Mr. McLellan might be able to answer more specifically the extent to which this has been allowed for.

Mr. Allmand: Very good.

Mr. D. R. McLellan (Director, Finance Division, Canadian International Development Agency): I have known for some time that these allowances were under review and we have made provision in the aid vote, which is a nonlapsing vote, for the necessary funds to absorb increases in living allowances for our trainees in Canada in the current fiscal year.

Mr. Allmand: What will be the exact increase of these allowances, sir?

Mr. McLellan: It would approximate \$20 a month.

Mr. Allmand: I see, so they will increase from what amount to what amount?

Mr. McLellan: From \$165 to \$185 per month.

Mr. Allmand: Mr. Strong, when this was first reported in the paper one had the

impression that demands were being made on CIDA by an association of students to increase these allowances. Was that correct?

Mr. Strong: We have had various representations made to us by individual students and by the universities and other interested parties. I was not aware there had been any formal representations by a group as you suggest, but a number of these individually have come to my attention. Mr. Kidd, are you aware of any?

Mr. Kidd: I am aware of no formal representation by an organization representing all the students as such.

Mr. Allmand: Could you tell the Committee if any of the students involved in the riots at Sir George Williams University, who are presently accused before the courts, have been receiving CIDA grants?

Mr. Strong: One student who is here under our auspices was involved and has been charged with involvement. I understand the case has not yet been disposed of. We have taken the position that so long as this person is able to continue to carry out her studies at

• 1145

the university and so long as no final resolution of the charge against her has been made that we would continue to allow her to receive her normal support.

Mr. Allmand: Has CIDA decided on any policy with respect to foreign students who are involved, not in student demonstrations, but what I would call destructive student demonstrations? Has it been serious enough in your opinion to have to lay down any guidelines or policy with respect to these problems?

Mr. Strong: It is a matter that has given us a good deal of concern. We have reviewed it. Individual problems often have very individual characteristics that have to be dealt with in that fashion, on an individual basis. However, in general, we feel that if a student is continuing to pursue the course of study for which he is receiving support, for which he was brought to Canada in the first place, in other words if he continues to be acceptable to the university in that capacity and has not been dealt with negatively by the law then there is no real justification for our intervening to prevent him from continuing his course of studies.

Mr. Allmand: In other words if I understand you correctly, as long as the student is still acceptable to the university he would be acceptable to your agency.

Mr. Strong: In general, that is true.

Mr. Allmand: As a result of the Sir George Williams University riot there was considerable misunderstanding and some counter demonstrations in the West Indies. Did your Agency through its people in the West Indies observe, or were you the object of, any protests towards the Canadian government? Did you do anything to try to make clear what was happening in Canada so that the people in the West Indies would understand exactly why these people were charged and so forth?

Mr. Strong: As far as our own operation is concerned, we really did not experience to my knowledge any difficulties nor were we involved in any demonstrations or specific problems arising out of the incident to which you refer. I believe that through our normal diplomatic channels, our missions in these areas, we have attempted to make clear both to the governments concerned and to the people, too, I believe, the precise nature of the problem. This is not really something that we did as CIDA, but something which would come under the jurisdiction of the Department of External Affairs. We are obviously generally interested in and affected by these things.

Mr. Allmand: Your people have not been sensitive to any worsening in relations between the people as opposed to the government in the West Indies because of these things. Their goodwill towards Canada has not been lessened as a result of them?

Mr. Strong: It is very difficult to tell at this point. We receive monthly reports from these people and I would expect over the next two or three months a review of these reports would give us a better basis for making a judgment on that. I think it is a little premature at this stage because we have not really had access to the views of all the people who are down there and who are exposed to this.

In a very general way, I would hazard the personal opinion that it would have some general effect. One would hope it would be a fairly temporary one.

Mr. Allmand: The last time we were discussing your estimates, Mr. Strong, we were discussing overseas students studying in

Canada under CIDA scholarships and the problem of having them return to their own countries and the requests you and the government have received by many of these students to stay in Canada. How does this situation stand now? What percentage of the CIDA scholarship students have requested to stay in Canada and have made real attempts to stay in Canada? Is it a high percentage?

• 1150

Mr. Strong: Less than 5 per cent have actually failed to return. It would probably be a larger percentage than that who would give us some cause for concern. There is no question this is a continuing difficulty. It is just one of the several reasons we are taking a very hard look at our undergraduate training program.

We have had some specific difficulties with the students from South Viet Nam. Wherever areas are in conflict we have this problem. Of course, in a general way it affects students from all areas, there is always a small number who wish to stay in Canada. The very large majority are prepared to and actually do live up to their commitment of returning and putting to work the training which they received in Canada. This is of course, the whole object of the exercise.

The Chairman: May I interrupt a second, Mr. Allmand? At the present time we have a quorum which we may find rather difficult to hold, because I know that some members must go to other appointments at 12 o'clock. We have had a rather extensive discussion with Mr. Strong. Would it be in order, or would the members consider it reasonable, to pass the three items of Estimates upon the understanding that we continue with Mr. Strong, and that he and his associates continue to answer as freely as they have so as to get the Estimates through? Would that be agreeable in the circumstances?

Perhaps we could make the various votes at the present time.

Votes 30, 35 and 35L agreed to.

The Chairman: Thank you, gentlemen. I am sorry, Mr. Allmand, you have not finished your question so please continue.

Mr. Allmand: Mr. Strong, you say that you have more difficulty with those who are here as undergraduates than with those who are graduates in this respect?

Mr. Strong: In general, that is true for a number of reasons. When a person comes as an undergraduate, they have not generally made a lifetime commitment to a particular job environment. Also, they have made a break with their family environment; they have been in Canada during a formative period in their own life and they have acquired, over a four or five-year period, a very deep involvement in Canadian life. The temptation to remain, under those circumstances, is much greater than the temptation of a person who is married and has a family and an established position in his country before he comes here for a lesser period, which is the usually postgraduate training. All of these factors normally suggest that we would have less difficulty with the undergraduate. It does not mean that there are not some graduate students too, because some of the areas in which they are qualified, are in keen demand in Canada. These people are also tempted. However I think the reasons are more compelling in the cases of the undergraduates.

Mr. Allmand: I have one final question. Could you give me, for comparative purpose, the total number of students who are studying in Canada under CIDA scholarships and also the total number of Canadians who are working abroad under CIDA sponsorship?

Mr. Strong: Yes, Mr. Kidd would have those more immediately at hand than myself.

Mr. Kidd: These may not be exact to the last figure, but we can get accurate number if you wish. There are approximately 2,000 students studying in Canada under direct CIDA auspices or the Commonwealth fellowship plan which we underwrite financially. The total number of advisers and teachers abroad are 714 in the educational field and 248 advisers giving you a total of 962.

• 1155

Mr. Strong: If you take the calendar year of 1968 as a whole, then Table 6 in the folio of the background material, which was provided at the last meeting, gives this for the total year, and it breaks it down into countries.

The Chairman: Mr. Fairweather, on a supplementary. Would you permit a supplementary, Mr. Allmand?

Mr. Allmand: I have a supplementary myself.

With regard to the first group of students that you mentioned, would that also include those adults who are here under technical training and so forth?

Mr. Kidd: This would include all types of training in Canada which CIDA finances. I should also add that the 2,000 figure is what we have at present. There would be more than that in Canada during the whole year because some people come for short term courses of three or four months. They might not be included at the particular time these figures were given.

Mr. Strong: For example, the figure for the total calendar year 1968 of people in Canada for all purposes, trainees and students, was 2,795.

Mr. Allmand: Are these people under CIDA sponsorship?

Mr. Strong: Yes.

Mr. Allmand: Do they include others who come over to Canada?

Mr. Strong: No.

Mr. Allmand: I am finished, Mr. Chairman.

The Chairman: Mr. Fairweather, on a supplementary.

Mr. Fairweather: I am sorry to interrupt. This is relevant but perhaps it is not within your knowledge. However, there are many, many more students in Canada from other countries than those who are under your sponsorship. Is it not something like 16,000?

Mr. Strong: I think a couple of our people will know the more precise figure, but ours represent a very small percentage of the total foreign to students. It covers approximately one student in seven.

Mr. Fairweather: I am not too far out. Thank you.

Mr. Legault: Thank you, Mr. Chairman. While attending the conference of the union of parliamentarians there was talk amongst the members that would provide help to prevent wastage. The remarks were not directed to the projects which were undertaken by Canada, but as an example, in one country it was quoted that a hospital had been built and after the completion there were no professionals, or technicians to attend to it. It was built and then suddenly closed. Do we have some type of report, such as we see of the

Public Accounts of the Auditor General, which would bring forth the results of the progress being made on all of our projects?

Mr. Strong: The operations of our agency are subject to reporting by the Auditor General, similar to all other government departments and agencies. There is no additional policy audit, except for our appearances before this Committee and answers to questions in the House. There is no device which would follow this up. Our job is to assure that this kind of thing does not happen, but there is no process other than the process of this Committee and of Parliament by which these are reviewed on a regular basis. I can say to the hon. member that I know of no Canadian project that has had this particular problem.

Mr. Legault: This remark was not addressed to any Canadian project, Mr. Strong. It was from another country.

One subject which was discussed was that—not all as it could not be applied to all—the recipient countries should at least provide an equal share of interest and development. Is this being followed by our own people in our projects?

Mr. Strong: Yes, Mr. Chairman. Our basic principle is that our projects must be undertaken on a co-operative basis. By that we mean, that the co-operating country, with which the project is being carried out, must

• 1200

provide part of the costs. Now, they usually provide the local costs, the costs of local labour, local goods, services and materials. On occasion, where countries find it difficult to provide all of these, we do offer part of the support for the local costs as well. But in general, we expect the local government to provide some portion of the cost and in many instances this is very, very high.

Mr. Legault: Thank you, Mr. Strong.

The Chairman: Are there any other questions on CIDA? If not, perhaps we could take a minute or two to decide what we should do for the remainder of the morning.

Mr. MacCallum, the Assistant to the Chairman of the International Joint Commission has been standing by. There is one vote, Vote 40, dealing with the International Joint Commission; and, in order to free Mr. MacCallum, perhaps members would agree to our taking that item of the International Joint Commission

now—by holding discussion and taking evidence on it, at any rate. Mr. Cadieux of the Department of External Affairs is standing by, and, in view of the hour, possibly we could start with him first thing this afternoon at 3.30. Would that be satisfactory to members?

Some hon. Members: Agreed.

The Chairman: Then, on your behalf, I would like to thank Mr. Strong and his officials most sincerely for their advice.

We will now proceed with the International Joint Commission. Thank you very much gentlemen.

Mr. Strong: Mr. Chairman, I would very much like on behalf of all of my colleagues to thank you all, not only for the interest you have exhibited in our program and for your support, but for the very fine way in which you have received us here. We appreciate it.

The Chairman: Thank you very much. I will now call Item 40.

DEPARTMENT OF EXTERNAL AFFAIRS C-INTERNATIONAL JOINT COMMISSION

40 Salaries and Expenses of the Commission and Canada's share of the expenses of studies, surveys and investigations of the Commission, \$481,700.

The Chairman: Gentlemen, we have with us today Mr. MacCallum, who is the Assistant to the Chairman of the International Joint Commission and also the legal adviser. In addition we have with us Mr. Thompson, the engineering adviser to the Commission. I understand that neither you nor Mr. Thompson have an introductory statement?

Mr. J. L. MacCallum (Assistant to Chairman, International Joint Commission): That is correct.

The Chairman: You are, however, available to answer questions. Firstly on my list I have Mr. Fairweather, followed by Mr. Nowlan.

Mr. Fairweather: Mr. Chairman, Mr. Lewis said that we did not know very much about CIDA and I must confess that this applies question will show my ignorance. I am wondering how the recommendations of the IJC are translated into some action by the respective governments. What is the procedure after the IJC has a view and studies a problem? What then happens?

Mr. MacCallum: The first step, as far as the Commission is concerned, after its report and recommendations have been formulated, is to forward these to the Government of Canada and the Government of the United States. Under our treaty—that is the Boundary Waters Treaty of 1909—the Commission does not make decisions for findings of fact or findings of law as a result of its investigations. In its report it describes the circumstances, the facts as we have determined them, the conclusions and the recommendations as to a course of action. This report we forward to the governments.

• 1205

Mr. Lewis: Forgive me, Mr. Fairweather. Mr. MacCallum, I did not quite follow you. You said that the Commission does not make findings of fact, but then later said that it sets out the facts as it has found them.

Mr. MacCallum: What of course, I meant to say, Mr. Lewis, was that the Commission finds facts to its own satisfaction. The facts, as we find them, are not binding on the governments. The ultimate decisions are made by governments and they may, or may not, follow the course of action recommended or proposed by the Commission.

The fact that they have asked us to investigate and report does not tie the governments' hands in any way. What action they take on the Commission reports is up to them, and it would be presumptuous of me to indicate what they do. Presumably, though, they consult all their own departmental officials and advisers on the basis of all the information available to the governments and they will arrive at their decisions. Normally, I believe, the two governments consult through External Affairs and the State Department before finally deciding for their own part what action they will take on the Commission report.

Mr. Fairweather: Well, I come to two specific instances of your inquiry. I am showing same prejudice here, because they represent pollution on three important rivers in New Brunswick—the St. Croix, the Presquile and Saint John Rivers. The IJC studied these and I would like to know what has happened.

Mr. MacCallum: I might just comment there. We have studied pollution on the St. Croix. We have not studied pollution on the Saint John or on any of the tributaries of the Saint John. We have not been requested to do

so by the governments, although we could, if required.

Mr. Fairweather: You cannot initiate any studies?

Mr. MacCallum: We do not initiate any studies. We are inert, shall we say, until the governments ask us to go into action on a specific area or a specific problem. We did investigate the St. Croix some time ago.

Mr. Fairweather: Are those studies public documents?

Mr. MacCallum: They are public documents as soon as they are released by the governments; and the St. Croix report was released by the governments, in due course, after they had considered it. Pollution abatement is essentially a provincial and state responsibility and, as I say, the government of New Brunswick has taken the prime responsibility for abating pollution on the New Brunswick side, while similar steps have been taken by the authorities in the State of Maine on the U.S. side

Mr. Fairweather: Well, I realize the constitutional position. Two of these rivers, the St. Croix and Saint John are boundary waters, and in this connection, surely, responsibility rests for pollution abatement with the national—not the provincial or state—governments.

Mr. MacCallum: Under the Boundary Waters Treaty, Canada and the United States are bound not to commit pollution on one side to the injury of health and property on the other. To that extent your statement is absolutely correct.

Mr. Fairweather: Well, I suppose that I have always tried not to comment. It seems to me, however, that, this being your 60th Anniversary, perhaps there is a way to harden, if you like, the recommendations made by the IJC. I think the public expects rather a more active role from this body. After all we represent them.

Mr. MacCallum: Yes, yes indeed. Of course, you will appreciate that the International Joint Commission is limited by the powers that have been given to it. We have endeavoured, particularly in the last year and a half, to follow up more aggressively, shall we say, the role that the governments did give us. Taking the pollution of the St. Croix as an example, the governments approved the water quality objectives which we had

recommended, asked the Commission to establish and maintain continuing supervision over the pollution of the St. Croix River, and to draw to the attention of those having authority cases where the objectives are not being fulfilled. Well, of course, those having authority are the officials of New Brunswick on the Canadian, and Maine on the United States, side—the federal water pollution con-

• 1210

trol administration. Last September, down in St. Stephen, we had a public international meeting in the best traditions of a little town, where the officials of the New Brunswick and Maine governments, municipalities and industries were called before the Commission to explain what they had been doing and why, after a certain number of years, the objectives were not being complied with in full. The meeting, which was given excellent press, TV, and radio coverage, was in fact, on national TV news, and, although it obtained a good deal of notoriety, some results were achieved.

Now, the speed at which pollution can be abated is largely a matter of money. There is technology involved in it, but the elected representatives are the ones who must decide how much money will be spent to bring about these improvements known to be required. There, I am afraid, the Commission cannot do much, beyond pointing out to the public and to the agencies what needs to be done, and trying to build up the public support which will enable the people who control the purse to spend the necessary amounts of money.

Mr. Fairweather: There is, at the moment, no equivalent in Canada of the United States' federal pollution control?

Mr. MacCallum: No, there is not.

Mr. Fairweather: Would this be because of our constitutional aspect of...

Mr. MacCallum: I believe that this has a good deal to do with it. I keep hearing that the government is going to bring in a Canada water act which, I understand, will have some provisions—the nature of which I am not aware—to assist, at least, in the pollution abatement.

Mr. Fairweather: Just one final question, Mr. Chairman. How many classified engineers are on the staff of the commission, Mr. Thompson?

Mr. MacCallum: Two of us.

Mr. Fairweather: That is interesting; a distinguished representative and then Mr. Heeney. Who else is there—any other lawyers or engineers?

Mr. MacCallum: The total staff is 12, including the chairman and two other Canadian commissioners, a legal adviser, an engineering adviser, a secretary of the Canadian section, a technician, five secretarial helpers, and a draftsman and illustrator who draws charts, maps, and the like.

Mr. Fairweather: The charts of your frustration!

Mr. MacCallum: The charts of the areas over which we have responsibilities.

Mr. Fairweather: Neatly answered.

Mr. Allmand: May I have a supplementary to what Mr. Fairweather was asking?

Mr. Fairweather: I am through.

The Chairman: Mr. Allmand on a supplementary.

Mr. Allmand: Mr. Fairweather was asking about action which resulted from your reports when you spoke about the Ste. Croix River in New Brunswick. Does the same type of action result with respect to your work in the Great Lakes? Do you merely give reports, or has action been undertaken as a result of these?

Mr. MacCallum: Indeed it had. At the present time we have an investigation underway into the pollution of Lake Erie, Lake Ontario, and the international section of the St. Lawrence River. The investigation is at the stage where the technical board which we appointed to actually carry out and supervise the field work and the technical studies is preparing its main report. This, we expect,

• 1215

will be in our hands toward the end of this summer. Thereafter, the commission will consider holding public hearings and formulate its own report for the governments. We have put in two interim reports—the first one very shortly after we received this reference—pointing to the seriousness of the problem of eutrophication, which is the over-fertilisation of the lakes, and recommending that certain steps be taken. I believe that the authorities on each side of the line—Ontario, several States in the United States, and the United

States and Canadian governments—have taken steps to reduce the introduction of nutrients into the lakes. But final action has not been taken. This was a matter of bringing to the governments' attention that, as soon as the seriousness of the problem became apparent to us, it should be faced up to very quickly and combated without unnecessary delay.

In the connecting channels of the Great Lakes—that is the St. Marys River between Lake Superior and Lake Huron, the St. Clair, the Detroit Rivers and the Niagara River—we did, back in 1950, recommend water quality objectives for boundary waters control in these channels. These were accepted by the governments and have really been implemented largely by the Province of Ontario, the Ontario Water Resources Commission, and the several state bodies in these waters. Moreover, we have been given the role of watch dog and supervisor to initiate action towards realizing these objectives. We have had public meetings on those channels, similar to the ones I mentioned on the Ste. Croix, to find out why the objectives were not being fully complied with and to induce those responsible to take the necessary action.

The Chairman: Mr. Lewis on a supplementary.

Mr. Lewis: Have you any idea what personnel comprises American part of the IJC?

Mr. MacCallum: Yes, indeed.

Mr. Lewis: Would you like to give us that?

Mr. MacCallum: They have no professional staff on a full-time basis. There are the three commissioners, a secretary, and clerical staff in support. I should just add there, that, on both sides of the line, the Commission is not limited to the professional advice which it can obtain from its staff. Each time a problem or a reference is made to the Commission for an investigation, the letter of reference spells out that the Commission may draw upon the specially qualified experts, such as engineers, scientists and economists, in the agencies and departments of the government service to assist in the investigation. They are the people who actually conduct the investigations. The engineering adviser and the legal adviser in the Canadian section, for example, primarily keep in touch with these boards to try to ensure that they are heading in the right direction, and that we know what is happening and can evaluate what they are doing. In this pollution investigation on the

Great Lakes however, there are probably over 100 Canadian technical people involved in the actual investigation.

Mr. Lewis: Are they all government people?

Mr. MacCallum: They are all government people, but if the Commission is unable to find the calibre of man, or the type of advise, or the specialist required, we have subject to you gentlemen, authority to retain outside consultants as occasion requires. We do not do that very often but there has been the odd time.

The Chairman: Mr. Nowlan; and then I have Mr. Ryan, Mr. Legault, Mr. Howard, Mr. Allmand, Mr. Guay. Did I miss you, Mr. Gibson? Well, I will perhaps fit you in then in an appropriate place.

Mr. Nowlan: To continue more or less along the lines of Mr. Fairweather's and Mr. Lewis' questions, I understand that we have a staff of 12, but what is the ratio of the American staff, by comparison?

Mr. MacCallum: They have three commissioners, a secretary, an administrative officer and two secretaries.

Mr. Nowlan: So, numerically, we have more?

Mr. MacCallum: That is right.

Mr. Nowlan: What is the reason for that?

Mr. MacCallum: Our government and Parliament have seen the need, shall we say, ahead of the United States government, to provide an adequate staff in the Canadian section. It is hoped that the United States

• 1220

section will be granted authority to balance their staff with ours. I know that they have been trying to do this for at least two or three years.

Mr. Nowlan: This, again, may be a general question, with all the perils attached thereunto. How many bodies of water come within your jurisdiction with this total staff of 12?

Mr. MacCallum: All boundary waters which are defined as waters from main shore to main shore along which the international boundary passes. Those would be the Ste. Croix, part of the Saint John, the St. Lawrence—all the Great Lakes system.

Mr. Nowlan: Yes.

Mr. MacCallum: Those are boundaries waters, and they are under our jurisdiction with respect to any obstruction or diversion affecting the level of water on the other side of the boundary. In addition to that, all rivers that flow across the boundary, or out of boundary waters, are subject to our jurisdiction in the sense that approval must be obtained before they may be dammed on the down stream side in such a way as to flood water back into Canada.

By comparison, the Prairie rivers, for instance—the St. Mary, the Milk, the Waterton and Belly—are not subject to our jurisdiction. Problems related to them—the allocation of their water between the countries, and suchlike—have, however, been referred to us for investigation and report with recommendations. To that extent, you might loosely say that they are under our jurisdiction. They are part of our responsibility, which extends, not only from coast to coast, but up the Alaska Panhandle—although we have had no reference involving those rivers as yet.

Mr. Nowlan: Like the Columbia River in British Columbia?

Mr. MacCallum: Starting back in 1944, we conducted, on the Columbia Basin, investigations which carried on for some 16 years.

Mr. Nowlan: As far as initiating action is concerned, do both governments have to agree to initiate action, or can you initiate action on your own behalf for your side of the river?

Mr. MacCallum: No, the Commission does not initiate action at any time. In a case where Commission approval of a structure—such as a dam—which raises water level is required, the government of the individual seeking that approval applies first to External Affairs on our side, or to State Department on the United States side, and they forward the application to the Commission for appropriate action—that is, approval or rejection.

Only federal governments can initiate requests to us for investigation. The problem or matter of difference is referred by either government—or both. Tradition has sprung up that the two governments confer in advance, on the terms of the reference, about exactly what is going to be asked of the Commission, and then both commit their resources to the same extent and we receive a joint reference from both.

Mr. Nowlan: So, while one government could initiate it, the practice has developed that this is done by conference or consultation first?

Mr. MacCallum: That is right.

Mr. Nowlan: They give the reference jointly?

Mr. MacCallum: That is right. This is at governmental level, which means that each government is equally committed to support the investigation that the Commission is requested to make.

Mr. Nowlan: Coming specifically to Vote 40, there is an item in the estimates of \$300,000, I believe—the amount this year, down \$6,000 from last year—for the boundary lake pollution study. My first question is, how long has the study been in progress, what has been spent by Canada, and what has been spent by the United States?

Mr. MacCallum: It is a little difficult to give you the exact totals because they are found in the estimates of the several federal government departments?—Energy, Mines and Resources, I believe—which have participated. To deal with the International Joint Commission vote first; the sum of approximately \$300,000 is the Canadian Section International Joint Commission commitment to share, equally with the Ontario Water Resources Commission, in the costs of a program which OWRC initiated, and which they have advanced and pursued earlier than they otherwise would have done in Lake Erie,

• 1225

Lake Ontario and St. Lawrence River investigation. Had the Ontario Water Resources Commission not undertaken this program, which is in direct support of the IJC investigation—but also of course is of value to them—then the Commission would have had to have found consultants or some other agency to do the work which the OWRC is doing. So, recognizing that we both had an interest in it, we agreed that we would share the cost of this particular program equally, subject to a maximum contribution by Canada of \$300,000.

I am afraid that the information I have on the other federal departments was compiled last fall. The Department of Energy, Mines and Resources estimated at \$3,485,000; the Fisheries Research Board \$1.5 million; the

Department of National Health and Welfare roughly \$237,000; and the Ontario Water Resources Commission—in addition to the part for which we reimbursed them—incurred expenditure of some \$383,000. Their total outlay, of which they recoup \$300,000 from us, was \$683,000.

Mr. Nowlan: Is that \$300,000 in the estimates \$3,000 which they also contribute?

Mr. MacCallum: That is right.

Mr. Nowlan: How long has this study been progressing?

Mr. MacCallum: The date of the reference was 1965.

Mr. Nowlan: Does it appear from the studies that there have been interim reports and/or a timetable for completion?

Mr. MacCallum: That is right. The timetable for the completion of the Board's first phase of the investigation—to find out if pollution is occurring, if so, from what sources, to what extent, and what should be done—will be completed this summer.

Mr. Nowlan: Do I gather from something you said earlier that the \$300,000 paid out by the I.J.C. has really been consultant fees for other professionals or people to do the work?

Mr. MacCallum: The bulk of that \$300,000 goes directly to the Ontario Water Resources Commission to reimburse them up to the maximum of the federal Commission.

Mr. Nowlan: Again, from something you said earlier, does the study from what you have found out to date, indicate that pollution can be abated or cured on, say, the Great Lakes, where, specifically the study is being taken?

It is just a question of money?

Mr. MacCallum: First, it might be an oversimplification to state that it is just a question of money. But more often than not, money is the determining factor. In a body of water as large as any of the Great Lakes, there are other technical problems which may—unquestionably do—make it more difficult; and the cure is not quite as obvious as it may be for a flowing river the size of the Ste. Croix or, perhaps, the Niagara River. Nevertheless, the preliminary information we have obtained from our Boards is that it can be stopped, the trend reversed, and the condition improved.

Mr. Nowlan: From the figures that you gave me earlier from the Department of Energy, Mines and Resources, the Department of Health and Welfare, the Ontario Water Resources Commission, and the Fisheries Research Board, are these the totals that have been spent to date on that particular project? Is that all the expenditure involved?

Mr. MacCallum: They are the estimates by those Departments for 1969-70.

Mr. Nowlan: What, do you know, has been the total so far spent on the project?

Mr. MacCallum: Since the reference in 1965, I can tell you only the specific amounts which the International Joint Commission has paid. These, of course, are relatively minor in the over-all figure. The Departments, until this year, have not kept their accounting on a project basis in such a way that we could identify money spent strictly on behalf of In-

• 1230

ternational Joint Commission investigations, because some of the work is done in the ordinary course of departmental operations, after which the results are made available to this co-ordinated study. I am sorry to say that I cannot give you the current figure, and I do not think that the figures for past years would be available elsewhere.

Mr. Nowlan: When the project was started, and the reference was made to 1965, there was, then, no over-all estimate of what might be involved. Would it be fair to say that, concerning cost, it was a somewhat open-ended project?

Mr. MacCallum: Not wholly.

Mr. Nowlan: If not, what was the rough estimate of the project?

Mr. MacCallum: The first assignment the Board was given after it was set up was to provide an outline of the investigations required, an estimate of the costs and time required, and personnel. I do not have that with me. It is on our file. I could give you that as a guide if it would be useful.

Mr. Nowlan: If you do not have it right now, you could cover that in a memo to the Clerk.

Mr. MacCallum: I would be glad to. Of course those figures were based on estimates by departmental officials and so on as to what probably would be involved.

Mr. Nowlan: If you would give a memo to the Clerk that would suffice for my purpose.

My last question, Mr. Chairman, again, is in reference to the staff. I must say that I was a little surprised at the lack of numbers. How many references were you involved in during the last fiscal year, or does it vary so much from year to year that there is no average?

Mr. MacCallum: Most of them continue over more than one year. We have five major studies going on now. We have continuing responsibilities for 26 boards of control that relate to areas and problems that have arisen and have been dealt with along the boundary and the boards are sort of our eyes and ears to follow up to make sure that what we said would be done is in fact being done. But we have five major investigations.

Mr. Nowlan: You mentioned 26 boards.

Mr. MacCallum: Twenty-six boards that report to us once or twice at least annually, many of them semi-annually, on what is going on in their area and whether our orders are being complied with. Of course that is largely the role the two advisers play—keeping in constant contact with those boards make sure things are going the way they should be.

Mr. Nowlan: Would this Great Lakes water pollution study be the largest single project that you are involved with at the present time?

Mr. MacCallum: I think it would be fair to say it is, yes. One that is almost as large though is a study of the possibilities of regulating the levels of any or all of the Great Lakes, and that is proceeding simultaneously. Those are our major and most demanding studies at the moment.

Mr. Nowlan: Thank you, Mr. Chairman.

Mr. Ryan: Mr. MacCallum, what are the other three major studies?

Mr. MacCallum: There is an air pollution study in the Sarnia-Port Huron area and the Detroit-Windsor area specifically. In addition to that, at the time the governments referred the study of those two areas to us they asked us to take note of air pollution problems that may come to our attention from any source anywhere along the boundary, in effect to make a preliminary investigation and keep them informed whether a more detailed investigation and a formal reference should

be made to the Commission. That latter point is a new departure for the governments—in giving us, as it were, a watching or a “sniffing” brief along the boundary to spot these incipient problems before they become too serious. Then we draw it to the attention of the governments and they decide whether to give it back to us for a thorough investigation. That is brand new and almost an exception to the point I made earlier—that it is the

• 1235

governments that trigger off these investigations. In this case they have asked us to short-circuit it and to draw to their attention problems that should be looked into.

We are also studying the measures that are desirable and practicable for preserving and enhancing the beauty of the American Falls at Niagara. As you know, they have been deteriorating and the Commission is involved in a study of what can be done and the desirability of doing so.

The co-operative development of the water resources of the Pembina River basin is one that has recently been completed and reported on to the governments.

The levels of Rainy and Namakan Lakes is the fifth one under active study. In that connection the Commission has a special task assigned to it under a convention entered into directly by the American and Canadian governments to determine when emergency conditions exist in the watershed, either from too low or too high water; and to determine what measures should be taken to reduce damages as much as possible. We have construed that as authority to devise a method of regulating the levels of Rainy Lake and the Namakan chain of lakes in such a way that emergency conditions will not arise, and we are engaged now in the process of modifying the regulation plan that has been in effect for about the last six years. We think we can do better.

Those are our major preoccupations at the moment.

Mr. Ryan: Mr. MacCallum, you told us that the International Joint Commission was set up under the Boundary Waters Treaty originally in 1909. Does your jurisdiction cover air pollution as well or are you getting a special reference in some way, shape or form?

Mr. MacCallum: We have received a special reference. Article IX of this 1909 Treaty is very far-sighted. It says that any questions or matters of difference arising between the

High Contracting Parties involving the rights and obligations as between the two of them or as between one government and the people on the other side may be referred to the International Joint Commission for investigation and report. It is broad enough to embrace practically any problem along the common frontier that involves those issues or potential troubles, whether it is water or air or whatever it is. This is the third air pollution reference that we have had in that connection.

Mr. Ryan: The Americans have the United States Army Corps of Engineers backing them up in large measure and I understand this is one reason that they do not need as large a staff.

Mr. MacCallum: That is right.

Mr. Ryan: But we do not have anything the equivalent here.

Mr. MacCallum: No, we do not, I suppose the Department of Energy, Mines and Resources comes as close as any of our departments to the Corps of Engineers' work.

Mr. Ryan: You said that you looked back at former references and have revived your interests in some of them. Is the Columbia River Treaty continuing to receive your scrutiny?

Mr. MacCallum: No.

Mr. Ryan: You do not look at the Upper Columbia?

Mr. MacCallum: No. Once the Columbia River Treaty was signed and put into effect the Commission has had no further role to play.

Mr. Ryan: There was an international board set up under that Treaty.

Mr. MacCallum: That is right. There is a residuary possibility as far as the Commission is concerned under the Columbia River Treaty—that a dispute or a difference may be referred by the governments to the International Joint Commission.

Mr. Ryan: There is one problem that you may or may not be still interested in—an option concerning a branch of the Kootenay going down into the States and then coming back into Canada. The Americans had to build a dam and I believe they have gone ahead with that dam.

Mr. MacCallum: That is right, Libby Dam.

Mr. Ryan: Is that finished now and in operation?

Mr. MacCallum: No. It is under construction. I am not sure of the scheduled completion date. I think it is probably another year or a year and a half yet.

Mr. Ryan: Would you not be interested if that flooded back into Canada in an inordinate way—in a way that was not contemplated?

Mr. MacCallum: The governments made provision for that in the Treaty itself. They said that Canada would provide certain territory required in Canada for this reservoir and they dealt with it directly under the

• 1240

Columbia Treaty rather than seeking IJC approval. It would be pretty awkward if there were both governments and the Commission in the act at the same time.

Mr. Ryan: So we could not get any follow-up from your Commission on how the Columbia River Treaty works are proceeding, how they are turning out, whether they are satisfactory or not?

Mr. MacCallum: Presumably it could if the governments wanted us to and asked us to, but I would think they have established their own permanent engineering board for that sole purpose, to keep the governments informed that indeed the treaty is working out the way it was intended to. I might add, though, we do have responsibility and authority over the levels of Kootenay Lake, where the Commission approved the dam that regulates the levels of Kootenay Lake and the outflow down into the West Arm. Libby Dam must be operated in such a way as to be consistent with the order of approval then in effect for the regulation of Kootenay Lake levels. We do tie in with the basin but we do not have anything to do with the Columbia River development or treaty as a whole.

Mr. Ryan: In respect to the Alaska-Yukon-British Columbia border situation and the proposed Taku-Yukon River development, are you working in any way on this proposition?

Mr. MacCallum: No, we are not.

Mr. Ryan: Are you being approached or consulted by American interests in any way?

Mr. MacCallum: No. I understand from a press announcement I saw a little while ago that there is sort of a joint study going on at the present time at the intergovernmental level, which does not involve the International Joint Commission, as to the market possibilities for power that might be generated if the Yukon-Taku or Tuya projects went ahead. The governments, at any stage, could refer that type of question to us for investigation but indeed they have not.

Mr. Ryan: So you strictly wait until you are referred to? You take no interest otherwise.

Mr. MacCallum: We are very much interested and we try to keep ourselves informed in advance of any problem that is likely to come under our wing, but it is an academic interest, shall we say.

Mr. Ryan: Yes, thank you.

The Chairman: Mr. Nowlan on a supplementary?

Mr. Nowlan: Is there no procedure whereby you can request a reference from the governments—not that you can initiate it, but that you can get to the governments and say that this problem should be looked at?

Mr. MacCallum: Shall we say at the staff level we work fairly closely with officers from the Department of External Affairs, and the Department of Energy, Mines and Resources, and the Department of Fisheries, and the various government officials. Mr. Thompson and I are civil servants and we talk to civil servants, and if a situation is blowing up in such a way that we think it would be a fit subject for a reference, we do not hesitate to draw it to the attention of officials in the department.

Mr. Nowlan: In a practical way, compared to an official way?

Mr. MacCallum: That is right: a telephone call, or over lunch, or this sort of thing; word gets around.

The Chairman: Gentlemen, it is quite clear that we will not finish with Mr. MacCallum and Mr. Thompson this morning and we will proceed this afternoon at 3.30 p.m. Would you be agreeable to continuing a little longer, say until 1.00 p.m. to deal with as much as possible, and then we will continue this afternoon at 3.30 p.m.? We will probably reach Mr.

Cadieux and the Officials of the Department of External Affairs around four o'clock. They will stand by in any event.

The next one on my list is Mr. Legault, followed by Mr. Howard, then Mr. Gibson.

Mr. Legault: Thank you, Mr. Chairman. Mr. MacCallum, you mentioned a while ago that the other major study you have is the question of regulating the water levels. In this study are you discussing at the moment the question of additional water diversion?

Mr. MacCallum: Diversion outside of the basin?

Mr. Legault: From outside of the basin, from Canada?

Mr. MacCallum: No.

Mr. Legault: There is no discussion whatsoever at the moment about water diversions?

Mr. MacCallum: That is right. The actual diversion, say, at Chicago that is now going on unquestionably will be taken into account in the evaluation of factors that affect the level of the Great Lakes. No consideration is being given to increased diversions or new diversions either in or out of the Great Lakes

• 1245

basin; it is what can be done within the basin to further regulate the diversion.

Mr. Legault: There is no request at the moment for additional diversions from the Great Lakes like the plan at Chicago?

Mr. MacCallum: No, no.

Mr. Legault: It is anticipated that this will be undertaken very shortly?

Mr. MacCallum: Not as far as the Commission is concerned. I am not aware and cannot say whether the governments are considering that or not.

In the terms of reference that came to us I believe there was a mention of the fact that the governments agreed that at the appropriate time they would be willing to give consideration to other aspects of regulation of the Great Lakes, but it is just as general as that.

Mr. Legault: Thank you very much.

Mr. Howard (Okanagan Boundary): Mr. Chairman, my question is about the Similkameen River in British Columbia. It is my understanding that it was established at the time that the Columbia Treaty was set out that the upstream nation has absolute authority and jurisdiction over waters in that sys-

tem. A number of years ago, I do not know how many, the waters in the Similkameen River were bargained away to the United States at a time when the area through which it flows in Canada was not populated, or certainly was not very well populated. Today that area is much more heavily populated. Today that area is much more heavily populated, and it is an area where farming and ranching can only be carried on as result of irrigation. That water is quite vital to the people in that area, and they are not allowed to draw from the Similkameen River for irrigation purposes because some arrangements have been made with the Americans to allow the water to stay in the river. It is my understanding there have been restrictions on the right to even drill wells which might reduce the water table in that valley in order that the water may go to the Americans.

In an area where the annual rainfall is only about 10 inches a year this is a very crucial factor and results in many acres of land that could be used for very productive farming not being available.

I would like to have your comments on that agreement that was made with the Americans, and I would like to know what we got in return for the water that we apparently gave to them, and what the possibilities are of reversing that situation?

Mr. MacCallum: First of all, under Article 2 of the Boundary Waters Treaty, as you pointed out, the upstream country, the federal or the province or state as the case may be, has exclusive jurisdiction and control over the use and diversion or obstruction of waters which in their ordinary channels would flow across the boundary. Applying that in the case of the Similkameen River, British Columbia or Canada or both have exclusive jurisdiction and control over such diversions provided that for any damage that is done in the downstream country as a result of such exercise of jurisdiction and control the injured person downstream can come into the upstream court and seek damages on the same basis as a Canadian who might have been injured.

As I recall the circumstances of the Similkameen River, and it happened just before I came to the Commission, the Commission was already investigating the Columbia River reference. The United States Government raised the question of a couple of proposed diver-

sions of the Similkameen River in Canada and the Commission was asked whether such withdrawals would adversely affect the people downstream where, I believe, they had either fully appropriated or over-appropriated the water in the river.

The Commission reported that if the waters were taken from the flood crest it would

• 1250

cause no damage at all. Taking it from there, I believe the province of British Columbia issued their water rights to their local residents on that basis and may well have said, "You may take this water out of flood flows, and so on". There were certain restrictions, and I am not familiar with what they were.

There was no bargain, as I understood it; there was no treaty. Whether or not there was an exchange of notes signifying a special agreement, I would not be prepared to say. But they were not bargained away. The Commission merely said, "If you take it at this time under these circumstances you will not cause any damage downstream." I do not believe a study has ever been made to find out what damage downstream would be caused and whether or not there would be a recoverable damage if more water were taken from the Similkameen or less were taken under different circumstances. The water rights in British Columbia are a provincial matter and I assume that they have made certain studies. I do not really know what the restrictions are but I am reasonably confident that there was no bargain rate. This was a question addressed to the Commission and the Commission replied as I have indicated. What happened after that I do not know, and the Commission does not have any continuing jurisdiction or responsibility in the Similkameen for that. . .

Mr. Howard (Okanagan Boundary): The provincial water rights branch then dealt through the International Joint Commission though, did they not?

Mr. MacCallum: No, they would get advice from the Department of External Affairs as a result of this question that was addressed to the International Joint Commission at that time, but what has happened since then I do not know.

Mr. Howard (Okanagan Boundary): Could I get information from you then as to what the possibilities are of Canadians being able to draw water from the Similkameen. Could you

investigate for me what the status is at the moment?

Mr. McCallum: The Commission really has not much ground for investigating or for asking the provincial water rights branch.

Mr. Howard (Okanagan Boundary): No, but you must have some records on this subject.

Mr. MacCallum: Not subsequent to the investigation that we made or the report that was put in back in 1950 or 1951. As I say, we have not followed the matter nor do we have any particular responsibility in the field. I would be glad to check on what happened at that time if it would help.

Mr. Howard (Okanagan Boundary): Yes, this is what I would like.

Mr. MacCallum: I am a little reluctant to say that I will write the B.C. water controller to find out what he is doing there because he might be justified in saying it is none of my business.

Mr. Howard (Okanagan Boundary): No, but I would be interested in knowing what happened in 1950 or 1951.

Mr. MacCallum: I will be glad to look into that and I will communicate with you.

Mr. Howard (Okanagan Boundary): Fine, thank you.

The Chairman: Mr. Gibson?

Mr. Gibson: Could you tell me the function of the pollution research centre with respect to the inquiry going on in the Great Lakes. Is it an integral part of it or is it a completely separate entity?

Mr. MacCallum: Is this the Canada Centre for Inland Waters.

Mr. Gibson: Yes, sir, at Burlington, Ontario.

Mr. MacCallum: I would like to think that the construction of that Centre and the program that has received so much impetus from it might well have been triggered by the reference to the Commission of the study of pollution and the levels of the Great Lakes. The Canada Centre for Inland Waters is strictly a Canadian governmental centre primarily established by the Department of Energy Mines and Resources but working in close co-operation with Fisheries and Transport, I guess, and the various other departments of the federal government that are

concerned with Canada's inland water resource. They have also provided for close work with the provincial authorities and with the various universities. I think there are about ten or a dozen universities within a very close radius. They are participating, or the agencies that are represented in the Inland Water Centre are participating very actively in the IJC investigation and much of the actual field work emanates from there where they have boats and all the necessary facilities and laboratories, but they are part of our co-ordinated investigation.

Mr. Gibson: The other thing, sir, that strikes me from listening to you today is that technically we are advanced, we are working well. We are co-ordinating with other groups

• 1255

in trying to find means of conquering the pollution problem. However, it seems to me—I would be glad of your opinion on this—that legally the enforcement branch of this topic has been wilfully neglected by all the governments in the sense that there has been no effort made or insufficient effort has been made by the Canadian government and the United States government and the state and provincial governments to co-ordinate their efforts in such a way that industry can be controlled and prevented from putting harmful ingredients into the Lakes. Would you agree with that?

Mr. MacCallum: Not wholly. For instance, the introduction of pollution into boundary waters, into the Great Lakes system on the Ontario side, does not really require participation by any government except one.

Mr. Gibson: No, but supposing on the Ontario side they stop polluting and on the New York side they pollute. What is the benefit of one doing it and the other not? Would it not have the same result?

Mr. MacCallum: Yes, as a general rule, but, in fact, on the Ontario side and on the New York side there are indeed very aggressive enforcement programs going ahead. I forget the name of the New York agency.

Mr. Gibson: Are they integrated?

Mr. MacCallum: It is the counterpart of the Ontario one.

Mr. Gibson: No, but supposing Ontario and New York both decided to stop pollution at the same place, what integration is there

between the two plans, if any, in legal terms? Is there an agency that co-operates between the two to see that both sides of the river are observing the measures?

Mr. MacCallum: That is the role of the International Joint Commission. We have set up common objectives. The governments on each side have accepted those objectives and they have said they will work towards these. The Commission shall we say, is the whip that stands above both of them and says, "Why have you not got this plant cleaned up?". If they say, "We will have it cleaned up by 1971," we say, "That is not quite soon enough, why not 1970?" Then they explain why.

Mr. Gibson: My point, sir, is that you have no mechanism to enforce by injunction, have you?

Mr. MacCallum: We have no enforcement authority at all, except public opinion.

Mr. Gibson: Would it not be desirable to have some agency which could enforce by way of injunction the recommendations of the two governments?

Mr. MacCallum: On the face of it, it sounds very attractive and as a staff man with the International Joint Commission I sometimes think it would be nice to have some authority and some muscle. But the corollary of it, you cannot have the government and the International Joint Commission and the other government all with equal powers. Which government is going to first say that we will let the International Joint Commission establish the objectives and enforce them? I do not know, I do not think it will be Canada, but that is the problem. Who is going to surrender that much jurisdiction to a non-elected quasi-judicial body?

Mr. Gibson: On page 12 of this report behind the headlines, Mr. Heeney's report, he says:

...But, measured against the enormity and urgency of the problem, progress is still distressingly slow.

Do you not need dynamic and imaginative agencies set up to enforce this thing with all the publicity you can possibly get and with the law behind you, from both levels of government.

Mr. MacCallum: It would be extremely helpful. All I can say is we have the commitment of the State of Michigan that by 1970

the Detroit River and the St. Clair River and Lake St. Clair as far as the Michigan side will be living up to the objectives that were recommended by the Commission in 1950. They will be complied with. The Canadian side is almost at that point now.

I agree that this sort of mechanism we have thrown together ought not to work, but if, indeed, by the end of next year, the Detroit River, which has been rather infamous, is cleaned up...We had one of these international meetings I spoke of down there this January and although quite a bit remains to be done all the major contributors are, indeed, working under a court order or under the order of the Michigan Water Resources Commission on a schedule. They are checked on each month or each quarter. In fact, they are making progress. I am inclined to think—this is only my own personal view—that as long as governments have

• 1300

a will to get this cleaned up and with the International Joint Commission co-ordinating the efforts of the governments from both side, maybe that is about as much as we can hope for.

When one side falls notoriously behind the other then we have this public meeting and, in effect, we are calling these enforcement agencies to account for not having met the objectives they are committed to. As a matter of fact those objectives now are under review with a view to tightening them up.

We have learned a bit more about various pollutants since they were established in 1950. It is, shall we say, a clumsy, sloppy sort of thing but it enables each nation to live side by side with its full sovereignty and with the goodwill that has been shown on both sides in most of these areas, not all of them, I am hopeful. It would be very nice if some of the reluctant ones could be pushed at a faster pace.

Mr. Gibson: Thank you, sir.

Vice-Chairman: Since Mr. Allmand has left, we still have Mr. Guay.

Mr. Guay (St. Boniface): My question is possible not too important, Mr. Chairman, but I have noticed that a study has been made pertaining to the Red River, which comes in from the south, though the States and into Manitoba. I have not had the occasion to read it. Did your group make this particular study?

Mr. MacCallum: We made a study of the pollution of the Red River.

Mr. Guay (St. Boniface): Someone else asked this question but do you have the authority or can you recommend to regulate the flow of the Red River? Possibly this would solve some of the problems in the area.

Mr. MacCallum: No. We have no authority over the regulation of the flow entering Canada from across the southern boundary. Our report indicated that the water which was crossing the boundary was not polluted, as it entered Canada. This came as a bit of a surprise to the public at large, because just a short time before that it had been polluted. There was no question about it. But meanwhile, and this is a sign of the times, North Dakota and Minnesota each established their own laws with pretty tight requirements for keeping pollution out of all their waters, including the Red River. We came to the conclusion that if, indeed, their programs were properly applied and enforced that there would not likely be any pollution problem at the boundary. To make sure that they did not slack off and forget about the Canadians who were falling heir to their good works, we recommended and have been authorized by the two federal governments to maintain continuing supervision with a monitor at the boundary to ensure that the quality of water which comes into Canada is of the same high standard that North Dakota and Minnesota require for their own waters. These are very sensible and attainable objectives.

Mr. Guay (St. Boniface): Is it polluted in Canada?

Mr. MacCallum: I am afraid so.

Mr. Guay (St. Boniface): Where did it start?

Mr. MacCallum: Very shortly below the boundary, but primarily in the Winnipeg area. That presented a bit of a problem when the situation was under consideration in the International Joint Commission. The argument was, why should the United States side be required to provide a higher quality of water than Canada was obviously interested in having, because they immediately polluted it after it reached Canada? We had to rely solely on the provision of the Boundary Waters Treaty which says that "neither side shall pollute to the injury of health and property on the other side", and so we have an assurance of relatively clean water arriving at the boundary. It is up to Manitoba to take it from there.

Mr. Guay (St. Boniface): Yes. Which was the most important study that was made, in your estimation, since you have been on this particular Commission? Was the recommendation which you made from that study, ever implemented?

Mr. MacCallum: The one that stands out in my mind, the most, is a combination of two studies and involved the application to build the power works on the St. Lawrence River, in the international section near Cornwall at Barnhart Island, and the study of regulating the levels of Lake Ontario. The results of our study on the regulation of Lake Ontario were reflected in recommendations to the government's approval, and then incorporation in the order of approval that the Commission issued for building the Barnhart Power Works. To that extent, our recommendations were all implemented, although we implemented a number of them ourselves by actually issuing an order of approval. That was one of the biggest up to that time. The pollution field is becoming increasingly important, and I am sure that it will continue to be so. The other one which is worthy of mention is the Columbia investigation which we started at a time where we did not even have appropriate maps. We had to go back to the surveying level, in order to have the data on which conclusions could be drawn. The Columbia River Treaty was negotiated very shortly after we recommended the principles on which the Treaty should be based. Those were the biggest and the most far-reaching ones in which I was engaged.

• 1305

Mr. Guay (St. Boniface): That is all, Mr. Chairman.

Vice-Chairman: Thank you, Mr. Guay. On behalf of the Committee I would like to thank you, Mr. MacCallum. You have been most helpful. Adjourned.

AFTERNOON SITTING

The Chairman: Gentlemen, we are ready to begin.

Mr. Cadieux has brought with him answers to a number of questions that have been asked. To save time, would it be agreed that they should be printed as appendices to our proceedings and in the meantime copies can be distributed to members present? I think a

number of them are in answer to questions raised by Mr. Roberts. Is it agreed?

Some hon. Members: Agreed.

The Chairman: I believe the first questioner is Mr. Winch.

Mr. Winch: Mr. Chairman, at our last meeting, before we adjourned, I was asking some

• 1535

questions relative to the passport situation. Could we have some explanation as to what were the procedures decided upon by the Department which issues passports when the new regulations came into effect. Because they involve such important changes, why was consideration not given to the problems that were bound to arise for those who this year have decided to go overseas? The department is now prepared and does issue a valid passport for one year under certain circumstances. Why could a renewal of an old passport not be made? I think this would have saved a lot of trouble. I am not going to go into other aspects because, as I said last meeting, Mr. Chairman, I have received—and I think other members have—from the passport office such wonderful co-operation with difficulties. I do not want to go into that now. Almost every recommendation that has been made to facilitate has been followed through.

In addition to asking why this was not foreseen, why provisions were not made for the allowance of a renewal for one year. Instead of the procedure one has to go through now, I would also like to ask another question. When a person made application and did so on the old passport application, in which one item calls for \$5 when \$10 is required now, why was he refused if he sent in the old application? New applications were not available and are still not available, not only across Canada, but they are not available, sir, in your own office which is one block from the Parliament Buildings. I think that is enough, sir. I may have some supplementary questions when I hear from the director.

Mr. M. Cadieux Q.C. (Under-Secretary of State for External Affairs): Perhaps Mr. Chairman, if it is agreeable, I can make one or two general comments. Then I will ask the head of the passport office, who is more intimately connected with the operation, to answer in detail the points made by Mr. Winch.

I will start by saying that the general reason why the renewals are not as easy as before

is that this is precisely part of the process of tightening up on passport security. The idea was that passport would be issued for five years on the basis of an application. This would make it possible for the passport authorities to check on the applicant and to issue the passport under conditions which would ensure a greater degree of security than there was before. This is the essential purpose of this. This was done and the decision was taken by the government, as indicated at the previous meeting, because there was an impression that we should take greater precautions than we had taken in the past to issue a passport that would give greater assurance as to the identity of the person.

Mr. Winch: Yes.

Mr. Cadieux: It is fully appreciated that in order to achieve this, there is price to pay. And the price that you pay is sometimes a greater delay, although I am confident that in time the present difficulties will be overcome. Certainly the people in the passport office are doing their best to do that. In time the public will become educated about these new regulations and facilities will be put at their disposal, and I think passports will be issued with greater speed and there will be greater security connected with this.

• 1540

Mr. Winch: The MPs are concerned now and also were last month with what we are faced with.

Mr. Cadieux: Yes, I certainly appreciate this, but I can say that we were somewhat taken by surprise by this sudden very considerable increase in the number of applications. As Mr. Sharp said in the House, the expectation was that there would be a certain volume of applications, but the volume was twice that which was anticipated. In the circumstances, the staff in the passport office have exerted themselves very considerably to try to meet this volume; the backlog is being reduced and they are disposing of current applications. Hopefully, within the next few weeks, they will be up-to-date; then they will be able to give the service to which you and we believe the public is entitled.

Mr. Winch: I have had a personal experience with this. First of all, I know that the new application form has not been distributed across Canada. Therefore, people sent in the only thing available, which is the old application form. It demands \$5. Applications have

been returned to people because they only sent in \$5. In view of the fact that they only have the old form to send in, will you please give an explanation of that? Also sir, would you explain why, in our own passport office, as of last Wednesday, you were still issuing the old form?

Mr. Cadieux: My understanding is—and Mr. Durdin will be able to compliment this—that we are still operating on the old form plus an amendment, which indicates the new regulation.

Mr. Winch: No, I am awfully sorry sir, but I must draw to your attention the fact that when you issued the old form to those applicants last Wednesday, you did not supply any addendum or change with them. Why?

Mr. W. S. Durdin (Head of Passport Division): Mr. Winch, I am very surprised that this has not been drawn to my attention previously. We undertook to have amendment sheets printed for all existing applications, and also for the additional stock needed to look after service this year. This was a mammoth compilation job but the distribution was undertaken through post-office channels; as far as we know, all forms that have been distributed do include the amendment sheets. Now you point out that as of last Wednesday our own Public Counter Section was distributing forms without amendments.

Mr. Winch: Right.

Mr. Durdin: If this is true and if the supervisor had been aware of this, he obviously would have drawn it to the applicant's attention immediately and to the attention of our own supply staff as well.

Mr. Winch: The reason, Mr. Chairman, that I am so certain about this, is that although I do not anticipate the need for a passport for some time, since my passport was no longer effective, last Wednesday I sent down for an application form to renew it. I was sent three copies of this application without any other additional sheet.

Mr. Durdin: Well, Mr. Winch. . .

Mr. Winch: It happened to me last Wednesday. That is why I know what I am talking about, sir.

Mr. Durdin: Mr. Winch, I am very glad that this has been brought to our attention, but as far as I know, all of our stock includes the amendment sheet.

Mr. Winch: That was all I got, sir.

Mr. Durdin: There are exceptions, obviously.

Mr. Winch: Well then, I was one of the exceptions.

Mr. Durdin: I am sorry, but there are exceptions; this is the result of mechanical hand-stuffing; obviously you must allow for errors. I can assure you, however, that a very mammoth undertaking was involved to ensure that all forms had the amendment sheets.

There is one other peculiarity: we are still getting forms that were issued in 1957. These were supposed to have been destroyed when we introduced the new form in 1963; however, people stuffed them away and they dragged out the form without regard to the

• 1545

fact that they were not current; this causes problems over which one really does not have any control.

Mr. Winch: May I ask one question, because this means an awful lot to people, and I represent a riding some 3,000 miles away. If they, as I, should not receive the stuffed sheet or whatever you call it, is it not possible, as long as all the other information is correct, that if you only receive the \$5, to issue a passport and then to say, "You owe us another \$5?" I think that would save a lot of trouble.

I have had more than one case, and I know other MPs have as well where people sent in a complete application with only \$5. Now they have done it because they have gone by this application, as I would have done if I had not known differently. Is it not possible sir, especially when they are leaving in four days, a week or two weeks, to accept that and to issue the passport, informing them that they owe you another \$5? Now would that be too difficult? It would save a lot of trouble on rejection of present passports.

Mr. Durdin: We do not reject the forms; we advise the applicants.

Mr. Winch: That is my very point; you advise the applicants that they only sent in \$5. and that the requirement is \$10. If I had filled this out as I got it, then I would have sent you \$5 as well.

Mr. Durdin: Well Mr. Winch. . .

Mr. Winch: Now could you not accept it and then say to them "Please send us \$5. later on?"

Mr. Cadieux: Subject to what Mr. Durdin will say...

Mr. Winch: Because I have had them turned down, sir, because of the \$5.

Mr. Cadieux: I know, but he has greater knowledge than I have of these applications; however, the amendments relates to the tightened security requirements. The amendments relate to the production of the birth certificate and the other documents that are required.

Mr. Winch: But you turn them down because they do not send \$10. instead of \$5.

Mr. Cadieux: Yes but this is only part of the story; you would be involved in correspondence afterwards trying to collect the extra \$5. and then asking them to produce a birth certificate.

Mr. Winch: No, I am saying, sir, that if they fill in everything, if they only send you the \$5. because this says send \$5., it is not security then, it is just \$5.

Mr. Cadieux: You see, the new requirement says that if you want a passport then you must send \$10. You must send your birth certificate or your certificate of naturalization.

Mr. Winch: I am sorry; I have not got it clear. You fill in everything else. You send your birth certificate or your citizenship to security along with everything else; but according to this you only need to send \$5.

The Chairman: I believe I can explain the difficulty, Mr. Winch. That form apparently does not require you to send in your birth certificate or your certificate of naturalization.

Mr. Winch: No, this is what is being supplied. I just got one last Wednesday from your own office.

Mr. Durdin: Mr. Winch do you know from which office you got this, please?

Mr. Winch: Yes, your office right at the corner.

Mr. Durdin: Which office did you get this from? Was it the public Counter Section, the Diplomatic and special Section, or from the Facilitation Section? This would help me because I...

Mr. Winch: I got it on the fourth floor.

Mr. Durdin: Thank you very much.

Mr. Winch: Look, I do not want to get them into trouble; I am only raising the problems that we are getting into.

Mr. Durdin: But I must be able to find out so that I can check.

Mr. Winch: Okay, it was on the fourth floor.

Mr. Durdin: Thank you.

The Chairman: It may be very useful to make sure that they are not still being handed out this minute.

Mr. Durdin: That is exactly the point, sir.

The Chairman: Other people might be put to an inconvenience too.

Mr. Winch: I do not intend to go away; my passport had expired, but you see the problem sir. Now it is not security, it is the \$5., so you cannot be concerned with security.

The Chairman: And the birth certificate.

Mr. Cadieux: And the birth certificate.

Mr. Winch: Well there is not anything on this application about that.

Mr. Cadieux: No; there is not.

Mr. Winch: But this is what they hand out.

Mr. Cadieux: This is the point I am making; I think we are talking at cross purposes here.

Mr. Winch: I am not talking at cross purposes. Inquiries are made by telegraph, telephone and registered mail; applications are returned with the \$5, because they sent in the old one which lacks the proper information. I myself last Wednesday could not get a new one. What is happening to our people across the country?

Mr. Cadieux: We are saying two things. One is that normally an application should not be distributed without the amendment; we do our best to see that the two documents reach every applicant; that is the first thing.

Mr. Winch: You did not have them in the post office that I went to.

Mr. Cadieux: I realize that but that was an accident; we will do our best to prevent this, but mistakes do happen.

• 1550

Mr. Winch: No, no. It also happens in the Vancouver post office.

Mr. Cadieux: The other thing is that only last week on the 17th, we put in 105 Canadian newspapers an advertisement which says: "Get your application form and amendment sheet." We say that the two are essential in completing the form to get your passport quickly.

The Chairman: Mr. Guay has a supplementary.

Mr. Winch: How in the name of heaven can they do that 3,000 miles away when I cannot even get the supplement when I make application here in Ottawa?

The Chairman: I think you have made your point pretty clearly. Mr. Guay.

Mr. Guay (St. Boniface): Before my supplementary, I just want to tell Mr. Winch that a lady sent me a telegram and told me it was faster to go to the moon than to get a passport.

If someone sent in an application on the old form but gave you the \$10 and the birth certificate, you would not send it back to him, would you? You would deal with the application then, would you not?

Mr. Durdin: Certainly.

Mr. Guay (St. Boniface): Thank you very much.

The Chairman: Mr. Forrestall.

Mr. Forrestall: Mind you, I do not see any point in pursuing this as we have in the last half hour or 25 minutes or so. It would have been a lot more interesting to have sat in the House and listened to the Minister of Justice on his amendments to the Official Languages Bill. But might I ask, now that it has come up, why or on what basis the decision was made to retain the old application forms. Surely we did not have millions of dollars worth. Perhaps there was an order issued to destroy them. Surely the Queen's Printer could have produced a new one overnight, even with the air strike because all this started long before that. We could have got effective distribution. Could I ask specifically if we had that large a backlog that we did not want to throw them away?

Mr. Durdin: Yes. When we were aware that there were to be changes in the requirements,

we had on hand almost 750,000 passport applications, and the problem of changing the form is more complex than might appear at first glance. It was decided to go ahead with the change in requirements on the basis of publishing an amendment sheet and having the amendment sheet stuck in each of the existing applications. This was not for the sake of, shall we say, trying to save money. The forms were already in location in the eight post offices in their depots and it was simply a question of amending these forms physically together with the stocks that were on hand and this would allow us to go forward and to introduce the new requirements in advance of the travel season. Otherwise there would have had to be a delay of probably ten months.

Mr. Forrestall: Was it physically impossible to have cancelled or made null and void all of the existing application forms?

Mr. Durdin: Yes, it was. I am sorry. It was.

Mr. Winch: Did I understand you to say it would take ten months to produce the new forms?

Mr. Durdin: Yes. It is a very complex process, Mr. Winch, very complex indeed; it involves design, checking the design—as a matter of fact we have had difficulties with the new design and we have had to start back almost not at point A but start back and redesign the forms.

Mr. Winch: If it takes you ten months to redesign a form, you can understand the problem in the mind of a simple person trying to make out an application for a passport, then.

Mr. Durdin: Well, no. On the other hand, it is in an effort to try and take these problems out of the forms that such care is taken.

The Chairman: Mr. Forrestall, have you finished with your supplementary? You have a supplementary, Mr. Allmand?

Mr. Allmand: Mr. Cadieux referred to the ad which you put out recently. I saw the ad in the Montreal papers on the week-end. Did you say that ad was just put out last week? It was a very good ad, by the way.

Mr. Cadieux: I have a specimen here from the Montreal Star which says May 17, and I have a note that it was published in 105 Canadian newspapers.

• 1555

Mr. Winch: Why was it not put out in January?

Mr. Allmand: That was my next question.

The Chairman: You see, Mr. Winch, the questions will all be asked.

Mr. Cadieux: The reason is that during the first few months the system seemed to be working adequately. It was only, I think, in April that the sudden surge of applications developed and we had difficulty in keeping up with the flow. It was at that point that we realized that people were having difficulty with the form and we felt that there was a need to recommend to the government the issuance of this advertisement.

Mr. Allmand: Will the ad be repeated, Mr. Cadieux? It only appeared in one issue as far as I know.

Mr. Cadieux: Yes, it will. I understand that it will be repeated.

The Chairman: Mr. Legault.

Mr. Legault: Mr. Cadieux, what is the time requested on the form that the application must be in prior to receiving the passport?

Mr. Cadieux: At least one month.

Mr. Legault: At least one month. How many applications do you receive requesting passports within ten days?

Mr. Cadieux: A great many.

Mr. Legault: Does that bring about confusion?

Mr. Cadieux: Oh, yes. It affects the work and the effectiveness of the passport office but they take into account that with the best will in the world sometimes people realize at the last minute that their passports are out of date and they ask for and expect special service.

Mr. Legault: But it is marked on the form that one month is requested.

Mr. Cadieux: Yes, and we invite the co-operation of the public and in most cases people have time to do it; but very often people are under the impression that their passport is still good and it is only at the last minute that they check.

Mr. Legault: But the error is not all on the part of the Department, then, when people ask for passports within ten days. Thank you.

The Chairman: Mr. Allmand, you have another supplementary?

Mr. Allmand: Yes. Mr. Cadieux or Mr. Durdin, is your staff still working overtime to clear up this backlog? If so, what type of overtime?

Mr. Durdin: Mr. Chairman, we are working extended hours in some areas but as soon as the volume of work for a particular section reaches a level where it is obvious that extended hours will not cover the situation we have added a second shift.

Mr. Winch: How late does the second shift work?

Mr. Durdin: It works from 3:30 to 11:30 a.m. There are problems, of course. You cannot in one particular section, our Passport Writers Section—there is difficulty in turning out passport writers so that we can mount a full second shift but with an intensive training program we are gradually adding to the second shift of the Passport Writers Section and I would hope that by the end of this week this section will be in production, but the productivity will not be as great as we would get from the normal shift. However, this would allow us then to operate the first shift for the normal period, which would be 7:30 a.m. to 3:30 p.m. Does that answer your question?

Mr. Allmand: One of the big difficulties seems to be in finding the passport applications. I know that my office has spent sometimes two to three weeks with the office over there in just trying to find somebody's envelope that was sent. Often they have said, "We cannot find it. Please fill in a new application, give us another \$10 and get another birth certificate and you will get it within a couple of days." It would seem that there is difficulty in just filing these things so that they can be found. That would seem to be the major backlog. What are you doing about that?

Mr. Durdin: There are two problems. One is applications in process, and the current backlog, I think, is about 22,000 applications. You appreciate these applications are moving from section to section and we have a box and mark according to box lists that aid the

• 1600

file searchers. We have them colour coded so we can pick out the date that the application started through the production line.

Nevertheless, it is a moving target and if an application runs into a problem it might be necessary to withdraw that application and to take other action with it. This would depend on a number of factors such as the urgency of the application and the planned departure date, if the person has indicated this information, whereupon either the senior examiner or possibly the facilitation section, with which you are most familiar, would then undertake to call the person to try and resolve the problem. If they can resolve the problem that file would go back into the production line.

It is a very difficult thing to try and pull out precisely at a moment's notice an individual application when it is in production. It must be searched for and in the event there is a misfile, which is a human failure, this complicates the situation because then the search must be widened on both sides of where the application should be. Quite frankly in some situations we have had files wind up in areas where they are not supposed to be at all and, of course, could not be found handily.

In really urgent situations, people say: "I am sorry, we must travel." What we have to do then is recreate a new application in order that we can issue a passport on that application. Hopefully we will be able to marry the previous application up with the new application on which the passport is issued before the document actually leaves the office. Does that answer your question?

The Chairman: I have a supplementary from Mr. Forrestall and Mr. Guay. Mr. Forrestall.

Mr. Forrestall: Mr. Chairman, my further supplementary is to enquire whether or not the large amount of backlog that has been created has come about as a result of the renewals that are required? Previously a passport was issued for a period of five years. I understand now it is for a period of one year.

Mr. Durdin: There is no renewal.

Mr. Forrestall: It is a permanent thing?

Mr. Durdin: Yes.

Mr. Forrestall: Why is mine only valid for one year?

Mr. Cadieux: Before it was five years plus five years. Now it is five years, period. In cases where there is uncertainty, to facilitate travel when there is urgency a passport can be issued for one year.

Mr. Forrestall: That is all my...

Mr. Cadieux: That is a limited validity.

Mr. Winch: That was my supplementary. Would Mr. Cadieux or the director...

The Chairman: You are not next, Mr. Winch. Mr. Guay.

Mr. Guay (St. Boniface): I will be very brief. Mr. Cadieux said a moment ago...

The Chairman: Mr. Forrestall has another supplementary.

Mr. Forrestall: I just wanted to ask whether or not we are heading, perhaps even philosophically, away from this type of an application form, this type of passport, and get into something that is a bit more permanent? Surely we cannot as a nation in a world that is getting smaller and smaller continue to cope with the expense involved that we have had. You are smiling, Mr. Durdin, but I am asking you quite seriously whether or not there has been any consideration given to the issuance of permanent passports to those people who require them which are good for the lifetime of the individual involved? If that has been considered and rejected, could you advise me of why it has been rejected?

Mr. Cadieux: Perhaps Mr. Durdin can comment further on this. I think he is closer to the passport operations than I am. There are perhaps two general points that I can make. First, is that as a matter of policy it relates mainly to security and the validity of the document. I think the government has decided that the normal rule will be five years for the passport. Applications will therefore have to be made every five years.

As you quite correctly point out, we are now getting into an area where a great deal more people travel and they travel a good deal faster than they used to. What will happen when a super jet lands at an airport with hundreds of people on it is something that is being considered very actively in the Department.

I am glad to say that Mr. Durdin and his staff have shown a good deal of ingenuity in this area. They have developed another kind of document that would be used for that purpose. I think this is something they have submitted to the government and which they are discussing with authorities in other countries.

• 1605

What would be the validity of this document is something that would remain to be determined. It would have to meet the requirement of faster handling than the passport we now have. I think the kind of problem that you have in mind, the fast travel requirement, is being considered by the passport office.

Whether a special type of document will eventually be issued for people who are in business or who are required to travel more often, I am not sure personally, but I will ask Mr. Durdin to comment on that.

Mr. Durdin: So far I doubt very much whether any of the foreign governments are looking forward to such a solution. I think the interim solution is that of issuing possibly card passports. This would be like a credit card type of document. As a matter of fact, the International Civil Aviation Organization of which Canada is a member has a study group working on this project. However, the problem here is like credit cards which have limited validity. They are not an open-end document. The problem is the loss of documents. And the very problem that caused the government to decide to shelve the renewal feature of the Canadian document would be very real with the card passport.

There is another thing when looking further ahead. It is possible in due course that there might be agreements amongst governments whereby persons who hold valid identity cards might be able to engage in a certain amount of travel. Whether this would be on a bilateral or area basis, I am not sure. However, I am mindful of the fact that neither Canada or the United States issues identity cards. Possibly this would cause further problems for in North America.

The Chairman: Mr. Guay, on a supplementary.

Mr. Guay (St. Boniface): Mr. Chairman, Mr. Cadieux said a moment ago that the advertisements went in when the rush came in April. I think that is using your own words. Have you a priority system in regards to the

application whereby first come is first served? I will add to this so you can comment on it. Could it be that because some members, such as we have noted this afternoon, who are getting thousands of applications might be bogging down the works for those who applied in March, and yet they are getting their passport in a relatively short time.

I am very concerned about that and the reason is that I received a telegram today from a group on a tour. The executive director of the chamber of commerce tells me that one group requesting passports applied in March and they are still waiting, and yet others of the same group who applied later on in April got theirs. Is there a particular reason, or are you using a priority system, and if you are then I presume this would not occur?

I am just hoping that consideration might be given there, and I am making the statement at the same time as asking you the question with regards to priority. Certainly there are cases of people who applied early in ample time for a trip, and then because everyone else, members of Parliament included, rushed to your office and probably bogged the thing down, these poor people who applied back in March may not get their passport in due time to leave for a trip. Would this occur?

• 1610

Mr. Durdin: We do have a priority system, but we can only process a completed application that has been documented properly. In these situations where we encounter this problem, obviously such an application must be withdrawn from its normal position in the production line. We must correspond or telephone or in some way communicate with the people to find out if they can provide us with the additional information. When we receive this it is married with the application and goes back immediately into production. These cases that are withdrawn are actually given priority over applications that have come in recently.

The Chairman: Mr. Winch, I think you had one last supplementary.

Mr. Winch: Yes, I have, Mr. Chairman, and it is an important one because Mr. Durdin knows that my secretary and I have been in touch with his office over the last two months. There is one matter in particular, I would like you to clear up, sir. I have discovered that under certain circumstances, even if the

application is irregular in some way, you will issue a passport which is valid for one year. Would you mind, please, explaining, because it is very important, on what basis will you issue that one-year valid passport if you cannot issue the five-year passport?

Mr. Durdin: As the announcement made on January 22 pointed out in situations where the person could not present evidence of citizenship, the Passport Office was authorized to issue them with a limited validity passport and when they returned from the trip, acquire the necessary documentation, return this documentation to the Passport Office with the one-year passport and we would extend it to full validity—a five-year period. That is the basis upon which we make the determination.

The Chairman: The basis is then, Mr. Durdin, that where you cannot establish citizenship by a citizenship certificate or a naturalization or birth certificate, then you will issue a one-year passport?

Mr. Durdin: Yes, particularly in situations where there is urgent reason for travel.

Mr. Winch: I think it is under the law and not under the regulation, I understand you cannot send a passport overseas, but I understand that if they are only travelling to the United Kingdom and back that if you give them a letter, although they have not got a passport, that that is acceptable. Am I correct on that? Will you please explain it?

Mr. Durdin: No, Mr. Winch, you are not correct. Persons arriving at a foreign port of entry must be able to establish identity and nationality beyond all reasonable doubt. In addition, they must satisfy the foreign immigration authorities that they are bona fide travellers and that they have sufficient funds to pay their overhead during their stay.

It is possible in some situations that a person might hold either an expired passport or a citizenship certificate, or, for example, a British birth certificate and, depending upon where one is travelling to, the latter document would be acceptable. In this case it is up to the immigration officer at the port of entry to make the determination. However, if they are to allow a person in in these circumstances, I am sure that the person is referred either to Canada House or to a British passport office in the case of a person who is actually a dual citizen—has both British and Canadian citizenship.

The Chairman: Mr. Prud'homme on a supplementary.

• 1615

Mr. Prud'homme: Yes, I would like to know what is expected for next year. The regulations have been changed this year, and in the future there will be no renewal of passports for an additional period of five years, so I think we must expect that next year there will probably be hundreds of thousands of passports whose five-year term will have expired, and which will not be automatically renewed. Once you have solved the various responsibilities you face this year, do you plan on setting up a new system for next year to avoid repeating the difficulties you encountered this year?

Mr. Durdin: Mr. Chairman, as you know, we are planning decentralization of passport issuance to three offices initially: Montreal, Toronto and Vancouver. These cities have been chosen because they are international airport departure points. A further office is to be opened within the following 12 months in the Maritimes and offices will be opened elsewhere when there is a proven volume that would support the opening of such offices.

Mr. Prud'homme: Thank you.

Mr. Winch: I understand the offices in Montreal and Toronto will open on January 1.

Mr. Durdin: This is the target date.

Ah hon. Member: Why not one in all provinces?

The Chairman: Can we assume that we have pretty well finished with this passport problem, for this afternoon at any rate? Mr. Roberts.

Mr. Roberts: Mr. Durdin, I have received very prompt and courteous service from your officers and I would like you to pass on for me my appreciation for the grace under pressure which they have exercised in relation to the constituent problems I have presented to them.

Last week I was asking questions about the extent to which the Glassco Commission recommendations had been implemented and I would like to go back to that.

There was a recommendation, Mr. Cadieux, that you be provided with an executive assistant in the Glassco Commission. Has that been done?

Mr. Cadieux: Yes, I have one.

Mr. Roberts: There was also a recommendation that there be two deputy ministers, I believe: one responsible for the administrative services of the Department and one, I believe, who could accurately be called an undersecretary responsible for political affairs, I suppose. That, I assume, has been rejected. Can you tell me why?

Mr. Cadieux: At the moment, there is one deputy undersecretary who deals with political affairs, and there is one assistant undersecretary who deals with administrative matters, and personnel matters essentially.

There is an examination being made at this moment of the Glassco recommendation in the light of the subsequent studies that have been made with a view to determining which is the best arrangement for the Department. So, it is hard to say whether it will be rejected or not because we may end up this way. I do not know whether you want me to expand on this. There are implications and the discussion can...

Mr. Roberts: No, that is fine. We may touch some of that later on in the questions.

Mr. Cadieux: Yes.

Mr. Roberts: Is there any plan to establish a research and planning section in the Department? I ask this, having gone through a policy review—perhaps the Department is still in one—I know that some of the officers who have been involved in this review have necessarily been taken away from their desks, and as the Department is short handed I am sure this has caused some inconvenience. I realize that it is difficult in external affairs or foreign affairs to plan in too detailed a way since one never knows quite what kind of events one is going to face, but it is my own conviction that more could be done usefully in this direction. Has the Department any plans to establish, perhaps a small section, but a group of people whose primary responsibility is to try to think ahead, anticipate problems, and suggest possible departures from or new approaches to policy?

Mr. Cadieux: Yes, as soon as we can afford it. Even when we cannot afford it, we think it is very important and we assign people to it continually. Over the past year there has been a good deal of research done in a number of areas concerned with policy reviews,

and this has involved considerable research and a good deal of time because this has to be done on a five-year basis. In some cases we have had to look further ahead than that.

• 1620

Naturally, you have to define what you mean when you talk about planning because in the very nature of developing budget proposals one is engaged in resources planning. Each year when submissions are made to Treasury, one has to plan ahead five years. Then, in certain divisions of the Department there is necessarily a kind of contingency planning which is related to what happens, for instance, if the Vietnamese operation were to be terminated or expanded. This is the type of planning which is going on.

Mr. Roberts: Would the planning officers be scattered about the various area divisions, or would they be collected in one group of people?

Mr. Cadieux: Whether or not planning must be concentrated in one big unit or scattered and considered part of the operational responsibility has been an argument that has been going on for a long time within the Department. I think that regardless of what happens about the other one, it is a question of resources. We are looking at this part of the reorganization of the Department, and it is quite clear that there is one kind of planning that cannot be left to the division. It is the type of planning which involves a number of divisions of the same kind or that cannot be given to any one particular division, or to a number of divisions. There is a requirement for that. The same thing is true about research.

Mr. Roberts: Could you give me any idea of the number of officers who might be placed in such a planning division?

Mr. Cadieux: We must be guided by the recommendations which will emerge from this study, but at the moment at least two officers are engaged in this. Apart from the other officers who are engaged on the planning side, I think that this is a fairly substantial investment. We have a fair number of officers who, at the moment, are supporting the policy review operations. These belong essentially to planning, but if you add those who are still left on planning, that makes a good deal more than two. If you add to that those who will be added once a decision is made as to the centralized unit, I think that

you already have the elements in existence or of a substantial planning unit in this part.

Mr. Roberts: In other words, the expertise collected in the policy review will not be dissipated, but will be a type of continuing function.

Mr. Cadieux: At the moment you can say that you have a nucleus which is in existence and that you have evidence of the planning unit which has been assigned to the various geographical areas to support the policy review exercise. These will revert to the planning unit which will already be fairly considerable at that time.

Mr. Roberts: The Glassco Commission suggested that heads of missions abroad came back and served as heads of divisions in Ottawa too infrequently. Has this been corrected or...?

Mr. Cadieux: Yes, I think a good many of them are now heads of divisions in Ottawa. I have some figures on this, for instance, I can indicate that the Head of the Arms Control and Disarmament Division is Mr. Bow who used to be in Czechoslovakia; the Chief of Protocol Division is Mr. Berlis who used to be in Poland; the Head of Commonwealth Division is Mr. Cornett who was the Head of Post in Ghana; Mr. Gilmour used to be in the Caribbean as High Commissioner to Trinidad and Tobago and is now Head of Consular Division in Ottawa; the head of the Franco-phone division, Mr. Blanchette was the Acting Commissioner in Cambodia; Mr. Halstead who is the Head of European Division, had the status of a head of post as Minister in Paris; the Head of the Far Eastern Division, Mr. Seaborn, was the head of our Mission, our Commissioner in Saigon. I can give you more...

Mr. Roberts: I am convinced.

Mr. Cadieux: I think the trend now is to staff divisions with people who have been heads of missions.

Mr. Roberts: One of the fairly strong criticisms the Glassco Commission made was, to the effect, that various management practices of the Department prejudiced the activities of the smaller missions.

Mr. Cadieux: I am sorry, I am not sure I understand you.

Mr. Roberts: Perhaps I can quote from page 114 of the Glassco Commission:

The effectiveness of the smaller missions, with limited staffs, appears to be prejudiced as a result of certain management practices of the Department.

It goes on to discuss rotational practices, the problems of leave, the replacement of officers, and transfer of officers in a short-handed department and so on. I wondered if this is a

• 1625

fair criticism, and also if various reforms have been instituted to look at the small mission problem.

Mr. Cadieux: Yes, there are two basic things which have been done. The first thing is to increase the size of the smaller missions. For example, if you have a man and a boy at a mission, and the man is recalled or has to be away...

Mr. Roberts: That is like getting rid of the poor by paying them money.

Mr. Cadieux: In this case, you are really operating on the minimum and we have been trying to increase the staff of some of the smaller missions in order to give them some flexibility. The other thing is to try to decentralize management, and to give more authority to the people on the spot so that they would, in a budgetary field and otherwise, have an opportunity to use their resources as effectively as possible. This is almost a revolution in management. We are now introducing it and I think it will take a few years before people are accustomed to deal with this. They will no longer be required to submit requisitions to Ottawa saying, "I would like to have a few more chairs" or "I would like to have the porch repaired" or "I would like to do this". The idea will be to put money at their disposal for these purposes. This will save a good deal of time and will also be economical as far as personnel is concerned.

Mr. Roberts: I would now like to ask a more general question about the controversy in approach between generalist and specialist officers in the Department. Perhaps I can preface it with a remark. I am often accused, by my colleagues, of making speeches rather than asking questions, but in view of the discussion we have had over passports I feel less embarrassed than usual. The Glassco Commission suggested, fairly strongly, that the practice of having a generalist officer who, upon occasion would be called upon to deal with administrative rather than political

matters, was a detriment to the administrative efficiency of the Department. The other day, in going through a brief presented by the Department of Finance, I was caught by a paragraph which seemed to express to me what I would hope is the Department's view. It says that since the 1930s the successive ministers of finance have followed the practice of transferring detailed operational responsibilities to others in order that the Department could concentrate on a central analytical and policy work which is described in its program objectives. I hope that the Department of External Affairs does the same thing, but it seemed to me that it would be useful for them to consider establishing a separate consular service, so that the cultural attaches could come from the Secretary of State Department rather than the Department of External Affairs, just as immigration and economic officers come from the Department of Manpower and Immigration, the Department of Finance or the Bank of Canada and so on. In this way, many of the functions with which the generalist officers must handle now within the Department—for which they are sometimes not specifically trained and for which there are other departments who are in some ways more closely concerned with them than the Department—could, “shuck off” some of these responsibilities to separate administrative services. Then, the foreign service officers could concentrate on what most of them have come into the Department of External Affairs to do, and that is to concern themselves with foreign politics, and policy advice to the government. Is there any hope that the Department of External Affairs will move in that direction?

Mr. Cadieux: As a matter of fact, it is moving in that direction. As we are expanding, we are setting up a whole classification of foreign service employees, people who are looking at the administrative side. We are also trying to specialize our officers in foreign policy work. There are certain qualifications which must be added, and one of them is that while our people are at headquarters and the larger missions, there are naturally pressures for specialization, however, we must bear in mind that out of our eighty-some posts the majority of them are not large, and consequently, in most cases, our people do not go to a post where it is possible for them to specialize, to a very high degree except in being Foreign Service Officers, so they should be able to handle a combination of political,

information, consular, administrative, or whatever kind of work is necessary to keep the mission going. That is the first thing

• 1630

which we must bear in mind. Since our service produces units which are not very large, the Foreign Service Officer at that place must have a kind of residual competency. If there is an immigration man to do immigration work, the officer is not concerned with it but if there is no immigration man and there is immigration work to be done, although he may think he is a political genius, he must pay some attention to this area. The same is true about aid work. In certain countries there may not be enough aid work for a full-time aid official. So he must turn his hand to that. There are very considerable pressures in the service to turn our officers into generalists. Another point which is very important is that if the government and the country believe in the professional service, it means that the end product is going to be a generalist. The head of post, who will have spent a lifetime in the service must oversee not only Foreign Service Officers but representatives of various departments who will make up the Canadian team in whatever country he will be responsible for. At that point he is Mr. Canada in that country. He is no longer an economist even though he may have graduated as an economist, and even though he may have thought of himself as an economist at various stages of his career. He is no longer a lawyer. He must try and identify what the interests of Canada are that he must pursue over there, discover them, and then make sure that the work is done or do it himself. That is really his job. He is more of a generalist than a specialist.

Mr. Roberts: Is there an attempt to develop a separate administrative service so that foreign service officers will not be burdened with that kind of work?

Mr. Cadieux: We have 190 of these administrators in the Department, and there will be 230 of them in the year 1970-71. That is a substantial number. Gradually administrative work will tend to be assigned to an administrator so that the foreign service officers will be able to devote more and more of their time to the work for which they are qualified and have been recruited.

Mr. Roberts: The Glassco Commission suggested that the Department was making

insufficient use of local staff. Has there been any change in the Department's practices in that regard?

Mr. Cadieux: We have in the Department some reservations about this. As you can imagine, in certain countries, and I do not need to specify which, it is not always possible to use local staff. There is here a whole area where there must be some natural limitations as to what can be done. That is the first thing.

The second thing is that even in friendly countries there are certain types of work where judgment is required as to what is Canadian interest and how it is to be pursued. It is not logical to put local employees in a situation where they might find themselves in a position where there was a conflict of loyalty. So there are real limitations here. But the advantages of resorting to local employees are, first, that usually there is no need to pay the foreign service allowances and therefore they are less expensive, and secondly, they usually represent a very important element of continuity, and a great fund of experience. We have found over the years that the local employees have a very important and very useful role to play, all in their proper place, if we take into account the areas where it is natural for them to operate and taking into account that there are other areas where they cannot really be of assistance.

Mr. Roberts: The Glassco Commission was very critical of the communications and paper work procedures in the Department. It said at one stage that the telecommunications resulted in a veritable flood of messages which adds to paper work and to cost, and threatens to engulf those whose duty it is to read and digest them. It went on later to say that the Department was being frustrated in its operating procedures by inadequate filing methods and a generally poor organization of files and the flow of telegrams and working memoranda. From my own admittedly distant experience in the Department, I would sympathize very strongly with the kind of situation which was described in the Glassco Commission, for the period which it described. Has there been any attempt to bring this problem under control, and with what success?

Mr. Cadieux: As for filing, I think that we

• 1635

are trying to improve our methods for storing and retrieving information, and here we are gradually getting into methods of electronic storing and retrieval.

The other thing is the control. There is a human element here that is very difficult to pinpoint and to keep within bounds. What I have to explain is that the Department of External Affairs is a department that is scattered, and it keeps in touch with the branches really through written documents, telegrams, dispatches and letters. In a way it can be very dangerous to be too restrictive, because you may achieve results that would be stifling in terms of the communication which you want to promote between headquarters and missions.

On the other hand, if you are too permissive you may indeed get into a situation where people fire off telegrams that are too long, and that are not necessary. Here we have been trying various devices to achieve better control. We send circulars around. We have some people who sift these telegrams and when they see something that appears to be too long, or might have been sent through a different media, notices are sent that this should not have been done this way. But it is a perpetual battle because we are dealing with persons, and how to induce self-restraint in the individual who is at the end of the line, or in heads of divisions or desk officers here, is something that is, as I say, of the essence of our work, and difficult to regulate.

Mr. Roberts: At one time there was suspicion, no doubt entirely unjustifiable, that heads of mission would always send telegrams rather than write letters because they believed that telegrams would actually be read by cabinet ministers and by the Under Secretary. But I assume that you find some of them now write memoranda and letters instead of sending telegrams.

Mr. Cadieux: There was a time when it was possible to keep in touch with most of the telegrams that came in, and I think that certainly my predecessor, the very distinguished, late Norman A. Robertson, made a gallant effort to keep up with the flow. I did my best and I remember there was a time when I came to work every Saturday. I came even every Sunday. I had my work analysed by experts and I discovered that I was spending an undue amount of time reading messages.

In many cases these messages are not connected; they are not presented in an orderly fashion. You read the report from Paris, the next one may come from Cairo, and another one may come from Poland. So that in order to get the raw material, you are processing information yourself in a way that is not orderly and may not be scientific.

After an examination of the problem, we reached the conclusion that it would be more economical for senior officers to have junior officers who would screen the material for them. And what we have tried to do is put the responsibility on the operational unit. If they get a telegram from a mission that appears both urgent and important, then their job is to make certain that the Minister and those who advise him get it in proper time with the right comments. This is a more sensible way; you are not cluttered all the time.

However, there is a difficulty about this system. Previously the Under Secretary was aware of which mission was producing a constant flow of good reports, which mission seemed to have officers who had style, and who seemed to have flare in always being on top of the news. Now he receives occasional telegrams with comments and he receives them only when some decision is needed. He gets the impression that it is more difficult for him to say: "This mission seems to be healthy and clicking and the officers there are really producing a constant flow of good reports". This is what he misses. This is the price, he pays.

Mr. Roberts: One last question, Mr. Chairman. The Glassco Commission suggested that in posts where there are representatives from several government departments, that there was a serious lack of co-ordination between the various Canadian departments and agencies. And it was felt, I think, that the ambassadors had not been sufficiently strengthened to play a real co-ordinating role among all the Canadian representatives who were in the capital cities. There was direct communication, for example, between the immigration officer and the Department of Immigration, and the ambassador was often not sufficiently strong or strengthened in dealing with the various subordinates who

commissioner in a position where he has the unquestioned over-all responsibility and co-ordination in his hands?

Mr. Cadieux: There are really two answers to this. One is the degree of interdepartmental co-ordination that there is here in Ottawa. As you know, there is a constant effort here to improve the machinery, but this is a constantly changing pattern. The machinery which was good three or four years ago may be obsolete now, and you have to create new patterns and set up new instruments all the time. This is translated in the field sometimes in a belated fashion. The missions are not always up to date with the machinery which has been created in Ottawa.

Very largely also, there is a problem of personality. Heads of missions are like captains of ships or heads of military units. Some exercise authority more naturally, more directly, more effectively, than others, and this is something that is sometimes difficult to regulate. Where a comparatively young head of mission is appointed over older specialists from other departments and here a situation may exist where authority is not always asserted too easily or too quickly. Again, a situation may arise where a head of mission arrives to deal with officers who have been there for a long time, and whose experience sometimes gives them a feeling that they are entitled to help determine the proceedings. To what extent they may be allowed to do this is, of course, something which must be resolved over a period of time. In such a situation problems of personality develop, the nature of which I am not sure that the Glassco Commission has fully investigated.

I think that, normally, a head of mission who does his work effectively gradually emerges, because as the leader of the team, he has the instruments, the facilities, and the support of governmental machinery here. As any leader of any team, if he has the moral authority, the intellectual strength, and the natural vigour to utilise the resources at his disposal, he will assert himself. If not, I am not sure that regulations will achieve the result. This is the second element.

Mr. Roberts: Thank you, Mr. Chairman, I have no further questions.

The Chairman: Mr. Winch.

Mr. Winch: Mr. Chairman, may I just ask a very brief but, I think, intriguing question of Mr. Cadieux? I am not going to repeat any-

were technically under his responsibility. Has anything been done to improve co-ordination of the various departmental representatives abroad and to place the ambassador or high

thing that I have asked before or that has been said before.

Mr. Cadieux, the Passport Office comes under the Secretary of State for External Affairs. I believe that the Citizenship Office comes under the Secretary of State. That is correct, is it not?

Mr. Cadieux: Yes.

Mr. Winch: This is my intriguing question. On applying for Canadian citizenship the applicant is required to send in two photographs of a certain size. Having received these, application is then made to the Passport Office and two photographs of a certain size must be submitted therewith. In size there is a quarter of an inch difference one way and three-eighths of an inch the other between these two sets of photographs. Is it not possible for an understanding to be reached between your two departments that the photographs should be of the same size? Firstly, it would be less confusing, and secondly, it is cheaper to purchase four photographs of the same size than two of two different sizes, when these are so close together. This is a small, but intriguing point.

Mr. Cadieux: Yes.

Mr. Winch: Why should there be a difference in the size of photographs of a quarter of an inch one way and three-eighths the other between the Citizenship Regulation Branch and Passport Division requirements? Why can you not have a standard photograph size?

Mr. Cadieux: Would you be able to comment on this?

Mr. Durdin: In the first instance, the Citizenship document is, in effect, a miniature certificate.

Mr. Winch: Right.

Mr. Durdin: Secondly, because it is a miniature certificate, there must be a photograph which will fit in the confined space.

Mr. Winch: Right.

Mr. Durdin: In the case of the passport itself, the size of the photograph and the other characteristics of the book-type passport is virtually governed by international convention.

Mr. Winch: Why can you not combine them?

Mr. Durdin: You suggest, as was asked earlier, that they be combined. I would think that this problem will resolve itself if, in fact, we evolve, internationally, an acceptable card passport, where documents are of the same

• 1645

size and the space is relatively small. The photographs, then, will be, in fact, the same size.

Mr. Winch: I am sorry, sir. But what does this international concern have to do with our Canadian citizenship? Why can we not have on our Canadian citizenship the same photograph size requirement that you specify on passports? There is only a slight difference in specification, and yet applicants must obtain two different sized photographs.

Mr. Durdin: As I suggested earlier, the Citizenship Registration Bureau document is smaller than ours because it must fit into the wallet. It is the CR-100 size credit document and, because of the confines of space, they cannot accommodate a photograph larger than they do at the present time.

Mr. Winch: Put smaller printing, trim off three-eighths of an inch, and they could.

Mr. Durdin: All right.

Mr. Winch: The matter has always intrigued me as to why the difference exists.

The Vice-Chairman: Mr. Guay, did you want to ask a question?

Mr. Guay (St. Boniface): I was just going to point out to Mr. Winch that instead of suggesting that the passport being made smaller, the other one be made smaller.

Mr. Winch: That is international.

Mr. Guay (St. Boniface): I see.

Mr. Winch: Our Canadian citizenship is our own control, while the other is international.

Mr. Guay (St. Boniface): I see.

The Vice-Chairman: Could I have order, please. Mr. Fairweather is not present and that completes my list of questioners.

Mr. Winch: Let us have the motions then. We have a quorum.

The Vice-Chairman: I would like, perhaps, to ask a question of Mr. Cadieux. As you

know, in January, I visited several of our chancelleries in Africa and in the Far East.

Mr. Goyer: Do you think that I could ask another question, a supplementary?

The Vice-Chairman: Yes, Mr. Goyer, on a supplementary on the passport situation.

Mr. Goyer: Did you ever discuss this matter with officers of the Department of the Secretary of State?

Mr. Cadieux: Yes.

Mr. Goyer: Can you foresee any acceptable solution?—because it is really a problem. When one has to apply to obtain a passport and another certificate is required, the applicant has to go to two photographers, or have two sets of photographs. This worries many people.

Mr. Durdin: Well, it is a very good point. We have discussed this with the Secretary of State and, obviously, it would be helpful if this problem could be resolved. I am afraid, however, this is as far as I can go at the moment.

The Vice-Chairman: Mr. Durdin, nothing can be done internationally, I suppose, with respect to the passport situation, but could not something be done with respect to the citizenship certificate, to standardize it with the international passport situation?

Mr. Durdin: Yes.

Mr. Winch: That was my point.

Mr. Cadieux: We can certainly undertake to raise the matter with the Department of the Secretary of State and see what can be done. I can see the logic of the point, indeed.

The Vice-Chairman: It is a point well worth looking into, Mr. Winch.

As you know, Mr. Cadieux, I recently visited a number of our chancelleries, in the Far East and in Africa, and in discussions with our foreign officers I had no complaints that I can recall from them about their salaries or situations. Some of the clerks and secretaries, however, did seem to be rather unhappy about their pay and allowances. Is it typical of all our missions abroad that Canadian clerks and secretaries are unhappy about the provisions made for them?

Mr. Cadieux: I was not aware that there was a general problem of unhappiness, but I suspect that, in some cases, the allowances in

particular countries may not work satisfactorily. This is something which we have to look into. As you will recall, at the last meeting, Mr. Wilson indicated that the whole problem of allowances was under review. I would hope that the new system will be an improvement upon the present one, and that the general system will result in giving clerks and stenographers greater satisfaction.

The Vice-Chairman: The review will be at all levels?

Mr. Cadieux: It will affect everybody. But it is a fact that if you have quick inflation in one country, until the rates have been settled, you may have a situation where, temporarily, the situation is difficult. This is one problem.

• 1650

The Vice-Chairman: I think it is the fact that probably, they need to live in a higher standard of accommodation abroad than they would be living in at home to obtain good water, clean lodgings, and the like. The main objection was just this—it does take more money to live on a higher scale.

Mr. Cadieux: We do not of course, control the salaries, because these are determined by collective bargaining. But the allowances...

The Vice-Chairman: It is the allowances, I think.

Mr. Cadieux: That, I think, is the flexible factor. As I say, it is under general review, and I hope that there will be some improvement there.

The Vice-Chairman: Thank you. There is no quorum right at the moment but, if we could have a little break agreed to, we might have it in about 10 minutes.

Mr. Winch: Are we short?

Mr. Roberts: How many do we need?

The Vice-Chairman: We need 16. Could we try to contact some members and bring them in?

Mr. Roberts: I would support that.

The Vice-Chairman: The movement is in process now, so could we have, perhaps, a five or ten minute break and then resume? If there is no quorum we can adjourn.

Mr. Forrestall: Some of the members, Mr. Chairman, are listening to the other debate in the House.

The Vice Chairman: Thank you, Mr. Forrester. I would take it that, perhaps, Mr. Cadieux would stay with us, but we could release the rest of the officials. We shall adjourn until five o'clock.

(Recess)

• 1655

The Chairman: Gentlemen, we have called the various items. The first item we passed was Item 40, relating to the International Joint Commission. The other items relate to the more general estimates of the Department of External Affairs, and they have been called.

Items 10 and 15 agreed to.

Then we revert to Item 1.

Mr. Legault: I do not believe that Item 40 was carried.

The Chairman: Yes, it carried a little earlier at this meeting, Mr. Legault.

Item 1 agreed to.

Shall I report these and the CIDA items to the House?

Some hon. Members: Agreed.

The Chairman: Thank you very much, gentlemen. I would also like to thank you, Mr. Cadieux, and your officials, for your very helpful answers to our questions.

Mr. Winch: Could I have some information, Sir, on the following meetings to be announced?

The Chairman: The next meeting will be a meeting with Dr. Lindsey of the Department of National Defence on the ABM defence. Our regular Thursday morning meeting was cancelled, so we are holding that meeting tomorrow afternoon at 3.30 p.m. I would anticipate that there will be a number of questions and probably we will not finish on Wednesday afternoon, so we have made arrangements to continue on Thursday afternoon.

Mr. Roberts: Mr. Chairman, I wonder (no mike on) on the advisability of having a meeting in camera. Once or twice during committee meetings with General Sharp, I raised the possibility that we might like to have a meeting in camera which would enable us to obtain some information which is not public information and would otherwise be denied to us. I would hope that we would

do that—subject, of course, to the views of the other members of the Committee on its desirability.

Mr. Winch: Mr. Chairman, I appreciate what the honourable member has to say, but this is a Committee of 30 members. I do not believe that it is possible to have a strictly in camera meeting with so many. Secondly, because of the importance of our work and our investigations, I believe that everything should be in public. If it cannot be made in public at a general meeting of this Committee, then we should be given very good reasons why it cannot.

• 1700

The Chairman: If you would give me the questions to which you have been unable to obtain the answers because the meeting has not been a closed meeting, Mr. Roberts, perhaps we could take a look at them, and I would be glad to take the matter up with the steering committee.

Mr. Winch: Can I also add, sir—and I speak from considerable experience—that any time a Committee of such importance as this meets in camera there is always, in public, some suspicion—and I do not want that—as to just why and what is being told to a Committee that the people of Canada are not entitled to know. I would prefer—much as I would like to get some information upon occasion—neither finger nor suspicion to be pointed at Committees that the people of Canada are not being told what we, as members, are.

The Chairman: Thank you very much, Mr. Winch. While we have the members together, perhaps I could get an expression of opinion as to the desirability, before we present our report on NORAD, of arranging to go to North Bay. This could be done very quickly. Everyone is very busy now, so I would think that members of the Committee probably would not want to take a longer tour at this time down to the U.S. or to the headquarters at Colorado Springs. The question arises, however, as to whether or not the Committee should plan on going to North Bay. This we could do, I gather, very easily in one day, and see much the same thing at North Bay as we would see at Colorado Springs. What is the wish of the Committee? I am sure that we could arrange a North Bay trip without too much trouble at an appropriate time, but even then the Defence Department likes to have about two weeks' notice. If we were to

go to Colorado Springs, it might be rather more involved.

Mr. Prud'homme: To promote this, though, would certainly be worthwhile.

The Chairman: It just occurred to me—I do not know what is there, I have not seen it myself—that before coming up with a report, perhaps we should see the physical installation.

Mr. Winch: Sir, I have had the privilege of going to both Colorado Springs and North Bay, and there are other members here who have done so as well. It is my personal opinion that, although it is most interesting to see Colorado Springs, when it comes to an installation and its purpose, you can learn just as much from North Bay as you can by going to Colorado Springs.

Mr. Legault: Perhaps this could be left with the steering committee to set a date and discuss the possibility of our going.

The Chairman: Is it the wish of the Committee to leave it with the steering committee to make that decision? Is there anything else that any member wishes to bring up at the present time? Mr. Brewin, and then Mr. Forrestall.

Mr. Forrestall: I agree with the decision about not necessarily going all the way to Colorado Springs, when we can learn as much from expertise here in a quick trip up to North Bay, but I would add to that the reservation that the same does not necessarily hold true for any review of Maritime Command structure as it relates to SACLANT headquarters in Virginia.

The Chairman: With regard to Maritime Command, perhaps I should bring the members up to date as to where we stand. It is my understanding that the Department of National Defence will have available for us, by the end of this month, a working paper on Maritime Command. Now, you will recall that it was suggested that we might establish a subcommittee to start work on that working paper, and that they would proceed at the same time as our Committee continued its investigation of NORAD—at the same time that we are working on our NORAD report. Members might be giving some consideration to whether or not they wish to be part of that subcommittee which will be considering Maritime Command.

Mr. Winch: While that is being considered by the subcommittee, sir, if it is necessary to go to Maritime Command, I would add—because I have past experience here also—that for full information the subcommittee would have to go, I believe to the North Pole, which is the control centre for Maritime Command.

Mr. Forrestall: That was the point which I was making.

Mr. Winch: The North Pole is the command centre.

The Chairman: Do members have any suggestions as to the size of the subcommittee to do the preliminary work on Maritime Command? Are we talking about a subcommittee of, say, nine or ten? We have a total Committee of 30.

• 1705

Mr. Winch: Not any larger than that anyway.

Mr. Forrestall: I think the important principle, Mr. Chairman, is that it embraces the points of view of the Committee as such. It is not proper, I suppose, to identify ourselves politically but I think that has to be accommodated.

Mr. Winch: As long as the majority of the members do not come from the Maritime Command constituencies.

The Chairman: I feel that the party representations should be rather similar to the party representation on the Committee. Perhaps the personnel of the subcommittee to do the preliminary work on Maritime Command could be left to the party representatives on the steering committee.

Mr. Forrestall: I think what you could do, Mr. Chairman, if you are looking for a procedural vehicle, is simply to call publicly upon the various parties to suggest to you their representatives on this Committee—having regard to an upper limit—then deal with the nominations in steering committee and report back to a meeting, probably in a week or ten days' time. All I am trying to suggest is that, from our own point of view, we are ready now to recommend the appointee or appointees from our own particular party.

The Chairman: We will put that under way and take that up at the next meeting of the steering subcommittee.

Tomorrow afternoon, Wednesday, then, and Thursday afternoon we will be hearing Dr. George Lindsey on the ABM system. On May 27—that is next Tuesday at 11 a.m.—Mr. Gellner will be here to present his critique of the original working paper, our basic working paper which was presented by the Department of National Defence on NORAD. That will be next Tuesday at 11 a.m.

Mr. Brewin: Mr. Chairman, what about other witnesses? Are you planning to have any other ones on NORAD?

The Chairman: Only if required. Mr. Michael Sherman will be presenting the critique on Dr. Lindsey's paper.

Mr. Brewin: On this ABM team we should have, I think, a critical scientific statement—not just supporters of the system. I raised

that point before and I raise it again. I urge the steering committee to find someone qualified to do this, and there are plenty of suitable candidates for the post. I also asked whether or not we are making any progress in getting the report of the commission for Senator Kennedy in the States on this matter.

The Chairman: I wrote a letter to Senator Kennedy asking to have his report made available to our Committee. I believe that steps have also been taken to obtain the Senate Committee reports. They have not yet been received, but steps to secure them were taken Mr. Brewin, on the same day as you raised the matter in Committee. If there seems to be any unusual delay, we will try to expedite them.

If there is nothing else then, perhaps this meeting will adjourn.

APPENDIX BBB

Questions asked by
Mr. John Roberts (York-Simcoe)

1. How many officers have been recruited over the last five years
- a) with more than one degree; and
 - b) above the FSO-1 level.

2. How many lateral transfers have there been above the FSO-1 level
- a) from other government departments; and
 - b) to other government departments.

ANSWER: (See attached statement)

STATISTICS ON RECRUITMENT OF FSO'S
CALENDAR YEARS 1965-69

Year	Total Recruited	With more than one degree	Recruited above FSO-1 Level	Transfers from other Depts above FSO-1 Level	Transfers to other Depts above FSO-1 Level
1969 (to date)	38	32	2	2	1
1968	23	20	1	1	4
1967	65	46	14*	3	4
1966	55	28	11*	1	0
1965	31	15	4	2	2

*Recruited by Special Competition.

Question asked by Mr. John Roberts
(York Simcoe)

Training in Foreign Languages

General Training

Exclusive of the arrangement for the study of French and English, the Department may pay tuition fees up to \$600 per annum for the study of foreign languages when it considers that it is in the interest of the government for an employee to have a knowledge of the language of an area in which he will represent Canada. Training also has been provided for wives of officers where wives assist their husbands in representational or promotional duties. At present, the statistics are as follows:

- Number of languages being studied 26;
- Number of employees receiving language training 83;
- Number of officers' wives receiving language training 25.

Special Training in Difficult Languages

In addition to the above general training in foreign languages, more intensive training in difficult languages is provided. During 1968-69, the following courses were provided:

- 2 officers studying Chinese (full-time) in Hong Kong on a three-year program
- 1 officer studying Japanese (full-time) in Tokyo on a two-year program
- 1 officer studying Japanese (part-time) in Ottawa
- 1 officer studying Czech (full-time) in Ottawa
- 1 officer studying Polish (full-time) in Ottawa
- 1 officer studying Serbo-Croat (full-time) in Ottawa
- 1 officer studying Arabic (full-time) in Lebanon
- 2 officers studying German (part-time) in Germany
- 2 officers studying Russia (full-time) in Ottawa

Substantially the same number of officers will continue the study of difficult languages during 1969-70.

Question asked by
Mr. Harold E. Winch
(Vancouver East)

Has there been any reduction in Canadian Forces Attachés during the past 5 years?

Answer:

In 1964 there were 17 Canadian Forces Attachés (CFSs) at diplomatic missions abroad. Since in several instances Attachés are accredited to more than one country (in

addition to the country in which he is resident), these 17 Attachés were accredited to 24 countries. In addition, there were 3 Assistant Canadian Forces Attachés.

In 1969, there are 19 CFAs accredited to 28 countries, and 3 Assistant CFAs.

Thus, there has been an increase over the past 5 years of two CFAs, and the total number of countries covered has increased by four.

Clerk of the Committee.

REPORT TO THE HOUSE

THURSDAY, May 22, 1969

The Standing Committee on External Affairs and National Defence has the honour to present its

SEVENTH REPORT

Pursuant to its Order of Reference of February 20, 1969, your Committee has considered the following items listed in the Estimates 1969-70:

Votes 1, 10 and 15 relating to the Department of External Affairs;

Votes 30, 35 and L35 relating to the Canadian International Development Agency;

Vote 40 relating to the International Joint Commission.

Your Committee commends them to the House.

A copy of the relevant Minutes of Proceedings and Evidence (*Issues Nos. 38, 39, 44, 45*) is tabled.

Respectfully submitted,

IAN WAHN,
Chairman.

MINUTES OF PROCEEDINGS

[Text]

WEDNESDAY, May 21, 1969
(72)

The Standing Committee on External Affairs and National Defence met at 3:40 p.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Brewin, Forrestall, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, Nowlan, Penner, Prud'homme, Roberts, Ryan, Thompson (*Red Deer*), Winch (17).

Also present: Mr. Buchanan, M.P.

Witness: Dr. G. R. Lindsey, Chief, Defence Research Analysis Establishment.

The Vice-Chairman introduced Dr. Lindsey who made a short opening statement and delivered a formal presentation on the subject of ballistic missile defence.

The Committee agreed to incorporate the slides used by Dr. Lindsey in his presentation as part of the Evidence of this afternoon's sitting.

The Committee also agreed to print Dr. Lindsey's advance presentation to the Committee, entitled *Part III: The Implications For Canada Of Ballistic Missile Defence*, as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix CCC*)

Members questioned Dr. Lindsey for the remainder of the sitting.

At 6:00 p.m., with the questioning continuing, the Committee adjourned until Thursday, May 22, 1969, at 9:30 a.m.

THURSDAY, May 22, 1969
(73)

The Standing Committee on External Affairs and National Defence met at 9:45 a.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Fairweather, Guay (*St-Boniface*), Laniel, Legault, Marceau, Nesbitt, Nowlan, Roberts, Ryan, Thompson (*Red Deer*), Wahn (11).

Also present: Mr. Buchanan, M.P.

Witness: Dr. G. R. Lindsey, Chief, Defence Research Analysis Establishment.

Members of the Committee completed their questioning of Dr. Lindsey during this morning's sitting.

The Chairman took the Chair at approximately 10:25 a.m.

At the end of the questioning, the Chairman thanked Dr. Lindsey for his testimony.

The Committee adjourned at 10:40 a.m., to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Wednesday, May 21, 1969.

• 1545

The Vice-Chairman: Gentlemen, I think we have enough present now to commence. Dr. Lindsey is here again today to continue his testimony with respect to strategic weapon systems. Part III of his written statement entitled "The Implications for Canada of Ballistic Missile Defence" has already been distributed to members of the Committee for advance reading. The written statement has specifically dealt with the following topics: The Significance of Canadian Geography for Ballistic Missile Defence of the U.S.A.; Risks to Life and Property from Anti-ballistic Missiles; Risks to Life and Property from Intercontinental Ballistic Missiles; Potential Protection for Canadian Targets; ABMs and NORAD.

I would like to mention that the Clerk has informed me that a room will be available to hold a further session to question Dr. Lindsey tomorrow at 9.30 a.m. should the Committee think this is necessary. The room would be 307, West Block.

Dr. Lindsey would you like to make an introductory statement before the questioning begins.

Dr. G. R. Lindsey (Chief, Defence Research Analysis Establishment, Department of National Defence): Yes, sir, I would.

At a meeting last week, we discussed possible future developments in the defence of North America against attack by bombers with special reference to the significance of Canadian geography. But before turning our attention to the particular problem of the air defence of North America, we set the background by examining the general problems of strategic weapon systems, stability and the prevention of nuclear war between the two super powers, the United States and the Soviet Union.

This general strategic background is just as applicable to the particular subject of today's discussion, the implications for Canada of ballistic missile defence. It will be evident to anyone who keeps in touch with activities in the United States, that a very large section of the scientific and of the political community in that country are extremely concerned over the implications of one system of ballistic missile defence, the one called "Safeguard", for the United States and for the whole world.

One of the hottest debates in years is raging, with impressive lists of eminent men on both sides of the question, "Should Safeguard be deployed?" The reason that this is such a far reaching debate, with so many knowledgeable and high-principled men on each side, it that is is a problem of truly enormous complexity. It has important aspects that are technical, political (and this includes both domestic and international), military, economic, legal and moral. It must be judged in relation to other strategic weapon systems, both defensive and offensive. It involves large and vital international issues, such as control of the arms race, the comprehensive test ban, and the non-proliferation treaty as well as the basic question of the stability of the strategic balance.

I hope that some of these wider issues will be treated by later witnesses whom you may invite here. What has been prepared for you in Part III of the written material already distributed, and in the illustrated verbal presentation which I am about to deliver, is confined to the strategic and technical aspects of ballistic missile defence. Most of the discussion is based on the Safeguard system, but it is probable that many of the facts applicable to Safeguard would have some relevance to other ABM systems which might be proposed in the future.

In the studies which we have done in the Defence Research Analysis Establishment, conducted in part by Mr. J. F. Ruddell who is sitting here, we have made no attempt to judge whether ABM should or should not be deployed. We have assumed, for the purposes of our analysis, that it will be deployed in the United States according to their present plan. What we have tried to do is to deduce what the implications of such a deployed system would be for Canada.

We will start by having a very brief summary of the history of ballistic missiles, and some of this was covered in Part I of the material that was distributed a week ago. If we consider the first period 1958-62 more or less, the main characteristics which stand out is that there were not very many ballistic missiles in existence then, and they were not very good ones. They were exposed, they were vulnerable, and it took many hours to prepare one to fire. Under those circum-

Figure 1

BMEWS

Alaska
Greenland
England

stances, there was a real possibility that if one side made a surprise counter-force first strike that he could catch almost all of his opponent's missiles and bombers on the ground, and could disarm his opponent and, in effect, win.

In that period about the only type of defence that was possible was early warning, on which a great deal of effort was expended, and also the putting of a certain fraction of the bomber aircraft into the air, where they would not be destroyed if there were an attack on their home base.

The anti-ballistic missile defence systems that we know about today were very much in the early research stage. It was highly questionable whether it was technically possible to intercept a missile with a missile. That was the period that was described as "the delicate balance of terror".

A few years after that, both the super powers had taken steps to change the situation. In a period of about five years they had reached quite a different state. By then both the United States and the Soviets had built large numbers of ballistic missiles and they were much more effective ones. They were virtually invulnerable, either because they were deep in hardened silos under ground, or because they were in submarines where they could not be found. They were also more reliable and they were much more accurate. Under those circumstances, it was practically certain that if one side tried to catch the other by surprise, and disarm him with a counter-force first strike, he would not be able to do it. The maximum number of missiles they could destroy would be insufficient to prevent a dreadful devastating retaliation on their cities.

• 1550

So now we had the state where assured destruction was possessed, and that nobody could win in a nuclear exchange. That was the situation which I described last time as mutual stable deterrence.

Under those circumstances, threats to use missiles became less credible because it seemed that everybody would lose if they were used, and that was when we began to see pressure on the part of NATO, for example, to build a flexible response so that they could use other measures than the ultimate.

During that time, ABM research was making considerable technical progress, and the scientists working on it discovered, in effect, that you did not have to hit a bullet with a bullet. They discovered that by having the right sort of nuclear warhead, you did not have to actually hit your bullet. You could come within a certain fairly large miss-distance and still knock the bullet

down. A better way to put it would be that you would render the warhead inoperable. By about 1967, ABM research had demonstrated that a lot of things which people had thought to be impossible could be done.

So much, then, for the history. We will now talk about warning. There are four general methods by which the approach of a ballistic missile can be detected by the people living near the intended impact point. In Fig. 1 and the following three diagrams we will show the curve of the earth, a launch point and an intended impact point I. This is the trajectory of the missile, and we will show the first part representing the launch phase when the huge booster rockets are speeding the missile up to the point where it has enough velocity to go a quarter of the way around the earth. So at the beginning there are large rockets boosting it up to higher speeds and radiating a lot of energy. Now, one of the systems BMEWS, the ballistic missile early warning system, has been in service for several years, and it consists of a big radar with a transmitter and a receiver which sends radar energy up above the horizon into a big lobe. When the missile enters the lobe the radar detects it. But you can see that the detection occurs at about half way along this trajectory, and if that represents about a 35-minute flight then you are going to get perhaps 15 or 20 minutes warning out of this type of equipment. There are stations of this type in Alaska, Greenland and England today.

The next type of detection is one that we discussed last time in connection with aircraft, but it also has application to missiles, and is called over-the-horizon back-scatter radar. You remember that above the surface of the earth there is a layer of ionized gas, the ionosphere, which reflects radio waves of the proper frequency. See Figure 2. If a transmitter and receiver are placed here, it is possible to reflect signals off the ionosphere and get them down to a point on the earth well beyond the horizon. This disturbance caused by the great rocket exhaust ionizes the air and produces enough electrical charge to reflect radio energy. Energy is reflected off this trail, and follows the same path back. The people at this radar know that a missile has been launched. That is called back-scatter because you are using energy which is scattered back to you from the target. The target is actually the ionized gas around the trail of the missile. On Figure 3 we show over-the-horizon forward scatter, and here our transmitter and receiver are far apart, many thousands of miles perhaps, and the transmitted energy is reflected off the ionosphere, the earth, the ionosphere, the earth, the ionosphere and comes down here. It might seem that this would not work,

Figure 2

OTII BACK SCATTER

Figure 3

Figure 4

ICBM DETECTION BY SATELLITE

but that is the exact principle which is used in shortwave radio transmission. With a small radio set you can pick up Australia under the right conditions—and that signal is bounced between the ionosphere and the earth several times. Well, this rocket trail which has ionized the air disturbs the ionosphere quite considerably so it is as if the mirror which was used to reflect the signal between transmitter and receiver had been broken. So, if we had a steady signal going from here to here, and then all of a sudden it is disturbed, it is a sign that somewhere at one of these bounce points the mirror has been shattered. This gives you an indication that something has passed through the ionosphere and it would tell you that a missile was being launched.

Mind you, it could be a test, or the launching of a space vehicle—it does not necessarily have to be a warlike missile—but it does tell you that a big rocket has been launched.

The fourth type of detection depends on an earth satellite. Here on Figure 4 we have shown half the earth with the launch point, the impact point, the missile trajectory, and the period at the beginning when much energy is being radiated by the rocket. Now, this is sufficient so that a very sensitive detector can pick it up even many thousands of miles away, and if the satellite is put into one of these hovering positions about 22,000 miles above the earth so that it remains fixed above a point on the equator, it is still possible for this sensitive detector to tell approximately where a rocket has been launched on the surface of the earth. That message can be transmitted by radio back to a friendly receiving station in home territory, so that that is a fourth type of detection. This one satellite would be able to cover nearly half the earth for this sort of thing.

So there are four effective means of giving the warning that missiles are coming. The last three give you much more warning because they tell you at the launch time, which might be 30 or 35 minutes before impact, whereas the BMEWS picked it up 15 or 20 minutes before.

Well, so much then for Early Warning. Let us talk about the threat which is expected to face the West on account of the building of missiles, and the type of missiles that are being prepared in the Soviet Union. This pair of charts on Figure 5 was shown by Mr. Laird, the Secretary of Defence in Washington, a few weeks ago and it represented a release of information that had not been public before. He indicated on a time scale from 1965 to 1975 the number of land-launched missiles ICBMs which were and could be available. The Americans had built their stock up to about 1,000 a couple of years ago and their plans are to keep that number steady. The total Soviet number

of ICBMs two or three years ago was only a few hundred, but a couple of years ago the rate of building increased and the total is now supposed to have passed the American total. Of course, one cannot tell what will happen in the future, but if you project the recent rate of building it would be considerably in excess of the Americans in a few years. Another feature which was released at the same time by Mr. Laird was that a certain fraction of these missiles are very large. They are the SS-9, and the payload is such that if it were used to propel one large nuclear warhead, it could have something between 20 and 25 megatons of energy in the one warhead. The rate of building of the SS-9, if continued for some years, would give the Russians several hundred quite soon.

As far as submarine-launched missiles are concerned, the Americans built to 656—I think they reached that last year—and the plan is to keep it at that level. The Soviet submarine-launched missiles are still down below a hundred but since then they have started to build up. This year, they are only a small fraction of the American total and the rate of building is difficult to forecast, but if it is continued they will pass the American total somewhere between 1972 and maybe 1977, but no one can tell what the actual rate will be.

Those were two of the graphs which were used to explain why the Americans felt they had to defend themselves against this increasing threat. These graphs only show us numbers, but do not forget that this SS-9 has a very large payload. With a large payload it is not only possible to simply deliver a large explosion in a single warhead, but also that payload can be used instead to produce more propulsion, to deliver the missile on other than a straight ordinary ballistic trajectory.

Now if that is the impact point on the left of Figure 6, and this is the surface of the earth, the ordinary so-called "minimum energy trajectory" as shown here is the one which gets you whatever range you must achieve with the least possible expenditure of fuel. As a matter of fact, to reach a distance of 6,000 miles—I think that is the one we used—the missile must be boosted up to 24,570 feet per second. Now, by using a bit more fuel, which means using a bit less payload to be delivered at the other end, it is possible to use a lower and faster trajectory. By putting the velocity up to 24,900 feet per second, it is possible to come in on this rather depressed trajectory which is a little faster and quite a lot lower. That might make quite a difference to radar detection. If the radar is located near the impact point looking along the horizon, and its power is such that it can detect a warhead at this range, then it would have picked up the ordinary missile at this point. However, the de-

Figure 5

Figure 6

VEL. (F.P.S.)

MINIMUM ENERGY TRAJECTORY	24,570
DEPRESSED TRAJECTORY	24,900
100 MILE CIRCULAR ORBIT	25,600

pressed one will sneak in under the beam and will not be picked up until it is very much closer to the target, giving less warning time. It would also

• 1600

be possible for the owner of the missile to use more fuel in order to manoeuvre, and, if he wanted to, after having approached say to here, he could decelerate his missile and drop it down to earth on a shorter trajectory. Another trick that he can use, if he is prepared to spend even more fuel at the expense of delivering a smaller warhead, is to put the missile into orbit. This requires 25,600 feet per second, which is still only a few per cent more than the velocity for the minimum energy trajectory. That would put an object into a circular earth orbit about 100 miles above the surface, and it could go around as many times as he likes.

The so-called FOBS, the Fractional Orbit Bombardment System, depends on an orbit that does not circle the earth as much as once. As we have shown it here, it is coming in 100 miles up, and then at some point it is decelerated and it comes back to earth. Of course if the target were in behind, the radar, the reentry vehicle would not be picked up by our radar until it got to about here, so there would be a delayed detection. Even, then, of course, the defenders would not know when or even if it was going to come back to earth.

Even more dangerous, instead of orbiting in this direction where the defence is looking, it will be equally possible to fire the missile in the opposite direction, have it orbit the earth from the south instead of the north and come in this way and dive down on the defences from behind. So there are quite a few things that you can do if you have a big missile, and the advantage is not necessarily confined to only delivering a big warhead.

Another thing is available, and that is to replace the one big payload with several smaller ones. Shown here on Figure 7 are three different types of attack on a field of Minutemen. In the top diagram the little circles represent Minutemen buried in their silos. We have shown them in a regular grid. In fact I do not suppose they are in a regular grid, but anyway they are spaced out quite far apart. There is a radius, representing the distance from the point of impact inside of which the damage inflicted by the ICBM explosion is sufficient to destroy the missile silo. As it is shown here, the attacking missile lands there, and because this silo is inside the circle, it would be destroyed. The silos are shown far enough apart that even the large damage circle of a very large warhead would never be able to encompass two silos so that the best the attacker could hope for with his missile is that he will destroy one silo.

Suppose he is afraid that some sort of defence may intercept the missile, and he chooses to use some of the big throw weight, as it is called, to use a tricky approach. Rather than simply deliver a large missile he may use one of these more complicated methods of reaching his target. Very likely he will have to use a smaller warhead and get a smaller explosion, and the size of the damage circle would be reduced. However, perhaps it has a better chance of arriving and not being intercepted. The chance of his getting through will be increased but the chance of destroying the silo is somewhat reduced. And still the best that the attacker can hope to do is to destroy one silo.

Suppose instead of using a tricky delivery of a single warhead, he chooses to put several warheads into the one nose cone, and we will suppose here that he has multiple re-entry vehicles, (MRV), but that they are not guided. It is rather like using buckshot instead of a bullet. It is not possible to make the individual small warheads as efficient as the big one, so that the circles representing the damage radius of the individual warheads will be much smaller than the one you could get by putting all the material into one warhead. Because they are unguided, we will suppose that the impact points are scattered at random. For this purpose we suppose there are nine little warheads, so we have nine little circles scattered at random amongst the silos, and in this example we have shown one hit. It does depend very much on the accuracies and the kill radii as to how many hits you would get. But in general when you go from the single warhead to the multiple unguided one, you do not increase the expected number of silos hit. So we have shown one hit here. On the next round he might get none and on the next one he might get two, but on the average perhaps only one.

A much more sinister development is to include some sort of individual guidance in each one of these re-entry vehicles and this is what is called the MIRV, the multiple independently targeted re-entry vehicle. This time every one of those

• 1605

little warheads is steered toward a particular target. Each one of them is trying to hit a particular silo. As it is drawn here, on Figure 7, each one has come pretty close to a particular silo. I think there are six of the nine actually hitting. That depends on the accuracy, and it would be quite a feat of technology to get the accuracy so good that six or nine out of nine made hits. However it is definitely possible to get the expected number up above one by this principle. This is the sort of thing that makes a counter-force attack much more likely, if you have a very large missile and you use multiple independent re-entry vehicles.

Figure 7

ATTACK ON MINUTEMAN

Figure 8

That is a very brief outline of the possible future threat as it is seen today.

Now we will talk a bit about the defence system that is being planned in the United States, the one called Safeguard. Safeguard has four main elements to it. On Figure 8 we have show the curve of the earth and we are supposing that the system is defending some Minuteman silos. There are two big radars, a perimeter acquisition radar and a missile site radar, often called the PAR and the MSR. There are two kinds of anti-missile missiles, the Spartan and the Sprint, and both of them are shown in underground silos.

The PAR looks out to a great distance. It has a very agile beam which can scan the whole of the sky above the horizon over a horizontal angle that depends on how many faces the PAR has. It picks up the incoming missiles at a very great range, over 1,000 miles. If it chooses to attempt an interception, it will probably start by assigning a Spartan to make the interception, but for the Spartan to work it has to be guided by the missile site radar. The missile site radar has to send one of its beams out to pick up the ICBM and it has to send out another one to track the Spartan. It also sends the instructions to the Spartan. A computer calculates the course to make an interception. If it works properly it will make an interception well above the atmosphere, some hundreds of miles forward of the Spartan site.

If the Spartan succeeds in thinning out the cloud of objects that are coming in, and it is intended that it should be very effective against the cheaper and less effective kinds of decoy, then there will be only a small number of objects left. Generally speaking, the means by which the defence attempts to sort out decoys from real objects is by using the effect of air resistance as the cloud of objects enters into the thicker air closer to the ground. At that point it will be possible to notice the lighter objects being slowed down more than the heavier ones, and this is where the other missile, the Sprint, comes into play. The Sprint is also controlled by the missile site radar and it would also be using information given it earlier from the PAR. The MSR would send one beam out to follow the Sprint up and guide it and another one to track the ICBM. The final intercept would occur very much closer to the target.

Those are the four elements of this Safeguard system: two radars and two missiles, one long-range and one short-range.

We will talk about Safeguard a bit more. The plan for placing the Safeguard in the United States is in several phases, but the complete system shows the following sites, indicated on Figure 9. Phase I has a site in Montana and one in North

Dakota. The symbols here indicate the PAR and the black dot indicates the other three components, the missile site radar, Spartans and Sprints. Later stages, if the system is fully deployed, would include a full site with a PAR somewhere in the area of Washington State, one in southern California, one down somewhere between Georgia and Florida and one in New England. The complete system includes another full site in either Michigan or Ohio and other ones without the PAR's in roughly the location shown on Figure 9.

These sites are not accurately placed. I do not think that it has been decided exactly where they will go, and designations like Michigan/Ohio leave a great uncertainty as to the exact position. However, there has been more definite planning in Phase I, which includes only two sites, and these are near large Minuteman fields.

Figure 10 gives some indication of the possible future deployments that might be carried out. If it is decided to pursue defence of the land-based retaliatory force, that is of the Minuteman fields, then Phase I is to put sites in Montana and North Dakota, and that would then be followed up with

• 1610

further ones in Wyoming and Missouri where there are Minutemen and one in the vicinity of Washington, D.C., because it is the national control authority which determines the strategy and use of both the offensive and defensive systems. If it is decided to pursue defence against submarine launched missiles, then the sites down the coast would have to be put in and the PAR's would be given faces looking out over the ocean as well as looking to the North, and they would have Spartans and Sprints. If it is decided to use the system to defend the population of the United States, to provide a thin cover over the whole area of the 48 states, then all the 12 sites shown on Figure 9 would have to be implemented. It is also possible that they would put additional ones in Alaska and Hawaii, but the 12 sites do not include those.

The scheme has been drawn up with the very real hope that strategic arms limitation talks will be able to progress and that is why it is done in these separate stages. At any time it would be possible not to go any farther, or perhaps even call off one of the developments. There is to be a review every year to decide whether to proceed and with which particular phase.

Figure 11 summarizes the difference between Sentinel and Safeguard. Sentinel, you will remember, was suspended about the time that the administration changed in Washington. Safeguard is not quite the same as Sentinel, and this gives us some idea of where the changes are. Sentinel gave as its first

COST	\$5 BILLION (SEPTEMBER 1967)	\$6.6 BILLION (MARCH 1969)

objective the protection of population against a light attack, which China would be capable of delivering about 1975. Its second priority was the protection of the deterrent, and its third priority protection against an accidental launching from anybody who has a missile.

Safeguard put the deterrent as the first priority, and they said that they would be protecting it against the type of attack that the Soviet Union could deliver. The protection of population against a Chinese attack went down to priority two. The same equipment appears, the PAR and MSR radars, the Spartans and Sprints.

Siting plan: Sentinel was going to put their whole system in by 1974, protecting both the population and the deterrent against ICBMs. As I mentioned, Safeguard is to follow an annually reviewed phased plan. They might build it up to protect the deterrent against ICBMs, they might protect population and the deterrent, and they may protect against submarine launched missiles as well as ICBMs. Sentinel was to put a number of the sites near cities, and this would have enabled them to thicken up the defence of cities by putting Sprints near missile site radars when the missile site radars were close enough to the cities to control interceptions on the approaches to the cities.

One reason that Sentinel was suspended was because a great fear was expressed regarding the proximity of these Sprint batteries to the cities. Safeguard takes these away from cities and therefore if the missile site radars are far from the cities and the Sprint range is rather short, it would not be possible to add Sprints easily and use them for city defence. So you can say that Sentinel would have been a good basis on which to thicken the system and Safeguard would not be such a good basis on which to build a thicker system.

The cost estimate of the first system made in September, 1967 was \$5 billion and the estimate made for Safeguard in March of this year was \$6.6 billion. It was stated later that the cost of the nuclear warheads as budgeted through the Atomic Energy Commission was not included and that would put it up to \$7.8 billion for the whole system.

Figure 12 simply reiterates the stated purposes of putting in the Safeguard system. The number 1 objective was to protect land based retaliatory forces, which is primarily the Minuteman, but also bombers, against a direct attack by the USSR. The second priority was to defend the American population against the type of attack the Chinese might be able to deliver in the next decade. The third priority to protect the population against an accidental attack from whatever source.

Now we will get around to the implications for Canada. When we are talking about Canada

in the strategic arms contest, we have to look at the map. Figure 13 is a polar projection taken from directly above the North Pole. Canada and the United States are at the bottom and then upside down from the usual way that we see them, the Soviet Union and China are at the top. These dotted lines are the ground tracks of great circle routes from points in Russia or China to points in the United States. They appear slightly curved on this projection. The way you would mark them on a globe is by just stretching a string as tightly as you could between the two ends, and that would mark out a great circle.

The thing that is very clear is that practically all of them go over Canada. Only ones from the extreme Pacific coast of Asia heading for southern California miss Canada and they do not miss by very much. We are right between the people who might be firing missiles at one another. We cannot

• 1615

help that. That is a fact of geography. Practically all of these missiles are almost certain to follow a path that goes just above the great circle. We are in no man's land and we always will be. That is something that is simply a fact of geography.

It also tells us that as far as direction of approach goes for targets in the United States, from North to South pretty well covers the general description of all the feasible tracks. Actually, of course, if you had a launching site in Eastern Siberia firing at New England, it would be coming in from the northwest, or a missile launched from Western Russia would be coming from the northeast, but generally speaking, they come from the North.

What we have tried to show in Figure 14 is the cover that a Spartan battery can afford to people on the ground. The black thing, which looks a little like an umbrella, represents the zone into which a Spartan, which was located down at the root of the diagram, could fire. It can fire in any direction, so that the black shape has a circular cross section. Because of its range limitation it can get out to the edge of the black zone, but not beyond it.

Now let us suppose that the incoming ICBMs, which are shown by the parallel lines, are rather like driving rain, being forced by the wind into a nearly horizontal trajectory. For a typical launch from somewhere in Russia or China to the United States, going over a range of perhaps 6,000 nautical miles, the angle of descent is about 20 degrees, so that it does come in at this glancing angle. Now if that were rain and this black object were an umbrella, you can see that the spot kept dry on the earth has this sort of elongated shape with the protected area extending downwind from

Figure 12STATED US OBJECTIVES

INTERCEPT ENVELOPE

Figure 15

PROTECTED
"FOOT PRINTS"

the umbrella. It is not round, even though the umbrella is round, and the extra protection because of the glancing angle comes downwind. Or, if the rain is coming from the North, the site here will give some protection to the North, but rather more protection to the South. You can see that the shape on the ground is going to be rather like that of a teardrop.

Figure 15 shows what it looks like. We just arbitrarily took a Spartan site in southern Michigan and this protected zone is quite big. It is called the protected footprint. That is drawn for an ICBM coming in from the north. You can see that it extends many hundreds of miles, but especially to the South.

The protected zone of a Sprint is much the same shape, but on a much smaller scale. It is shown here as if the Sprint were in the same position, but you can see that the Sprint is more of a point defence system, whereas Spartan very definitely provides a big area defence. I have no intelligence that says there is going to be a site here. That is just shown for purposes of illustration.

What we have tried to do on Figures 16 to 18 is to give you some idea of where the bursts might here as to be fired if there were an attack on North America. Figure 16 and the others that follow it have had to be done on an unclassified basis and what we have shown has been calculated very simply. The limits of the arcs are established by geometry, by the extent of the Soviet Union. There is a lower point here below which the Spartan will not be used for safety reasons. There is an outer zone here beyond which it cannot be used because of the limited range of the PAR and of the missile itself. We have drawn these outer limits as rather blurry and indefinite, because we do not know exactly where the outer limit is. In fact, you would not know unless you asked the Russians what trajectory they were going to use. These are not accurate, but I think if we somehow had a magic source of information that told us exactly what type of trajectory was going to be fired against us, we would probably find that these zones were not a very different shape from this.

These two points here on Figure 16 are the intended sites of the phase one installations in

• 1620

Montana and in North Dakota. We are supposing that they are also targets of an ICBM attack. The fan-shaped zone is the one on the ground above which the Spartans would have to be burst in order to intercept the ICBM before it hit the target at Great Falls. You can see that the zone extends well north of the border. I do not know whether it should be just here or just there, and whether Calgary is in or out. Certainly some of

Canada is in. You can also see that the opportunity to intercept would be reduced to almost nothing if it had to start at the border. We have shown a similar attack on the one in North Dakota, and again the fan extends up over Canada, and Winnipeg is involved. It is just a fact that if a Spartan is going to defend this place, that this is where it is going to have to make its bursts. We have shown here an attack on another Minuteman field between the two Spartan sites. It would be possible to defend them with the Spartans, and then the fan has a slightly different shape. But again, the bursts would have to be made above Canada.

On Figure 17, we have shown a similar set of drawings for the northeastern United States. Those of the 50 largest cities in North America, which are located in this area are shown as large black dots. The small dots are cities that appear in the list of the 300 largest cities in North America. Canada has quite a few of these cities; however, we are supposing in this particular diagram, that the attacks are limited to a few of the largest cities in the United States: Chicago, Detroit, Buffalo, New York, and Boston. We do not know where the PARs, MSRs, Spartans or Sprints are going, but for the purposes of illustration, we have shown one here in Michigan and another in Massachusetts.

Using the unclassified figures and this simplified form of calculation we have drawn one diagram. If for example, we take the attack on Detroit, this tells us that the burst from Spartans—and it obviously would be this battery in Michigan that would defend Detroit—would have to occur somewhere to the north of this dashed arc in order to prevent damage on the ground from the Spartans. They could not occur north of this zone whose outer boundary is marked by the short lines, because there would not be the time or the range to get the interception out any farther. You can see that the zone includes some of Michigan and some of Ontario. If we have the attack here on Buffalo, the zone here representing the first possible interception comes down almost to the arc that represents the last possible point of interception. What that indicates is that it is doubtful whether sites here and here (in Michigan and Massachusetts) could defend Buffalo at all; if they could, it would be only by firing at exactly the right time. When the zone begins to look like that, it tells you that the protection at the apex is rather doubtful. All these are worked out for assumed angles of arrival, and no one knows what the real angle of arrival will be. Presumably, if the Russians were trying to attack Buffalo, they would be able to draw these diagrams too. They would choose one of the most difficult azimuths of attack, perhaps this central one here.

Figure 16

SAFEGUARD PHASE I
1974

Figure 17

ICBM ATTACK ON U.S. CITIES

- - LARGE • - SMALL CITIES
- ▲ PAR-MSR-SPARTAN-SPRINT
- ||||| } INTERCEPT ZONE

I would like to reiterate that this is just an example, and that we do not know that this is where the sites will actually go; the numbers that were used here are unclassified ones. However, I suspect that the shape is not very different from what it would be if we had a lot of the knowledge that we can never have; for example, what angles are the Russians going to use?

We have one more diagram, Figure 18, where we suppose that Canada was attacked by two ICBMs, one aimed at Toronto and one at Montreal. We are supposing that the two sites that we showed on the previous diagram are still in Michigan and Massachusetts. It indicates that to defend Toronto with a Spartan, the bursts would have to occur somewhere in this zone. If the enemy used the most dangerous type of attack, it would come in here. There may or may not be time to get in about one interception before it is too late to defend Toronto. In the case of Montreal, it would be even more difficult to defend, if the nearest Spartan were here in Massachusetts, and if all of the assumptions that we have made turned out to be exactly accurate. You can also see that, naturally enough, to defend Toronto or Montreal, the bursts would have to occur over Canada.

• 1625

These zones represent areas in our country above which Spartans would have to burst if the system were going to operate. Naturally, we are very interested in knowing what risks would be inflicted on Canadians.

Let us talk, first of all, about who might be put at risk by attacks. The light attacks that I have in this column on Figure 19 simply represent the attack on two cities, as we showed on Fig. 18. If those two cities were the two largest ones, then approximately 20 per cent of Canadian population would be somewhere near the intended impact points; while about 80 per cent would not be targeted. In the heavy attack we have 40 Canadian cities being targeted. That may be 10 per cent of 400 that would be attacked in North America. In the case of Canada, the 40 largest cities include something like 60 per cent of our population; therefore, 40 per cent of Canadian population would not be very close to the targets. However, this 40 per cent and this 80 per cent might also be underneath the Spartan bursts that were intercepting attacks on these or other cities. So we have to give thought to both of these types of protection.

Figure 20 summarizes what the dangers would be. When we are talking about dangers from nuclear weapons, we have to distinguish very clearly between ICBMs, that were put there to kill people, and Spartans and Sprints that were put there

to kill ICBMs and save people. The damage done by an ICBM which bursts where it is intended is going to be very great. The character of the damage depends to some extent on whether it is burst on the ground at zero height or a few miles above the ground. If an ICBM bursts on the ground, and I am talking here of a big one, like a megaton, it will produce very serious fallout. The large X indicates a very serious hazard to life. It will produce terrible prompt radiation, heat that will burn up miles and miles of the city and blasts that will shatter everything within miles of the point of impact.

However, if the owner of the ICBM wants to do the maximum possible damage in the city, it is very likely that he would burst it a few miles above the ground, because that will make even more damage from heat and blast. As a matter of fact, it will reduce the danger from fallout to a very low level; it will still produce considerable danger from prompt radiation. However, if his purpose is to damage the city as effectively as possible, it is likely that he would use the air burst; that does remove the fallout hazard.

I have written electromagnetic effects down below. They are not a danger to life and limb, but they may be quite a serious hazard to technical equipment. There are two sorts of electromagnetic effects: one is a sudden pulse that can short-circuit electronic equipment; the other is a production of ionization in the atmosphere that can spoil radar or communications, type of equipment. However, it will not kill people, although it may make the defences inoperative.

The ICBMs produce dreadful hazard to the target if they burst where they are intended to, whether it be on the ground or in the air. In comparison, Spartan is supposed to be burst very high above the ground, considerably more than 25 miles up. We have done some calculations for 25 miles, based on the unclassified effects of nuclear weapons, to give us a lower limit that we can use to measure from. If a Spartan warhead is burst 25 miles up, it will produce negligible fallout; prompt radiation will not be a serious matter; the heat would not start fires. There would be blasts that could be measured; it would probably break some windows. This is the point at which the Spartan begins to do damage on the ground. The small but noticeable effect is indicated by the small X on Figure 20. Below 25 miles, it will do more damage; of course, if it came down to the 5 to 10 mile region, it would do plenty of damage.

At 50 miles, even the blast effect becomes too small to break anything. Sprint has a much smaller warhead and it can be burst at lower altitudes. If it were burst three miles above the ground,

ELECTROMAGNETIC EFFECTS

it would produce no fallout, no important radiation or heat risk. The blast effect could be measured on the ground; it would probably break some windows. If Sprint were burst 20 miles up it would not produce any of these hazards.

Therefore, you can see on this sort of scale, the hazard from Spartan which will burst above 25 miles or from Sprint is really very small compared to the frightful hazard from an ICBM.

• 1630

Fallout is the subject of a lot of attention. Therefore, we have Figure 21 here that tells you a little bit more about fallout risks. We distinguish between air bursts and ground bursts; by air burst we mean that the weapon is detonated high enough above the ground that the fireball does not touch the ground. Actually, if it were high enough up—perhaps air burst is not the right word, it would be more of a space burst—but air burst means high up—the radioactive material that one has to fear only comes from the warhead, and it moves up with the fireball into the stratosphere. It is very widely distributed all through the stratosphere. Most of it decays, and what does settle down to earth is very widely distributed all over the world. It can be detected with sensitive instruments long afterwards. The short-term fallout radiation risk to people living near the burst is very small because the matter goes up and is distributed.

If the burst occurs on the ground, not only do you have radioactive material from the warhead but it is imbedded into the crater; the material that is flung up from the crater, which is vaporized earth, is made radioactive and traps the fission products from the bomb itself and you have a far greater volume of radioactive material, which does not go way up into the stratosphere; most of it comes back to earth fairly soon—some of it immediately, some of it blown downstream by the wind, and some of it will come out with rain. In the near vicinity of the burst there will be intense fallout which is a very serious hazard to human life.

Therefore, as far as fallout goes, it is very bad with ground bursts and not anything like as much as a hazard if the burst comes at high altitude. Remember, anti-missile missiles intended to protect against ballistic missiles are burst very high, and if they prevent an ICBM from bursting on the ground, then they have reduced fallout very considerably.

I think that covers the matter of risk about as thoroughly as we will be able to do it today.

On Figure 22 there are just a few conclusions that one can make relative to Canada. First of all, we have indicated the main conclusions if the targets of ICBMs are all south of the border. We can say

that Canadian air space—and I do not know if “air space” is the right word, but I mean the space above Canadian territory—is necessary if the United States is to protect itself by this type of system against an attack from the North.

Canadian siting of ABM equipment is not essential, as far as we can make out, for protection of important U.S. targets. With the type of diagrams we showed you before, it seems that most of the important American targets can be protected without the equipment having to be put north of the border.

The risks to Canada from these high altitude ABM warheads seems to be pretty minor in terms of the sort of contest that we are talking about here. As far as fallout is concerned, I should mention that if there is fallout in the United States because of ground bursts, Canada is going to catch a lot of the fallout too. The ABM defence produces virtually no fallout and it might save a great deal of fallout in Canada, even if the bursts on the ground are in the United States. Therefore, from the point of view of fallout, I would say that ABM defence is a good thing and not a bad thing.

Figure 23 shows what happens if Canada is the target of ICBM attack. It does appear that the full Safeguard deployment could provide some protection for many Canadians, but it depends exactly where it is and it depends on factors that would have to be worked out in great detail. It certainly cannot protect all Canadians. It almost certainly could protect quite a few but only against a light attack or an accidental launch, because this is not a thick system and nobody could hope to get much protection from it against a heavy Russian attack. This simply says, once more, that a light ABM defence is not going to be effective against a heavy ICBM attack.

Sir, I think that covers fairly well some of the points that were in Part III and perhaps we should turn it over for questions now.

The Vice-Chairman: The first questioner is Mr. Brewin.

Mr. Brewin: Mr. Chairman, I am sufficiently stunned by the presentation that I am not sure I am capable of asking questions, but I will try.

• 1635

Looking at it first of all from an over-all North American point of view, I understand the criticism is based upon the effectiveness of the proposed defence for the purposes for which it is intended. I take it from the very last point you made, that a light system, such as is contemplated in the Safeguard system, is not a defence against a heavy Russian attack with the type of missiles it has now;

6. NO LIGHT ABM DEFENCE WILL BE EFFECTIVE
AGAINST A HEAVY ATTACK.

that it would not protect populations in any way from massive destruction. Is that right?

Dr. Lindsey: Yes, sir, that is absolutely right.

Mr. Brewin: And, of course, that does apply incidentally to Canada in the very last point that you made, that whether you install the ABM system in Canada or not it could only protect against a light attack.

Dr. Lindsey: If it is deployed on the scale of the Safeguard that would be true.

Mr. Brewin: If the purpose of the attack is to destroy, as nearly as possible, the deterrent power of the American strike force, then this would not in any way be done by the light system, would it?

Dr. Lindsey: That is a different point. When I said that the system could not defend North America against a heavy attack, I was speaking of population. If the Phase I of the Safeguard is put in to defend the two Minutemen areas in those two northwestern states, it would provide a protection of some measurable quantity to those two fields of Minutemen. Perhaps it would protect a half or a quarter of the Minutemen. That is no good at a city:

if you stop three quarters of the missiles, if four come in and three are intercepted and one lands, everybody is dead.

Mr. Brewin: Taking the present contemplated system, you would only be protecting about 350 missiles, would you not?

Dr. Lindsey: Yes, in Phase I that is true.

Mr. Brewin: I have a statement here referring to North America that I would like to read to you to see if you agree with it:

The fact is that our offensive deterrent is so massive and so dispersed that it needs no such protection, and in fact, except for two Minutemen sites containing 350 missiles, will not receive much protection under this system. The bulk of our deterrent is composed of 646 Polaris sized missiles on submarines and 630 long-range bombers. These, combined with the remainder of our 1,054 Minutemen ICBMs and thousands of shorter range missiles in Europe and elsewhere, provide an arsenal of deterrent to which nothing of significance will be added by the Safeguard system.

Could you comment on that and say if you agree with that deduction?

Dr. Lindsey: I am sure that the statement is true for 1969. I think the reason that the Americans

have decided to go ahead with Safeguard, or at least have requested permission from Congress to do it, is that they are not sure that that situation will still apply in 1974. They have enough and some to spare today; they say that themselves. It would require a rather unpleasant development on the part of the threat, to lose that position in 1974, but I think the purpose of the system is to guard against that possibility.

Mr. Brewin: In other words, at the present moment it does not add effectively to the Americans deterrent power to have this Safeguard ABM system installed?

Dr. Lindsey: I think, if by some magical process you could have Safeguard effective tomorrow, it would not add anything because they have mutual stable deterrence today. They are not so sure what it will be like in years hence.

Mr. Brewin: Supposing you project these things into the future, is there any reason to anticipate that by the development of even greater penetration aids, greater aids to the offence as against the defence, defensive systems themselves will become once again obsolete, and you are seeking security, but you have reached a position of similar insecurity after the expense of a very vast amount of money, and a great deal of effort being put into it?

• 1640

Dr. Lindsey: I think that is entirely possible. We may see, if there is not some sort of successful strategic arms limitation talk, an extension of this contest between offence and defence; and the defence provides a measure and the offence a countermeasure, and the defence a counter-countermeasure and so on and so on.

Mr. Brewin: Is it not a fact that in the history of these things, the reaction to any new step by one of the super powers has been an overreaction by the other super power, so that there is a spiral going ever upward of greater and greater insecurity and higher and higher cost? Do you think that would be an unfair way of describing the situation?

Dr. Lindsey: I am not sure about the greater insecurity; I am sure about the greater cost.

Mr. Brewin: I do not think there is any argument about the greater cost because I take it that this \$7.8 billion that the Americans contemplate spending is a first step and, in itself, a totally ineffective step.

Dr. Lindsey: It is being rather cruel to say "totally ineffective". Neither is it certain that it is a first step. There is no extended plan at the moment.

Mr. Brewin: If it is not a first step in regard to the projected plan, the \$7.8 billion is probably only a first step in regard to the expenditures.

Dr. Lindsey: No, the \$7.8 billion is supposed to cover the full Safeguard plan with the 12 sites. That was the intention and there is no plan beyond that that has been announced to date. The \$7.8 billion buys you the full Safeguard but it is only a thin defence.

Mr. Brewin: I think that is all.

The Vice-Chairman: Mr. Allmand.

Mr. Allmand: Dr. Lindsey, you set out some of the risks as you saw them. I want to put to you some other risks that I have read about that you did not mention and ask you whether you and your officials have given any thought to these.

One of these risks was mentioned in the *Time* magazine article of March 14 entitled *The Great Missile Debate* and while I realize that *Time* is not an authoritative source I would like you to comment on this. They say in this article that

One of the most alarming arguments raised by ABM opponents is the prospect that Spartans and Sprints could accidentally explode while still in the ground, devastating a huge surrounding area.

This point is not raised only by nervous housewives but also by scientists, and they go on to refer to an article in the *Saturday Review*. Now if these Spartan and Sprint bases are very near the Canadian border and if these anti-missile missiles could accidentally explode they could cause a great deal of destruction to the neighbouring parts of Canada. So I would ask you if your Department or any of the officials in your Department have given consideration to that particular risk that I have referred to—the accidental explosion of the Spartans and Sprints?

Dr. Lindsey: Yes, and we have watched with considerable interest the history of the nuclear weapons that have been deployed by the United States and by the Russians, and their record has been extraordinarily good. I think the United States has been handling about 15,000 nuclear weapons all over the world for a period of many years and they have never had an accidental nuclear explosion. We are practically certain that the Russians have not either. The safety precautions that are taken, mostly controlled by the Atomic Energy Commission, really do put safety at the top of their priority. Their safety precautions are very considerable and on the two or three occasions where there have been accidents causing nuclear weapons to fall out of aircraft or into fires, there has not been a nuclear explosion. So that the safety precautions have been tested in genuine accidents and they have worked effectively. We should remember that some of the air defence weapons like

the Nike Hercules have been deployed around cities for many years, they have nuclear warheads in them and there has never been an accident. It is true that if there were an accidental nuclear ex-

• 1645

plosion near a city it would be a terrible hazard but I think the safety precautions are so extreme and the record has been so perfect that it is not a thing that one should worry about too much.

Mr. Allmand: Dr. Lindsey, it is my understanding that while the safety record has been good for the ICBMs and the traditional atomic bombs there is a difference with these Spartan and Sprint ABMs which indicates that they are a greater safety risk than the ordinary missiles—because I suppose of the type of missile they are. Are you aware of a distinction between the Spartan and Sprint. I see ABMs as opposed to atomic warheads on the ordinary ICBMs, which would make them a greater risk. The reading that I have done indicates that there is a greater risk for accidental explosion.

Dr. Lindsey: I can see that there might be one difference, that the ABM system would presumably have to be ready to be used on very short notice whereas offensive warheads perhaps would not have to be put on such short notice. There might be certain precautions that you could take 15 minutes or 30 minutes before they were used.

Mr. Allmand: That leads me to a further criticism. It seems that with the bombers which have atomic weapons and with the ICBMs the decision to send these away comes from the President but with the ABM system, because a very short reaction time is required—in other words the PAR and the other radar systems pick up these ICBMs coming from the enemy—the decision to fire such a system must be done by computer and not by decision of the President. This possibly could be the matter that is involved in the accidental explosion. There are two risks, the first is that the decision to explode is by computer and the second risk is that there is not really a human decision in firing these things off, especially if there are decoys and so forth sent up.

Dr. Lindsey: There were quite a lot of questions asked on that subject in the recent Congressional hearings and I tried to read what was said. I think there will not be firing by computer only. I am convinced from what I read there that they intend still to have some sort of a manual or human intervention but whether it will be the President or not, I do not know. Then, of course, if the anti-missile is fired, if it works properly and if it hits the target, the burst will be very high up, and if it misses the

target there will not be a burst. So I do not think that gives you the danger of a burst on the ground—which of course is the thing that would create the dreadful danger.

Mr. Allmand: I am far from being an expert but I merely put this additional risk to you as I see it. It seems that the Americans are concerned about the risk of accidental explosion on the ground. The reading that I have done is that the very conservative people of North Dakota, who usually are considered very pro-military, have themselves raised strong objection to having these ABMs on their territory because of the risk of accidental explosion on the ground. If they feel that way perhaps we should consider it too, since these sites are very near Canadian territory.

I want to put forward another risk that you did not mention. In the hearings before the American Congressional committee Professor Hans A. Bethe of Cornell University pointed out that if this system were set up the Soviet Union, or any other potential enemy, could knock out the radar system by sending a missile which would explode 100 miles in advance of the radar system, causing a fireball which would wreck the radar system, follow it up with their ICBMs and they would get through. Now if they sent this pre-missile through to wreck the radar system and exploded it 100 miles before the PARs and the other radar systems, this means that this missile would explode over Canadian territory—that is, the missile which would be geared to wrecking their radar system. Have we considered this type of risk?

Dr. Lindsey: Yes. It does not exactly wreck the radar, what it does is to produce a great cloud

• 1650

of ionized material in the upper atmosphere that would obscure the radar's view for some minutes, and when the cloud has passed away the radar is still effective—it has not been destroyed. It is rather as if they had made an enormous opaque cloud in outer space through which the radar could not see until the cloud had dissolved. So it does not create a hazard on the ground. It is indeed a means of making the defence problem more difficult, and it might be a very effective way of doing it, but it is not going to hurt anybody on the ground.

Mr. Allmand: You say that this pre-missile which would be geared to hindering the radar system would be far enough up in the atmosphere so that it would not hurt Canadians?

Dr. Lindsey: Yes.

Mr. Allmand: I now move on to another risk and that is one which states that the enemy mis-

siles can be rigged or triggered so that they will explode as soon as the ABM missile explodes in their proximity. The ABM missile is supposed to destroy the ICBM mechanism so it will not explode. However, these critics say that this can be very easily by-passed by rigging or by triggering the ICBM to explode at the same time. Of course, here instead of having one explosion, the explosion of the ABM, you also have the explosion of the ICBM.

This would not be too dangerous with the Spartan, but if you take the explosion of the Sprint plus the explosion of the ICBM quite close in, again, to the targets which are near Canadian territory, you could also blast quite a few Canadian cities. What about this possibility of rigging or triggering the ICBM to explode despite the fact that the ABM explodes in its vicinity?

Dr. Lindsey: There has been a lot of discussion about that point and the people in the Atomic Energy Commission who design these weapons tell us that they think it would be very difficult for the ICBM to be triggered that way. To explain exactly how you would have to know about the design of nuclear weapons, and of course, that is something that has never passed out of the United States.

There are reputable scientists who think that it would be possible to have this fuse that would go off and I think the weight of evidence is probably against them, but one cannot judge without knowing all the facts.

If it were possible, then I think you can say at least the defence has caused the offending missile to burst not where the owner intended it to burst, and therefore, you probably create less damage to North America than you would have had it burst where it was intended. The Sprint is...

Mr. Allmand: That would be more true of the Spartan than of the Sprint.

Dr. Lindsey: In the case of the Spartan, I think if it did go off it probably would not do any damage. In the case of the Sprint, if it caused the ICBM to burst at low altitude it could do damage on the ground. That is quite true. However, the Sprints are short-range missiles and we do not know where exactly they are going to be located. It may well be that they are so far south of the border that their bursts will all be above the United States in which case the problem would not be one that we would have to worry about.

Mr. Allmand: Maybe we should find out where they are going to be.

Dr. Lindsey: I do not think that it has been decided yet.

Mr. Allmand: I have just two other questions, not relating to the risks but relating to two other matters. Do you know if any of our government officials have tried to interpret the Non-Proliferation Treaty which we have signed to determine if our co-operation with the Americans in an ABM system, even to the extent that we allow them to use our air space, would be a contravention of the Non-Proliferation Treaty? It has been suggested that any sort of co-operation on our part would be against the Non-Proliferation Treaty which we have signed.

Dr. Lindsey: I have read some discussion of that in the United States and they evidently feel that it would not contravene Article 6 of the Non-Proliferation Treaty, but there is some dispute about that. That really is the sort of problem that I think some of the subsequent speakers will be better able to answer than I would. Certainly, if what the Americans are doing is not contravening it, I do not think that

• 1655

our little part would be. They have considered this and they do not think it would be in contravention of Article 6.

Mr. Allmand: It is in great dispute.

Dr. Lindsey: Yes, it is.

Mr. Allmand: My last question relates to the strategic value of the ABM system. If the ABM system is to protect the Minutemen sites in the second-strike capability of the United States, is it not true that the real second-strike capability of the United States rests with their Polaris submarines and their bombers which are in the air at all times, and that consequently there is no real necessity of building an AMB system to protect the second-strike capability when the ABM system does not protect the Polaris or the bomber system in any case? They will have that no matter what happens with the ABM system. So from a strategic point of view, it would seem that the ABM system if it was meant to protect the second-strike capability does not really do that, and this is not really a credible argument for building the ABM.

Dr. Lindsey: I think of the three elements in the second strike, and you have named them all, the ICBMs are probably the most potent of the three. The Polaris submarines are very effective, and as you say, they are not put at risk by any missile system. There are not very many bombers kept in the air at all times and it is very expensive to keep a large number in the air. I think they are

afraid that the FOBS, the Fractional Orbital Bombardment System, that might come in low or a first-strike submarine launch missile could catch a lot of bombers on the ground.

Mr. Laird has said that deterrence is so important that he would not like to have to depend on only one of the three systems. They feel that they would like to have a reasonable probability of any one of the three working.

However, none of what we have said alters your claim that the Polaris is very effective and does not seem to be at risk. It has been stated in some of the recent American testimony that perhaps developments in anti-submarine warfare in the future will put the Polaris at risk. However, it has never been said what those threats are.

They think that deterrence is important enough that they would like to have two or three ways of doing it rather than just one.

Mr. Allmand: Mr. Chairman, I have completed my questions but I think that maybe we could take note of the fact that some of these questions, even through the admission of the witness, are far from being answered, and maybe we should try and get some witnesses who could answer some of the other points, especially with respect to the Non-Proliferation Treaty, and so on.

Mr. Roberts: May I ask a supplementary question?

The Chairman: Mr. Roberts, on a supplementary.

Mr. Roberts: Since the ABM system is designed to protect the second-strike force, would it not be easier to simply relate the detection systems, not to the firing of a missile which would protect the site, but simply to relate them to the firing of the Minuteman itself? Since what you are presumably doing is protecting the second-strike force, and if you are being attacked by in-coming inter-continental ballistic missiles, you are obviously in a situation where the utilization of your second-strike force is going to be pre-eminently in your mind. What is the point at this stage of continuing to protect the second-strike force when what you would really be doing is thinking of using it? Of course, if you detected the in-coming missile and fired your Minuteman, there would be nothing left there for the in-coming missile to hit when it got there.

Dr. Lindsey: That is true. I think what you are advocating there is the hair-trigger response. In order to reduce the chance of a war by accident or of the sudden escalation of a war to the ultimate when it was not really necessary, the Americans are extremely reluctant to rely on firing back on

warning, and indeed, they do not have to do it today. If we are going to have a truly stable state where the risk of an accidental war is tiny, it would be a great pity to have to defend yourself that way. It is a sort of a last desperate way of defending yourself.

Mr. Roberts: If that explanation is correct then I would assume that the priorities which were listed on the chart that you gave us (Figure 12) are incorrect. In fact, the ABM system is really designed against accidental attack rather than a possible full-scale attack because otherwise you would then be in the hair-trigger situation.

Dr. Lindsey: I think the third objective was to protect against accidental attack. The assumption that there would be only one missile that went off by mistake and that could hardly be mistaken for a giant attack by hundreds of missiles.

• 1700

The feeling is that with several thousand missiles on short-term alert all over the world for years and years there is always the tiny chance that one of them will be fired by mistake. However, it is really almost incredible that the whole lot would be fired by mistake.

The Chairman: Mr. Roberts, will you take this up a little later? I will put you on the list. I have a long list here. I think you can get back at that later.

Mr. Roberts: I will not be able to get back at it later, but the point, I thought, had just been cleared up.

The Chairman: Is it agreed that he have another question?

Mr. Roberts: I think we agree, Mr. Chairman. I think my second supplementary was considerably more...

The Chairman: I think you are abusing your supplementary.

Mr. Roberts: I would hate to do that, Mr. Chairman.

Mr. Thompson (Red Deer): Dr. Lindsey, I was in Washington yesterday and I noticed that there were many cars carrying the bumper sticker that says "ABM is an Edsel". I tried to interpret how this statement made some sense. Apparently, it did to some people because it was plastered all over cars all over the city. From the evidence that you have heard and the information which you have at hand is enough known about the technical side of the whole ABM program actually to give some assurance of its being technically possible and functional?

Dr. Lindsey: There are a number of very qualified physicists who have doubts about it and they have been very vocal in recent weeks. When you read their testimony, you cannot help thinking that there are a lot of unanswered questions about the program. It is an enormous undertaking. Certain features of it represent extensions and things like computer programming beyond any level of complexity that the human race has tried to do yet. So there are a lot of unknowns. I dare say they will have troubles and it will not work as soon or as well as was expected, but I think enough is known about it that the odds are it will be able to intercept some ICBMs if they were fired at it.

The real purpose, of course, is to stop the war happening and I am pretty sure that the unknowns are sufficiently great in the United States that the Soviets do not know how effective it will be either. If they were planning an attack, they would, I am sure, have to rely on the possibility that it would intercept quite a few missiles. We just do not know what the system will be like in 1975; I do not think anybody does. There is a lot of difference of opinion about whether it will be very good or not so good. I suppose the Edsel is considered to be something that was much advertised and advanced, but not very successful when it was delivered, and I suppose that is what the sticker means. They could be right.

Mr. Thompson (Red Deer): Perhaps a couple of elementary questions, Mr. Chairman. You mentioned today that new developments in the anti-missile technical aspect of the ABM made it possible to now neutralize an approaching missile without actually contacting it. What is the basis of neutralizing that approaching missile? Does it explode? Does it trigger a nuclear explosion or does it neutralize it without doing that?

Dr. Lindsey: The Spartan warhead releases most of its energy in the form of X-rays, and X-rays are stopped in air but they can travel unimpeded through the near vacuum of space, some tens of miles above the earth's surface. They would strike the outer casing of the ICBM and heat up the outside so much that it would be vaporized and it would send a shock wave into the interior of the machine and probably shatter, bend, or otherwise distort the inside. So, in effect, the warhead by exploding delivers energy at a great distance which spoils the mechanism of the device. The intention is not that it will produce a nuclear explosion in the ICBM warhead.

Mr. Thompson (Red Deer): The threat of fallout on any population that might be below is not nearly as great as we have been led to think by publicity?

Dr. Lindsey: I believe that is true. The fallout hazard is very small indeed if the burst occurs at high altitude.

Mr. Thompson (Red Deer): That does not release into the currents which surround the earth any great amount of radiation or harmful material?

Dr. Lindsey: It does, but they will stay up there so long and they will be so widely distributed that what finally comes to earth will not be a serious hazard to human life. Of course, this is the sort of thing that was done for years in the nuclear test programs. I think there were about 400 nuclear weapons burst in the air by the five nuclear powers, and you can measure the radioactivity on the ground with a sensitive instrument, but everybody did not die.

Mr. Thompson (Red Deer): Is this what you mean then, in your summary statement, where you say:

The effects on persons or property on the ground due to interception by Spartans or Sprints will be negligible...

Dr. Lindsey: That is what I meant, yes, sir.

• 1705

Mr. Thompson (Red Deer): I have another question which refers to your statement, Dr. Lindsey. You implied that in a comparatively few years there probably will be new sources or new systems of missile detection and space surveillance. Is the potential for this surveillance and this detection of such magnitude that it might affect the whole program of actual physical deterrence in terms of distance and so on?

Dr. Lindsey: I think it would require rather a large change in the present state of knowledge to say that an effective heavy defence could be designed at a reasonable cost today, but one cannot tell. Knowledge is accumulated very quickly in these programs and one cannot predict what will happen. Certainly, if methods of detection and interception were greatly improved in the future it might make a defence possible at a cost much less than that of an offence, but that has not happened yet.

Mr. Thompson (Red Deer): Another statement you make, Dr. Lindsey, is that the five Spartan batteries which will be directly across the border and the seven others that eventually will supplement them for the over-all program as it is projected now in full deployment will give all 48 states plus the American population—and I would assume that this applies to the Canadian population as well—protection from a light attack or from accidental launching. That is a very specific and definite statement you have

made. Is it actually expected to do that as far as technical knowledge is concerned at the present time?

Dr. Lindsey: That is exactly the intention of the system, yes, sir. I am not sure how far it extends into Canada.

Mr. Thompson (Red Deer): I am not speaking of theoretical intention, I am speaking of technical capability as we now understand the whole ABM system and the Spartan.

Dr. Lindsey: That is what it is intended to do and that is what the designers hope it will do, yes, but the extension into Canada is less certain. I do not know just what proportion of Canadian citizens could be given that protection. Of course, for them to get the protection it would be necessary not only that it be physically possible but that it also be arranged in the computer program. An ICBM follows a predictable path and the defence can tell where it is going to land and, if they wish, they can refrain from intercepting a missile; for instance, if it were going to fall into the sea perhaps they would let it go.

Mr. Thompson (Red Deer): I have another rather elementary question, Dr. Lindsey. You mentioned the Baker-Nunn Optical Camera at Cold Lake and apparently it has some surveillance value. Would you just explain the function of this machine?

Dr. Lindsey: Yes. Its main purpose is to support the space research program and it is a very accurate telescope with a camera attached to it. Normally what happens is that the crew at Cold Lake are told that a particular space object is expected at a certain time in a certain place, so they know about where to look. They then follow it very accurately and feed the results back into a central computer so the progress of some object in its orbit can be followed from day to day. This would help to predict when a low-orbiting object was going to re-enter the earth's atmosphere, or it would help to establish the orbit more accurately, or it would tell you if something had manoeuvred, which is very interesting, of course, if it belongs to another country. It really is a means of space research. It would not be effective in detecting a newly launched ballistic missile.

Mr. Thompson (Red Deer): Thank you, Mr. Chairman.

The Vice-Chairman: Mr. Lewis.

Mr. Lewis: Dr. Lindsey, because of some of the things I want to say frankly, may I first congratulate you on the lucidity of your explanations. May I then, to speak very frankly, say to

• 1710

you that I, as one member of Parliament and one citizen of Canada, resented your written presentation as well as your oral presentation today, because in my reading of the presentation and my listening to you, despite the fact that you underline you are just dealing with technical problems, you have tried to make a case for the value of the ABM system. Is that not so on the basis of your writing and your presentation today?

Dr. Lindsey: No, sir, I did not try to do that. I was trying to present to this group a number of facts that I thought they would need in order to assess the problem and to give some pros and some cons. I think I have given some of both.

Mr. Lewis: I did not hear or read many of the cons, Dr. Lindsey. I suggest to you that the major problem facing those of us who have an interest and a duty to have some decision is the effect of deploying a questionable defence system—and you have admitted all through that it is questionable—at a time when there are many unknowns—and you admitted all through that there are many unknowns—with the possible effect on the morale of the world, on the escalation of the arms race and so on. I did not see or hear anything about this basic question of the ABM. Yet, you say “one should not wax too indignant over the hazards inflicted by defensive ABM systems without contemplating the effects of the offensive ICBM, if it should succeed in its intended mission.” What relevance is that to the problem as to whether or not the ABM is an effective deterrent against the ICBMs?

Dr. Lindsey: It does not really affect that problem. I think that the main purpose of any strategic offensive or defensive system is to prevent the war from happening. There are many unknowns and disagreements about whether this ABM deployment will make that more or less likely. There are eminent people on both sides of that question. That quotation was made in the assumption that unfortunately the deterrence failed, and that there was a launching of ICBMs at Canada or at the United States. I was trying to say that if ICBMs were launched at North America the damage done to people on the ground by the presence of the friendly weapons is nothing compared to the damage that would be done on the ground by the arrival of the enemy weapons.

Mr. Lewis: May I, with respect, say that that is obvious even to an ignoramus like myself about the technical questions. What I again resent, in a friendly way, is the constant talk about “the effect will be such if there is a light attack”. What in heaven’s name do you mean by a light attack? What conceivable situation do you see where the

Russians will, for some sort of sport, send over a few ICBMs to be detected and destroyed somewhere in the ionosphere? What kind of logic lies behind this sort of presentation to this Committee? If there is a launching of ICBM missiles by the Soviet Union, is it not fair to assume that it will be the beginning of a pretty serious nuclear war?

Dr. Lindsey: Yes, sir, I think it is. The normal

• 1715

background of the “light attack” which has been considered in Washington is that it would come from China and not from Russia.

Mr. Lewis: Dr. Lindsey, I suggest that even they have now discarded that.

Dr. Lindsey: They put it down to second priority.

Mr. Lewis: There is not very much talk now about the threat from China, even in the United States.

Dr. Lindsey: No, there is much less than there was.

Mr. Lewis: Yes, and now it is in the other direction.

Dr. Lindsey: Yes, and also the emphasis has changed from protecting the population against the “light attack” to protecting the deterrent against a Russian attack.

Mr. Lewis: Let me again ask you about this. No matter how good this light Safeguard system may be, is it right to assume that they cannot possibly destroy all the ICBMs which may be launched against the United States? Will some of them come through?

Dr. Lindsey: I think it is almost unbelievable that a defence system would be 100 per cent effective. I am sure some would come through.

Mr. Lewis: This light system is questionable in its effect and may not work at all, and if it does work, may work only for a fraction of the ICBMs that some people assume may be sent over. What justification is there for the ABM system now, in that situation?

Dr. Lindsey: Well, it could be effective against the light attack from China. Every ICBM which is intercepted would represent the saving of millions of lives. In the case of the heavy attack from Russia against the deterrent, if you could save just a few of the deterrent missiles, that might be enough to make deterrence work. You do not have to be 100 per cent effective in protecting your deterrent missiles. Of course, in the case of cities you would like to be 100 per cent effective.

Mr. Lewis: Dr. Lindsey, I am asking these questions a little strongly, and quite deliberately, because both you and I feel strongly about this matter. Are you not going around in a circle? If the purpose of all this missile, anti-missile and all the rest of the build-up in the United States, and presumably on the Russian side, is to have deterrence against the possibility of nuclear war, then if that is the case, what is all this talk about how many people you are going to save? I suggest to you that if a nuclear war started, and a first strike was started by either of the superpowers, sooner or later their entire arsenal will be in the air and on the ground and will destroy the world, so why are we talking about saving people with a light attack and a heavy attack? I just do not understand what you are talking about.

Dr. Lindsey: I think this is the heart of a very complicated problem and Dr. Rathjens spoke very ably on it a few weeks ago. As I remember, the way he put it was that the thing which we put as our first priority is to prevent the nuclear war. We will really try to prevent that but there is always the fear that we will be unsuccessful and in that case there is the question about doing something to reduce the dreadful consequences if it does happen. The question before the country, I suppose, is how much do you put into the first objective and how much into the second? Unfortunately, some of the things that you do for the second objective may reduce the probability of achieving the first one, and that is a horrid dilemma.

Mr. Lewis: Indeed it is.

Dr. Lindsey: It is.

Mr. Lewis: Let me ask you, if I may, two or three more questions on the ABM. Let me try to summarize it in a layman's language. As I understood it, you agreed with Mr. Brewin that at the present time in 1969 the statement—I am not quoting it, I am doing it from memory—the ABM system cannot really be effective is correct?

Dr. Lindsey: I think he was talking about 1969 and I said it would not be necessary in 1969, and that deterrence is assured without it.

Mr. Lewis: Suppose you have trouble now, would the light Safeguard system be of any real value in defending when it is protecting only one third or so of the American ICBM?

Dr. Lindsey: It does not exist today, sir.

Mr. Lewis: Will the proposed plan protect only about one third or so of the American ICBM, since the Polaris submarines are out and the bombers are in the air, so that at the present time the ABM system...

Dr. Lindsey: It is not necessary today.

Mr. Lewis: It is not necessary, and it would not mean very much.

Dr. Lindsey: Not today.

Mr. Lewis: No. In what way is the deployment of anti-ballistic missiles in 1971 or 1972 or 1973 of any consequence to the developments that you thought may occur in five or six or seven years?

• 1720

Is it not possible, assuming that there is some value in it, for the moment, to hold on to your know-how, to continue whatever technological development you may carry on without the additional cost of deploying these anti-ballistic missiles, and wait for the situation where the value of it is much clearer than it is now? Would that not make more sense?

Dr. Lindsey: It would if the time taken to put such a complicated and difficult system into operation were short enough. I suppose the designers of the system think it will take a long time to make such a thing effective, and they are afraid they could not do it in a hurry. They are worried about a threat that is years away and might never arrive, that is perfectly true, but they do not want to be caught in a position where it has arisen and there is not time to counter it.

Mr. Lewis: Caught in what position, Dr. Lindsey? How has it arisen, by the fact that somebody has launched some missiles against the United States?

Dr. Lindsey: No, no, no.

Mr. Lewis: At that point surely Mr. Roberts was entirely right: you launch your missiles back. But caught by what? In this connection I cannot understand that the Pentagon and the military industrial complex of the United States are talking about. What is it they are going to be caught by?

Dr. Lindsey: They are afraid that those large SS9-type missiles, of which a few hundred have appeared and which are being produced at a fast rate, will be able to carry these Multiple Independently-targeted Re-entry Vehicles that would enable one counterforce rocket to destroy several deterrent rockets on the other side—and that is the position against which they fear they may have to defend themselves.

Mr. Lewis: How does that do that? If you have a MIRV going, if I understood you—correct me if I am wrong—then your anti-ballistic missile that you now have, that you are going to deploy, will be lucky if it hits one of the blessed warheads on

MIRV and all of the other warheads will go their merry way to destroy the hardened silos that they hit.

Dr. Lindsey: Well, every MIRV that is intercepted will presumably save one silo from destruction, and if you save a rather small number from destruction then you have deterrence.

Mr. Lewis: Then are you talking about the MIRV actually being launched, this defence that you are describing, which I am sure you will agree is not terribly effective—if you save one silo and they can destroy several more it is not terribly effective—or are you talking about deterring the Soviet Union from launching a MIRV when he knows you have an anti-ballistic missile that cannot really do him much harm.

Dr. Lindsey: We are aiming at the Russian planner who is trying to decide whether to attack or not. The hope is that when he makes his calculations, knowing that the ABM system is there, he will decide that if he attacked he could not disarm the United States and, therefore, he will not attack. So we have deterred him and we do not have a nuclear war, and that is what we want.

Mr. Lewis: Does he not know that now, Dr. Lindsey,—

Dr. Lindsey: He does know it now.

Mr. Lewis:—even without the ABM system.

Dr. Lindsey: He knows it today.

Mr. Lewis: Is he not likely for many years to know that he cannot possibly simultaneously destroy all the American missiles that are in silos, all the Polaris submarines and all the bombers that are in the air with missiles in them? You are not suggesting that the Soviet planner is under any illusion that he can do that. And what does your ABM system accomplish for him, how does that frighten him anymore when he knows perfectly well that you are going to protect one-third of your missiles and that your AB missiles are not likely to hit everyone of his missiles but only a fraction of them? In what way is this insanity any sort of deterrence—in what way in this total situation?

Dr. Lindsey: I think you have described the position today very accurately and we would like to keep it that way—. Nobody is going to attack because he knows he cannot disarm us. The fear is that if the Russians were to build a large number of MIRV's and an effective ABM of their own and achieve some sort of anti-submarine force or, alternatively, have their ABM able to intercept the American submarine-launched missiles, then they might feel one day that they could do this and get away with it—and that is what the United States does not want to happen.

• 1725

Mr. Lewis: It is assumed that that is what the American military planners really have in mind and, frankly, I have never been impressed that that is the case—and the same for the Soviet military planners, I may add.

Dr. Lindsey: That is the case as made by the Secretary of Defence last month.

Mr. Lewis: Yes, I appreciate that that is his case.

I still ask you as the expert before us in what conceivable way does the deployment of 12 ABM sites, assuming that they are all put in place, add to the deterrent?

Mr. Prud'homme: Mr. Chairman, I think that Dr. Lindsey is here as a technical adviser to give us information about the ABM system in order that we can form our own opinions and be better informed to question further witnesses who may come before us. The witness is not here to defend a position; he is here to give us some background material and information. It seems to me a little bit unfair to put him in the position of having to give us opinions. He is here to give us background material and information in order that the committee can be better informed to question other witnesses according to the views they have formed. I do not think we should pursue this discussion with Dr. Lindsey any further along this line.

The Vice-Chairman: I will take what you have said as a point of order. Did you have something to say on that point, Mr. Thompson?

Mr. Thompson (Red Deer): It is a very valid point of order and I think we are taking up the time of others who may wish to ask questions.

The Vice-Chairman: I do think, Mr. Lewis, that perhaps you have a little chip on your shoulder in this connection.

Mr. Lewis: No, I never have any chip on my shoulder, Mr. Chairman.

The Vice-Chairman: You did make an insinuation that he was biased in this whole matter and I honestly do not think this is the case.

Mr. Lewis: I did not say that he was biased. I do not make insinuations.

The Vice-Chairman: I thought you did.

Mr. Lewis: No, and I want to correct you. It was not an insinuation, it—

The Vice-Chairman: I am glad to know that.

Mr. Lewis: Before you say you are glad to know it let me complete my sentence. I do not think it

was an insinuation; it was a statement on my part—I was not insinuating anything—that the written statement which we were given and the presentation which we heard this afternoon was to me an apologia for the ABM system. I have the right to have my opinion on what I listen to and what I read. I read this very carefully, once before I arrived here this afternoon, and again. I noticed in a report in the press—I do not have it before me—that the same kind of general conclusion impressed the reporters, and I am certain that anyone who read this and listened to Dr. Lindsey would reach the same conclusion. Therefore I think it is not only fair, it is necessary to discuss with Dr. Lindsey whether he thinks that the ABM is in any real sense a deterrent in the present situation, yet alone what might happen in future developments.

The Vice-Chairman: Well, I think he has made it clear, at least to the Chair, that he does believe it is a deterrent. He has been asked to come here and tell us about the implications for Canada of the ballistic missile defence. He has not been asked to come to—

Mr. Lewis: Mr. Chairman, you are not sitting there as a judge sits in court to tell me what questions I may ask or not ask; you are here to preside over the meeting and so long as I have time you will please permit me to ask the questions that I want to ask.

The Vice-Chairman: Yes, but we are now on a point of order and other members are objecting to your course of conduct at the moment. That is what it amounts to, Mr. Lewis.

On the point of order, Mr. Thompson?

Mr. Thompson (Red Deer): Mr. Chairman, Mr. Lewis has just said that anyone who reads this will automatically come to the same conclusion that he has. I want to completely disassociate myself with that statement. He can speak for himself but not for me.

Mr. Lewis: I would not try to speak for Mr. Thompson in a thousand years, Mr. Chairman. I would be sure I was wrong if I did.

The Vice-Chairman: Mr. Brewin, on a point of order.

Mr. Brewin: Mr. Chairman, the point of order I would like to make is that those in this committee who are examining witnesses should be given the

• 1730

utmost latitude to conduct the examination in the manner they see fit, as long as there is not some obvious impropriety. Mr. Lewis was conducting the examination in a manner that he saw fit. He is

eliciting a lot of useful information, I do not think he should be restricted in any way, and I hope that you, as Chairman, or any other Chairman are not going to get into the habit of telling us just what questions we are to ask and how we are to ask them.

Mr. Prud'homme: On the same point of order, I do not think the chairman is telling us what questions to ask. I still go back to what I said earlier, that Dr. Lindsey was asked to prepare for the committee a special report. You might disagree with it, and that is your privilege, but I am sure that with the explanation he is giving us this afternoon and that he gave at the last meeting we will be better prepared to ascertain the counter views of others. However, I do not think it is fair to ask him the counter views on something that he has prepared for us.

Mr. Lewis: Mr. Chairman, I really do object to these interruptions.

Let me read the paragraph, Mr. Chairman. This is from Dr. Lindsey's statement.

To summarize, the significant risks come from the offensive ICBM (or SLBM) and not the defensive ABM. If ABM prevents an ICBM from bursting at its intended point, both lives and resources have been saved; if it prevents it from bursting on the ground, then the radioactive hazard has been decreased, to Canada as well as the USA, even if the targets were all south of the border.

This kind of statement, Mr. Chairman, lacking what Dr. Lindsey has now said in reply, not only to my question, but to the questions of Mr. Brewin, Mr. Allmand and others, that there are other ICBMs that the ABM will not touch and that therefore there will be continuing destruction, despite the ABM, leads anyone reading that to the conclusion, in my view, that there is a suggestion that the ABM system is desirable.

The Vice-Chairman: Mr. Lewis, there can be all kinds of development in this situation. As I see it, that statement that you have just read is a perfectly factual and perfectly legitimate one for Dr. Lindsey to be presenting to this Committee.

Mr. Lewis: I did not say—

The Vice-Chairman: If you want it expanded upon, you have your opportunity here, but let us not lay charges against our witnesses.

Mr. Lewis: I am not laying any charges, Mr. Chairman. I am saying that unless these statements are further tested, as some of us have attempted to do, and as I have attempted to do I admit with some feeling for which I do not apologize, this kind of statement, I say, conveys the impression that there is value in the ABM. I am testing just this kind of thing.

The Vice-Chairman: This I am quite prepared to let you do, Mr. Lewis.

Mr. Lewis: This is what I have been doing. I do not need any lectures from you or even my good friend, Mr. Prud'homme.

Mr. Prud'homme: It was not my idea to lecture you, sir.

Mr. Lewis: I am asking you, Dr. Lindsey, whether in the present situation, with all the nuclear offensive weapons available, the projected ABM system can possibly be a deterrent in the mind of a potential enemy, if there is a potential enemy?

Dr. Lindsey: I think there are conceivable developments that would make it a deterrent by 1975. I do not think that it is necessary in 1969.

Mr. Lewis: You said "conceivable developments": what conceivable developments could make the deployment of 12 sites of anti-ballistic missiles valuable as a deterrent in 1975? This is what we are talking about.

Dr. Lindsey: Yes.

Mr. Lewis: We are talking about this particular system that is being proposed. In what way can that be a deterrent in 1975?

Dr. Lindsey: Several things would be required to happen by about 1975: firstly, that the Russians build a lot more of these large rockets with MIRV in them, which would enable them to destroy almost all of the Minutemen in their silos.

Secondly, it would require them to build either an AMB system of their own, or an anti-submarine system of their own that would negate the deterrent effect of the American Polaris missiles.

Thirdly, it would require that by some means they disarm the American bomber force and this might be done by submarine missiles; it might be by the FOBS, or it might be by a good air defence system.

All those things would have to happen. Then the part of the 12 sites that would have a deterrent effect would be that around the four Minuteman complexes and in the control centre in Washington, but not the part around the cities.

Mr. Lewis: Therefore, Mr. Brewin's suggestion to you, which you in part negated, was surely a correct one, that this is a first step, because if all the developments which you have indicated, and you said that all of them would have to occur by 1975—and obviously, if I may add Washington sitting absolutely still and doing no research work or anything else, which is very unlikely—then, surely, this Safeguard system would not be of

very much value at that time. You would then have to have not a light ABM system, but a hard one, not \$7.8 billion, but \$60 or \$70 billion, which I think is the figure given, for the full system.

Dr. Lindsey: I do not think it would have to be

• 1735

as big as that to protect the deterrent. Of course, we talk about the 12 sites as if they were an unbroken package. Mr. Nixon made it very clear that he is going to decide year by year whether or not to extend the scheme. I think if something like we have just postulated were to happen, we would see it coming and the yearly decisions would probably be altered in that way. Perhaps there would be no deployment over cities and more over the deterrent.

Mr. Lewis: Therefore, I suggest to you that you must agree with Mr. Brewin's suggestion to you that this is a first step. May I put it this way to you: either the Safeguard is really a complete waste of money, because it is not a deterrent at all, or if the developments that you have indicated do take place on the Russian side by 1975, then the Safeguard becomes completely inadequate, and a total ABM system at \$40 billion, if not \$60 or \$70 billion, which is another figure that I have read, would be necessary, and one can take it for granted that if steps towards these developments are detected or suspected as taking place in the Soviet Union that there will be a progressive increase in the ABM system, or some equivalent system year by year? Is that in effect what you are saying?

Dr. Lindsey: That could well happen. I think correspondingly if the two super powers disliked this development and they entered into strategic arms talks, they might agree not to proceed any farther with it.

Mr. Lewis: I hope so.

Dr. Lindsey: That could happen too. But I am pretty sure that if one side makes a move which causes the other to fear that its deterrent is at stake, the other one is going to spend money to protect its deterrent. I am not sure how much it would take. I do not think it would take as big a system as you indicated to protect the deterrent, because all of it does not have to be protected.

Mr. Lewis: My memory, and other members of the Committee will please correct me if I am wrong, is that someone from the Hudson Institute who was before us in the Fall said that the hard system would be in the neighbourhood of I think \$40 to \$60 billion.

Dr. Lindsey: I think he was talking about full area protection of all the population there. I

believe we are now talking about only protecting the deterrent, which is a much less ambitious task.

Mr. Lewis: Yes, I suppose there are fewer sites.

Dr. Lindsey: You would not try to protect 100 per cent, but maybe 25 per cent of them would be enough to protect.

Mr. Lewis: To do what? To be a deterrent?

Dr. Lindsey: Yes.

Mr. Lewis: That I cannot see.

If you do not think you should answer or do not want to answer this question, that, of course, is your choice, but if a country like the United States, or the Soviet Union, either of the super powers, has the offensive capability that they have now, which is pretty vast and pretty frightening, what would be the danger in a country like the United States saying, "We will not enter this ABM and another phase in this arms race, because nothing the Soviet Union has can possibly destroy our effective second strike capability, as Mr. Allmand and other people have brought out and you agreed.

Dr. Lindsey: Not today.

Mr. Lewis: I beg your pardon?

Dr. Lindsey: They could not do it today.

Mr. Lewis: No, nothing that the Soviet Union has today or in the next few years, as far as we can foresee: that would be correct would it not?

Dr. Lindsey: It would be.

Mr. Lewis: Yes, "...could possibly destroy our very effective second strike capability, and therefore we will not enter this kind of limitless expenditure but rather rest on our very effective deterrent that we have at the moment for the next few years, and from that adequate position of strength negotiate", as they want to, according to Washington, "some arms limitations, some arms race reduction." Wouldn't that be more sensible than entering a questionable defence system?

Dr. Lindsey: I suppose the scheme of phasing Safeguard year by year with an annual review is an attempt to do just what you said; that each year they will review the arms talks and see how they are doing and perhaps they will say, "You agree not to build the MIRVs and we will not build phase 3". I think that is a very real possibility.

• 1740

Mr. Lewis: Do you, sir? I suppose you have seen, as I have, that even before Congress has approved the Safeguard system that the Pentagon has already ordered the beginning of work on it.

Dr. Lindsey: Well, they are certainly trying to do Phase I, but . . .

Mr. Lewis: Before it has even been approved.

Dr. Lindsey: They should not do that.

Mr. Lewis: Dr. Lindsey, the fact is that they should not do that, I agree, and I am pointing out to you how unreliable these people may be. The fact is that Congress has not approved, the argument is still going on in Congress but I think Under-Secretary Packard the other day—I do not have the clipping before me but I am sure I am quoting accurately—stated frankly that the Pentagon had already given instructions to begin the construction of the sites and the deployment of these anti-ballistic missiles. He even said that if Congress does not approve it, they will have to stop and to scatter the thousands of people they are now employing—many thousands of people—I forget the number. If people are this determined to do something which Congress has not yet approved on the basis of some money they have from the year before, how reliable are such people to do the kind of thing that you say, that they will review each year and maybe stop? What reliance can one have in that kind of behaviour?

Dr. Lindsey: The President of the United States said that was his intention. I suspect that the hurried continuation of the program which you mention is probably on those two sites—in Montana and North Dakota. And they are probably using funds which were authorized earlier for Sentinel.

Mr. Lewis: They are using Sentinel funds?

Dr. Lindsey: I suppose so, yes.

Mr. Lewis: And Sentinel has been scrapped.

Dr. Lindsey: Yes, although the equipment is the same and I think those two sites are probably the same as in Sentinel; it is the other sites that have been changed.

Mr. Lewis: I do not know. All I know is that the Sentinel program has been officially scrapped, the Safeguard program has not been approved and the Pentagon has now started major work on installing the Safeguard program, which has not been approved. As far as I am concerned, I cannot have any confidence that people like that are likely to be as reasonable year by year as you suggested they may be.

Dr. Lindsey: Well, sir, as a civil servant I would never recommend spending money that had not been authorized by Parliament.

Mr. Lewis: At least that part of your testimony is rather reassuring.

The Vice-Chairman: Is that it, Mr. Lewis?

Mr. Lewis: That is it.

The Vice-Chairman: Gentlemen, would the Committee agree to print Dr. Lindsey's advance presentation to the Committee as we did on previous occasions, and also as an appendix, to incorporate the slides used in Dr. Lindsey's opening remarks as part of the evidence of this sitting, the latter, the slides, to be just incorporated in the evidence? Is this agreed?

Some hon. Members: Agreed.

Mr. Guay (St. Boniface): May I ask two very simple questions?

The Vice-Chairman: I was going to ask that we adjourn until 9.30 a.m. tomorrow, Mr. Guay. Were you here when I made that announcement?

Mr. Guay (St. Boniface): No, I was not.

Mr. Prud'homme: Do we not usually sit at 11 o'clock?

The Vice-Chairman: We do usually but the only time we can get a room is tomorrow at 9.30 a.m.; Room 307 in the West Block.

Mr. Thompson (Red Deer): Mr. Chairman, that overlaps with another committee that several of us are on. It is a bit difficult.

The Vice-Chairman: We would not be long tomorrow morning. We have possibly three or four questioners only.

Is it your wish that we continue now? I have Mr.

● 1745

Howard. Mr. Roberts has left now. He may be expecting to ask his questions in the morning. That is the only problem. Would it be your wish to hear Mr. Howard's and Mr. Guay's questions now?

Mr. Allmand: When somebody leaves a meeting still in progress, he has to stand the risk that we might finish. Not that I want to see Mr. Roberts not ask his questions, but it is not worthwhile bringing back the witness in the morning just for one questioner if we can finish off.

The Vice-Chairman: We have Mr. Howard and Mr. Guay here. Is it your wish that Mr. Howard proceed?

Some hon. Members: Agreed.

The Vice-Chairman: Mr. Howard.

Mr. Howard (Okanagan Boundary): I will proceed, Mr. Chairman, but I would point out that I think Mr. Roberts is very much interested in this particular subject. He left on the understanding

that there would be a subsequent meeting and I think it would be rather unfair to him not to give him an opportunity. Is it not possible to have some time other than 9.30 tomorrow morning?

The Vice-Chairman: The Clerk advises me 9.30 a.m. is the only time available tomorrow and Dr. Lindsey says he will come back at our convenience any time.

Mr. Brewin: Mr. Chairman, it was mentioned by the Chairman of this Committee—I do not mean yourself as Vice-Chairman—that we would meet tomorrow at 3.30 p.m. Has that been explored?

The Vice-Chairman: We have been cancelled out on that one for tomorrow, Mr. Brewin.

Mr. Guay (St. Boniface): It is a relatively short notice, Mr. Chairman, to make a change in the plans. I think it was only yesterday that we were told, as has been mentioned, that we would have a meeting today and another on Thursday in the afternoon. There are probably others who are certainly as busy as I am, but I had planned differently. I had something else in mind for tomorrow morning, so it does cause a certain inconvenience. Although some have left and are under the impression that you will hear them in the morning, I will abide by your suggestion if you feel that we should go along and finalize it.

The Vice-Chairman: I think we are pretty well committed to a hearing in the morning. But on the other hand, if Mr. Howard cannot be present in the morning and you cannot be present, Mr. Guay, I think you should ask your questions now.

Mr. Guay (St. Boniface): I will try to be here.

Mr. Thompson (Red Deer): Mr. Chairman, the basic problem I think is with the Committee on Immigration and Manpower. There are several of us who overlap. It is a great difficulty to absent oneself from a Committee that was formally called prior to this meeting and I fear for a quorum or a proper hearing tomorrow morning. That is the problem.

The Vice-Chairman: I should think that a quorum will not be necessary. There will not be any vote to come to a head. That would be the probability, I should think.

Mr. Lewis: We had better ask questions or adjourn, Mr. Chairman.

The Vice-Chairman: Mr. Howard, do you wish to proceed?

Mr. Howard (Okanagan Boundary): I am interested in this business of the nuclear blackout. I assume you are talking about this idea of the explosion of the missile that comes in ahead of time

and puts radar out of action. This sounds to me like a relatively simple procedure, and as there are only a very few radar installations involved in this ABM program, it would seem to me that the whole program could be put out of action with a minimum of effort.

Dr. Lindsey: I think the nuclear blackout is perhaps one of the most difficult things to counter-act. The opacity of the clouds to radar depends very much on the wavelength which is used, and one counter-measure would be to use radars of two or three different frequencies, and also to have more radars. I think this is the sort of case for which forward siting, perhaps in Canada, might have more value than for the present type of system. One of the difficulties, of course, in assessing a thing like that is that there have been very few nuclear weapons exploded at high altitude, and as long as the nuclear test ban is in effect there never will be any more, so that one has to judge it all by theoretical calculations and you just do not know

• 1750

exactly what would happen. I think it is a serious difficulty.

Mr. Howard (Okanagan Boundary): This leads to another question. Assuming that we had to have an ABM system—and I am certainly not prepared to agree that we do—where is the best place to put it? I am rather shocked sometimes when I hear discussions in which we talk about placing it in such a position that it would perhaps not involve Canada, if possible, but that it is all right if millions of Americans are killed—and perhaps I am being a little whimsical when I say if millions of Soviets are killed. It would seem to me that we should try to develop a program that would preserve as many lives as possible on both sides of the world. Where is the best place in terms of saving lives for such a system to be located? Is it in northern Canada or is it along the U.S. border?

Dr. Lindsey: That is the type of problem that has been discussed between the two countries for a long time in the case of anti-bomber defence, but it has not been discussed in the case of ballistic missile defence.

Mr. Howard (Okanagan Boundary): Is there no technical advice on this subject?

Dr. Lindsey: I think the prospects of improving the protection of North America by siting radars farther forward might become much more important in the case of a system that depended on mid-course interception or very long-range interception. I think some improvement could be made with the Spartan type of interception, but not very much in the case of Sprint which is more of a point defence.

The problem has never really been tackled by the two countries working together because the Canadians have said so far they just are not going to participate in active ballistic missile defence, so there have not been joint studies of the problem. If there were they might produce some interesting results, but they have not ever been made.

Mr. Howard (Okanagan Boundary): It has been suggested that one of the reasons for not engaging in an ABM system is that it would provoke a counter system or counter developments on the other side, and yet from what you have told us today the ABM system as proposed is extremely thin. One would almost say that it is highly ineffective against any sort of ordinary attack other than a very minor attack. In what way then would you say that it could provoke a counter effort by the Russians, for example, if it is such an ineffective system?

Dr. Lindsey: I do not think it will provoke a counter effort by the Russians.

Mr. Brewin: May I have a supplementary on that?

The Chairman: Yes.

Mr. Brewin: Would not the same reasoning that you used before apply? They would see the light installation as being nothing more than the start of or the preparation for a thicker system and they would start to say that they cannot wait until we get it thoroughly installed. If that is all unstable would it not be just another case where there might well be over-reaction?

Dr. Lindsey: It could happen and I think it was to make that less likely that one of the changes between Sentinel and Safeguard occurred. That was the alteration in the siting to put the missile site radars far away from cities so that they could not be easily thickened-up for city defence. This was just for the very reason that you mentioned.

There is always the question of who started it. Perhaps you could say Safeguard was the reply to the Russian ABM system. I think it is rather fruitless to say who started it and who is reacting. It is just almost impossible to say who made the move and who made the counter move.

Mr. Howard (Okanagan Boundary): If the ABM system gives such thin defence to cities, and it is a very expensive system, from the standpoint of protection of the cities and the people in cities would the money not be better spent by putting it into a shelter program?

• 1755

Dr. Lindsey: I dare say that if you made a mathematical calculation about lives saved per

dollars spent and you postulated an attack on cities you might save more lives with shelters than with an active defence system, but then of course, it would not have the other objectives of protecting the deterrent. However, it is true that for saving lives in an attack on cities civil defence is very cost-effective.

Mr. Howard (Okanagan Boundary): When did the shift take place in the thinking of the planners in the United States from protection against the Chinese to the switching back to a deterrent or a protection against the Soviets? As I recall, when this was first discussed it was designed as an anti-Chinese program. When did that shift take place?

Dr. Lindsey: I think it was between the outgoing Democratic administration and the incoming Republican one over a period of two or three months just as 1968 turned into 1969. I think that was about the time the change occurred. The reason as explained by Mr. Laird was partly because of this information about the increased building rate of the SS9 Soviet rockets.

Mr. Howard (Okanagan Boundary): I almost wonder if the planners or those who were trying to sell the program were accepting the fact that there was not really any legitimate reason to protect against the Soviets but there might be against an irrational leadership in China, and then when they discovered that the Chinese were not advancing as fast possible in the technical field and were actually likely to be incapable of mounting any kind of an attack contrary to their earlier fears, they changed their line of salesmanship then to the idea that they should go back and defend ourselves against the Soviets?

Dr. Lindsey: In the discussions before Congress that point of view was expressed but I do not feel that I can make a comment on it either way. The expressed reason for making the change, as I think I have tried to explain, is the official government point of view.

Mr. Howard (Okanagan Boundary): If the system is not capable at this time of defending against MIRVs and the other existing systems, is it really possible to thicken this system fast enough to overcome the production rate that the Soviets would have of their multiple re-entry vehicles?

Dr. Lindsey: I suppose it would only be possible if a certain amount of progress started now and the momentum was maintained. I dare say that one of the main reasons for the desire to start the program now is to retain the possibility of accelerating the build up if they decide they want to do it. It takes a long time to learn how to make these components and to net them together, a very long time, and you could not just decide quickly to alter the pace of the program.

Mr. Howard (Okanagan Boundary): What is the estimated lead time involved?

Dr. Lindsey: If the authorities obtained for the phase 1 in 1969, I think they believe the sites will be operational either in 1973 or 1974. So it is nearly five years, and that is on a base of years of research and development and a Sentinel program that achieved a certain amount of momentum. One has to say it takes a long, long time between the original design and the final appearance and service, and then it takes a lot longer to make the thing work the way it is supposed to. That is why they have to plan these things so far ahead, and because they are planning far ahead there are many unknowns.

Mr. Howard (Okanagan Boundary): Fine; thank you.

The Vice-Chairman: We will adjourn, then, until 9:30 a.m. tomorrow and meet in Room 307, West Block.

Thursday, May 22, 1969

The Vice-Chairman: Gentlemen, we will call the meeting to order and continue our questioning of Dr. Lindsey in connection with the ABM problem. Our next questioner is Mr. Guay.

Mr. Guay (St. Boniface): As I said, Mr. Chairman, one of the questions I had intended to ask has already been asked and I am satisfied with the answer. However, Dr. Lindsey made reference yesterday to the fact that the stationary satellite could be used with regard to early warnings and I

• 0945

would like to ask if we could use the Canadian satellite that is being put up at the moment by Bell Telephone for the Canadian government in this particular respect, or will it be used in part for that purpose?

Dr. G. R. Lindsey (Chief, Defence Research Analysis Establishment), Department of National Defence: The satellite we use to survey a part of the earth to detect the launch of missiles ought to be orbiting above the centre of the zone that it is serving, so if we were trying to use a satellite to observe the launching of rockets in Asia, the satellite should really be over Asia. The Canadian communications satellite is to relay information from Canada to Canada and it will be orbiting on the longitude of the centre of Canada, so it would not be in the right place to do this job.

Mr. Guay (St. Boniface): When we were in France we were told something slightly different from what you are saying. At that time the French people told us that they would like to make use of

our satellite if we would allow them to do so, so our satellite certainly covers a very broad range. Also in a newspaper they showed the shadow of our satellite from the location where it has been deposited, and it certainly overshadowed almost all of North America completely. This is the reason I am asking you that. North America in particular was well covered. If I understand correctly, what you are saying is that if we were to use a satellite it would mean that it would have to be somewhere closer to, Russia or China, for example. Is this what you mean?

Dr. Lindsey: For a satellite to detect a rocket being launched in Asia it must be able to see Asia, so it would have to be in the other hemisphere from ours, and if we put our satellite over Canada or over the Atlantic Ocean in order to transmit messages from either Western Europe to Canada or from one point in Canada to another, then, it will be over the Western hemisphere, but for the purpose that we were speaking of—to detect launches—it would have to be over the middle of Asia. So, I do not see how one satellite could do both jobs.

Mr. Guay (St. Boniface): At the height it is at the moment, you mean to say it would not see Asia?

Dr. Lindsey: No, you can only see half the earth no matter how far away you go.

The Vice-Chairman: What about right over the pole, Doctor?

Dr. Lindsey: It will not stay stationary over the pole. It is not really stationary at all. It tries to go around the equator once every 24 hours while the equator is turning around underneath it once every 24 hours. If you put it over the pole it will not stay there. It would have to be circling in a polar orbit and it would be over the pole perhaps once every hour and a half.

Mr. Guay (St. Boniface): If we were to use one jointly with the United States for the purpose you described yesterday, where would it have to be?

Dr. Lindsey: It would have to be somewhere over Eurasia.

Mr. Guay (St. Boniface): Fine.

Dr. Lindsey: It would have to be able to see the place on the ground from which the rocket was being launched and therefore it would have to be in the proper hemisphere to do that job.

Mr. Guay (St. Boniface): I have another short question, Mr. Chairman. It is with regard to the various sites in the United States that you indicated yesterday, and particularly that place on your map which was earmarked as phase 1. If phase 1, which is in North Dakota—and the same thing

would apply to any of the other areas—was closer to Canada than it is at the moment would it be to our advantage with regard to not being involved in a deployment of any of these missiles over Canada, and particularly over large cities such as Winnipeg and Calgary? If it was closer would it move the deployment further up, or would it be to our advantage if it remained where it is or if it was placed further south? In other words, is the site that has been picked by the U.S.A. the ideal site and the ideal location, not only for them but also for the Canadian people, most of whom live in the southern section of Canada?

Dr. Lindsey: If we want to obtain some protection from the site, then we would like it to be as far north as possible. If we want to be subjected to the minimum risks from the use of the missile, we

• 0950

would like it to be as far south as possible. In fact, I think the sites are far enough south that probably the short range Sprint missile would barely reach the border, perhaps not at all, but the Sparton would reach far up into Manitoba. If the site were moved 50 miles north or south it is still true that it would burst far over Manitoba, but so far above it that we expect no danger. I think the question of the exact location of a site and its importance to Canada, would depend a lot more on the later phases, after phase one. Do not forget that phase one is to defend particular Minutemen, and they are in place today so they are not going to move them. Therefore the ability to move those sites is pretty limited if they are to defend the Minutemen. But in the case of the other planned sites in the Washington State, Michigan or Ohio, and New England, I think there is considerable uncertainty about where they will go. There implications for Canada do depend on exactly where they are going, and that is not yet known.

Mr. Guay (St. Boniface): Thank you, doctor.

The Vice-Chairman: A supplementary, Mr. Legault?

Mr. Legault: Dr. Lindsey, a remark was made by someone yesterday and it was a little out of order then but it seems to follow Mr. Guay's question. You were trying to sell the impression that these sites should be installed further north in Canada and to sell that point you said that they should not be close to the border but further north so as to prevent any of these explosions over the populated area. If these sites were further north, it would provide better protection.

Dr. Lindsey: Sir, I am glad you asked that question. It gives me an opportunity to say something that perhaps I should have said yesterday. I am not trying to sell anything.

Mr. Legault: It was just a remark from someone who did not know who you were. He said, "Is he trying to sell us the idea that these sites should be further north, rather than close to the border?"

Dr. Lindsey: What I am trying to do for this Committee is to explain to them that as a result of our work, we analysts believe that if the sites were to provide the maximum protection for Canadians they would have to be fairly far north. If they are sited where we think they are going to be today, the question of protection for Canada is very much in doubt. It would protect some areas and not others. As far as risk is concerned, we do not believe that there are serious ones, but such as they are, they could be reduced even more as far as the Sprint is concerned by siting them a bit further south.

Mr. Legault: Further north?

Dr. Lindsey: If the Sprints, with a very short range, are to be kept absolutely out of Canada, then the sites would have to be whatever the range of Sprint is, and they would have to be farther south than that. The question of the value of moving sites farther north has never really been thoroughly analyzed. We have not invited a joint study with the Americans, and they have not asked for one either, so that problem has never been very thoroughly investigated.

Mr. Guay (St. Boniface): A supplementary if I may, Mr. Chairman and Mr. Legault. This is what I really had in mind when I was questioning you a while ago. I believe that you left me to understand that it would be rather difficult to change the sites now, because of the Minutemen.

Dr. Lindsey: For phase one, yes sir, that is true. Perhaps it could still be changed for the other phases.

Mr. Guay (St. Boniface): We could probably have a good discussion with the U.S.A. in this particular regard.

Dr. Lindsey: I do not think it is too late to do that.

The Vice-Chairman: Did you have another question, Mr. Legault.

Mr. Legault: Thank you very much, Mr. Chairman, but the doctor has answered it.

The Vice-Chairman: Do you have a supplementary, Mr. Nesbitt?

Mr. Nesbitt: Would it not be to the advantage of the United States, particularly since some of their Minutemen are located in Michigan or Ohio itself, to have the Minutemen plus the others moved very much to the north, if it were technically feasible

to do so from a defence point of view. Then there would be much less damage and danger of fallout, • 0955

if any Soviet missiles were aimed at these Minutemen bases. Would that not be correct?

Dr. Lindsey: That may be true, sir, but I think the Minutemen are very immovable. They are literally buried in concrete and I think to move a thousand Minutemen would incur an enormous expense. It is practically beyond question that they would ever think of doing that.

Mr. Nesbitt: Yes. But as I understand from your remarks and others, a great many of these are in Montana, North Dakota and Washington. I am referring to the ones which are adjacent to the heavily populated industrial areas of the United States or indeed, Southern Canada.

Dr. Lindsey: I think most of the Minutemen sites are not near large industrial areas.

Mr. Nesbitt: It was my impression that there were some in Ohio or Michigan.

Dr. Lindsey: I do not think so, sir. It was intended that there would be an ABM site in Ohio or Michigan, but I do not think that one would be assigned to the protection of Minutemen silos. I think they are in the mid-west, Montana, North Dakota and Missouri and Wyoming.

The Vice-Chairman: Where would the Titans be, doctor?

Dr. Lindsey: I think they are in one of those areas too. I forget which one.

Mr. Nesbitt: They are not near large populated cities in either the United States or Canada?

Dr. Lindsey: No, they are not.

Mr. Nesbitt: The risk from missile attack on those bases which would involve ground-blast would not be very likely, where they are located at present, to cause extensive fallout damage to major population areas?

Dr. Lindsey: I am not so sure about that because fallout can spread an immense distance. Inasmuch as it has been possible to move them away from cities and still keep them within the 48 States, that has already been done.

Mr. Nesbitt: Thank you, Mr. Chairman.

The Chairman: Mr. Laniel.

Mr. Laniel: Mr. Chairman, I have many questions on my mind, but I do not seem to be able to sort them out. I will start from something that you say in your paper, Dr. Lindsey. At page 45:

From a strategic point of view, anti-bomber and anti-missile defence are part of a single problem.

This thing is not clear in my mind actually. In my view, the use of Canadian territory is for interception, not for surveillance or radar, but for interception and is important to the air defence. Both protect the deterrent but as far as we are concerned, not wanting the Americans to come over the populated area of the Canadian territory which is in the south of Canada with their interceptor, it might be advantageous for Canada to have itself an interceptor that would take the destruction of the bombers further north. If we look at it from the ABM point of view which is also there to protect the deterrent, and due to the fact that the impact will be high in the atmosphere, I do not think that the Canadian territory is all that important because of fallout. You made the point that if we use a Spartan the chances of fallout and dangers to populated areas and cities will be minimized quite a bit in comparison to what would happen with bombers. I ask myself the question you asked yourself at page 35, is it really important that there should be ABM installations in Canada? Would you agree that Canada has a more direct responsibility, as long as the need is still there to defend North America against bombers, and that as far as the defence of North America against ICBM is concerned its responsibility could be limited to a surveillance or to the radar system or other means which could still give North America the same protection or practically the same protection against ICBM?

• 1000

Dr. Lindsey: In general, I agree with what you said, sir, yes. When I said that the two problems, anti-bomber and anti-missile defence were part of the same strategic problem, what I really had in mind was the question of whether we need bombers and submarine launch missiles and ICBM's, and whether we need strategic defence for all three. The obvious purpose of the whole super-system is to deter and to prevent a war.

When we get down to the details of the air defence system, or the ABM system, there are differences and you have pointed them out. Our land bases are very important for the air defence of North America, and it would be virtually impossible to carry it out effectively without having certain installations on Canadian soil. But I think it is also true, as you pointed out, that it is possible to carry out a limited defence of the deterrent with the installations all in the United States; although, if it is ever called upon to operate, some of the interceptions would be above Canada.

Mr. Laniel: Besides, are we not dreaming when we think that the Safeguard system might be

aimed at the protection of Canadian cities, especially when we know that the Sentinel, which was meant more to protect the American cities, was put aside and replaced by the Safeguard, which is mainly concentrated on the defence of the deterrent? Are we not really just talking only to ourselves when we try to defend the ABM system and try to see the slight protection that it might give to the Canadian cities?

Dr. Lindsey: I believe that the American plan for full deployment, by which it was going to protect American cities, was intended to protect American cities only. We did not ask that the plan cover Canadian cities, and they have not asked us if we wanted to discuss it. All that we did in the analysis that was described to you yesterday was to see whether it would be physically possible to extend this cover out to Canadian population centres.

The conclusion we came to was that it probably would be physically possible if the sites were somewhat adjusted with that in mind. We have not asked that this be done, and the Americans have not offered to do it. We just have not talked about it.

But I am sure that the present plan is set up only with the protection of American cities in mind, and you would not expect anything else, because we have not been a partner to the scheme at all.

Mr. Laniel: You mean the complete—

Dr. Lindsey: The complete, 12-site deployment, yes, sir. The first two sites in Phase I are not supposed to defend population; that was never claimed. They are just to defend those Minutemen installations in the West.

Mr. Laniel: My next is a technical question. You said in your presentation that it was learned, with time, that an ABM did not have to have a direct hit on an ICBM to destroy it. Could you expand on that destruction. Would the radiation that would neutralize the ICBM provoke the explosion of the ICBM in the air, or would it just neutralize it so that even if it fell down it would not have any effect and the fallout would come only from the Sprint or the Spartan?

Dr. Lindsey: For many years, when people thought that ballistic missile defence was technically impossible, it was because they felt that one could not hit a bullet with a bullet, especially if the bullet was going at 18,000 miles an hour. The great dis-

• 1005

covery that made ballistic missile defence technically possible was the design of this nuclear warhead, which meant that if the defensive missile

were burst within quite a wide distance from the ICBM the radiation from the defensive warhead would render the ICBM inoperative.

Mr. Laniel: It would not explode, then?

Dr. Lindsey: It is expected that it would not explode, and that the pieces would fall to the ground perhaps as a single unit, or that it might break up in the air and come back to earth. But the expectation is that there would not be a nuclear explosion from the ICBM.

That point has been disputed by a number of scientists, and you could not really make a firm judgment on it without knowing how the warheads were designed, including the Russian warhead; and, of course, we do not know that. So this is a point on which there is some disagreement. But most of the expert advice that we have had from the United States is to the effect that the ICBM will not explode; that it will be damaged by the radiation in such a way that it will not go off.

Mr. Laniel: Speaking of an attack on a Minuteman site in the United States, you presented in your diagram (Figure 7) three possibilities. You spoke of MIRVS, I think, and of having a better chance to get more Minutemen on a site then you would with just a MRV. Did you take into consideration something else that you mentioned, namely, electronics, because I guess ICBM's could be classified as electronics gadgets? You said that electronics could be neutralized by—was it—radiation from an explosion within an area, which might have an effect on the operation and might even without a direct hit on a silo, have a more neutralizing effect on the deterrent than you said?

Dr. Lindsey: Yes; in the chart that we discussed yesterday (Figure 20) in relation to the risks from nuclear weapons, I spoke mostly about the risks to human life. Then I mentioned that there were also electro-magnetic effects.

The two electro-magnetic effects that seem to be the most important are the electro-magnetic pulse, which could damage or destroy electronic circuits at quite a great distance, and the blackout, which could make a great cloud of ionized gas in the upper atmosphere that would interfere with the transmission of radio waves.

Mr. Laniel: Are the silos a protection against that?

Dr. Lindsey: They are a partial protection against the electro-magnetic pulse, because it was known that this was a hazard; but I suppose if the burst were close enough it might be too much for the protection. However, steps have been taken to reduce the effect of this electro-magnetic pulse. It is rather like lightening, on, even more violent.

Mr. Laniel: Thank you, Mr. Chairman.

The Vice-Chairman: Thank you, Mr. Laniel, Mr. Nesbitt?

Mr. Nesbitt: It may be that Dr. Lindsey has answered this question. Unfortunately, I was not able to be here yesterday afternoon. If you have, Dr. Lindsey, I will just wait until I see the Committee's report. If you have not, perhaps you could provide some sort of an answer.

These matters of Safeguard and Sentinel have been widely discussed by the public and in the media. In the United States we hear a great many allegedly prominent men in your profession say that these various systems, are no goods. Of course, the media are not always accurate; they are most of the time, perhaps, but sometimes they colour reports to suit their own purposes—and, we all realize that—but could you give us the bases on which some of these people, very eminent in their own fields and colleagues of yours, make their principal objections, and why do they feel that these systems might be ineffective?

Dr. Lindsey: There has been an immense debate in the United States about this, and very eminent people on both sides either support the deployment of Safeguard, or attack it. I have made a list of the famous people on both sides, and I think it comes out about equal in eminence and in numbers of Nobel prize winners, and that sort of thing. There is just no doubt at all about the fact that there is a serious difference of opinion over this system.

Mr. Nesbitt: But in the case of those who claim the system is of no practical value, what are the principal points on which they base their support of this view?

Dr. Lindsey: To support the view that the

• 1010

Safeguard is unlikely to be successful?

Mr. Nesbitt: Yes.

Dr. Lindsey: One of the arguments that has been raised is that it is not necessary, that there is already sufficient deterrence to accept the worst attack that could be inflicted on the United States and still leave sufficient weapons to reply and punish the Soviet Union to an extent that they could never tolerate. That is one argument. I think the argument would certainly carry in 1969. The question is whether it is necessary in 1974 or 1975. That is where the biggest difference of opinion comes and it is not surprising. Who knows what the world is going to be like in 1975 when one considers the progress of scientific research in these areas and also political developments that we can-

not forecast? So there is a big difference of opinion about whether the deterrent needs this protection or not.

Another attack that has been mounted on it, particularly by scientific people, is that it will not work. They say one reason it will not work is that it can never be tested. A large complicated military system will normally take many years to perfect, and it can be perfected only as a result of many realistic tests and exercises.

In the case of an anti-submarine warfare system, you can have very realistic tests. You can have real submarines, real ships, real aircraft, real exercises, and you can find out whether the sonar works. Of course you cannot actually attack the submarine and destroy it, so you are never quite sure whether the weapon will work. But at least the majority of components in the system can be tested. That is true of air defence systems also, except that you cannot carry out the final test of shooting the aircraft, so you are not quite certain that the air-to-air weapon will be able to kill. The feeling in the case of the ABM system is that you cannot carry out a realistic test, because you will not dare fire ICBMs at the system, and you perhaps would not even fire them without the use of nuclear warheads. There are counters to that argument. There have been tests in the Pacific missile range when real ICBMs have been fired out over the Pacific and real ABMs have been fired against them, but they have not had nuclear warheads in them. They know from records that the anti-missile came within so many meters of the missile at the point the fuse would have detonated, but that does not prove that it really would have destroyed it. You then have to go back to calculations.

Mr. Nesbitt: Pretty close, though.

Dr. Lindsey: Yes, and if the calculations are right it would have killed it. There is that uncertainty that you have never put it to the final test.

Another argument on the side of the people who say it will not work is that it is more complicated than anything that has ever been tried before. I think it is more complicated. There are unsolved problems in computer programming and in the network of a large system. I think one reason why the Americans are keen to do at least Phase I is so that they will have two complete installations and they can at least work on the computer programming and the electronic problems and then hope they can solve the difficulties that normally can be learned about only by trying.

Another objection to Safeguard that has been raised in many quarters is that it will fuel the arms race. You missed a very long exchange on that subject yesterday, Mr. Nesbitt.

Mr. Nesbitt: I think I saw some of the reports. I know what the arguments would be.

Dr. Lindsey: They were given, and one can make a good case for saying that the ABM perhaps does fuel the arms race. Then there are also doubts about the effect of it on the non-proliferation treaty and the comprehensive test ban, which are both steps in arms control in which most of the world is glad to have seen progress made, and they would not like to see them hindered. There are two sides to that argument as well.

Mr. Nesbitt: Dr. Lindsey, these objections are the ones which are of a political nature rather than a scientific nature. Are they being advanced by scientists, or are they being advanced by people who are perhaps more experienced in the field of public affairs?

Dr. Lindsey: One report recently said that now more than ever in the past, scientists are getting into politics and politicians into science. I think on this subject everyone feels free to talk about everything. They are all experts.

Mr. Nesbitt: That may be. I do not know about the scientists getting into politics. That might be a good thing, but I have grave doubts about politicians getting into science.

Dr. Lindsey: They are in it now in Washington.

• 1015

It is an immensely complicated problem and it has so many aspects to it that you cannot really expect each person to have a licence to speak only in his own area.

Mr. Nesbitt: No, but a person might be a very eminent authority in one particular field of knowledge and then it seems to be a human failing that when that person pontificates on other subjects with which he is relatively unfamiliar, his eminence in one field is taken to apply to his opinions on subjects about which he knows very little.

Dr. Lindsey: You are absolutely right, sir. I could not agree more. I am hoping in subsequent meetings of this Committee that you will have some witnesses who are much more expert in the fields of international affairs and arms control. If you hear some professionals in those fields, you will be able to get more expert advice on those aspects of the problem.

Mr. Nesbitt: I was particularly interested this morning in the reasons, from a scientific or technical point of view, why these systems might or might not work. I think you answered my questions very well. Thank you.

When you mentioned some of these scientists who are pontificating on the subject of international affairs, that brought forth my other observation.

Dr. Lindsey: That is a very fair comment. I think when we talk about strategic problems it is very difficult to draw boundaries. There is a little bit of everything in that area and many people seem to feel that they have useful ideas, but I think some people do get out of their depth very badly.

Mr. Nesbitt: Yes, and if I said that I do not think they will work for technical reasons, I would be getting out of my depth, I know. Perhaps others who say they are not needed, because it is all going to be sweetness and light in 1974, might be a little out of their depth, too.

The Vice-Chairman: Mr. Laniel.

Mr. Laniel: Dr. Lindsey, at one of your previous appearances before the Committee I asked you a question about the possibility of eventually developing some electronic counter-measures to put ICBMs out of control on their way to North America. You said one would have to do that at the beginning. It is too far out and once it is launched it is on its way and it has the propulsion that it needs. It just goes and it is not electronically controlled. I am trying to find in your brief the terminology that you used yesterday for the different kinds of launches that could be made to attack North America. You mentioned the normal one and a lower one, and then you said the orbital one, or something like that. You were speaking of MIRV, which is a multiple re-entry vehicle. What does the "I" stand for?

Dr. Lindsey: Multiple "Independently" targeted Re-entry Vehicle.

Mr. Laniel: But how can that kind of ICBM be controlled, especially in orbit, the one that could subdivide? You could use some kind of electronic device. Is it not controlled all along from the launching up to the point where it will be targeted to something?

Dr. Lindsey: Not necessarily controlled from the launching site or the launching country. It could have inertial guidance in it. In effect the missile, which is boosted into the velocity required to take it to North America, could have a clock inside it that makes it coast after burnout for 32 minutes and then lights the de-boost engine pointing in such and such a direction. This could all be inside the weapon. Instructions would not have to be sent from outside. Therefore I do not think you could interfere with it by spoiling someone's signal or command to it.

It is true, of course, that the internal mechanism will have to have delicate machinery and electrical

circuits and these might be vulnerable, but not nearly as vulnerable as a signal coming from another continent.

• 1020

Mr. Laniel: In that case the targets will have to be chosen in advance. They could not be selected. For a weapon going around in orbit, you could not make a selection. You would have to say: "That satellite will be there for these targets."

Dr. Lindsey: I think there would be quite a difference between the fractional orbital bombardment system, FOBS, and another type which is called Multiple Orbital Bombardment System. The Fractional Orbital Bombardment System does not go around the earth. It would go either a quarter or three-quarters of the way around and its target would be set in advance, so that when it was launched, the launcher would know exactly where he wanted it to fall.

The other type, the Multiple Orbital Bombardment System could be left in orbit indefinitely as a sort of psychological threat, and in that case the owners would have to tell it when to come down and send it a signal. However, it is not generally believed that that would be a serious threat. It would not be as accurate as ICBMs or FOBS and its opportunity to bombard a particular area would only come up several times a day when it happened to be in the right position. Therefore, it would take quite a long time to bring it to bear. It might be a frightening type of weapon but as far as effectiveness goes, it does not seem to be nearly as effective as a simpler type of weapon.

You are quite right. If they had that type, it would have to receive instructions. Mind you, the instructions could be given to it when it was near home. It comes over home-base, say, twice a day and you could send it signals which say, "All right you, in three hours and forty-two minutes let yourself off," and then the signal would be stored and it would carry out its commands three hours and forty-two minutes later. If you were going to interfere with the signal, you would have to do it when it was close to home which is difficult.

Mr. Laniel: The only reason why I recommend this system is that it is a cheaper way of defending ourselves.

Mr. Guay (St. Boniface): On a supplementary...

The Vice-Chairman: Mr. Guay.

Mr. Guay (St. Boniface): I have in mind something similar to what you have just mentioned. Perhaps some device could be found to send the doggone things back to where they came from.

Dr. Lindsey: I do not think you could send them back where they came from, but it is conceivable

that you could alter their instructions and tell them to explode in an off-route place. That is conceivable.

Mr. Nesbitt: I suppose there has been work on the use of lasers in dealing with this sort of missile?

Dr. Lindsey: Yes. A lot of thought has been given to non-nuclear kill mechanisms, and of course the ultimate desire in that regard would be our old friend the death ray which we read about as boys. There has not been an effective death ray yet, however, I think the laser offers a possibility and I am sure people are working on it quite hard. However, it would have to be a very accurate and very powerful ray in order to damage something hundreds of miles away which is moving at high speeds. It is conceivable. Indeed, people are working on that problem.

The Vice-Chairman: I have no further questions on my list. If there are no further questions. . .

An hon. Member: You can ask yours now Mr. Chairman.

The Vice-Chairman: I would like to ask a few questions. Mr. Wahn, would you mind taking the Chair while I ask a few questions?

The Chairman: Mr. Ryan.

Mr. Ryan: Thank you Mr. Chairman. Doctor ICBMs would have to have heat-hardened noses much like a space vehicle. Would they not?

Dr. Lindsey: To re-enter the earth's atmosphere without destroying themselves, they would.

Mr. Ryan: Yes. You told us yesterday that these Spartan warheads are designed to give forth X-rays which would vaporize ICBMs. Today you say it might cause it to fall apart and come down. I know that it is impossible to have a test to actually

• 1025

prove what would happen, but what leads you to speculate between vaporizing and the fall-apart idea?

Dr. Lindsey: I did not mean to imply that the X-rays would vaporize the whole of the re-entry vehicle. It would heat up the outer near surface where the X-rays struck to such an extent that they would vaporize. They would vaporize so suddenly and violently that they would send a strong shock wave all the way through the whole re-entry vehicle which would perhaps shatter it or at least bend it. There would not be enough energy in the X-rays to vaporize the outer part of the re-entry vehicle unless it was very close to the explosion. Lighter objects like decoys might be

vaporized completely so there would be nothing left but gas.

Mr. Ryan: If it were thrown out of kilter it is likely that most of the ICBM would burn up in the atmosphere.

Dr. Lindsey: Yes. If its heat shield were damaged, then that would probably happen on re-entry.

Mr. Ryan: How does the term "cooking" apply in this situation?

Dr. Lindsey: "Cooking" is referred to when a different kill-mechanism is involved. This was very much to the fore in the debate some years ago over the BOMARC. The principle of "cooking" is that neutrons which are released in the explosion of the defensive warhead would penetrate into the fissile material in the ICBM or in a nuclear weapon carried in a bomber. Neutrons will penetrate through any sort of shield unless it is very thick. The principle of the fissile material is that by having neutrons moving around inside it producing a chain reaction, it gets hotter and hotter. The intention here is that enough neutrons would be sent into it from the defensive burst so that it would heat up inside, not to the extent that there would be a nuclear explosion, but to the extent that it would be distorted or cracked. The shape must be extremely accurately maintained if the mechanism is going to trigger properly, so the cooking consists of a sort of internal spoiling of the inside of the nuclear weapon so that it will not produce a nuclear explosion.

Mr. Ryan: I take it that it does not now look to be as reliable a method as the vapor.

Dr. Lindsey: I do not think it is the method that Spartan uses.

Mr. Ryan: Are there any Minutemen or other ICBM bases in Alaska?

Dr. Lindsey: I believe not.

Mr. Ryan: Why not? Is there some special reason for that? One would think that it would be much closer to possible targets in China and the U.S.S.R.

Dr. Lindsey: Yes, it would be. I suppose if the United States had built a large force of medium range ballistic missiles, as the Russians have done, then that would be a natural place to put them. However, they have elected to put virtually all of their deterrent into intercontinental range missiles. Having done that, they can keep them close to home, maintain maximum security over them, and provide defence if they so wish. They are quite accurate enough to do the job.

Mr. Ryan: Could it be that there might be some installations there which are classified?

Dr. Lindsey: Yes. That is possible and if it were so, I would not be able to say it. Actually I do not know of any.

Mr. Ryan: Yesterday there was some question about the risk of Spartans and Sprints in that they had to be at a ready state at all times, and on surface rather than in silos. Would the risk be any greater than the present risk which we run with our atomic warheads on our BOMARCs at North Bay?

Dr. Lindsey: I do not think they would be a greater risk than the Nike/Hercules missiles which have been deployed around American cities for years and which have never produced a nuclear explosion. I think they would be comparable with them or the ones which have been in our air defence aircraft for years.

Mr. Ryan: Further to Mr. Nesbitt's line of questioning, would you give us the odds, or the probability or likelihood in connection with this development of the ABM warheads versus the incoming ICBM? Is it probable that this technology will do the job? What are the odds on it?

• 1030

Dr. Lindsey: Are you speaking of the possibility of preventing the ICBM from going off as opposed to making it go off?

Mr. Ryan: No. I am talking about it generally. As a physicist, what in your opinion—let us put it that way—are the odds and the probabilities? Is this a good technological development? Will it work? What are the probabilities?

Dr. Lindsey: There is one piece of evidence that gives us a lot of information here. Some two or three years ago the Americans fired 14 real ICBM's out over the Pacific and they intercepted them with anti-ballistic missiles installations on, I think, Kwajalein or Johnston Island. I believe 11 out of the 14 came close enough that if their calculations about the miss distance are right they would have destroyed the warhead. I think that tells you that you can come close enough to a bullet with a bullet to have a very good chance of destroying it. Of course that is one test firing against a site that knew that the target was coming and there were no decoys or any other penetration aids used.

When you begin to build up the contest and say there are going to be measures, counter-measures, and counter-counter measures, it gets awfully difficult to say just what would happen in a particular engagement. You are also going to have it all happening in 1975. When you do not know what measures and counter-measures the other people will have and you do not even know what ones we will have, it really does become a bit of a guessing game.

I think we can say though that it is very likely indeed that one anti-ballistic missile can destroy one intercontinental ballistic missile if there are no complicating factors. However, there probably will be.

Mr. Ryan: Decoys and so on?

Dr. Lindsey: Yes.

Mr. Ryan: Can we take it though that the delivery stage the 11 out of 14, is pretty well assured? That part looks very reliable?

Dr. Lindsey: They can control the anti-missile accurately enough to put it very close to the ICBM, and that has been proven.

Mr. Ryan: All right, you say that they can put it very close. To your mind, is this warhead going to be able to destroy the ICBM? What are the probabilities of that?

Dr. Lindsey: I think they are very good. I think if the ABM can burst within the calculated kill distance of the ICBM it will probably stop the ICBM achieving its mission.

Mr. Ryan: I would take it then that you have some confidence in this system, but perhaps not a complete confidence? Would that be fair?

Dr. Lindsey: That is exactly right. I would be surprised to find any reputable scientist saying that he was 100 per cent sure that all these problems would be overcome.

Mr. Ryan: With the 12 sites fully deployed in the United States with ABM's, and having a regard to what you have illustrated for us that the umbrella of each Spartan and each Sprint installation projects a footprint, and also having a regard to the fact that the likeliest attack upon us is going to be from the North and that the protected shadow or footprints would all be to the South in the United States, there would then be what I might describe as a leading edge along our border. In your slides you also indicated that the Spartans would be expected to go out about 400 miles at the maximum and to explode in the atmosphere.

Dr. Lindsey: No, Sir, Spartan is above the atmosphere.

Mr. Ryan: Above the atmosphere. I am sorry. I meant to say that. Would this not then leave a distance under the edge of the umbrella to the earth of some height?

Dr. Lindsey: Yes, it would, and I think one can explain that quite well with the analogy of the umbrella in the driving rain. If you hold the umbrella directly above your head and the rain is coming in at a glancing angle, some rain will fall on the ground

inside the lip of the umbrella that is in the up-wind direction so that the dry area will be displaced down-wind. It is quite true that you could live under

• 1035

the front lip of the umbrella and have it above your head but still not be protected from something coming in at a glancing angle; that is true.

The footprint, if you remember the shape, does extend forward of the site but it extends much farther backward than it does forward, and it extends less than the 400 miles forward for precisely the reason that you have indicated.

Mr. Ryan: Less than 400 miles. How much less than 400 miles?

Dr. Lindsey: You cannot give a simple numerical answer to that because it depends on the angle of descent of the ICBM. I think if it is coming in at 20 degrees, the warning time is sufficient, the PAR gives you enough pick-up, and so on, it would be somewhere in the vicinity of 300 miles, or perhaps a bit less.

Mr. Ryan: Would not some of the Spartans be likely to go off in the atmosphere while trying to get under this leading edge?

Dr. Lindsey: I think this would be a choice open to the owner of the Spartan, and they have elected not to burst them at low altitudes. I think there are two reasons for that: First, is potential damage to people on the ground; second is that this X-ray kill mechanism that I described does not work very well in the atmosphere because the air would absorb the X-rays, whereas in empty space the X-rays preserve their killing power to a very great distance. So they just will not burst it at low altitudes.

Mr. Ryan: As I see it, there will be at least 100 miles from the ground to where these bursts would likely occur. There would be 100 miles in height that would be vulnerable to other possible methods of entry, like skip bombing from Canada into the United States, or changing the direction of an incoming ICBM at the last few moments so as to bring it in at a much shallower angle and get in under that umbrella edge.

Dr. Lindsey: I think if the ICBM was able to manoeuvre late in its course the Safeguard type of defence would be in big difficulty because I do not think it could manoeuvre at the last minute very easily. I think a manoeuvring ICBM would call for a certain improvement in the type of defensive mechanism. It really is intended for a truly ballistic missile that comes like a stone on a predictable course without the last minute ability to manoeuvre.

Mr. Ryan: Yes. I suppose the defence could still take care of one that did come in under the leaning edge?

Dr. Lindsey: I think it is a little bit like a batter facing a pitcher. If the pitcher fires a fast ball the batter just has to judge the flight and swing at the right time, but if he is met with a curve and waits until the curve is broken and then judges the last minute flight of the ball, he might get a hit. If he starts his swing just as the ball is breaking, he will probably miss. Also, if he can hit it before it breaks he will get a hit.

Mr. Ryan: It would seem to me that we Canadians who live mostly along the southern border of our country may be in an extremely disadvantageous position in the event of an all-out attack on these sites which will be along our borders.

Dr. Lindsey: I think if we wanted to get some protection out of an ABM system we should talk to the designers about the system before they have decided exactly where the equipment is going. There is also the point that even if it were physically possible for one of their sites to defend a Canadian target we still have to find out whether the arrangements are going to be made for them to do that, because they do not have to; it is their system and we are not being very co-operative about it at the moment.

Mr. Ryan: An enemy, too, could throw in some ICBM's with dirty bombs along this unprotected edge and let the drift obliterate the population. This would be quite a possibility, would it not?

Dr. Lindsey: Yes, I think if an attacker wanted to produce heavy fall-out contamination in North America, he would certainly be able to do it. He could target points far away from either cities or deterrent bases, most unexpected places, because a big dirty bomb burst on the ground would produce dreadful fallout over a very wide area. However, if he did too much of that some of it might blow right back across the ocean and he would get it too, so I think there is a limit to how far anybody would try that sort of attack.

Mr. Ryan: Yes. Those are my questions, Mr. Chairman. Thank you, very much, Dr. Lindsey.

1040 •

The Chairman: Are there any other questions arising from the last member's questions or are there any other questions which any member wishes to ask Dr. Lindsey?

If not, I believe that completes the questioning and on your behalf I would like to thank Dr. Lindsey very much for his answers to our questions and for his assistance to the Committee. Thank you, very much, Dr. Lindsey.

ABM and NORAD
SummaryPART III: THE IMPLICATIONS FOR
CANADA OF BALLISTIC MISSILE
DEFENCE

The most basic implications for Canada regarding defence against ballistic missiles are the same as for the rest of the world—that is, the preservation of stability and the resultant prevention of nuclear war. However, because of our geographical position on the direct great-circle route between the two Super-powers, and sharing a long border with one of them, we are concerned with the problem in a very special way.

The Significance of Canadian Geography for BM
Defence of the USA

In the previous section, it was demonstrated that Canadian geography has a vital significance for the defence of the United States against attack by bomber aircraft. In fact, it would be impossible for

the US to create an effective defence system without the use of Canadian airspace, and very inefficient to attempt to do so without the basing of radars, air bases, and/or missile sites in Canada. Comparable questions arise for ABM defence. If the US wishes to defend her own territory against ballistic missile attack, must she launch defensive missiles over Canadian territory? Must she base ABM installations in Canada? Further questions which can also be asked of anti-bomber defence include: is it possible for a system sited for the defence of targets in the USA to give any protection to targets in Canada, and, also, what are the risks to the people and property on the ground beneath the interception?

As with air defence, the problem begins with early warning. The earliest warning that can be obtained of the approach of an ICBM is the detection of the launching. Since tremendous energy is released by the booster rockets, sensitive instruments may be able to detect this at very long range. However, generally speaking, the closer they are to the launch site, the better the detection. Canadian territory does not offer any unique attraction for the location of such sensors.

Once the booster rockets have burned out, the main means of detection or tracking is by radar. The Ballistic Missile Early Warning System (BMEWS) depends on three large radar stations in Alaska, Greenland, and England. In general, the best locations will be close to the likely ICBM trajectories, so, since Canada lies under most of the probable trajectories, her territory could be valuable for the location of future warning and tracking radars.

Many types of active ballistic missile defence systems have been conceived. They fall into three categories, depending on whether the ICBM is destroyed in the launch phase, in mid-course, or in the terminal phase of its trajectory.

Canadian territory is too far away to enable a land-based weapon to intercept an ICBM launched from the Soviet Union before its booster rockets have burned out (i.e. during the launch phase).

If a mid-course interception system were designed, it is probable that Canadian geography would be very important. Some of the tracking and control radars and the anti-missile missiles might be in ships or aircraft, but since the middle portion

of the trajectories cross over Canada, it would seem that many of the installations would be most effective if located in our territory.

If radars (or other sensors) are needed for the close examination of objects on ballistic trajectories, for discrimination of decoys, for accurate determination of trajectories, or for tracking during and after a manoeuvre, it is quite conceivable that sites in Canada would be advantageous. It is also possible that problems of nuclear blackout could make it desirable to have a widely based system of sensors. However, no requirement for sites in Canada has arisen to date with regard to active defence against ballistic missiles.

For both peaceful and military purposes, it is necessary to maintain detection, tracking, and surveillance of objects orbiting in space. Since polar orbits are concentrated on the northern latitudes, Canadian territory could have a particular value. This optical tracking camera at Cold Lake, Alberta, is used in this role. Such instruments serve useful purposes for scientific and commercial satellites, in co-operation with communication relays and telemetry stations.

In an active defence system intercepting ballistic missiles near the terminus of their intended trajectory, the anti-missile batteries will be sited in the general vicinity of the protected targets. Safeguard is such a system, as was its predecessor Sentinel. In neither case was there a request from the US for permission to locate installations north of the border. Analysis done in Canada indicates that little would be gained for defence of targets in the USA by siting missile batteries much to the north of the zones to be defended. It is possible that some advantage would be gained by placing some Perimeter Acquisition Radars (PARs) north of the border, especially if Safeguard is to have a capability to intercept missiles approaching on the low trajectories of the Fractional Orbital Bombardment System (FOBS) or Depressed Trajectory ICBM.

As regards the firing of defensive missiles over Canada and the bursting of defensive warheads above Canadian territory, the position of the more northerly targets in the US (such as the Minuteman complexes to be defended by the first phase of Safeguard) and the long range of the Spartan anti-missile missile make it very evident that the system cannot function unless anti-missile missiles launched from the northern Spartan batteries make their interception over Canada. Whether their altitude puts the missiles above the legal limit of national airspace, and into international outer space, is a question for space lawyers, but it should be remembered that they will only be fired as a defence against overflight by ICBMs launched across Canada with destructive intent.

The requirement to fire over Canada in defence of targets in the northern USA will apply to other long-range anti-missile missiles like Spartan. Sprint has a much shorter range, and it is quite possible that a terminal defence system specifically designed for the sole purpose of protecting small hard targets (such as Minuteman) would employ an interceptor with a range less than Sprint. Except for defence of targets within a very few miles of the border, such missiles would not have to intercept over Canada.

Risks to Life and Property from ABM

The next question to discuss is the physical risk to persons and property on the ground, whether Canadian or American. It has been mentioned that the Spartan has a very large thermonuclear warhead. The mechanism by which it destroys the effectiveness of the approaching ICBM functions best in the near-vacuum of outer space, and the intention of the system is to perform the interception far above the dense atmosphere.

Our calculations indicate that if a warhead of the general size of a Spartan were to burst 25 miles above a city, there could be some light damage to property from blast (broken windows) and, if the weather were clear, it is possible that fires could be started in tinder-like material and that the exposed skin of persons outside in the open could receive burns. These effects become very much more serious for bursts at lower altitude; indeed, it is probable that an attacker who wished to produce maximum casualties and damage to a city would fuse his ICBM warhead to burst no more than a few miles above the centre of the city, achieving most of his damage through blast and fire. However, the same effects become much weaker for bursts above the 25 mile altitude, and it is understood that all detonations of Spartan will be well above 25 miles.

If the weather is clear, a large nuclear detonation, even at high altitude, can pose a hazard to vision. If a person were outdoors when the detonation occurred, he would suffer a temporary flash blindness rather like snow blindness. If he were unfortunate enough to be looking in the general direction of the burst at the precise instant that it detonated, he could suffer some permanent but partial impairment of vision.

A Spartan burst would not produce a dangerous radioactive hazard on the ground. If all the megatons in all the Spartans in the full Safeguard deployment (12 sites) were detonated at their high operational altitude, the resulting radioactivity would be widely distributed through the stratosphere. Almost all of it would decay before eventually settling to earth. The increase to the general background level of radioactivity on the surface of the earth would be much less than that caused by

the approximately 400 nuclear explosions that have been let off above ground prior to 1968, and far below the tolerance levels agreed for industrial safety.

The other anti-missile missile, Sprint, has a very much smaller warhead than Spartan, and can, therefore, be used at much lower altitudes without inflicting serious damage on the ground. Like Spartan, it poses no significant danger of fallout. It is not yet known whether Sprints in the Safeguard plan will be close enough to the border for them to burst above Canadian territory.

Risks to Life and Property from ICBMs

One should not wax too indignant over the hazards inflicted by defensive ABM weapons without contemplating the effects of the offensive ICBM if it should succeed in its intended mission. If its target is a city, or an airfield, it may be fused for an airburst or a groundburst. The airburst produces a greater total area of damage to buildings of low resistance or to other comparatively soft structures (such as aircraft), and will not cause serious radioactive fallout.

If the target of the ICBM is a hardened missile silo or underground control centre, the probability of destruction may be increased by using a groundburst, since nothing can survive in the crater, and the shock transmitted through the earth might seriously damage underground installations.

A groundburst may produce heavy radioactive fallout, not only in the vicinity of the target but over very large areas downwind of the burst. The degree of radioactive contamination depends on the composition as well as the size of the nuclear weapon. The smaller weapons depend on fission, and it is the fission products which are strongly radioactive. Large weapons require fission to trigger them, but may achieve most of the energy release through fusion. If the proportion of fission is small, the bomb is described as "clean", and produces relatively little radioactive fallout even with a groundburst.

The possibility of serious "worldwide" fallout (as dramatized by novelists) would only exist if a very heavy attack were made using groundbursts with large "dirty" bombs. This could have unpleasant consequences for the attacker as well as the recipient, and is, therefore, unlikely to happen. Nevertheless, an attack aimed at hardened ICBM silos and underground control centres could well involve hundreds of ground bursts, and even if the weapons were "clean", the fallout within an area of many hundreds of miles from the weapon bursts could be very serious to human life.

All this has a very real significance for Canada. Depending on the political situation and the strategy selected by the USSR, Canadian cities and military installations might or might not be included as

targets. To pave the way for bomber penetration, air defence installations will be targeted. In addition, if the objective is to cripple their major opponent, it is difficult to believe that the Soviets would leave a friendly neighbour with an undamaged economy available to help in the rehabilitation of the USA.

The nature of fallout caused by groundburst nuclear weapons, and the geography and meteorology of North America, are such that a series of groundbursts in the northern half of the USA, particularly in the area of the Minuteman bases, is likely to produce heavy fallout in Canada. Consequently, even if Canada were fortunate enough to escape the impact of nuclear weapons on her own territory, she might still have to face the hazard of radioactive fallout due to nuclear weapons burst in the USA.

It may be possible that the result of detonating an anti-missile missile close to an incoming ICBM could be to make the ICBM detonate too. The designers of the ABM warhead intend that the defensive burst will damage the ICBM in such a way that its warhead will not produce a nuclear explosion, and this is most likely what will happen. However, it is believed in some quarters that the designers of the ICBM warhead can and will fit a special fuse causing it to detonate on the first receipt of radiation from the defensive explosion. Without judging the merits of this argument, it will nevertheless be true that, in every case, the total damage to North America would be less than would have been suffered if the ICBM had burst where its owners had intended.

To summarize, the significant risks come from the offensive ICBM (or SLBM) and not the defensive ABM. If ABM prevents an ICBM from bursting at its intended point, both lives and resources have been saved; if it prevents it from bursting on the ground, then the radioactive hazard has been decreased, to Canada as well as the USA, even if the targets were all south of the border.

Potential Protection for Canadian Targets

Although the Spartan anti-missile missile has a range of about 400 miles, it should not be concluded that it can protect every target within a circle of 400 miles radius centred on the missile site, and no target outside of that circle. The volume into which a Spartan can reach and intercept has the shape of an open umbrella, with the handle on the Spartan site, the stem vertical, and the rim some distance above the ground because of the need to limit the height of burst to a safe and effective altitude. The incoming ICBMs approach at a low angle (typically in the vicinity of 20-25 degrees from the horizontal for ranges of 5000-6000 miles). If one thinks of a shower of ICBMs as raindrops, driven nearly horizontal by a strong wind, it can be seen that the um-

brella will be able to keep an area on the ground dry which is not circular but oval, elongated in the down-wind direction, and with its centre down-wind of the battery site.

This "dry zone" is known as the "protected footprint". Its exact shape depends on the horizontal direction and the angle of descent of the ICBM, being shorter for the steeper trajectories. If the PAR makes an early detection of the incoming ICBM, establishes a track without undue delay and transfers the data to the Missile Site Radar (MSR), and if the decision to engage that ICBM from that Spartan site is taken promptly, then it may be possible to launch the Spartan in time to make the interception at its maximum range (on the surface of the "umbrella"). Otherwise, the radius of the umbrella and the size of the "dry zone" or footprint will be reduced.

A similar geometry on a reduced scale describes the protection afforded by the shorter range Sprint anti-missile missile.

If the USA deploys the full Safeguard system to give light area protection to all of the country, there would be five sites along the northern border, each equipped with PAR, MSR, and Spartan and Sprint. The approximate locations have been listed as:

Great Falls, Montana
Grand Forks, North Dakota
"Upper Northwest" (Washington State)
Michigan/Ohio Area
Southern New England

It is understood that the sites will not be close to large cities. Therefore, the purpose of the Sprints will be to defend the PAR, MSR, Spartan battery, and whatever ICBM and bomber installations are close enough. Thus, no Canadian protection can be expected from the Sprints of the Safeguard system. On the other hand, the protected footprints of the five Spartan batteries, plus the seven others that make up the full deployment, will cover all 48 states, providing protection to the American population against a light attack (from China), or from an accidental launching from any source.

A natural question to ask is whether it will be possible for these Spartan batteries to provide protection for Canadian population. Or, put another way, how many Canadians will live inside the "protected footprints" of the five northern Spartan batteries?

This question cannot be answered in detail without more precise knowledge of the performance of the components of the system, and of the location of the sites. Even with this information, it would still be necessary to postulate the exact trajectories that the attacking ICBMs would follow. However, by making estimates of all these factors, it is possible to state that Montreal and Toronto appear to be in a fringe area such that they could be defended

against some but not all of the most probable trajectories. If the attacker had the same information, and if he elected to attack these cities, he would presumably choose one of the trajectories least favourable to the defence. The degree of protection available to these two cities depends in a sensitive way on the exact position of the PAR/Spartan sites. The same relationship probably applies to many other of the larger Canadian cities, implying that a considerably increased protection could be given to them by moving PAR and/or Spartan sites to more northerly locations in the USA. There are, however, Canadian cities (such as Edmonton and St. Johns, Newfoundland) which are too far from the border to be protected from Spartan type installations in the USA.

It must be emphasized that such factors only determine whether it would be physically possible for ICBMs aimed at Canadian targets to be intercepted by Spartans sited in particular places. If it were physically possible, it would still have to be arranged in the firing doctrine and computer programming that the interceptions would, in fact, be attempted.

The question of potential protection for Canadian population has been discussed in terms of the planned deployment of Safeguard. However, even the full deployment (of 12 sites) can give no more than a thin degree of protection to American cities, which could be significant against a light or accidental attack but would be overwhelmed by a heavy attack. For this or other reasons, Canada may not wish to request protection for her population by Safeguard. Nevertheless, should strategic developments cause the USA to deploy a thick ABM system for defence of population against a heavy attack at some time in the future, it is probable that the capability of such a system to provide a comparable degree of protection to Canadian population would be governed by much the same factors as have been described for Safeguard.

ABM and NORAD

An important instrument for practical defence co-operation in North America is the NORAD Agreement. The mission of NORAD is defence against air attack, but its responsibilities include warning against missile and space attack as well. In the Agreement renewing NORAD for five years to 1973, it is stated "that this Agreement will not involve in any way a Canadian commitment to participate in an active ballistic missile defence".

From a strategic point of view, anti-bomber and anti-missile defence are part of a single problem. To determine whether North America is being threatened, or should alter its state of alert, many types of information are wanted, and should be assessed as a whole rather than piecemeal. Strategic decisions and operations are most effectively handled as a single aerospace activity.

NORAD receives information concerning missile and space activity from many sources. ICBMs approaching over the polar regions would be detected by the BMEWS. This consists of large detection and tracking radars in Alaska, Greenland, and England, whose information is relayed to the computers in the NORAD Combat Centre. Many of the communications circuits come through Canada. Processed warning information is passed on to other organizations such as the National Military Command Centre in Washington, National Defence HQ in Ottawa, the US Strategic Air Command, and Supreme HQ Allied Powers, Europe. Radars at air defence sites on both coasts of the USA have been modified to enable detection and warning to be given if SLBMs were to appear.

In order to be able to give warning against attack from space, NORAD operates a Space Detection and Tracking System (SPADATS) with a variety of sensors in many locations. A Canadian contribution is the Baker-Nunn optical camera at Cold Lake, Alberta. The reports of objects in space are catalogued by computers in the NORAD Space Defence Centre, which continually updates the information on orbiting satellites, spent booster tankage, and other objects. By watching these, it is possible to detect manoeuvres or disappearances, predict re-entry, and identify the appearance of new objects.

Thus, NORAD can detect, identify, and give warning of ICBM and SLBM attack against North America, and can observe the movements of objects orbiting in space. But it cannot intercept or destroy ballistic missiles.

To carry out its mission of defence of the North American continent against air attack, NORAD conducts the operational control of the air defence forces such as radar stations, interceptor squadrons, and surface-to-air missile batteries. Some of these are located in Canada, some in the USA. Some are manned by Canadians, some by Americans. Some are financed by Canada, some by the USA. Certain weapon systems (such as the Hercules surface-to-air missiles) are entirely American in location, manning, and financing, but come, nevertheless, under the operational control of NORAD.

If Safeguard or some other ABM system is deployed in North America, arrangements will have to be made for its operational control. Also, the information necessary in order to assess the overall strategic situation and make the major strategic decisions regarding aerospace defence must be provided. The necessary type of information is very much the same as that already collected by NORAD today, but five years hence there would probably be additional sources from new systems of missile detection and space surveillance.

Many of the tactical decisions made in air defence depend on the assessments by experienced

officers of a situation presented to them by the communication and display system. Although they have to make their decisions quickly, the speed of human reaction supported by the SAGE computer is sufficient to permit identification and interceptions to be made. The approaching aircraft are unlikely to be moving faster than about 10 miles a minute.

The more detailed command and control of the units of an ABM system are likely to be somewhat different in character from that for air defence units. ICBMs will approach at speeds above 250 miles a minute. There is an opportunity, in principle at least, to allot defensive weapons to attackers with full knowledge of the intended targets, since the future trajectory of a ballistic missile can be predicted (unlike that of a bomber). Because many of the characteristics and tactics of the ICBMs attack are not known, but must be assumed in order to make the decisions regarding defence, it will be desirable to correct inaccurate assumptions as soon as they are perceived, and make the improved information available to the entire defence system very quickly indeed.

The only way to handle such a problem is by a very considerable extension of the role of computers. Practically all of the operational control of the weapons will have to be performed by computer, following instructions programmed into them long before the battle is joined. The main decisions will be taken when the computer programs are designed, although further decision will probably be required prior to and during the battle.

From the Canadian point of view, it can be said that NORAD has proven to be an efficient and satisfactory means of handling the collection, evaluation, and dissemination of information regarding aerospace activity, and the operational control of active air defence. It has served, in addition, as a convenient and useful channel for the exchange of technical and planning information between the two partners.

However, if ABM becomes a reality, it may or may not prove desirable to place its operational control under NORAD, quite aside from considerations of Canadian participation. At the present time, the US has not decided how the operational control of Safeguard will be organized, and it does not appear that a decision is a matter of urgency.

Summary

In order for the Safeguard system to defend targets in the northern United States, it will be necessary for them to intercept ICBMs above Canadian territory. This will likely be true for any future ABM systems employing long-range anti-missile missiles.

The effects on persons or property on the ground due to interception by Spartans or Sprints will be

negligible in comparison to the effects of ICBMs or SLBMs which reach their targets. In addition, the successful operation of an ABM system would reduce the risks from fallout for all the inhabitants of North America.

The ability of the full Safeguard system to extend its limited protection to major Canadian centres of population is not certain, and would depend among other things on the exact locations selected for PARs and Spartans. The same would likely apply to future ABM systems designed to protect US population.

NORAD is very effective for the processing of intelligence information regarding the aerospace threat, and the operational control of the forces for anti-bomber defence, and has also proven to be a useful channel for technical information and planning between Canada and the USA. It is too soon to forecast what the US view will be regarding the relationship between NORAD and Safeguard, quite apart from whether Canada does or does not elect to participate in any aspect of active ballistic missile defence.

MINUTES OF PROCEEDINGS

[Text]

TUESDAY, May 27, 1969.
(74)

The Standing Committee on External Affairs and National Defence met at 11:10 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Brewin, Cafik, Fairweather, Forrestall, Goyer, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Legault, MacLean, Nowlan, Ryan, Roberts, Thompson (*Red Deer*), Wahn, Winch (19).

Also present: Mr. Buchanan, M.P.

Witness: Mr. John Gellner, Editor *Commentator*, Toronto.

The Chairman welcomed Mr. John Gellner who had been retained to provide an assessment of the Departemental paper on NORAD.

The Committee agreed to print the comprehensive index of Issues Nos. 19-20 and 22-35 inclusive, prepared by Mr. Dobell's office, as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix DDD*). The Committee also agreed to print copies of the index, separately, as well.

Mr. Gellner made an opening statement and then was questioned by Members, on subjects related to NORAD.

The Vice-Chairman took the Chair at approximately 11:50 a.m.

The Committee agreed to print Mr. Gellner's advance presentation as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix EEE*).

At 12:35 p.m., with the questioning continuing, the Committee adjourned until 8:00 p.m. this day.

EVENING SITTING (75)

The Standing Committee on External Affairs and National Defence met at 8:05 p.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Cafik, Gibson, Guay (*St. Boniface*), Harkness, Laniel, Marceau, Penner, Roberts, Ryan, Thompson (*Red Deer*), Winch (12).

Witness: Mr. John Gellner.

Members continued their questioning of Mr. Gellner during this evening's sitting.

At 10:05 p.m., on completion of the questioning, the Vice-Chairman thanked Mr. Gellner and the Committee adjourned to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday May 27, 1969.

The Chairman: Gentlemen, I think we are ready to begin.

I would like to welcome Mr. John Gellner to this session of the Committee's hearings on NORAD. Mr. Gellner is familiar to all members as he appeared before the Committee on January 21 in connection with our earlier study of NATO.

• 1110

You will recall that Mr. Gellner has been retained by the Committee to provide a critical assessment and evaluation of the paper on NORAD that was prepared by the Department of National Defence and presented by Lieut. General F. R. Sharp, Deputy Commander of NORAD.

I think all members who have studied that working paper prepared by the Department of National Defence were impressed by its thoroughness and the value of the information contained in it. Basically however, we did want to have an outside evaluation just to avoid any suggestion that we were being unduly influenced by a departmental point of view. For the same reason, you will recall that I announced the fact that copies of that departmental working paper had been circulated to a very wide and representative mailing list for critical evaluation and comment. It went, for example, to the heads of political science departments of all universities in Canada, it went to the editors of the major daily newspapers, and it went to all those expert witnesses who appeared before us on the NATO inquiry. Moreover and I think this is vital, the Department of National Defence knew before they prepared the paper and submitted it to us that we were going to test its objectivity, completeness and content in that way. I think that we have established a pretty good procedure and one which will go a long way toward guaranteeing the objectivity and content of the working papers that are presented to the Committee.

Members have mentioned that it would be very helpful if we had an index of our NATO

proceedings. Mr. Dobells' office very kindly has prepared such an index. Although copies are available for all members it occurred to us that perhaps it would be desirable to have it printed, preferably as a separate document, so that it can be inserted in the appropriate place in our NATO proceedings.

Is this agreeable to members of the Committee?

Some hon. Members: Agreed.

The Chairman: Coming back to Mr. Gellner's paper, this was distributed to members yesterday. It deals primarily with the NORAD paper which was presented by Lieut. General Sharp, although incidently it also discusses some points raised by Dr. Lindsey in his papers where these were particularly relevant.

I should add that Dr. Lindsey's paper will be subject to the same procedure of evaluation at a later date, Dr. Michael E. Sherman having been retained for this purpose. It has been emphasized that these evaluations are to be critical ones designed to test the objectivity and completeness of the working papers, are themselves to be objective and are not to reflect personal points of view. If personal points of view are to be contained in the working paper they are to be identified as such.

As Mr. Gellner had only two weeks to prepare this paper and to appear before the Committee prior to his departure for Europe the day after tomorrow, members have had only a brief opportunity to study it.

Mr. Gellner has assessed the nine major subjects raised in the Department of National Defence paper, namely The Need for an Integrated System, Canada's Contribution to the Integrated System, American Military Presence in Canada, the Bomber Threat, Effectiveness of NORAD System in an Emergency, Defects of Present System, The Alternative: AWACS, Cost of Change-over to AWACS, and Space Defence.

Now if we were to proceed logically, it would probably be best if we proceeded

subject by subject. From past experience I am not sure that this will work in a practical way. Which way do you wish to proceed? Do you want me to ask you to limit your questions to each one of these headings or would it be more practical to permit members to range over the entire paper? Is it feasible to limit questions heading by heading or do members prefer to raise question on any one of these nine subjects when their turn comes for questioning?

Mr. Forrestall: I would prefer to ramble, Mr. Chairman.

Mr. Nowlan: I would agree with Mr. Forrestall, Mr. Chairman. It is nothing new to ramble in any committee, especially this one,

• 1115

with all deference. While it looks more orderly to take it section by section we did have an experience with Transport just the other day. One member had a particular pet peeve on one of the first items, kept the witness going on that subject all morning, and other members could not even get around to asking any questions. I would like to see a general approach taken.

The Chairman: It has been suggested that we follow a rambling approach rather than a scientific, one.

Mr. Allmand: Mr. Chairman, I would not put it that way. I think it is difficult to adhere to one of these sections. We may pass sections 1, 2 and 3 and be on section 4 and some of the matters in that section may relate back to others. I think they are all related and it is very difficult to restrict the questioning at any one time to one section.

The Chairman: Is that agreeable?

Mr. Fairweather: This does not refer to our witness, and I realize the time limitation, but I am wondering if there is not a way we can so arrange things to get a paper of this length a little earlier than the day before the hearing. Some of us had other things to do. I confess frankly that I have read about one third of it, just because of lack of time. I am not referring to Mr. Gellner but to the principle of receiving papers a little earlier, if possible.

The Chairman: The next one will be Dr. Michael E. Sherman's and we will do our best to get that to members in time. If necessary we could postpone the meeting. We rather

hesitated to postpone this one. It seems then, if Dr. Gellner is agreeable, that we will have rambling discussion rather than limiting it section by section.

Have members had an opportunity to glance through the paper? Dr. Gellner, could you perhaps make a very short introductory remark. No doubt we will be able to complete the reading of the paper in any event before the meeting is over.

Mr. John Gellner, Editor, the Commentator, Toronto: In this case I would like only to say that I tried to have a look at the present system. It seems to me that while the present system was the one considered acceptable and necessary at the time, it was construed about ten years ago and has certain defects which the new system, the AWACS system, is trying to eliminate.

Now these defects were brought out in the previous papers and testimonies which were put before you—except that in my opinion one great defect was not strongly enough stated. This is no reflection on the previous testimony, it simply did not come to this point.

In general the defences are too far South. We speak about interception as far north as possible but if you look at the map attached to the working paper of the department and if you realize that at best the heavy radars of the system have a range of about 200 miles against targets at 30,000 feet, much less of course as you come down—it is only about 100 miles against targets at 10,000 feet—and if you then measure off a distance of a maximum of 200 miles from the radars which are farthest North, that is from the interception radar, not the DEW Line—the DEW Line has no interception capabilities—you will find that this system simply cannot intercept very far to the north because we would be out of reach of our detection apparatus.

The fact that the system is so far south therefore brings in itself a certain danger. Now you have heard, and I agree, that if it comes to a nuclear war it is possibly not

• 1120

really relevant whether we are killed by the offensive missiles or the defensive missiles. But I think this is over-simplicity because certain people—after all it is a question of individuals and groups of people—may not be touched in a nuclear war but may be touched by the fact that the defences are so far south. I gave in the paper an example at random of a city like London, Ontario. There may be no

missile or no bomber ticketed to bomb London, Ontario. It may not be a worthwhile target for the enemy. However, the Detroit defences contain a missile, the Nike-Hercules, with a maximum range of 75 miles. This missile fired northwards would explode just about in the London area, and therefore a weapon which may well have been destined for New York may then fall on London.

From the standpoint of somebody who lives there, this is significant. It cannot be said for this group of people that it just does not matter whether they are killed by offensive or defensive weapons because they may not be killed by offensive weapons. Therefore, there is a good case for bringing the system farther north. This system of fixed installations which we have now cannot be brought farther north.

As far as the ABMs are concerned, I made the point that our doubts of whether or not we should take part are not very relevant because we already participate, and we have participated for a lengthy time. We have not participated, and do not participate, in an active defence system; that is, in a weapons system which is capable of intercepting and destroying ballistic missiles. The United States is not participating in such a system because it does not exist.

In everything that exists today, the capacity to track objects in space—and this may well be ballistic missiles; we hope not—in the detection line, which is the ballistic missile early warning line, in planning at Colorado Springs headquarters, and in all these areas of space defence, we participate on an equal level with the Americans. The Americans have no active defences either. They are just planning one, the Safeguard system.

So this question about whether we should or should not go into space defence has somehow been answered, because we have decided at one point in the past to participate. This point in the past is, of course, several years ago.

I have now come to a short chapter which I may perhaps read because it is only a couple of paragraphs. There I somehow summarized, as I said in the paper, leaving out all figures, all ranges, all costs, and so on.

The present North American air defence setup—the present one—makes it mandatory for the United States and Canada to operate it in common. AWACS could be operated separately, that is, a Canadian AWACS system and an American AWACS system, but

only at the price of lesser efficiency on both sides, higher cost for Canada, probably diminished safety for the United States.

It would not be practical for Canada to continue on its own the present system, that is, a fixed installation system, on Canadian territory when the United States changes over to AWACS. Since the latter, the AWACS, puts an even higher premium on the availability of Canadian air space, airfields, and communications than does the present system, there should be a different arrangement for

• 1125

sharing capital costs from that which prevailed when the present organization was established.

An added bonus from AWACS would be that it would enable Canada to maintain a proper surveillance of Canadian air space, and that it would help in the surveillance of Canadian territory and sea approaches as well.

The question of Canadian participation in ABM defence does not arise; we already participate. Our continuing as partners in NORAD does not depend on whether or not we take part in the operation of the Safeguard system but the latter should, in any case, even if it is entirely U.S. operated, come under NORAD.

The Chairman: Thank you, very much, Mr. Gellner. I have a number of questioners, Mr. Laniel and Mr. Allmand.

Mr. Allmand: Mr. Gellner, on pages 6 and 7 of your brief you point out the slowness with which the NORAD system operates due to the two key control system. You say at the top of page 7, "the fact remains that the system as a whole reacted too slowly to be fully effective if it had really come to war".

As long as we have this two-key control system, and it would seem that it is necessary with nuclear weapons, how effective can this system be? I see on page 6 you pointed out that it took the Canadian government 42 hours to make up its mind what to do at the time of the Cuban crisis. How effective can any sort of system be that needs atomic weapons to defend the territory?

Mr. Gellner: I said also in this paper, sir, that it is inevitable when two sovereign states make a treaty that there is, of course, a certain delay as two sovereign states make up their minds. I gave the example of Cuba

more as an example to show that governmental machinery will have to be speeded up if the system is to work effectively. How you are going to do it is your business. Forty-two hours, of course, is much, much too long for a decision.

Mr. Allmand: How quick would you think that the decision would have to be made to be effective?

Mr. Gellner: In the case of ABM it would not be very important if the Safeguard system came in because the Safeguard system will be entirely American.

Mr. Allmand: I am thinking of the bomber attack.

Mr. Gellner: In a bomber attack I would think—this a ball park figure, and it is pure speculation—it should not be more than two hours.

Mr. Allmand: I have another question. On page 10 you state that the Americans are now dismantling the present NORAD system. You say that "they have begun a phased dismantling" and also that they "are not installing gap-fillers". Does this mean that in this period before they have gone ahead with the AWAC system that we have a void in the air defence of North America, and if we can afford this void at this time, how much does that say for the need of proceeding with a more complicated and more expensive system?

Mr. Gellner: We have this void already and have had it for the last years. I said in the paper that the DEW Line which is only a single line can probably be avoided by flying so low that the DEW Line radars will not pick up the aircraft. This cannot be done with the Pinetree Line, or probably not. I would like to say that I will always say "probably" and "likely", because there may be many variables I do not know about.

From the look of it, the Pinetree Line cannot be avoided by low flying, and certainly not easily, because it has so much depth that a jet aircraft would have to fly low for a very long distance. It has to fly 200 miles before it comes to the northernmost radar and then it still has to go through usually three or four

Between the DEW Line and the Pinetree Line there is in any case a hole in the middle where a bomber can move freely. This hole in the middle is very dangerous because with an improvement of air-to-surface weapons the bombers may fire the air-to-surface weapons from a position where the bomber cannot be detected. This situation already exists.

Mr. Allmand: That is apart from the dismantling.

Mr. Gellner: Yes, that is apart from it. Even if the system were not in a planned way gradually weakened, this difficulty would arise. The gap-fillers which have not been installed would intercept low flying aircraft. They have not been installed, even at a time when AWACS was not yet in the cards. It is a complicated and costly thing. When I spoke about the thinning out I referred for instance to the East Coast, where the Americans in Labrador and Newfoundland have closed down certain radars. I think what you are doing is that you are taking a certain calculated risk to make the transition slower, more planned and better phased.

Mr. Allmand: You do not think that the reason why they are taking this calculated risk is because they feel rather secure, not because of the air defence system but because of the balance of power and the deterrent effect of the second-strike of the United States. That is the real security.

Mr. Gellner: Yes, I would now say that the situation is very stable. But you do now know what it will be. Perhaps they think that while the situation is so stable, and the deterrent so powerful—whereas nothing much has been found to weaken the deterrent—that they can best afford going over from one system to the other. But, we will still need a system which would deny any enemy the control of our air space, and this AWACS system would be the better one. It would also, of course, be the better one for us because as I pointed out it would come much closer to the demand put by the Canadian government on April 3 of this year to have surveillance of our own air space by our own means.

The Chairman: Mr. Fairweather, Mr. Brewin, Mr. Laniel, Mr. Thompson and Mr. Cafik. Mr. Fairweather.

Mr. Fairweather: I do not want to re-fight Canada's response in the Cuba crisis except to ask whether there might not be some validity because of our integrated command

lines of radar, and in some places only two lines of radars.

in NORAD to have been privy to the political decisions which led up to the stage of alert which you mention. As I understand it, the governments of the world were notified on that Monday and Canada, although part of this integrated command, had no advance warning. Now, history and others can say I am wrong. You cannot do it.

Mr. Gellner: Oh, no. I think the government was quite justified in saying that we were informed but not consulted. I think—as far as I know, and I am no expert on Canadian politics—but as far as we know from such authoritative works as *Canada in World Affairs*, the position of the government was that we were informed but not consulted. Now whether or not it was prudent to punish ourselves by the 42-hour delay, because it may have resulted in self-punishment since we were not consulted, is something for you to decide. The Minister of National Defence at that time, who is present here today, apparently—again following what I learned from books—took some steps on his own to alleviate the situation without cabinet approval, he considered it so serious.

Mr. Fairweather: Now, turning to the other aspects of the paper, is the AWACS system primarily orientated to a manned bomber assault?

Mr. Gellner: The AWACS system is only orientated to the manned bomber and to the air breathing missile, which is the missile that goes through the atmosphere. Of course, the Russians also have such missiles, for instance, on their submarines. An example of an air breathing missile is the BOMARC.

Mr. Fairweather: Is there any validity to the suggestion that Canadian are paying a great deal more attention to mounting an AWACS system than the Americans, now that the proposition is highly experimental?

Mr. Gellner: As far as I know they are proceeding on it with all deliberate speed. They are examining the type of aircraft, and radar. As well, they are developing a missile and proceeding on AWACS.

Mr. Fairweather: But no contracts have been let for the aircraft to carry the AWACS system yet?

Mr. Gellner: Well again, this is all hearsay. It would not take much time because the airframe of either the Boeing 707 of the DC-8s would do the trick, so the production

of the AWACS aircraft itself would not take very long. Of course, what will take time is the production of the proper electronic equipment for this aircraft. The aircraft are, in fact, available if it is true that they are only thinking in terms of the Boeing 707 or of the DC-8s.

Mr. Fairweather: I have noticed that, for instance, Senator Stennis, who is Chairman of the Senate Armed Services Committee, has expressed a serious reservation about the proposal. I think that is all for the minute.

• 1135

The Chairman: Mr. Brewin.

Mr. Brewin: Mr. Gellner, in your paper at least twice towards the end you refer to the fact that Canada cannot be dissociated from the idea of ABM defence, and that we already participate in it. I am referring to what you said at pages 16 and 17. I take it that they both refer to what you said at page 14; namely, that we were always engaged in ABM defence because the mission of NORAD is to defend North America against attack from air and from space. Missiles, as well as bombers, are a form of invasion of space. Is that your reasoning?

Mr. Gellner: Bombers are an invasion of air, and ballistic missiles an invasion of space.

Mr. Brewin: Yes, but your argument is that NORAD has always been involved in anti-ballistic missile considerations, and that we cannot dissociate ourselves from it. Your thesis is that we already participate in it.

Mr. Gellner: We have already participated for several years.

Mr. Brewin: Surely that does not mean that we participate in any particular system of ABM defence, whether we judge it to be effective or useful or otherwise. You are not suggesting that, are you?

Mr. Gellner: No, no. I made this special point in saying that we could continue in NORAD and in what we are doing without ever touching the Safeguard system. As an example I gave that of the Americans with a Nike-Hercules system under NORAD which is, so to speak, administered by us too, because the Deputy Commander is a Canadian and so are other important staff officers. We do not participate in the point-defence provided by Nike-Hercules, so we would not have to participate in the point-defence provided by Safeguard, either.

• 1140

Mr. Brewin: Therefore I take it that you would agree that as a sovereign nation it is up to us to make up our minds as to whether any particular system contributes effectively to the defence of North America?

Mr. Gellner: Absolutely, and we do it. I gave the example of Nike Hercules. In our judgment we did not think that we needed to link Montreal and Toronto with Nike Hercules in the same way as Chicago and Detroit are linked by Nike Hercules. This was a Canadian judgment. We did not take the weapon, but this does not mean that we have dissociated ourselves from Nike Hercules. Nike Hercules is commanded just as much from Colorado Springs as any other weapon system in NORAD, and we are co-responsible for any kind of decision which is made in NORAD because we are a partner. Therefore we could very well say that this Safeguard system protects the Minuteman sites in the Northern states. We have no Minuteman sites to protect, ergo we are not taking Safeguard for any other reason. It is our wish. I wanted to say that we have not dissociated ourselves from defence against attacks from space, we have co-operated.

Mr. Brewin: That is right, but by this statement you are not implying any approval, for Canada at least, of participation in a particular Safeguard system, to take an example?

Mr. Gellner: I am happy to say that it is absolutely up to us whether we adopt the weapon system or not. I can give you another example. We decided to adopt the defensive fighter, the F-101. The Americans adopted the F-106 after the F-101. This is perfectly all right. Of course, the Americans are responsible for our flight operations and we for the American flight operations with different weapon systems because we are an integrated command, but our freedom of choice of weapon systems is not impaired at all.

Mr. Brewin: I see. You do not intend to imply by this from your point of view, let alone what we are free to do, any particular approval of the Safeguard system?

Mr. Gellner: If you are asking for my personal opinion, for what it is worth, and it is not worth very much, I would say from what we know about the Safeguard system that it would not be of any use to us on Canadian soil. From what I can gather from the published, non-classified information this is a sys-

tem which will protect the second-strike capability of a deterrent force, and as we do not have a deterrent force we really do not need Safeguard. That is all there is to it.

Mr. Brewin: May I ask you to go a little further. At the foot of page 12 you say:

The same applies to ballistic missiles, or will, if and when some kind of active ABM defence that will work is established.

Are you implying that in your view at the present time no kind of active ABM defence that will work is established?

Mr. Gellner: No. I should have said "embraced". We know nothing more about Safeguard—and again I must make the proviso, as far as I know—except that the two missiles in Safeguard work. However, so far there have been no Safeguard installations and as far as I know none will be established until 1973, so we do not really know what is going to happen.

Mr. Brewin: You are not making any judgment, then, on whether the system when installed will work?

Mr. Gellner: I am sure that when the system is installed it will work, it will intercept oncoming missiles because Spartan and Sprint

• 1145

are outcomes of the tested system, Nike X, which was tested repeatedly and has intercepted ballistic missiles. I suppose the radar connected with it is capable of seeing ballistic missiles because we can already track ballistic missiles. So, from a technical standpoint there is no reason the thing should not work, but the question really is how far will it overcome a strengthened attack. These are again ball park figures and I am only giving them as an illustration, but if you were to ask me, "Will the system intercept five ballistic missiles?" I think I could unhesitatingly say, "Yes, it will intercept five ballistic missiles". If you were to ask me "Will it intercept 500?", that is another question and I would be more than doubtful. It depends. Undoubtedly a few ballistic missiles would be intercepted by Safeguard.

Mr. Brewin: Let me put this to you. I know you follow these things. Have you followed the hearings before the Subcommittee on International Organization and Disarmament Affairs of the Committee on Foreign Relations,

United States Senate, of the United States strategic and foreign policy implications of ABM systems?

Mr. Gellner: Yes.

Mr. Brewin: I understand that a number of distinguished scientists, including Dr. York and Dr. Hans Bethe, have objected to the system on the grounds that by stepping up penetration aids, and by what they technically call blackout and other means, the attack can easily outdo the defence. It may produce the same level of security as before, perhaps, but at much greater expense. Have I stated it correctly?

Mr. Gellner: Yes, but I think I would disagree with these scientists on this ground. There is always a tendency to look at the worst, as if everything a nation had would be used to overwhelm the Safeguard system. If you think of the Safeguard system at present—and leaving aside the mythical question of the Chinese missiles, we do not know yet whether they have a missile, and looking just at the Soviet missiles—what it wants to do is to make sure that not all the Minutemen will be knocked out and therefore—enough of a second-strike capability will remain to make it deadly risky for an attacker to contemplate an attack. There are 1,000 Minutemen there. To make it a deadly risk for an attacker to attack would probably only require—and these are again ball park figures—that 200 survive because 200 Minutemen would make mincemeat out of the Soviet Union. If the Safeguard system assures a weakening of the attack, it has already fulfilled its purpose of insuring the second-strike capability of the United States.

I will give you an example. The French are now building a missile system of their own in which they are just using hardened sites and they are confident that these sites, because of the configuration of the terrain, will withstand an attack. They are satisfied that these 30 missiles would create such havoc in the Soviet Union that the Soviet Union would think twice before it attacked. This shows you that it is not a question of beating off an attack, it is a question of insuring the survival of enough of the deterrent capacity to keep

• 1150

the deterrent operating. That is the purpose of Safeguard. I would say that if Safeguard knocks down a few missiles it would enhance the second-strike capability of the United

States. If the expenditure of \$7.8 billion to knock down a few ballistic missiles is worthwhile, that is for the Americans to decide.

Mr. Brewin: Then you apparently do not accept the view of Dr. York, for example, that there are such disadvantages, problems of design, that "the capability either of the Sentinel system or the hard-point defense ABM to accomplish its task..." is in serious doubt. You apparently do not have the same doubts.

Mr. Gellner: NIKE X has been repeatedly tested. Again, I do not have my notes here, but missiles fired, I believe, from Vandenberg Air Force Base in California were repeatedly intercepted by defensive missiles fired from the Kwajalein atoll in Micronesia.

I would like to repeat that the weapons which are incorporated in the Safeguard system are no different from the weapons of the NIKE X system; they are only refined. The whole conglomerate of radars in the two different weapons systems is new, but every part of that has been independently proven. I cannot believe that a tested weapon will fail every time. It may not do what it is expected to do, but it will do 20, 30, or 40 per cent of what it is expected to do. I would like to repeat that it cannot beat off a missile attack. It can make part of the deterrent force survive.

Mr. Brewin: But can it not be overbalanced by the development of other techniques on the other side, so that all you are doing is putting in a defence that makes the attack a little more hazardous? Then the attack, in order to get even, can react, or perhaps even over-react? Is that not correct?

Mr. Gellner: The whole story of warfare is a continuous struggle between offence and defence. Sometimes one and sometimes the other prevails. For instance, as you know, in World War I the defence had it over the offence. Barbed wire, trenches and machine guns practically stopped the biggest armies the world has ever seen. In World War II, in general, the offence had it over the defence. Here the advantages are definitely with the offence, but this does not mean that the defence does not have certain capabilities.

In the field of bomber defence, as an example, the enemy has ticketed one aircraft to destroy Winnipeg. If this aircraft is destroyed by the defence over the Arctic Circle that is very nice for Winnipeg. It is not going to beat off a possible bomber attack, in itself, but it confers a certain local advantage.

We do not know but that defence against ballistic missiles will come eventually. Plans are now afoot to provide—or there is thinking—a blanket defence. That is a pool of radiation and heat that probably, or hopefully, will destroy all missiles that come into it. If this comes, then the defence will have the momentary advantage until the offence overcomes it again. It is a seesaw battle.

Mr. Brewin: Yes. I would like to pursue it with you, but I will not. I just have one or two further questions.

Appropos what you have already said, I think, in answer to Mr. Allmand, I want to read to you again from the summary of Dr. York's evidence before the Senate Committee:

Another result of the arms race is that, due to the ever-increasing complexity of both offensive and defensive systems, the power to make certain life and death decisions is inexorably passing from statesmen and politicians to more narrowly focused technicians, and from human beings to machines. An ABM deployment would speed up this process.

• 1155

Are you in agreement with that?

Mr. Gellner: The ABM system, like any other system using nuclear weapons, still requires the release by the President of the United States of the nuclear warheads. I cannot see why an ABM system would be treated differently—that is, would not require the release by the President, if the offensive weapons do.

It is true that everything comes closer to computer control, but as long as you maintain the situation which we had in the Cuba crisis, in which the Canadian Cabinet can say "We just do not play", this over-rides all the computers in the world—and it did over-ride them.

Mr. Brewin: Are you confident of that? It seems to me quite hard to accept that where the decision has to be made in a hurry some means will not be found of delegating it, if there is any sort of tension, so that it will, in fact, be made in a hurry. Otherwise, you might as well not make the decision at all. The blow would have been launched.

It seems to me that the point Dr. York makes is a sound one, that the whole nature of the process is removing decision from presidents and politicians, however much they may have it in theory, and handing it over to

the machine that has to see in a hurry what is coming over and respond. Is that not right?

Mr. Gellner: I have full confidence in the Canadian Government. It will not abrogate its power to a computer. I am fairly certain of that.

Mr. Brewin: Will it not be too late then for them to act on this system?

Mr. Gellner: I can see the possibility, if there is terrible strain in the world, of all cabinet ministers having these little bellboys in their pockets, and being in continuous communication, so that a cabinet meeting can be held whether they are together or not. I think it could possibly be done that way, but this is speculation.

Mr. Brewin: It takes only 10 to 15 minutes for a missile to travel from Asia or Europe to North America, does it not?

Mr. Gellner: Yes; it takes about 15 to 25 minutes.

Mr. Brewin: Then I do not understand how one can have cabinet meetings of the Canadian Government, the contacting of the American government, and then a decision to respond.

Mr. Gellner: To fire the ABMs would only require the decision of the President of the United States. I do not know how fast he can respond. The firing of the retaliatory missiles is not something which has to be done immediately because they are in hardened sites. They are in submarines. The outlook may be protected by an ABM system. So there is a little more time. You do not have to react immediately. Of course, to be effective the ABM has to be fired, and the President of the United States, or his deputy, will have to be on call.

Mr. Brewin: I think that is what Dr. York has in mind. I will pass now, although there are many other things I would like to ask you about.

The Vice-Chairman: Thank you, Mr. Brewin. Lest I forget, would the Committee agree to the printing of Mr. Gellner's advance presentation as an appendix to today's *Minutes of Proceedings and Evidence*?

Some hon. Members: Agreed.

The Vice-Chairman: Mr. Laniel is the next questioner.

Mr. Laniel: Thank you, Mr. Chairman.

Mr. Gellner, you say in your paper that the air defence of North America is a single and indivisible problem. This makes me wonder why Alaska is not integrated in that, or is not part of the NORAD organization? Can you think of any reason for that?

Mr. Gellner: I understand that the Alaskan command is under NORAD. It is just not one of the joint organizations. It is completely U.S.-run. But the defence of the whole of

• 1200

North America, including Alaska, as far as I know, has always been under NORAD. As I have said, the only difference is that it is not one of the joint regions. It is an entirely U.S. region.

Mr. Laniel: If the case of Alaska can be taken as a possible exception, do you think it could be possible for NORAD to re-arrange its regions to give more sovereignty to Canadian territory in the sense that if the region would correspond to the Canadian territory and to the border line, Canada could envisage a possibility of manning everything under its territory itself?

Mr. Gellner: It is, of course, theoretically possible. The defences are patterned so that they will be most efficient; that is, for the least expenditure of manpower and of money the results which can be achieved will be achieved.

When you look at your map section in the working paper you see the all-important position of the SAGE centres, the big computers into which all information is fed and which automatically give information necessary for the tracking, interception, and destruction of an attacker. You will find that out of four SAGE centres three are in the United States and one is in Canada. This is not for nationalist reasons but because of the defence pattern.

Obviously, we could install our own SAGE centres north of our border and we could have our own backup radars, our own viewing system, and man it all ourselves. It is theoretically possible. It would not be as efficient and it would not be as economical as the present system, but we could do it.

When you come to the new system, AWACS, it would be easier because the control is in the aircraft itself. I am not quite sure whether there will not be some ground installations, but probably none of very great import. The whole idea is to make the system

independent of fixed installations. Since this control would be in the aircraft we could have it in such a way that aircraft which are stationed in Canada would be entirely Canadian-manned, both AWACS control aircraft and the fighters.

In this case I would hope that there would be a very heavy financial contribution from the United States because the bulk of the AWACS aircraft would, in fact, I believe, have to be stationed in Canada and they would render the United States a very great service. So even if you decided that all aircraft stationed in Canada must have Canadian crews, must be serviced by Canadians, and there must be no Americans on the airfield or in the aircraft, then at least you would have to negotiate a very heavy financial contribution from the United States for the services so rendered. Under AWACS it is possible, but under the present system I do not think it is practical.

Mr. Laniel: The reason why I ask you this is that myself and maybe other people in Canada did not really appreciate what happened during the Cuban crisis. You said Canada was informed and not consulted.

Mr. Gellner: I think I understand that this was a statement of the government. I have no access to it.

Mr. Laniel: Yes, but just assuming that this is the fact, I think that if Canada has a chance to hold a closer control than it has on part of the system, a more sovereign control, it might prevent repetition of a situation like

• 1205

this. I do not know. If you look at the map of the NORAD organization, you see that it covers the eastern region which only touches a very small part of Canada. The United States probably made up its mind that this was its own business between itself and Russia, but it could have ended up in a war.

Mr. Gellner: This is obviously a concern of the Canadian government. I will quote from the text of the government's statement of April 3, 1969. The government said, "The role assigned to Canadian forces in the surveillance of our own territory and coast lines in the interest of protecting our own sovereignty. . ." is the prime mission of the forces. In another spot it said, "We shall endeavour to have those activities within Canada which are essential to North American defence performed by Canadian forces."

My argument is that this will only be possible at unreasonable sacrifice under the present system of fixed installations, but it may well be possible under the system of mobile installations.

However, I would like to repeat, if the government will insist, first, on surveillance of our air space territory and territorial waters, then second, as long as those activities are based in Canada, we should endeavour to have those activities done by Canadian forces. I would hope that the Americans would pay a great part of the cost because they would benefit highly from the same activities.

Mr. Laniel: Taking the example of the Nike-Hercules, although you said it was not necessary that Canada be involved in the ABM system, would you think it would be better if it was? Would you admit that it would give the chance to meet the requirement and to improve the present defence system by moving it to a northern part of North America?

Mr. Gellner: I would like to emphasize that I said that we are engaged in the ABM system and rightly so. What we do not have to do is to take part in certain weapon systems which are connected with anti-ballistic missile defence. I do not believe that any purpose would be served by stationing weapons in Canada. There may be a certain purpose in stationing the connected radars farther north. This is something which I do not know really, but this would give a significant advantage. This is possible.

As far as the weapons are concerned, the Spartan long-range missiles and the Sprint short-range missiles, no advantage would be gained by having such weapons stationed in Canada because the system primarily is devised to defend certain areas in which Minutemen missiles are located. These are in Montana, North Dakota and around there. So Sprint, just like Nike-Hercules against bombers, is a point defence weapon. It is so to speak on top of the missiles to defend them at short range.

Mr. Laniel: Yes, but would you mean by this that the Spartan and Sprint that would have the responsibility of defending a minuteman site would have to make the selection of the missile close enough so that it would know the intent of the missile, or is it possible to try and cut off the missile attack generally in the northern part of the country?

Mr. Gellner: You could not do it with Sprint. Sprint, I understand, has a range of only 30 miles, and therefore this is the last resort. The attacking missile has already gone through. Spartan uses space, and therefore it

• 1210

does not really matter. There the missile is intercepted. Certainly there is an advantage. It would be an advantage in intercepting the missile just at the moment when it is fired. We all know, from watching TV, that after firing it moves very slowly and, therefore, the interception would be easiest at the moment of firing. Perhaps a weapon will be found, possibly a cruising satellite, with an anti-ballistic-missile missile which could actually intercept at launch. This would be the ideal because the target would be easiest to hit. It moves very, very slowly. But once a target has a lot of speed and is in outer space I do not know if there are any advantages to be gained by having it in mid-course. I would say no, because in mid-course a target would be highest up, therefore you would have to shoot farther and, furthermore, you would have less warnings then in the last stage. I think by and large Spartan and Sprint are well placed where they are supposed to be placed, that is in the United States.

Mr. Laniel: I have one last question concerning the integrated command of NORAD. Actually the responsibility of the second in command there, who is a Canadian, is only military in the sense that once the political decision is made either he himself or in consultation with the commander decide on the tactical use of armament, where and how.

Mr. Gellner: His responsibility is the same as that of the commander of NORAD.

Mr. Laniel: It is not all that important whether this is a Canadian or an American, the decision would be a military one.

Mr. Gellner: Yes, his decisions of course are military. The decision to engage nuclear weapons is a political decision, and this will be transmitted to whoever at the moment is in command in Colorado Springs. If the commander is there, he is in command; if the commander is not present then it is General Sharp's responsibility. And you are quite right, he uses his forces by and large in the tactical field. Still, it is a tremendous responsibility; it is not a low class job to use this very far-reaching system with this tremendous capability for destruction. I agree that

even if there was an American Deputy it would not matter greatly, but it is nice that we have an influence on the tactical decision at this very high level because, obviously, this is an officer who has gone through our schools, has our concepts and our outlook on the military job. It is comforting, in my opinion, to have one of our own people in this very, very high position.

Mr. Laniel: Yes, but it is still sentimental because NORAD is there to protect the deterrent, the first responsibility of General Sharp would be to protect the deterrent and he could not act as a Canadian; he would have to act as a responsible military officer in charge of the defence of North America only.

Mr. Gellner: Oh no. Safeguard, as it is now conceived, is to defend the deterrent but NORAD defends everything. NORAD defends, theoretically, Ottawa. The question whether Ottawa can be defended or not is something else again. But the fact is that the brief of NORAD is not to defend the deterrent. Certain weapon systems can only defend a certain object. Let us say Nike-Hercules can only defend the city around which it is stationed. Safeguard will defend missile sites. But the whole system defends North America and, therefore, the Canadian officer will defend Ottawa as much as New York.

I would again like to come back to the point which I tried to make. There is a tendency to say: Well, when nuclear war comes we can only duck anyway, therefore why make preparations, why think about it—we are all gone anyway. Now this is the outlook which a novelist in "On The Beach" is entitled to make, but I do not think that serious people with responsibility can make it because we do not know what the course of a nuclear war would be. It is quite possible and probable that very great sections of the population would survive and, if the defence contributes to this partial success, so much the better. If the potential enemy has the capability of attacking I think it is difficult to avoid trying to have the capability to defend oneself. This is the rationale of course of Soviet air defence also; the Soviets say since the United States has the capability of attacking them, they must have their defences.

Mr. Fairweather: Mr. Chairman, may I be permitted one question?

The Vice-Chairman: With permission, Mr. Laniel?

Mr. Fairweather: I thought he was finished.

Mr. Laniel: Yes, I was finished.

The Vice-Chairman: Go ahead, Mr. Fairweather.

Mr. Fairweather: I was interested in the last answer about how nice it would be to have an influence on the tactical decision. But is this not the whole point—that in the Cuba affair we had no influence on the tactical decision because we were not privy to it.

Mr. Gellner: In the Cuban matter it was really of course a tactical decision. Let me make it quite clear that our Deputy Commander was still there, our officers were still in the staff positions and working, our forces with the help of the then Minister of Defence and on the basis of certain direct communications between officers in Colorado Springs and certain stations were at a certain state of defence. Now if a war had come, a tactical battle would still have been fought. This would have been fought under U.S. and Canadian joint command. But we would not have been in what the commander of NORAD considered the optimum position to repel an attack. As an example, his optimum position would have entailed the moving of certain American squadrons farther north to Canadian air fields. Now this could not be done without the concurrence of the Canadian Government. But, tactically our officers would have been privy, if you want to call it that, or would be engaged in the battle just the same as before. There were certain limitations because we did not go around with the decision to increase the alert state and that is all.

The Vice-Chairman: The list of questioners consists of Messrs. Thompson, Cafik, Harkness, Roberts and Guay in that order. It looks as if we will have to sit this evening, gentlemen, if Mr. Gellner is available.

Mr. Gellner: I am available.

The Vice-Chairman: We cannot sit this afternoon because the co-ordinator of Committees has advised that no room will be available.

I will call the next questioner, Mr. Thompson?

Mr. Thompson (Red Deer): Mr. Gellner, in endeavouring to interpret your own summary report that we have before us, I gather that you were saying to us that you agree that the statement of the government on April 3 which reads

"the surveillance of our own territory and coast lines in the interest of protecting our own sovereignty"

• 1220

is a desirable objective and much of what we discuss as it relates to ABMs is beyond our control and beyond the necessity of our participation.

Then you go on to say also very clearly that surveillance today of North American air space is not satisfactory, that the hole in the middle is a very real thing and that it should be plugged. You have explained to us that our present surveillance system is really too far south.

Then, if I understand your statement, you are saying to us that AWACS is a legitimate and an important part of air surveillance and that we should participate in it. Am I correct in that?

Mr. Gellner: I made one proviso. It is not really certain yet. There is the difficulty of looking downwards with radar. All these difficulties can be overcome and AWACS depends on the ability to look downwards with radar, that is, against the ground with radar—to be able to distinguish an object from the ground proper.

I understand scientists are confident that all the kinks can be ironed out, in which case AWACS would be the thing to have.

Mr. Thompson (Red Deer): Then you go on to say that the cost of AWACS is not really beyond us, that probably a squadron of 35 aircraft that are available at the present time would give us adequate surveillance over the whole of the air space in a satisfactory way.

Mr. Gellner: This figure is based on the calculation that apparently the radars of this aircraft will have a range of about 400 miles. They of course have the advantage of not being arrested by a mountain or by any other obstruction because they would be so high up and this means that every aircraft can survey about half a million square miles. Aircraft can be properly patterned to survey everything it is necessary to survey in order to really know what is moving in our air space.

Mr. Thompson (Red Deer): You say the alternative is either the status quo or to withdraw entirely from participation in NORAD and establish our own surveillance.

Mr. Gellner: Yes. With AWACS, as I said we could do it. We could do it because of the mobility of the control stations. But I also made the point that it would be very costly. If we are masters of our air, the Americans are quite safe. They may have to bolster it, but this surveillance of our air space gives them much more security than they have now. Therefore surely we would be entitled to share the costs on an equitable basis with them for the work performed in our air space. If each country went its own way, they would have to duplicate it south of the border. This would give them less security and us more cost. This does not seem to be very reasonable.

Mr. Thompson (Red Deer): You have then eliminated the first alternative which is the present system of surveillance, which you say is inadequate. The only other alternative is to attempt to work out something on our own.

Mr. Gellner: I think that the present system has almost, I would say, come close to outliving its usefulness and is also fairly dangerous because of the stationing of defensive weap-

• 1225

ons so far south. I gave the example of the BOMARC site at Buffalo, New York. The BOMARC fired from Buffalo, New York, at full range, would just about explode on top of Montreal. It is too far south, and this cannot be helped with the present system unless we build new lines. And if we built new lines we may just as well go into the modern mobile system.

Mr. Thompson (Red Deer): Then, Mr. Gellner, if it would be financially and technically and militarily possible to develop our own AWACS system, of what use is that system if we have no anti-missile defence system?

Mr. Gellner: Please understand that AWACS combats bombers and air-breathing missiles only. This is not an ABM defence. It can only defend against anything which moves in the air. So far that is only bombers and missiles which are in fact unmanned aeroplanes, air-breathing missiles. Going over to AWACS does not give us any ABM capability.

Mr. Thompson (Red Deer): I understand that, but then what would we have with which to complement AWACS if we were to accept this alternative.

Mr. Gellner: AWACS requires the fighters to identify, intercept and shoot down attack-

ers and we may take what the Americans recommend, the F-106X, or in view of certain objections to this aircraft, maybe we will choose another fighter to work with the control aircraft. All this is part of one system, the ground installations and the long-range air-to-air missiles, and so on and so forth. It still will give us a capability only against bombers and air-breathing missiles.

Mr. Thompson (Red Deer): What I am trying to get at, Mr. Gellner, is that the alternative to participation in NORAD, both as it relates to air surveillance within a system such as AWACS or an ABM surveillance system, is either to spend a great deal more money for a less effective system of surveillance and defence or else to withdraw completely from any type of defensive participation.

Mr. Gellner: It is possible to withdraw completely. But this certainly is quite the opposite to what the government's statement on defence is. The government's statement on defence postulates a better surveillance of our territory and the approaching zone than we have now. On the contrary, so far from withdrawing from the defence function, in fact it promises a strengthening of the defence function because if we do not do anything, if we withdraw from NORAD and do nothing at all, then of course we have no surveillance at all. Then anybody can fly in our sky without filing a flight plan. This is the very opposite to what the government wants. The government wants the maintenance of our sovereignty through good surveillance.

Mr. Thompson (Red Deer): Then what you are saying is that there is no alternative that has any logical practicality at all other than to participate in AWACS or whatever system is worked out.

Mr. Gellner: If we reject pacifism completely, then there is no alternative except to do something for the defence of North America.

Mr. Thompson (Red Deer): Carrying that just one step farther, if that is the alternative, to withdraw altogether, what do you see would happen as far as the United States is concerned in giving themselves adequate surveillance insofar as that might relate to our own air space or our own territory?

Mr. Gellner: If they consider the threat so great that they have to have an assurance for their own protection that the Canadian air space will not be used by intruders, then they

• 1230

undoubtedly will put certain pressures on us to allow them to do the surveillance. I do not know how far they will be successful, but the fact is that it is a question of their judgment as far as their security is concerned. I would say that right now I would suspect they would say they have to know what is moving in the Canadian air space for their own security. This situation may change. I do not know, but right now I would say they would be more than keenly interested that Canadian airspace cannot be used by intruders.

Mr. Thompson (Red Deer): Just one more question then, Mr. Gellner. You say in your closing paragraph that the question of Canadian participation in ABM defence does not arise that we already participate; and whether or not we take part in the Safeguard system or whether it is entirely U.S., it is better that the entire thing be under NORAD.

Mr. Gellner: Yes.

Mr. Thompson (Red Deer): And this is really your final conclusion, is it not, as far as any logical policy for us is concerned?

Mr. Gellner: My belief is that if—heaven forbid—it came to an air battle over North America, an air and space battle over North America, it would be one battle. Both sides would use whatever they had and would use some makes of weapons which go through the air and of weapons which go through space. Now, I cannot see how this defence can be divided there. You have to fight a tactical battle, as was suggested, from some kind of command post. You have to have control over the whole battle. Therefore it will be difficult. I cannot see how in fact it can be done to divide defence against attack from the air and defence against attack from space. This will be very, very difficult. So logically I think General Sharp makes a point in saying that from the military standpoint it should be under NORAD, and I would strengthen it by saying that logically it should be under NORAD. After all, the detection is already under NORAD; if NORAD has already adopted the early warning and detection function, why should then the interception function be taken out of it? It is one and the same operation.

Mr. Thompson (Red Deer): Well, then, just to state it in the simplest possible deduction, it is either to do that or to do nothing and to lie down completely in a passive way as far as any military participation at all here is concerned.

Mr. Gellner: Yes, with the proviso that we could, if we decided to, if AWACS came in, do it on our own at very great penalties for both sides, for both the United States and Canada.

Mr. Harkness: May I ask a supplementary question? As far as AWACS is concerned, is it not simply an example of new and improved technology in this particular field? And just as when the old manual methods were outdated by the introduction of SAGE and BUIC and so forth as a means of control of interceptors and Bomarcas and thus were put in in order to make an improved and more effective system, the AWACS in the same way are now supplanting the SAGE, BUIC etc., in order to give a new and improved system.

Mr. Gellner: I fully agree with you.

Mr. Harkness: There is no basic difference in regard to the whole set-up of NORAD and there would not be any difference through the introduction of AWACS. It is simply an improved technology.

Mr. Gellner: Absolutely. We already see it in the present system. In the present system, as you know, there is still manual control in Alaska and in Newfoundland and Labrador. The system simply has not come around yet to put SAGE in and probably, now with AWACS already coming, is not going to go

• 2135

into the expense of putting computers into these two flanking positions. So the system as it is now shows what you describe as gradual turning over from manual control to automatic control and then it will be the gradual turning over from automatic control in fixed positions to automatic control in aircraft.

Mr. Harkness: Yes. The point I am making is that there is no real basic difference from what has happened in the past. It is just a matter of introducing improved technology as it becomes available.

The Vice-Chairman: Is it the Committee's desire to adjourn now or shall we have one more questioner?

An hon. Member: Let us adjourn.

The Vice-Chairman: We will adjourn until 8.00 p.m. this evening. We will likely meet in Room 308 in the West Block and you will receive your notices.

EVENING SITTING

Tuesday, May 27, 1969

The Chairman: If the Committee will come to order we will resume at the point at which we adjourned. Mr. Cafik will be the first questioner.

Mr. Cafik: Thank you, Mr. Chairman. Mr. Gellner, I have two lines of questioning. The first is a series of what I hope will be short questions and short answers relative to the AWACS system.

It was pointed out earlier—and I think you agreed—that the AWACS is a natural extension of our present radar—and by that I mean the American and Canadian NORAD radar system—and I gathered from what you had said earlier that the AWACS would extend our frontier farther into the north. If this is true, would most, or all, of the AWACS be based in Canada and, if so, where would they be based?

Mr. Gellner: The main advantage of the AWACS, as you said, is that the defensive belt, the belt in which any attack would be detected and intercepted, could be moved by miles farther north from where it is now. Now the defensive belt is practically in the inhabited area. If this is so, then the control aircraft, those big ones which carry the electronics gear which detects and controls the fighters—we will call them control aircraft—would not necessarily have to be stationed on airfields as far north as Edmonton, or Mooseonee, or Goose Bay. They could be staged from the United States. But this would not be very economical, because you would have many wasted flying hours. Therefore, they would be best also stationed in the northern defensive belt.

The fighters which would be called upon to do the actual interception and the shooting down would, in any case, have to be stationed as far north as is possible, under weather conditions which would allow the use of an airfield the year around. I would say Churchill is an airfield which can be used the year around. That is roughly where I would envisage the fighters would be stationed, in any case; and the control aircraft as far north as would be economical.

Mr. Cafik: Mr. Gellner, how many fighters would be required to back up this AWACS system?

Mr. Gellner: I do not really know. I said in my brief that 35 control aircraft could give us surveillance of our territory such as the present system cannot give with many more ground stations than 35.

It would depend on what the actual killing defences—that is, the ones that do the interception and shooting down—would consist of. As AWACS is only to come in in the mid-70's we do not really know what it will be. It may well not be manned fighters at all. Therefore, I cannot really give you a figure.

It depends on how many fighters one of these control aircraft can control at one time. Assuming that 10 will be in the air at one time—let us say in an emergency—and each can control four weapon systems, whatever they may be; then you would have to have 40 weapons systems to call upon. But this is something I cannot tell you.

I do not know how thick the defences would be. This would also depend on our wishes. We then have to make an appreciation of the threat and say that there will be so many, or that a lesser number, or greater number will do. This is dependent on our wishes—how thick we want to make this defensive system.

Mr. Cafik: Does the movement toward an AWAC system mean that the present systems of Hercules and Bomarc, and so on, would become obsolete? Or would they be moved farther into the North and become part of the defence system related to the AWACS.

Mr. Gellner: I am sure the Nike-Hercules could not be used. A weapons system with a range of 75 miles could not very practically be used in the North. They would have to be too close together because of their limited range.

I think the Bomarc would be perfectly usable. The Bomarc has a range of 400 miles, which is not very much less than the radius of action of a modern fighter. The Bomarc can only go one way, so it is good enough if it has a range of 400 miles; it cannot come back. The modern fighter, after all, has human

• 2015

beings in it and has to come back; so it has to have a range of 800 miles.

The Bomarc, I think, could be used. I do not think it is being envisaged by the Americans, but it is quite a usable weapon. It is a good weapon. It has a lot of speed, and it is very reliable. Therefore, the Bomarc could be used.

20382—24

We have also a fighter, the CF-101. I do not think that the question of the use of the CF-101 really arises, because before the AWACS comes in our CF-101's will be about 15 years old and will be ready to be retired. We would have to go to something more modern.

The Americans are thinking in terms of the F-106 fighter, which now exists. It is not really a very modern weapons system, but it may well do. I do not know.

Mr. Cafik: If we proceed with the AWACS program would you envisage the dismantling of the existing Bomarc sites in Canada and the moving of them to new locations?

Mr. Gellner: The present sites would have to be dismantled in any case, because they are much too far to the south. North Bay is only 200 miles north of Toronto. It is really an inhabited area. A site on the outskirts of a city of over 40,000 inhabitants is not where we would like to have our defences based. Therefore, the Bomarcs would have to be moved quite a bit forward. I would say another 1000 miles farther north.

Mr. Cafik: Is it possible to do that without the AWAC system, or does the AWAC system make it possible?

Mr. Gellner: We cannot do it now, because by moving it forward the Bomarcs would be ahead of our radar.

Mr. Cafik: That is right.

Mr. Gellner: Our radar line reaches only 200 miles out. It would be useless to put the weapons in front of the radar. Therefore, we have to leave it as it is now, with the fixed installations. But with the AWACS we could well move the Bomarcs forward.

Mr. Winch: May I ask a supplementary?

Mr. Gellner: The Bomarc is anti-bomber. On what basis do you think it can be moved anywhere to shoot down a ballistic missile?

Mr. Gellner: No, it cannot; it still remains an anti-bomber weapon, because AWACS, as we were discussing with Mr. Cafik, is a weapons system against bombers and airbreathing missiles; that is, missiles which go through the atmosphere. Therefore, AWACS would not be a defence against ballistic missiles. But Bomarc would be perfectly capable...

Mr. Winch: I have just one further question. Is not the United States going out of the Bomarc?

Mr. Gellner: Yes.

Mr. Winch: Then why would we retain it?

Mr. Gellner: Because we have it; because it would not entail buying something new. I would like to make quite clear that I am not saying that we should retain the Bomarc. I am only saying that we could well retain the Bomarc, because against bombers it remains a viable weapons system, provided it is in the right spot.

The Americans are going out of it because their Bomarcs are south of the border. Not only are they right in the inhabited area but they would also explode right over our heads if they were shot in a northerly direction. So I rather welcome the American decision to go away from Bomarcs. The Americans cannot move them forward, but we have still a lot of territory to move our Bomarcs forward.

Mr. Winch: Perhaps they will give them a new name and move them farther north. This could happen.

Mr. Gellner: I would like to make it clear that the Bomarc is a weapons system against which there is no objection. It is a satisfactory weapon, and as far as we know will remain a satisfactory weapon for many years to come. I think what is bad in the Bomarc is that it is far too far to the south, and that is inevitable in the present system. And, second, they are all bunched together. There are 28 of them in North Bay all on one pad. One hit would knock them out. But if they were spread out and were moved farther north I think they could still serve.

Mr. Winch: Thank you, Mr. Cafik.

• 2020

Mr. Cafik: Mr. Gellner, do you envisage that an attack against the United States over Canadian territory would be by bombers and not ABMs?

Mr. Gellner: I am quite sure.

Mr. Winch: Otherwise it does not make sense.

Mr. Gellner: Yes, I can very well envisage it, because if somebody decides to attack such a nuclear power as the United States, I think he would, under present circumstances, be crazy in deciding something like that.

Mr. Winch: Without the ABM.

Mr. Gellner: He would use everything he has. He would use ICBMs, bombers, missiles, satellites, and everything which he has. Surely, he would not keep anything at home to have it destroyed in the counter attack. He would be quite foolish if he did that.

Mr. Cafik: Mr. Chairman, May I be allowed to proceed now for a moment?

The Chairman: Yes.

Mr. Cafik: Mr. Gellner, getting back to the AWACS, you were talking about a larger aircraft which would, in itself, be a sort of command vehicle that would direct the attack or the defensive attack by a fighter aircraft against any incoming bombers. Would they receive their instructions—say from Colorado Springs or North Bay—through the ordinary present command structure, or would the AWAC System make the present control system for early warning and defence obsolete?

Mr. Gellner: I order to simplify the systems, something must be interposed between Colorado Springs, which is a very high headquarters, and the tactical operation by ISIS controlled aircraft. I do not believe that the present system would be suitable. Some other command structure would undoubtedly be devised for the new system, but this is an administrative measure. You would simply change regions, and the locations of headquarters, and so on.

Mr. Cafik: It would seem rather difficult to me, Mr. Gellner for the individual command aircraft to direct this thing. It would be hard to control if you had a multiplicity of sources of defence such as this, as opposed to the present central one, like Colorado Springs. Does this not pose a problem?

Mr. Gellner: Oh, no! At the present time the air battle, if there were one, would be controlled at the divisional level. I hope you will go to North Bay and see it and you will see it in the ordinary staff officer at the console who directs and controls the aircraft. The same officer who is now at the console in what they call the "Blue Room"—because the lights are blue for night vision—would be at the console in a flying aircraft. There would be no change in that. There is no such thing as a control by the highest headquarters in Colorado Springs. This has been decentralized but, of course, all the threats go to the Commander in Chief. Right now, if an enemy aircraft penetrated a certain sector, the man who would actually direct a Bomarc missile

against the intruder would probably be one of the directors in a divisional headquarters. To put it on a human level, he probably would be a captain and he would fly in an aircraft and would control the veteran against an intruder. Of course, he could only control this weapon if he had been given the go-ahead to do that right down the chain of command from Colorado Springs to the region. Now some chain of command of this kind that would have to be established in the case of AWACS as well.

Mr. Cafik: I have only another two or three questions, if you do not mind.

The Vice-Chairman: I have you at the bottom of the list, Mr. Winch.

• 2025

Mr. Cafik: Mr. Gellner, if the AWACS and the necessary aircraft for defence were going to be based in Canada, and if Canada made a decision that we wanted to man all such vehicles within Canada, and participate in the AWACS in that manner, do you envisage any kind of a problem with the Americans themselves? Would they be agreeable to such an approach, particularly in view of the problems they had in the missile crisis that we spoke of earlier today.

Mr. Gellner: If I understand you correctly, you are presenting a hypothetical case in which all the control aircraft, fighters, or other missile weapon systems which are based on Canadian soil would be Canadian manned, and commanded.

Mr. Cafik: Perhaps the Americans might foot of good hunk of the bill in view of the fact that they participated.

Mr. Gellner: Quite rightly, because they would largely benefit from it. I think this is perfectly feasible, provided the Americans have some guarantee that this aircraft and weapon will be used if they are in danger of attack. Now, how, and what guarantee can be given, I do not know, because you must bear in mind that in this AWAC System the defences will be much farther to the north than they are now, and therefore practically all will be on Canadian soil with some exceptions in Alaska and so on. Now if you want them to all be manned by Canadians, then the same defences which protect us, protects them. They want to be protected, so I think they probably would have no objections against us manning and having it all, provided they knew that they will be protected.

Mr. Cafik: In other words, to achieve that it seems the only way they could have that assurance is by a pre-signed agreement which stated that upon their orders we would tell them to go. In other words, we would have no say in the decision-making as it were. That would give them the guarantee—I cannot see much short of that—if we had complete control of the operation. Can you envisage them agreeing to anything short of that?

Mr. Gellner: I can envisage a kind of arrangement very similar to the arrangement which is in Europe in NATO. They have a NATO Council, and in it everybody who has an interest in safety is represented. This NATO Council makes common decisions, so instead of decisions being made independently in Washington and in Ottawa, in two different places you could establish a North American Council in which the decision would be made by the Americans and Canadians together. This would be similar to the decisions which are made in the NATO Council. I should not say that this may satisfy the Americans, that is being over-optimistic, but it may satisfy those who are always told to retain the trump hand in the release of the nuclear warheads. It depends on them, but whether or not this is a way of doing it I could not tell.

Mr. Cafik: Would you not be inclined to think that the Americans would be less than enthusiastic about entering into such an arrangement in North American when they probably are a little frustrated that their hands are tied as much as they are in NATO. It would seem unlikely that they care to tie themselves up that much right across the whole board. If we tie them up in North American is the same way, it might weaken the deterrent by having that kind of command structure.

Mr. Gellner: My reading of the articles towards NATO is that, far from feeling that they are tied in it, they really want to maintain this system because they reached a break with France since they insisted that this integrated system of NATO should be maintained against French opposition. Therefore, I would say that United States are reasonably satisfied with the system prevailing in NATO. Now, of course, there is a difference. Here in North American they may want something much

• 2030

stronger than a common council. But this is something which would have to be investiga-

ted. The fact is that if you go into AWACS there is the possibility of dividing—that is, of saying we are going to do everything north of the border and you do everything south of the border. Then if we do not react to any intrusion of our air space the Americans could react themselves south of the border. But this would not be in our interest because the weapons would fall on us. We have an interest in the reaction being as far north as possible. Therefore there will have to be some understanding. Even if we have two different systems we must have an understanding of co-operation to make sure that the interceptions will in fact take place where they can take place in the AWAC system, as far north as possible.

Mr. Cafik: Mr. Gellner, I have one last question on this particular aspect of it. With the interception of manned bombers with nuclear weapons, say, coming across into our air space I do not understand, and this may be a naive question, whether the interceptors would be in fact flying a suicide mission in trying to destroy one of these incoming bombers. Would the effect of destruction perhaps detonate the weapons and destroy the attacker as well as the defender.

Mr. Gellner: No. You must appreciate that I do not know classified information, but my understanding is that in the case of the BOMARC, which is unmanned, it would be destroyed itself. And the BOMARC is such a big warhead that if it explodes I believe anywhere within a mile of the target it knocks the target down elsewhere. It knocks itself down. Anyway, it cannot come back because it has no pilot. With a very big warhead and with tremendous power it does not have to hit the target,—if it comes within a mile it knocks the target down. The fighter has a very much smaller air-to-air missile which is fired from such a distance, let us say several miles from the target, that the explosion is not going to effect the attacking fighter at all. It is a smaller warhead and, therefore, has to come much closer. But it can come much closer because this air-to-air missile is directed from an aeroplane, from a human brain as it were, therefore it can be directed or can “home” right into the target. It is not a suicide mission. When I speak of danger of interception over our heads, you have to bear in mind that the BOMARC, let us say, will intercept the target wherever it is. It is true that it can be prevented from the ground from intercepting—it can be destroyed before

it goes—but when an attack comes in with nuclear bombs on you will have a tendency to destroy the bomber.

First of all, the bomber can see the oncoming flights on its radar. A nuclear bomb cannot explode unless it is deliberately fused. I think this categorical statement can be made because we had some very bad crashes of bombers with nuclear bombs on, one I believe in North Carolina and one in Greenland, and there were such fires that the bombers were destroyed to cinders but the bombs did not go off. They have to be deliberately fused. But let us say that the crew sees the oncoming missile on its radar, or the oncoming fighter, and they may say, all right, we have had it, but we will take as many people along as we can and they fuse the bomb and release it before they are themselves hit. That is one thing.

Secondly, as Dr. Lindsey explained to you, there is some suspicion that there exists now a device that can be put into the bomber that fuses the bomb at the reception of the first outside radiation, and Dr. Lindsey mentions this as a technical possibility.

Thirdly, the explosion of the BOMARC at comparatively low altitudes, because of the fact that it is such a tremendous explosion, will knock down a bomber a mile distant. If this exploded at 10,000 feet, of course even the BOMARC would do considerable damage on the ground. So we have every reason to hope that the interceptions will be somewhere in the subarctic and Arctic.

Mr. Cafik: Now I want to proceed to the relationship of NATO and NORAD because I think the central question facing the Committee is how can we best play some role, perhaps in the preservation of peace. I think that there are a lot of varying views on this particular question. You were here as a witness at the time. When we looked into NATO, and now we are looking into NORAD I would like to know what your views are as to the relative value of contributions to NATO versus NORAD. In other words, do you attach in any prominent way more importance to one or the other of the alliances in terms of our contribution towards the preservation of peace?

Mr. Gellner: Well, I would say that NATO can exist without us, NORAD cannot. NORAD is dependent on our air space, on our ground facilities and on our communications. Therefore, in NORAD we are a necessity. Really I do not think there can be effective

defence of North America without Canadian co-operation of some kind—even if it is only passive, even if it is only to give the air space, the air fields and the communications to somebody else. We are essential in NORAD. We cannot say that we are essential in NATO. We are very important in NATO but NATO could do without our military contribution. It is not a question of life or death. While I consider NATO, as you know from my previous testimony, to be very important, it is not absolutely essential that we should be in it. There are many advantages to our being in it. But we have to be in NORAD or North America cannot be defended.

Mr. Cafik: If that premise is true, Mr. Gellner, what choice do we have in real practical terms? If the United States superpower decides in its own mind that for the preservation of its own safety and its own freedom that it must have our space and that it must in a way violate our sovereignty, then do we really have any choice—or do they have any choice but to do it regardless of what we might say?

Mr. Gellner: Certainly you have a choice. You can say that we are going to take part in NORAD and pull our full weight. This I think is the sense of the government's statement on April 3, 1949, when the government indicated that not only will we pull our weight fully, we will do more than we are doing now. Then you have the second choice: we will co-operate but we will not take our full share. Thirdly, you have the choice of complete pacifism by saying we are not going to do anything but in view of the fact that you, the United States need it so badly, you might help yourself. This is a choice which politically the people of this country must make. But here I go by the statement of the government, which says not only are we going to pull our weight, we are going to do more than we have done before. This I understand is now the position of the Canadian government. Certainly, this was the enunciated position of the Canadian government.

Mr. Cafik: Thank you very much, Mr. Gellner and Mr. Chairman.

Mr. Harkness: First, in connection with the ABM system or the Safeguard system, in particular, Dr. Lindsey put forward the thesis that at the present time we have a situation of stability as far as the nuclear stalemate is

● 2040

concerned, with each side having a first strike and each side having a second strike capability, and the maintenance of peace depends to a considerable extent, or possibly depends to a considerable extent on the maintenance of this situation of stability. I think a considerable number of people are concerned that the institution of the Safeguard system would disturb this stability and would thus make the risk of a nuclear exchange greater. I would rather take it from what you have said that you do not subscribe to that theory. What is your view in that regard?

Mr. Gellner: My belief is that as long as we have not got peace, every one of these big countries is going to develop its weaponry. They are not going to stop that. I do not believe that because the United States and the Soviet Union have come to the conclusion that their theoreticians are right and that now there is a stable situation, both are going to stop their research programs. It is also, as you know, not practically possible. You have to go ahead all the time in research. Therefore, the development of offensive weapons is not going to be stopped because the two sides think that there is a stable system in the world. It is going to be stopped by an agreement amongst the nuclear powers to stop, and an agreement which is enforceable and which is controllable. They may say, "We now have a sufficient arsenal; we do not want to know more about it." But this is not the case. Therefore, whatever the United States does or the Soviet Union does for its defence, the development of boosters and warheads will go on merrily.

The very existence of a civilian space program makes this inevitable because in the civilian space programs, boosters are being developed which are very much bigger than the boosters used for weapons and which could theoretically carry warheads several times the size of the warheads which can now be carried by the boosters of the ICBMs. Therefore, I do not think that Safeguard is destabilizing. I think it does not make any difference. On the other hand, I would say that perhaps it is not absolutely necessary because this is a terrain so powerful today that some picayune thing such as Safeguard protecting some missile sites is not going to make a lot of difference. And again, the belt around Moscow probably is not going to make a lot of difference. But whether it is there or not, the development of weapons of mass destruction is unfortunately going to go on.

Mr. Harkness: Well, as a matter of fact, you said this morning that a basic purpose of the Safeguard system was to ensure that a greater proportion of the second strike capability would remain than would be the situation if there were no Safeguard system. I think I would go a bit farther than you have indicated and put up the proposition that as technology is constantly improving and as the

• 2045

offensive capability of anti-ballistic missiles and of their means of evading detection and so forth is increasing and therefore the offensive generally is likely to be stronger four, five or six years from now than it is at the present time, the institution of the Safeguard system would probably help in maintaining this stability rather than upsetting the balance.

Mr. Gellner: I myself am not very much given to this kind of theory which is now so general. You will remember that Dr. Lindsey also said that the greatest danger was at the time when the offensive missiles were themselves unsafe; that is, at the time when they were all in bombers on airfields which could be knocked out or which were like Titan and Atlas in non-hardened sites just out in the open, and that stability came once the retaliatory force became safe by being put into submarines and into silos. Now here you could have the argument that it would be even safer if you put a defensive missile on top of the silo.

Mr. Harkness: What I was getting at, which I think is quite clear, is what your views were in regard to the statement that we hear quite frequently and that the people who are strongly opposed to the Safeguard system constantly reiterate—that this will, we will say, disturb the balance; make war more likely. Your view does not coincide with that and, in fact, I put up the proposition, which I do not think you subscribe to, that it perhaps makes it less likely rather than more likely because you have a greater second-strike capability preserved.

Mr. Gellner: I would say you may well be right. It certainly does not make war more likely.

Mr. Harkness: The next thing is in regard to what you deal with on page 6, the Effectiveness of NORAD System in an Emergency, which actually comes down to a difficulty which has existed, as far as nuclear weapons

particularly are concerned, from the beginning of any alliances making use of them, that is the whole question of control. Before going further into the matter of control, I would like to point out that you state here, "The facts are" and then you go on, and some of these facts are not correct.

Mr. Gellner: Well, I stand corrected.

Mr. Harkness: I think perhaps I should make that clear. First of all, you say at the bottom of the page:

...the Canadian forces, on their own initiative...

I think this casts a reflection on the forces that they paid no attention to civilian control and went ahead.

Mr. Gellner: Yes. I said, though, sir:

...on their own initiative and with authorization from the, then, Minister of Defence...

Mr. Harkness: Yes, but as you have this stated there, "on their own initiative" certainly gives the impression that they went ahead on their own to take, we will say, defensive measures and to go on to a state of emergency. This is just not correct and I would object to this particular statement being in. The second, "With authorization from the, then, Minister of Defence...took some steps to improve their preparedness" is correct. But I think "on their own initiative" really should be out of there.

The Vice-Chairman: Mr. Harkness, exactly what words were you objecting to? Let us have it clear.

Mr. Harkness: To "the Canadian forces, on their own initiative". Then it says, "and with authorization".

The Vice-Chairman: That takes you over to page 7.

Mr. Harkness: Yes. It took some steps, but this was not done on their own initiative and I say I think it casts a wrong implication on the armed forces and would lead a considerable number of people, people who are opposed to armed forces in any event, to argue that the armed forces tried to take control of the situation, which is not true.

• 2050

Mr. Gellner: Mr. Harkness, I am glad that you pointed to this fact, because you will appreciate that as I am not privy to Cabinet

secrets, I have to use information which has been published, and this is information which was published. But if you say they took no steps at all without your authorization, so much the better.

Mr. Harkness: I would like to make quite clear that no steps were taken at all until I had instructed the Chiefs of Staff of the three Services to take steps. As I say, I think it is dangerous to have this in the evidence without correction because undoubtedly a lot of people would beef on this, arguing that this was a case in which the armed forces tried to take control of affairs.

The Vice-Chairman: Mr. Harkness, possibly you and Mr. Gellner could get together after this meeting.

Mr. Harkness: No, no.

Mr. Gellner: I bow, of course.

Mr. Harkness: I thought this should be corrected for the record so that a false impression would not go out in this regard.

The Vice-Chairman: We have already agreed that this brief become part of our Minutes of Proceedings, and I would like to be certain of the exact correction. This is my point.

Mr. Harkness: It is corrected now in the record.

Mr. Gibson: I submit that it has been corrected by Mr. Harkness' statement.

The Vice-Chairman: All right, then, if this is the feeling.

Mr. Guay (Saint-Boniface): I was going to ask Mr. Gellner a supplementary question pertaining to this. If you will allow me to do so, I will be very brief. Mr. Gellner, did you not contradict yourself with respect to the part played by the Minister of National Defence during the Cuban crisis? In one place you applauded the Minister for taking some steps on his own because he felt the situation was so serious that it was not prudent to punish ourselves by delaying, and later you went on to say that you have confidence in the Canadian government that it will not arrogate its power. Do you recall that?

Mr. Gellner: Yes, absolutely. I cannot really see any contradiction there because I also said that it is inevitable in any kind of an alliance between sovereign nations that such a thing, can in fact occur. I am not really critical of the fact that it did occur because

such a thing may well occur when two sovereign states are in an alliance. The fact is that because it did occur, in my opinion the system was not better prepared to meet an attack if it had come than if the Canadian government had been much faster about agreeing to it, but I consider it inevitable that this can happen in NATO as well. As long as these governments are sovereign, it is a privilege to go along or not go along. This is the whole idea of the two-key system, is it not? Two keys have to be turned and if both of them have the right to turn them whenever they feel they should, there may be this discrepancy of XY hours. In dealing with the effectiveness of the system, I said in the one case when it was tested there was such a delay that if there had been an emergency the system would not have functioned as well as if both governments had immediately agreed to take the same steps.

Mr. Guay (Saint-Boniface): You base it all on "if"?

The Vice-Chairman: Before we go any further, Mr. Harkness, the Clerk advises me that while it is true there is an explanation and a correction on the record, he thinks we should have it in the actual presentation which is an appendix to our proceedings. Would you now tell us the exact words that you want out of that line at the bottom of page 6?

Mr. Winch: We have objected to it.

The Vice-Chairman: We want to know the words so the appendix will go in as amended.

Mr. Harkness: It is the four last words at the bottom of page 6, "on their own initiative".

To continue, Mr. Chairman, I also take objection to the statement that Mr. Gellner has just made. He then goes on to say:

and with authorization from the, then, Minister of Defence...

who happened to be myself:

... (but not the Cabinet), took *some steps* to improve their preparedness, the most important actions, especially in terms of deployment of forces and readying of nuclear munitions, were not and could not be taken.

I also take objection to the "*some steps*". In

• 2055

actual fact all the steps that could be taken to get into Defcon 3, which in our parlance

meant a state of readiness, were taken. As a matter of fact, within about 36 hours all our ships were out at sea fuelled up, ammunitioned up, and so forth. They were all out of harbour. The air forces were all on alert, they were ready to take off at any moment. The land forces had gone out to deployment areas, and so forth. We were really in a full state of alert as far as the deployment of forces, and so on, were concerned.

As far as "readying of nuclear munitions" is concerned, there were no nuclear munitions so none of them could be ready. At that time we had not signed any agreement with the United States. We did not have any kind of nuclear weapons in Canada so therefore there could not be any readying of nuclear weapons, it was an impossibility.

Mr. Guay (Saint-Boniface): Was this a Cabinet decision, Mr. Chairman.

Mr. Winch: No.

Mr. Harkness: The actual situation was that in a very short time our forces were in as great a state of preparedness as they could be gotten into in that very limited length of time.

Mr. Gellner: If I may explain. We were partners in NORAD and, if I understand what Defcon 3 entails, there are two steps which come immediately to mind which were not taken because they could not be taken; the first was the forward deployment of American squadrons to airfields in Canada with nuclear weapons and the second was the recall of people from leave. I understand, sir, there are other points but these are the two that immediately come to mind. When I say the "deployment of forces" I do not mean the deployment of Canadian forces but of NORAD forces. The "readying of nuclear munitions" is not the readying of Canadian nuclear munitions, which we did not have, but NORAD nuclear munitions which the Americans had. I think the people were deliberately not recalled from leave as they should have been because this would have drawn attention to the fact that we were in a state of high alert. As far as I understand, all steps were not taken.

Mr. Harkness: It is quite true that people were not recalled from leave, but nobody else was allowed to go on leave. The fact that a certain number of people were on leave really did not make very much difference, if any, as far as a state of readiness was concerned.

Mr. Gellner: I said the development of American forces.

Mr. Harkness: As far as the deployment of American forces are concerned, they had American nuclear armed planes at Thule and at Sondre Strom Fjord in Greenland, and less than a squadron at Goose Bay would really have made no material difference either.

Mr. Gellner: Of course, I do not want to question you, sir, but I think the facts which I presented contain a Defcon 3 overseas alert stage.

The Vice-Chairman: On a point of order, Mr. Gibson.

Mr. Gibson: Mr. Chairman, I submit that this is rehashing the past and it is really out of order. We want to get on with our current and future plans and this has gone far enough.

The Vice-Chairman: Mr. Gibson, we have some sympathy with your views on the matter but actually it is in the presentation.

Mr. Harkness: Mr. Chairman, I submit that nearly everyone who asked questions this morning referred to the Cuban missile crisis and this is why I thought I really should correct some misapprehensions which this as it appears would convey.

• 2100

The Vice-Chairman: Mr. Laniel on a point of order.

Mr. Laniel: On the same point of order, Mr. Chairman. I agree with what Mr. Harkness is concerned about, but this is still a document that was prepared by Mr. Gellner and he is answering for it. There may be questions of different opinions on it or the interpretation of facts. Because of the mere fact that Mr. Harkness made a point of clarification I do not think the Committee has the authority to change the report.

Mr. Winch: You cannot change it.

The Vice-Chairman: It is changed with the agreement of Mr. Gellner, though.

Mr. Laniel: If we start to do that, Mr. Chairman, we will do it with other witnesses as well, and I think this is a completely wrong procedure. I think we should take the statement as it is. Mr. Harkness has made his point clear and he had ample time to give the facts as he lived them in those days. Mr.

Gellner spoke about facts that he knew about himself. I think it is the responsibility of the Committee to protect the witness and leave his statement as it is.

The Vice-Chairman: Mr. Laniel has a good point there and I do not mind putting your proposal to the Committee, but it is not exactly on the point of order. Perhaps we could take it up afterwards. Mr. Thompson, are you on the point of order?

Mr. Harkness: Mr. Chairman, perhaps I might just say a word here. I do not want to labour this matter any more, and so forth. I thought the Committee itself should know what the facts were, because Mr. Gellner, with all due respect, was not in a position to know the facts.

The Vice-Chairman: I can understand why he does not mind his report being amended.

An hon. Member: I think he agrees with that.

The Vice-Chairman: Let us put the proposition to...

Mr. Winch: Mr. Chairman, on a point of order.

The Vice-Chairman: Mr. Winch, on another point of order, or the same point of order?

Mr. Winch: We cannot amend the presentation of Mr. Gellner.

The Vice-Chairman: That is all Mr. Laniel said.

Mr. Winch: We can explain it, but we cannot amend his presentation.

The Vice-Chairman: Order, please, Mr. Winch. Mr. Thompson, on the point of order.

Mr. Thompson (Red Deer): I do not think Mr. Harkness is asking to amend it. I do not think he is taking too much time. He has not taken as much time as some of the rest of us have. I think it is of great historical significance to have a few of these things cleared up by one who is in the know. I do not think we should go on with it, but I think the clarification that is being made is good.

The Vice-Chairman: Are there any further comments on this point of order that was raised by Mr. Gibson?

Mr. Guay (St. Boniface): I would suggest that Mr. Harkness carry on.

Mr. Harkness: I have finished on that, Mr. Chairman. Actually, this really leads me to the main matter.

The Vice-Chairman: Do you have another line of questions, Mr. Harkness?

Mr. Harkness: No. What I have in mind follows from this; that is, the matter of control of the whole NORAD system, and so on.

The Vice-Chairman: That would be quite pertinent.

Mr. Harkness: Yes. As far as the ABM part of this is concerned, if it is built and if it becomes part of NORAD, the Spartan missiles will explode in outer space and the Sprint missiles will all explode on American territory or above American territory. What is your view of, we will say, our right to attempt—as some people in this country would like to do—to say to the Americans: “You cannot put this system in because it may interfere with our air space, or the stratosphere above our air space?”

Mr. Gellner: As far as I know the two cases apply only to nuclear weapons which are destined to be used by us. There are not two cases for nuclear weapons which are used entirely by the American forces. The Safeguard system would not be in any different position than the Nike-Hercules system where we also have, of course, no influence. Let us say perhaps influence, yes, but no decision so far as its use is concerned.

If the argument is only that it should not be used because everything above our heads in some line going into the infinite is ours, then first of all it is a legal question which lawyers will have to decide. On the other hand, you have to bear in mind that in outer space objects traverse our heads continuously. I do not know how many there are right now, but I would not be surprised if a scientist came in and said that right now 100 objects are crossing Canadian territory, because I understand that something like 2,000 are continuously being monitored.

I have never heard us object to these, so there is a precedent which would indicate that we really do not have a case if it is in outer space. However, as I say, this is something for lawyers to examine. So far we have never protested against objects crossing in outer space over our heads.

Mr. Harkness: In other words, your view is that the order to use the Spartan and Sprint systems, if they are put into effect, would be a matter entirely for the United States?

• 2105

Mr. Gellner: My understanding is that this is a fact. The two-key system which requires our agreement and their agreement only pertains to those working systems and those moves which are connected with Canada.

Mr. Harkness: So far as defence against manned bombers is concerned, you have quite a different situation. It would require the agreement of the Government of Canada for nuclear weapons to be used either by our own forces or by American forces over Canadian territory?

Mr. Gellner: I think so, yes.

Mr. Harkness: There will be no question in that regard whatever?

Mr. Gellner: I tried to explain this in my paper. As far as Spartan is concerned, I really do not know what the legal position of outer space is. I would suspect that it is no man's land. As far as Sprint is concerned, the two Sprint sites which are now being established are so far from Canadian territory, and the Sprint is such a short range weapon, that really the likelihood that it could get into Canadian air space as far as we know is nil.

Mr. Winch: Mr. Harkness, may I ask a supplementary?

Mr. Harkness: All right.

The Vice-Chairman: Mr. Winch, with the permission of Mr. Harkness.

Mr. Winch: You have said the Spartan is over no man's land. The evidence we received from Dr. Lindsey shows that the Spartan would be used completely over Canadian territory. You call that no man's land?

Mr. Gellner: I call no man's land outer space. I said I suspect that outer space is no man's land for two reasons. First, I have not heard of anyone who has asserted sovereignty over outer space. No one has said outer space is American, Russian, French, Canadian, and so on.

Second, I gave the example of outer space being used over our heads as a matter of course. I do not think we have ever said that one cannot have a satellite crossing in outer space over our heads. It is done all the time.

Mr. Winch: Have you seen the graph that was presented to us by Dr. Lindsey on the Spartan explosion? A lot of that was not in outer space.

Mr. Gellner: Of course, I do not want to get into any discussion about it, but my understanding is that Spartan is trying to intercept incoming missiles from 300 to 400 miles away from the Spartan site. That is roughly the idea. The idea is to have two lines of defence. One line of defence before the ballistic missile re-enters the atmosphere and the other one after it has re-entered the atmosphere. You hope that Spartan will knock it down. If Spartan does not knock it down, when it has re-entered the atmosphere you have the back-up of Sprint.

My understanding also is that Dr. Lindsey said that not only is it going to happen in the near vacuum of outer space—I believe those were his words—but there is an advantage because actually Spartan is so constructed that it is most effective in the near vacuum of outer space. This is, I understand, from his paper. I do not know how much credence you want to give to *Time* Magazine, but *Time* shows this picture and it is 300 to 400 miles up where Spartan intercepts. That is far above the atmosphere.

• 2100

Mr. Harkness: Mr. Chairman, I had moved off the ABM system to the anti-bomber defence, really, and this is what I just started to question Mr. Gellner about. Now there was in the questioning this morning, and there has been at various other times, a considerable number of questions raised as to whether the political decisions concerning the United States forces and concerning the Canadian forces, and both decisions as far as NORAD is concerned being conveyed to the commander of NORAD, would be made in time for the anti-bomber defence to be effective. Personally, my view is that these fears are not well founded in spite of the example you gave of the Cuban crisis.

In the event of one bomber coming in, of course, nobody is going to use nuclear weapons anyway. But if the detection system shows a very considerable number of strange aircraft coming into Canadian air space, then you are still going to have two hours warning time or something along this line, sufficient time for a decision to be made first by the President of the United States as to whether he releases nuclear weapons for use, and secondly by the Canadian government as to whether we release the ones under Canadian control for use.

Mr. Gellner: I think I said this morning that about two hours would be sufficient.

Mr. Harkness: The point I am making, and I wondered whether you would agree with it is, that this does give sufficient time for the political decision to be made in view of the fact, as I say, that this situation would arise only if there were penetration by a considerable number of unknown aircraft.

Mr. Gellner: I agree with you that two hours be the absolute maximum which could be spent on this deliberation. In fact, the decision could be reached within five minutes.

Mr. Harkness: In any event it gives sufficient time. This was the only point I was trying to establish.

Mr. Winch: Mr. Gellner, do we understand from you that if the USSR were going to make an attack on North America against the United States, they would use manner bombers that give two hours notice on the radar system and not use the ICBMs which according to Dr. Lindsey would give us only 15 minutes?

Mr. Gellner: I did not say that this was mutually exclusive on the contrary, I think that twice I tried to say that anybody who would want to attack a major nuclear power like the United States would use everything he has. He would use ICBMs, bombers, air-breathing missiles, armed satellites, anything which could carry a weapon, because obviously he would know that either his first shot succeeds and he knocks out the retaliatory force...

Mr. Winch: But would not the ICBMs which give only 15 minutes notice preclude any possibility of manned bombers which give two hours notice?

Mr. Gellner: No, this is not what I said. All this could be timed to coincide. All the ICBMs could be fired let us say 3, 4, or 5 hours after the bombers have taken off in the Soviet Union. They could all arrive at the same time.

• 2115

Of course it is an opinion, but I am certain that anybody who would attack a major nuclear power would use a mix of everything he has. There is no point in keeping anything back because it will be lost anyway in the counter-attack, if the first attack does not succeed. So I do not think it is mutually exclusive. He would use bombers and ICBMs. He would use air-breathing missiles and satellites, everything together.

The Vice-Chairman: Mr. Roberts.

Mr. Roberts: Thank you, Mr. Chairman. All the questions I have will deal with bomber defence. I have nothing on ABMs.

Most of my questions arise, Mr. Gellner, from your paragraph that begins at the bottom of page 5 and goes on to page 6. It is about the present state of NORAD defence. It is not long. Perhaps I could read it:

In other words, with more than 150,000 men, and for an annual expenditure of upward of two-and-a half billion dollars, NORAD is not altogether able to deny the air over North America to intruders. In case of war, some bombers would get through... It goes without saying that if there were no NORAD system, foreign aircraft could disport themselves in the skies over North America at will, undetected and unmolested.

And then there is what seems to me to be the key sentence:

Then, and probably only then, would a serious bomber threat arise, because what inhibits now the use of the still cheapest and most accurate means...

is the maintenance of the present defence system, roughly.

I think I follow your argument there, but perhaps I could restate it in a way which might correspond with your thought and perhaps not. If there were no bomber defence, then the bomber-delivered nuclear weapon would be a very potent and accurate first-strike weapon. But the maintenance of some kind of air defence system really translates the bomber threat into a counter-strike weapon or a second-strike weapon. Is that a fair conclusion or not?

Mr. Gellner: I do not think so. I would like to come back to the situation where, let us say, the Soviet Union decides to attack North America and here they are faced with the situation that if the first strike is successful, that is, if it knocks out so much that nobody will really want to make a reply that it will really not be worthwhile being spiteful and shooting up three measly weapons, then he has succeeded. But if he has not done this, then the counter-attack will destroy him. Therefore, I would say that from the standpoint of the attacker who mounts what he hopes is going to be a devastating surprise attack, and this is only hope, he will have no interest whatsoever in holding any kind of weapon back because his weapons will be lost anyway. So he will put everything in his first

strike, and I would then say the bomber may well be a first-strike weapon. It does not matter which it is.

Mr. Roberts: I find it a little difficult to see that because I could see how you would want to use the mix, and time the send-off of the missiles to match the arrival of the bombers, but it would seem to me that the bombers are going to be detected before they get to the target. So you would have to time your missile launch to the time of detection of the bombers and the bombers would be detected far enough ahead that the reaction of the country being attacked would be to launch its retaliatory strike at that stage. So even though the bombers have been sent out in advance of the launching of the missiles, they would still arrive at a point when the missile war had already started.

• 2120

Mr. Gellner: Absolutely, but it can be theoretically done because look at the defences as they are now. You can assume that the DEW Line detection can be avoided. The DEW Line is a single line and you can probably fly under its radar coverage. The DEW Line is very useful but it is not really a very strong defensive line, and that is why we have the heavy radar in the south.

Now this heavy radar in the south would also only give you probably 20 minutes warning because its utmost range is 200 miles if the bombers stay high enough, and if the bombers can be expected to fly 600 miles an hour, the warning which the Pinetree line gives is also only 20 minutes.

Mr. Roberts: But this equation would be changed presumably if we had back-scatter or forward-scatter radars.

Mr. Gellner: Absolutely. I am saying that this is the present system.

Mr. Roberts: Perhaps I can explain my quandary in this way. We have a system now for detection, we cannot because of the nature of military secrecy actually be told how effective this system of detection and destruction is, but I gather from your paper that we are likely to be asked to spend considerably more money for an increased protection and yet we do not know really how much more marginally efficient the improved detection-destruction systems are. In other words, we are groping around in the dark in a sense. We are rather like a company which is being asked to introduce a new product

when we know what the cost of the new product will be but we have really no very effective way of gauging the effectiveness of the new product in relation to the past product. Under these circumstances it seems to me that we have a very vital concern in trying to find out how much more marginal protection we would get from, say, an AWAC System and whether that marginal protection is worth the cost. I believe Dr. Lindsey indicated that there was some hope that the AWAC System might actually cost us in the long haul a bit less our present NORAD arrangements. I am not so good with figures, but it seems to me from what you have suggested that it would cost us something like \$92 million a year compared with \$11 million in the 1968-69 estimates, which is roughly over eight times the cost.

Mr. Gellner: I also of course added that this \$11 million and \$6 million is exceptional because for so long we have not invested and that even if we maintain this system the rainy day would come when we would have to invest again, even with the old system.

Mr. Roberts: Yes.

Mr. Gellner: Now, I also gave you the figure of an \$800 million capital investment in our system. Now this \$800 million worth also had to be purchased and if you spread that over 10 years, although the system is only 10 years old, you also come to \$80 million. So the difference is not so very great. However, these are old ball park figures. I believe what you have to look at are the theoretical possibilities. Now if everything depends on circumstances, the best system may fail completely. They say that the best radar system in Europe is the British one, yet apparently it did not pick up the Hercules which a mechanic flew home. This can well happen to any system but, theoretically, we know in the old system that, first of all, once you are 200 miles beyond the last radar of the Pinetree Line then comes a long, long distance of ground which is not covered at all—there is nothing there—and then there is the DEW Line. There is a hole in the middle. There is absolutely no detection there, except by accident, spot checking and so on. This was not so very critical as long as the potential enemy had to penetrate the Pinetree Line. He had no option if he wanted to get at the retaliatory forces in the United States or at the City of New York—he had to punch through the line. The line then was believed to be deep enough to give strong opposition to such a penetra-

tion. But now we are at the point where he can shoot through the line, he does not have to penetrate it at all. Now we must make a choice. Either we must deepen the present line so much that he will not be able to shoot through it, that he will have to go in and expose himself to interception and destruction, or we have to go to something else. Now I think you would be fully entitled to get an estimate in figures of what relative costs would be. When you look at these figures, let us say the the tripling of the depths or the doubling of the depths of the present Pinetree Line, please do not only look at the cost of the installations but also remember that every one of these new radars has a crew of between 140 to 190 men. These 140 to 190 men have to be maintained, they have to be paid, married quarters have to be provided, and the operations and maintenance costs of one Canadian serviceman is \$12,300 a year. That does not include his salary or allowances, that is for operations and maintenance. You then compare the deepening of the present installation with AWACS, then look at both money and at manpower and you will be able to get a fairly good picture.

• 2125

Assume now that either decision will result in the raid being detected, then you still have the situation of whether the raid will be intercepted and whether the target will be destroyed? Now I do not think that even top secret knowledge will give you an answer to this question because this, again, depends on so many variables.

Mr. Roberts: Could I interrupt here. This seems to me though, nevertheless, to be a crucial question. Basically, how much more effective in damage limitation would the new system be? Can we make any estimate?

Mr. Gellner: It would be more effective to the extent that all interceptions and all destructions would be over the uninhabited area, in our present system at least a proportion of the interceptions would of necessity be over inhabited areas so if you talk in terms of limiting damage then the new system will in any case be better.

Mr. Roberts: It gets back to the over-kill problem. If it simply prevented us from being destroyed three times instead of twice it might not be worth the marginal expense. Could we have some estimation of how effective in damage limitation the new system the Canadian government that it will to

Mr. Gellner: This is purely my opinion. I do not believe in total destruction after a nuclear war. I think that the destruction will even then be selective. Destruction will fall on the targets which are actually hit and then there will be of course a very great number of places which will not be hit. Now objection is taken in that fallout will then kill the survivors. Against this there are of course two very strong objections. The one is that if they are high burst, as well might be the case, the immediate fallout will be very small, the late fallout will come down—I do not know when—in a month, in a year, in five years, and by then the radioactivity will have greatly decayed. Therefore it is not perhaps true that the fallout is necessarily going to kill everybody. Also, we could well do something about fallout. The simplest of civil defence knowledge will protect to a degree against fallout. Any kind of damage limiting would be to our advantage because rather than three times over-kill it may be 10 times over-kill in one place. The enemy may drop a 10 megaton weapon on one place which would totally destroy it and there may be no kill at all in another locality. So anything you can do to alleviate this will have of course some results.

Mr. Roberts: I admit that the next series of questions I would like to ask you are really designed to elucidate the point where I, and I think some of the other witnesses we have had before the Committee, disagree with you. Towards the end, just before your conclusions, you say:

... it takes a lot of sophism to argue that one kind of defence is not de-stabilizing, while the other kind is. What matters is that they are all in use, in one way or the other and to one degree or the other. The question of whether to use any of them should in every case be approached pragmatically.

I admit that I resent the word "sophism" here but I know you were writing the paper under

• 2130

pressure. It seems to me that a lot of distinguished witnesses before the Committee have taken exactly that point of view. Gen. Sharp, Mr. Yarmolinsky, Mr. Cadieux and Dr. Lindsey drew a pretty clear distinction in answer to many questions between defence against potential first-strike weapons and defence against weapons which were counter-strike weapons. And the paragraph in Dr. Lindsey's

paper, if I may read it because it puts the matter clearly, says:

In a sense, damage limiting can be regarded as superfluous, in that it will not be needed if deterrence... is successful. However, there can be a more serious objection to damage limiting if it is carried to such a degree that it drastically reduces the ability of the opponent to inflict damage in a retaliatory countervalue second strike. In this case, it would be weakening the basis of mutual deterrence and moving the balance away from stability. It is a strange twist of logic, that a defensive move to save lives can be dangerous.

And he goes on to quote from a paper by Professor Rathjens.

Various witnesses before the Committee have made this point. You have tended, I think, to say that people are claiming that we should not have any defence because there is no defence at all, and this you dismiss as a sophistic argument. But I suggest that the situation is more complex than that. If we get down to do as Herman Kahn suggests, to think about the unthinkable, we do get into a situation where we draw distinctions between first-strike weapons and counter-strike weapons and indeed many people, I think—not you—do argue that improving defences against what are essentially counterstrike weapons—if those improvements take us down to a position where we really might have a fairly complete protection against counterstrike—would not be stabilizing, as you have suggested, but would in fact be very destabilizing. Am I right? I am not trying to convince you or to persuade you but I am just trying to establish that there is a divergence between your point of view here and that of many of the people we have had before us.

Mr. Gellner: You see, the difficulty which I find is this. How can you have a defence which protects you against a first strike but does not protect you against a counterstrike; which protects you if the enemy is the attacker but does not protect you if the enemy is a counter-attacker? Because surely you have only one defence system.

Take the anti-bomber defence. The anti-bomber defences are based on the detection of an enemy attack. So you detect the enemy attack and you have defences to thwart it and these defences are in place. But you would also want these same defences which are in

place to play dead after you have attacked the enemy and the counter-attack comes in. Now this, with the greatest respect for the others, I just cannot understand.

Mr. Roberts: I would put it that it really corresponds to a situation as you have described earlier; that if an all-out attack did occur on the part of the Russians towards the United States, it would occur by their throwing everything against us. And in this stage, the detection—not the destruction but the detection—of the bombers would take place early enough that the deterrent which the United States has in hand would then be called into play before the bombers could really come into play, at least if we develop a forward-looking radar detection system. And then in those circumstances, increased expenditures on bomber defence—once we had got to the point where early detection was possible—would be money spent basically to combat a strike which could only make sense in that situation of effective ballistic missiles on both sides of a counterstrike—the defence against a counterstrike.

Mr. Gellner: I do not follow you at all, unless you would limit defence to detection only. In fact, then, to do it this way you would have to detect only but have no means of fighting the attack.

• 2135

Mr. Roberts: But as long as we are relying upon a deterrent system, what the anti-bomber defence provides us with basically—at least this is what has been put to the Committee—is a protection of the deterrent. Now the protection of the deterrent really depends upon the detection. If you detect early enough, then the opposing side will know that the deterrent will come into play; so that if you believe that the stability of peace depends upon the mutual deterrent power on each side, then any detection system which finds the bombers or the wave of bombers coming in early enough protects the deterrent in the sense that once that attack is perceived, then the deterrent comes into play. Therefore, your effective warning system provides a protection for your deterrent system. I admit it is not damage limiting but in so far as the justification for bomber defence is a protection of the deterrent, what you really require is a fairly forward advance detection system which will tell you when you are in the situation where your deterrent force is in danger from attack on the other side.

Mr. Gellner: But then you would have to rely on the attacker that in fact his attack will be aimed only at the bomber bases and not at cities and will remain aimed at bomber bases—you are talking about manned bombers—even after he knows that the other side's bombers have already taken off. I think this is assuming too much, is it not?

As far as antiballistic missiles are concerned, there is no question because the very idea of the hardening of the bases, of putting some in submarines, is one of the reasons that you do not have to react at once, that you can have a look at what is really going to happen because your counterstrike force is protected. And the Americans say they are going to put ABM's on top of the silos to further protect them. But in a bomber, you are quite right that once the enemy attack is detected, my own bombers have to take off because they are not on the hardened sites, they are not under water, they could be destroyed. But then you say, for the sake of stability I am going to stop at detection. I am not going to knock anything down and I am going to allow the enemy bombers to bomb New York or Toronto or Chicago because my counterstrike will destroy Moscow, Kiev and Leningrad. Now I do not think this is really logical because obviously, once the attack is detected, then he knows that he will not find any bombers in the airfields if they are prepared and he will go after the cities. I think we are then entitled to look after the limiting of damage.

The difficulty of theory is that it does not count with human beings. This is it.

Imagine you had a system which could only detect but could not destroy. Imagine then what terrible havoc an attack by 20 bombers could do. American bombers apparently carry up to 30 megatons each so this would be unbelievable destruction with millions killed. Yet, if you had the destructive capability, you might be able to thwart the whole attack. So I do not think that anybody can limit himself to detection.

Mr. Roberts: You argued, I think, in answer to some questions by Mr. Harkness, that it was unreasonable to expect the major powers not to continue their research activities in the development of new and improved weapons, and I would agree with that. Would you not agree, however, that there is some historical evidence, at least on the part of the United States, that there has been a readiness to limit the deployment of weapons? For

instance, I think that on both sides there has been a diminution of the number of bombers both on the part of the United States and on the Russian side which are ready to go and that the United States has kept its number of Minutemen basically stable in terms of numbers; so that one could conceive of situations in which the great powers would be willing, once they had arrived at a stable balance of

• 2140

deterrence, to limit the deployment of weapons. Would you agree with that?

Mr. Gellner: All these limitations are only quantitative. They are not qualitative. Now obviously the United States has something like 1,700 missiles available. With these 656 submarine missiles and 1,000 Minutemen and I do not know how many of Tibans still available with 1,700, a certain 1,700 obviously to increase the numbers would not be very useful, because I do not think there are enough targets for 1700 missiles. Therefore, quantitatively they are fine, but qualitatively, as you know, they are constantly increasing the potency, the accuracy and the range of this 1,700. In Polaris, from Polaris I to Polaris II and Polaris III, and now to Poseidon. Every one of these missiles has a bigger warhead and has better penetration capabilities as has MIRV and so on. Therefore, qualitatively they are being constantly improved.

The same applies to the Russians. You read about the SS-9 missile. That is a very great advance on the SS-4. Apparently it has a warhead twice as powerful. Therefore, I cannot see any restraint in the fact that they have not deployed more weapons.

Mr. Roberts: May I...

The Vice-Chairman: There are other questions, Mr. Roberts.

Mr. Roberts: I know, Mr. Chairman.

The Vice-Chairman: I have Messrs. Guay, Winch and Gibson.

Mr. Roberts: I will try to close quickly.

The Vice-Chairman: I would appreciate it, Mr. Roberts, if you could shorten the questions and also the answers.

Mr. Roberts: I would now like to turn to your section No. 7 on AWACS. Perhaps I have misinterpreted what you have said but it seems to me that you argue that basically the United States is really going to present us

with a *fait accompli*; that they are going to go ahead with the system and that Canada therefore really does not have much choice but to go along and find some role within it. You go on to say that the question that poses itself is what Canada should do—follow suit and prepare for the transition, or stand pat with what we have and then get out of NORAD, when the Americans will have one system of defence and we another, which would make integration, of course, impossible; and that everything speaks for adopting the first alternative.

That may be so, but it is not self-evidently obvious to me that everything speaks for the first alternative, other than perhaps on grounds of national pride. Faced with the \$92 million a year cost that you have estimated, why should we not in fact say that, as an AWAC system could be operated to by United States, we might lease territory and give air rights, and so on? Aside perhaps from questions of national pride, what is so horrendous about adopting the alternative which you there reject rather summarily?

Mr. Gellner: I do not think you can combine it. If you say "All right; let the Americans have the AWAC system, but we, of course, are going to give them the facilities for it" there is no point in keeping our old system. Because the Americans are going to be in the north and are going to protect us the old system would then be superfluous. This would only be thinkable if the Americans had AWACS south of the border and we the old system north of the border. As I explained, we are interested in pushing the defensive belt farther north, and our interest in doing that is, if anything, greater than the American interest.

Mr. Roberts: Am I right in taking from certain of your comments and explanation that, for example, it might be feasible for us to lease AWACS from the United States at a dollar a year? They once sold us an aircraft carrier for a dollar and that turned out to be rather a bad bargain, I think. But it would be feasible for us to operate the system as Canadians, I think, on certain of the considerations that Mr. Laniel described?

Mr. Gellner: Yes; I think they covered this by saying that this system could be Canadian-manned; but obviously the hardware would be American-owned, but the Americans would want to have guarantees of the system being used in an emergency, because the one who

mans it works the system. So nothing has been changed.

Mr. Roberts: I have one final question, which is perhaps one of history, but it is relevant to the answer you have given. You start your paper by saying that:

... "air defence of North America is a single, indivisible problem".

which I would accept. That does not necessarily mean that we should deal with that problem through a single, integrated command rather than a joint co-operative effort. For example, although, in the past, we have dispersed Canadian personnel throughout the whole of the NORAD system, it would not have been technically impossible to organize the system so that the defence of Canadian territory or airspace was in the hands of Canadians, as Alaska is in the hands of Americans.

The development of an AWAC system would, with some kind of appropriate financial support from the United States, enable Canadians once again, within a framework of

• 2145

partnership, to survey and control the airspace over Canada and, at the same time, to provide their effective contribution to the protection of the North American deterrent, which rests basically in the hands of the United States.

Dr. Gellner: I said in the paper that under the present system this does not seem to me to be practical, but that when AWACS came in we could in fact separate; but, if we separated, that it would perhaps be more costly for us and would give the Americans less protection because they would have to cruise south of the border and rely on us to do the job in the north.

We would then come back to the same situation, that they would want to have some guarantees that this protection would work. It is technically possible, and I think I said that twice in my paper.

Mr. Roberts: I have just one further question and I admit it is a nebulous one. It involves your making an estimation of the American intention. Do you think the United States will be prepared to consider such a system, in which Canadian airspace would be controlled through the system that you and I have both described?

Mr. Gellner: I do not know.

Mr. Roberts: Thank you, Mr. Chairman.

The Chairman: Mr. Guay?

Mr. Guay: I will be very brief, Mr. Chairman. I would like to ask Mr. Gellner a question dealing with the brief he has presented to us.

First of all, the members of this Committee have received a brief, which I think was a wonderful brief, from the Voice of Women. I was going to ask him if he had had a chance to read it and, if so, briefly what were his thoughts on it.

Mr. Gellner: I believe that in my own magazine I criticized this brief which was sent to me. If we are talking about the same one.

Mr. Guay: The latest one?

Mr. Gellner: No; I have not seen this one.

Mr. Guay: This latter one?

Mr. Gellner: I think I saw a smaller one...

Mr. Guay: It is dated May 22nd.

Mr. Gellner: No, I have not seen this one.

Mr. Guay: Then my question, Mr. Chairman, relates to page five, where Mr. Gellner has told us that some aircraft or missiles could slip in undetected. I would like to quote very briefly here:

The line has virtually no capability against low-flying aircraft. (It could be given that capability by the installation of, so-called, gap-fillers, but this could be very expensive, and quite unreasonable at a time when plans are afoot to scrap all or most of the fixed radars.)

Are there really plans to scrap all radars, and is it for the purpose of implementing other safety measures such as a satellite to detect more aircraft? Or have you other means in mind when you say that "plans are afoot to scrap"? That is a definite statement you are making there.

Mr. Gellner: I refer to AWACS, of course. These are the plans which are afoot. We already see a better way than fixed installations. Therefore, to put money now into strengthening the old system, when a new system is already on the horizon and apparently, if certain kinks are taken out of it, perfectly feasible, does not seem reasonable. If I had the choice—after all, this is all opinion—I would go for the modern system in-

stead of putting more money into the older system.

• 2150

Mr. Guay (St. Boniface): But there are definite plans afoot to do exactly what you said here.

Mr. Gellner: The Americans have announced that they are investigating the AWAC System. They have already, I think, appropriated in two instalments something like \$115 million for contract definitions of the AWAC System; therefore, the AWAC System is not a dream. The AWAC System is something on which some money is already being spent in the United States and plans are being developed.

Mr. Guay (St. Boniface): Can you give me an answer, possibly yes or no, to this question? Would this new system that you are speaking of, AWAC, solve the problem of the low-flying aircraft that could slip in?

Mr. Gellner: Yes.

Mr. Guay (St. Boniface): Do you believe that the generals should have more power given to them than they have at present?

Mr. Gellner: No.

Mr. Guay (St. Boniface): Do you recall the statement that you made in December, 1962? Would you care to comment on that particular statement in regard to the armed forces, or are the armed forces still saddled with a task which they cannot fulfill in your estimation? I presume you recall what I am making reference to—your statement in the *Commentator* in December, 1962 when you said:

the trouble in Canada is not that the generals have too much power, but too little—there is "an unhealthy master-servant relationship"

Mr. Gellner: I understood your first question to relate to NORAD and was: should the generals have more power? My answer was, unequivocally, "no". It is not possible, because the release of nuclear weapons obviously must remain a political decision. Now, I cannot, of course, recall—being a newspaperman—a statement I made seven years ago, but if you read it to me I would probably know generally...

Mr. Guay (St. Boniface): It is very brief; I could.

Mr. Gellner: ...the kind of—the adjective fails me, but something like “cringing”—attitude which sometimes exists between the serviceman and his political masters. This has nothing to do with NORAD. This may have to do with the type of uniform. Then you asked me a question, should the generals have more power? This first question, before you reminded me of 1962, I took to refer to NORAD and I think in NORAD they have all the power they can reasonably be given.

Mr. Guay (St. Boniface): Thank you, Mr. Chairman.

The Vice-Chairman: Mr. Winch.

Mr. Winch: Mr. Chairman, I find myself in a somewhat difficult and perhaps untenable position. I will not be misunderstood. I want to pay my respects to Mr. Gellner, who has appeared before this Committee on numerous occasions over many years. However, I personally—and I say “personally”—cannot accept the presentation made by Mr. Gellner today, nor his answers to the majority of questions. I believe, sir, his position is too theoretical, unrealistic and, upon some matters, not in accordance with facts known by this Committee and presented by previous witnesses. That being my thought, sir, I do not think there would be any advantage to this Committee if I were now to proceed to ask questions. Therefore, I pass.

The Vice-Chairman: Thank you, Mr. Winch. Mr. Gibson.

Mr. Gibson: Mr. Gellner, in the brief presented by the Voice of Women on May 18, 1969 there is the statement:

Reinforcing the opposition...

that is to the whole defence plan

...is the argument that the program contravenes the Nuclear Proliferation Treaty just at a time when Moscow seems interested in curbing the arms race.

Now the entire hearings that we have had on NATO and NORAD have accentuated the buildup of arms, and what physical arms we can develop. I am not naive enough to think we are all brutes for doing that, but it does strike me that the Voice of Women brief has a certain amount of cogency in making that statement. At Geneva there is a disarmament conference under way. We were privileged to visit Geneva a week before that conference took place, and I am very concerned that throughout our deliberations there has never

been any discussion of that conference. What is going on at Geneva? Have you had any information?

• 2155

Mr. Gellner: Oh, yes; the same, probably, that you have.

Mr. Gibson: I am not criticizing you, sir, but my concern is that if there is a possibility of Moscow's disarming—possibly there is not—would not these urgings on the part of our government to build up a tremendous strike force and defence of this type lend credence to the view that the United States is intent on attacking Russia, and would Russia not have that view? If so, do you not think we should tie this disarmament conference material in with our discussions so that we review both sides of the coin at the same time?

Mr. Gellner: First of all, I do not think there is any suggestion of our building a tremendous strike force. Not only are we not building a tremendous strike force, we are depriving ourselves, voluntarily and quite properly, of the one strike force we have, which is the Air Division in NATO.

Mr. Gibson: But if I may interrupt you, we are planning on spending millions and millions of dollars, and it seems to me that even in the spending of the money possibly that should be a consideration. What do you think about that in relation to these talks on defence and disarmament?

Mr. Gellner: On defence, now...

Mr. Gibson: But it may not be necessary if peace talks are progressing.

Mr. Gellner: Somebody said that whoever pretends he knows what is going on in the Kremlin is either a knave or a fool, or both.

Mr. Gibson: Well, on that theory we will never get disarmament.

Mr. Gellner: Yes, I know. My position is this: Obviously disarmament is less practical, but arms control is our immediate goal. But arms control and disarmament always follow peace. Not peace, disarmament. You first have to have the peaceful situation and then you are only too glad to disarm, but it does not follow that because you have disarmed you will have peace. I think all the historical examples which we have are to the conquered.

Now, when we discuss NORAD we are not speaking of a single offensive weapon; we are not speaking of a single weapon which is capable of reaching any place in a foreign country. We are also not saying that we are going to spend regarding Canada or lend it sums on defence in this context, because while I agree with Mr. Roberts, and as I pointed out myself, if we went into AWACS we would have to spend in the beginning more than the same, then less than we are spending now. The fact is that even if we stay put we will have to spend more, because our old equipment will run out.

• 2200

I cannot see that we are increasing our defence effort. Now, the only argument would be if you said, "There is now a very high hope of disarmament; let us call a moratorium. Let us not do thing for X years." Let us say that both sides keep a moratorium; that the Soviet Union does not do anything either. Now, if you can get a system by which such a moratorium can be inspected properly, monitored and so on, obviously such a moratorium would be a good thing. There is no indication of any slowing down of the defence effort of the Soviet Union. Admittedly, there is no evidence of the slowing down of the defence effort of the United States. The fact is that both sides are going ahead.

Mr. Gibson: The fact is, also, that the conference in Geneva is going ahead and I wonder why we get no news of it. I may be naive in asking this, but do you not think the government and the press should tell us what is going on at Geneva?

• 2200

Mr. Gellner: I assure you...

Mr. Thompson (Red Deer): It has been going on for 15 years.

Mr. Gibson: This may be, but the conference that is on now has not been going on for 15 years. It has been going on for about three weeks.

The Vice-Chairman: Let us have some order now. There is no doubt about it...

Mr. Gibson: I am genuinely concerned about this. I cannot see why we do not know what is happening.

Mr. Gellner: This Eighteen-Nation Committee on Disarmament if I am correct, and I

stand to be corrected, has been sitting now for seven years. What is going on there during these three weeks is only the umpteenth session of the same conference. I believe it is a 1962 creation. Whenever significant progress was made it was reported, but you cannot expect newspapers to report that nothing happened. This conference, of course, has reporters there just as at every other conference. It is not secret. The sessions as you know are open. Of course, there are also some private negotiations. Let us say that if in the three weeks something sensational happened, it the two sides had embraced as friends, it would have been reported.

The results in the seven years have not been totally insignificant. As you know, we have the Non-proliferation Treaty now which is a creation of Geneva. It is not very satisfactory because it does not bind the Soviet Union, the United States, or any of the nuclear powers to disarm. It only says that they will talk about it. They can keep all the weapons if it limits the non-nuclear powers, and that is something. This was copiously reported. If something similar happens again I am quite sure it will make the headlines. The fact is that in the seven years they...

Mr. Gibson: All right, that is fair enough. What about the fact of detente in Europe? That is on the agenda, too. There were other matters—Nixon went over there and made overtures. The buildup in the press and the publicity is all on the defence aspect and the arms but there does not seem to be any build up in the press towards concentrating on what is going on over there and informing the public about what is happening. Would you agree with that?

Mr. Gellner: No.

Mr. Gibson: You do not agree. You think the public is adequately...

Mr. Gellner: I think there are just as many reports on actual proofs of detente as there are of actual proofs of armament. My personal opinion is that we have no evidence in Europe of an East-West detente. In fact, the Russian position is very much hardened. They have come with the theory that if the country was once a Marxist country it cannot become anything else. This is far from detente. This is counter-detente. I am not saying that they are not possibly going to change their minds tomorrow. However, I understand that my brief is concerned with NORAD and this Committee's concern is NORAD.

Mr. Gibson: Forgive me for asking this question. I am trying to keep the two things in mind.

Mr. Gellner: No. I would say that right now their only possibility if they followed you would be to proclaim an armament moratori-

• 2205

um. If such a moratorium could be inspected on both sides I think this would possibly be a good idea, but the Russians have consistently refused any kind of inspection on their territory.

Mr. Gibson: Do not the Americans also?

Mr. Gellner: No. The Americans have proclaimed that they would allow inspection. In fact, the Americans were the first to come up with the idea—the so-called open-sky policy of President Eisenhower—that foreign aircraft would be inspected.

Mr. Gibson: Thank you, sir.

The Vice-Chairman: Is that it Mr. Gibson? Gentlemen, that concludes our list of questioners.

Mr. Laniel: On a point of order, Mr. Chairman. I just would like to put in the record my total disagreement with the remarks of Mr. Winch, and in the name of the Committee I want to tell Mr. Gellner that we are very grateful, the majority of us...

Some hon. Members: Hear, hear.

Mr. Laniel: ... for your present and past appearances at this Committee and for your frankness. It was very helpful to the Committee. Thank you.

The Vice-Chairman: Thank you, very much, Mr. Laniel. Mr. Gellner has to catch a plane.

Mr. Thompson (Red Deer): I would just like to lend my support to the statement that has been made by my honourable colleague. I resent the fact that a statement has been made that you presented material that is not in accordance with fact.

Some hon. Members: Hear, hear.

Mr. Thompson (Red Deer): As far as I know I do not agree with it.

The Vice-Chairman: I assure you on behalf of the Chair, Mr. Gellner, that those are my sentiments, too. You can see that you certainly have by far the majority of the Committee with you, and in fact, we found our two sessions with you to be most intriguing. We thank you very, very much for what I would say was a fine presentation.

Mr. Gellner: I assure you I do not bruise easily.

The Vice-Chairman: Meeting adjourned.

APPENDIX "DDD"

INDEX OF ISSUES NOS. 19-20 AND 22-35 INCLUSIVE
THE STANDING COMMITTEE ON EXTERNAL AFFAIRS AND NATIONAL DEFENCE
JANUARY - MARCH, 1969
(Report No. 21 on Proceedings—Not Included)

	Issue No.	Date	Page	Minister or Witness

APPENDIX EEE

Primarily, this paper is intended to offer comments on the evidence already given before this Committee. To make reference easier, the sequence of explanations is followed that was used in the basic working paper submitted by the Department of National Defence.

* * * * *

1. *The Need for an Integrated System.*

The working paper makes the flat statement that, "the air defence of North America is a single, indivisible problem". This is true, but requires perhaps some explanation.

The integration of North American air defence—and thus NORAD—became necessary when the point was reached where the human brain was unable to cope quickly enough with all the data which had to be digested and correlated if the defence system was to work. The increased speed of the targets, the use of ever more sophisticated electronic counter-measures (ECM), and the development of new air-to-surface weapons forced the defence to go from manual to automatic control, in other words, to take the solving of interception problems away from human controllers and turn them over, as it were, to computers at the SAGE (semi-automatic ground environment) and BUIC (back-up interception control) installations.

Especially the operation of SAGE—BUIC is, as the name implies, merely a back-up in case SAGE control is lost, and with only about one fourth the latter's capacity—is a big, complex and costly job. The SAGE installation must be located for greatest efficiency, not on the basis of political considerations. Also, with defence echeloned in depth, targets must be handed over from control centre to control centre as the attack progresses and the need for a hand-over arises. The international border can not be made the line where one control ceases and the other takes over. This would not make sense in case of actual attack.

Finally, we would have had to pay out much more than in fact we did had we looked after the Canadian portion of the air defence system entirely ourselves. As it was, the United States bore the whole cost of the DEW Line; and under CADIN (Continental Air

Defence Agreement North; see p. 19 of the working paper), paid two thirds of the cost of many other air defence installations on Canadian soil.

Since it was the automatization of present-day North American air defence based on fixed installations (land-based radars and control centres) that made it indivisible and NORAD necessary, it follows that the system could theoretically—but not reasonably—be divided again when it becomes mobile with the introduction of AWACS (Airborne Warning and Control System). We will come back to this, later.

2. *Canada's Contribution to the Integrated System.*

The working paper states that, "Canada contributes approximately 8 per cent to 10 per cent of the overall costs of maintaining and operating the NORAD system". In itself, this ratio is not very significant at present, but may become so when the time comes to divide the costs of a reorganized and re-equipped North American air defence. For this reason only, it may be useful to look at our present contribution which, in my opinion, is quite a bit less than 8 per cent to 10 per cent of the total.

This contribution can only be measured in terms of input of money and personnel. I have no means of verifying the U.S. figures and am thus accepting the official ones given for the American input: 144,000 men and 2.5 billion dollars.

NORAD itself lists the Canadian outlay as 135 million dollars. This figure is, however, misleading, because it takes in the whole annual cost of Canadian Forces Base Cold Lake, Alberta, which comes under Canadian Forces Air Defence Command (ADC), but contains only two air defence units, a heavy radar and a SPADATS (Space Detection and Tracking System) installation. These two units, and some base administration personnel, make up only about 13 per cent of total strength at Cold Lake, say, 250 men out of 1959, as of this month. The annual cost of Cold Lake is 24 million \$, and if we calculated on a pro rata basis, only a little over 3 million \$ of this could be booked against air defence. Even if we deduct only 15 million \$

as unrelated expenditure from the 135 million \$ mentioned above, we arrive at a figure of 120 million \$ as our monetary contribution to NORAD. This is rather less than 5 per cent of the total.

As of this month, ADC strength was 10,103 Service personnel and 3,068 civilians. If we subtract such personnel in Cold Lake as are not engaged in the air defence function, we come to a figure at certainly not more than 11,500 actually available to NORAD, or 8 % of the total, at the utmost.

In my opinion, then, and as a rough estimate which could perhaps serve as a yardstick in future considerations, the United States pays 95 % of the operations and maintenance cost of NORAD, and provides 92 % of its personnel.

Only as a matter of interest it may be noted that, if we assign two points for every position of commander of a higher NORAD headquarters and one point for every position of a deputy commander, Canadian officers hold almost 23 % of the top command posts. We are certainly not badly treated in the integrated organization.

3. American Military Presence in Canada

The figure of "683 American NORAD personnel in Canada", given in the working paper, looks low but not substantially so. It would comprise U.S. Servicemen in the following categories:

(a) "Co-manning", that is, the holding of certain positions in the United States by Canadians, and in Canada by Americans.

(b) Personnel of the one control centre (Goose Bay, Lab.) and three heavy radars (Stephenville, Nfld., Goose Bay, Lab., and Saglek, Lab.), all in 37 NORAD Division, manned by Americans.

(c) Custodial personnel of nuclear weapons stored at six sites in Canada.

I would think that there would be closer to a thousand U.S. Service personnel in these three groups, but the difference, if any existed, would be of no significance.

Apart from NORAD personnel proper, the four DEW Line main stations on Canadian territory (see map, "NORAD Warning Systems", annexed to the working paper) are manned by civilian employees of Federal Electric Co. The managerial personnel is American, and so is a proportion of the operating and servicing crews. I would estimate

the number of these U.S. civilians at no more than 500. There are also 24 Canadian military, and six U.S. military, at the DEW Line main stations, which are all commanded by Canadian officers. The numerous DEW Line auxiliary stations, incidentally, are unmanned. They are periodically inspected by crews from the main stations.

4. The Bomber Threat.

A threat is present if a condition exists which *could* bring about a perilous situation. (For instance, there is a threat of typhoid fever if a condition exists at the source of a public water supply which *could* cause it to be contaminated.) If we look in this way at what constitutes a threat, then it is really idle to speculate what the intentions of the Soviet Union or of China might be. We know that the Soviets possess a significant number of manned (bombers) and unmanned (missiles) nuclear weapon carriers which can reach this continent. Soviet peaceful intentions or the threat of nuclear retaliation by the United States, it does not really matter which, may keep them out of the North American air space. What does matter is that the nuclear deterrent is not credible where intrusions by foreign aircraft are concerned. Nobody in his right mind will counter-attack—or even threaten to counter-attack—with nuclear weapons just because there are unauthorized overflights of his territory by aircraft of a potential enemy. He will first want to identify them, warn them off. In general, he will want to deny the air to aerial intruders, just as he will want to deny his territory to land, and his territorial waters to seaborne intruders. This control of the air, more difficult than the control of the land, and in some respects also more difficult than the control of the sea, is the main task of NORAD. This being so, there is no need to debate whether or not there is an imminent Soviet bomber threat, or there will be a Chinese bomber threat some time in the future.

At present, the NORAD system can exercise a modicum of control over the North American air space, but no more than that. An intruder can fly beneath the radar coverage of the DEW line and thus slip in undetected. Then there is really no coverage at all until the main defensive belt, the outer limits of which are determined by the range of the heavy radars of the Pinetree Line, is reached. This the "hole in the middle", often mentioned in NORAD briefings.

The Pinetree Line radars (for locations, see map, "NORAD Long-Range Radar Sites", annexed to the working paper) have a range of approximately 200 miles to a height of 30,000 ft. and above, and a little over half that to a height of 10,000 ft. From there down, range decreases rapidly. The line has virtually no capability against low-flying aircraft. (It could be given that capability by the installation of, so-called, gap-fillers but this would be very expensive, and quite unreasonable at a time when plans are afoot to scrap all or most of the fixed radars.) On the other hand, it has enough depth—except in some sectors—to make slipping underneath its coverage no easy matter.

In other words, with more than 150,000 men, and for an annual expenditure of upward of two-and-a-half billion dollars, NORAD is not altogether able to deny the air over North America to intruders. In case of war, some bombers would get through because the defence might not succeed in shooting them down, but others simply because they would probably never be detected. It goes without saying that if there were no NORAD system, foreign aircraft could desert themselves in the skies over North America at will, undetected and unmolested. Then, and probably only then, would a serious bomber threat arise, because what inhibits now the use of the still cheapest and most accurate means of delivering nuclear weapons—the difficulty of penetrating a defended area with manned bombers—would no longer obtain. In the meantime, and with the NORAD system working within its limitations, the writers of the working paper are no doubt right when they characterize the present bomber threat as "limited but still significant".

5. Effectiveness of NORAD System in an Emergency

North American air defence is under tight political control. At the same time, its effectiveness depends on speed of response. These two requirements—and they are both essential, because attackers and defenders would, if they ever clashed, use nuclear weapons—must be properly wedded if the system is to function.

On the one occasion when it was tested in a real-life case it did not, and it has been deduced from that experience that the pre-1958 arrangement of two national commands working in friendly cooperation would func-

tion better than the present, rigidly institutionalized, integrated system.

The facts are that at the height of the Cuban missile crisis, on the evening of 22 October 1962, the Commander-in-Chief of NORAD, with the concurrence of Washington, put his forces on "Defcon 3". (Defence Condition 3, the ordinary being Defcon 5 and the highest Defcon 1—after which there is only "Air Defence Emergency" when nuclear bombs are actually falling.) The Canadian government of the day hesitated for 42 hours before it concurred in the raising of the alert state to Defcon 3. By then, the worst of the crisis had passed. Although the Canadian forces, on their own initiative and with authorization from the, then, Minister of Defence (but not the Cabinet), took some steps to improve their preparedness, the most important actions, especially in terms of deployment of forces and readying of nuclear munitions, were not and could not be taken. As a result, NORAD was not really at Defcon 3 until the early afternoon of 24 October 1962.

Nothing happened, of course, and NORAD soon went back to its ordinary Defcon 5, but the fact remains that the system as a whole reacted too slowly to be fully effective if it had really come to war. Rightly or wrongly, reaction speed was sacrificed to what was then judged to be the proper exercise of political control.

The Cuban missile crisis revealed a weakness of the NORAD system, but one which is built into any military arrangement between sovereign states. In any case, as pointed out under 1., an integrated organization is necessary because of technical reasons, at any rate as long as the system is based on static installations, and on telecommunications and data links between them.

6. Defects of Present System

The vulnerability of the present system is well demonstrated in Part II. of Dr. Lindsey's paper. I would like to add the following observations:

The likelihood that an enemy would be able to knock out one of the SAGE installations, on which the operations of the different sections of the defensive line depend, is slight—the one at North Bay, Ont., for instance (admittedly the strongest of them all), is virtually invulnerable beneath several hundred feet of rock. And even if a SAGE fell out because of mechanical failure, BUIC (see under 1.)

could do the job—or, at any rate, the essentials of the job—of computation and control. There is, however, the danger that an enemy could punch a hole in the line by destroying successive radars. No information would then be fed from that part of the line into SAGE or BUIC, and there could thus be no effective response to a penetration. A glance at the map, “NORAD Long-Range Radar Sites”, annexed to the working paper, will show that in the centre the Pinetree Line has very little depth. Punching a hole through it, there, would be quite possible, the more so as the antenna and scope arrays of these big radars can neither be concealed nor hardened.

The “hole in the middle”, mentioned under 4., is also beginning to become critical. So far, the best of bomber-launched air-to-surface missiles (ASM; also sometimes called “stand-off bombs”) have a range of approximately 350 miles. They thus can not be launched from beyond the coverage of the Pinetree Line, fly through it, and hit targets behind it. ASMs of 1,000 and even 1,500 miles’ range are, however, already in sight. These could be fired from carriers which would remain invisible to the defenders, in the “hole in the middle”. Such a development could make the system such as it is now largely ineffective. It would pretty well compel us to decide either to expand it with new fixed installations or to choose a new approach (AWACS).

Another weakness of the system—and this, I believe, has not been brought yet to the attention of the Committee—is that the defence belt is too far to the south. Interceptions would take place in many cases at the fringe of the densely inhabited area or even above it. This is unavoidable because of the limited range of land-based radar.

Paradoxically, the public is alarmed about the dangers that would supposedly ensue from the explosions over our heads of the defensive missiles of the Safeguard AMB system, when—as Dr. Lindsey rightly points out in Part III. of his paper—there is virtually no such danger. On the other hand, the fact that Bomarc, a missile with a maximum range of 400 miles, and Nike-Hercules, with a maximum range of 75 miles, would be launched from sites in the United States, and certainly in a northerly direction, and that the threat of this happening has existed for something like 10 years now, has been largely overlooked. Both Bomarc and Nike-Hercules, of course, carry nuclear warheads.

A nuclear bomb can not explode unless it is deliberately fused. Still, the crew of a bomber who see an oncoming missile on their radar, might fuse and drop their nuclear ordnance before they are hit themselves. There is also, as Dr. Lindsey mentions on p. 41 of Part III. of his paper, at least the theoretical possibility of fitting the bomb with “a special fuse causing it to detonate on the first receipt of radiation from the defensive explosion”.

It must also be remembered that Bomarc and Nike-Hercules will go after a target wherever it is. An interception over an inhabited area—inevitable in the case of Nike-Hercules, not to be excluded in the case of Bomarc—would thus result in tremendous damage from the nuclear weapons dropped at random from the bomber, and in much less but still potentially serious damage from the detonation of the defensive missile. In that way, we could, in Canada, in fact suffer the destruction intended by the enemy for a target in the United States. We thus have a particular interest in seeing the defensive belt moved farther north, and this is of course not possible with the present fixed installations.

In this connection, a further observation may be in order, and this concerning Bomarc, a weapon system which has been much criticized, even on official level. In fact, there is nothing wrong with Bomarc as such: it is a reliable weapon, relatively cheap (in manpower and money) to operate, and with all-weather capabilities superior to those of a manned fighter. It is the tactical deployment of Bomarc that is highly questionable—missiles from the Bomarc in the Buffalo, N.Y., area, for instance, would operate at maximum range just about on top of Montreal—and so is the bunching of numbers of missiles on a single, unprotected site. This is now dictated by the general nature of the defence system. There would, on the other hand, be nothing particularly wrong with Bomarcs dispersed along, say, the 55th parallel, provided it were otherwise reasonable to do this within the framework of a new and different arrangement of North American air defence.

7. *The Alternative: AWACS*

The idea behind AWACS is thoroughly explained in Part II, of Dr. Lindsey's paper. The Americans are going ahead with the scheme, and no doubt will, regardless of what Canada may decide to do. True, they have not committed much money to it yet, but—and this is perhaps more significant—they

have begun a phased dismantling of the present system, clearly with the intention of both obtaining from it as much security as possible while AWACS is not yet available and letting it run down slowly, so that the transition, when it comes, will not be too abrupt. Even in the absence of a public statement, American intentions in this matter can be deduced from their actions: they have in places thinned out their sections of heavy radars (e.g. in 37 NORAD Division); have scrapped some Bomarc bases; and are not taking the steps they would probably otherwise have taken in view of the evolution of the threat, for instance, are not installing gap-fillers to intercept low-flying aircraft. (See under 4. The Americans have, however, gap-fillers along their southern seaboard, facing Cuba.)

The question then poses itself of what Canada should do: follow suit and prepare for the transition to AWACS; or stand pat with what we have, and then get out of NORAD when the Americans will have one system of defence and we another, which would make integration of course impossible. Everything speaks for adopting the first alternative.

Without the American heavy radars, the present system would have little depth (none at all in the centre and on the west coast), but we could operate if after a fashion, taking over the remaining few U.S. installations on Canadian soil (in Newfoundland and Labrador, see under 3.). To make an all-Canadian air defence system effective, we would have to spend a lot of money, for additional automatic control centres, for instance, and for fighters and/or missiles to cover the whole length of the country. Even then, we would at best have the kind of system we have now, with all its defects, and at incomparably higher cost.

AWACS, on the other hand, if it is made to work (there is still some problem with downward-looking radar, as explained in Part II. of Dr. Lindsey's paper), would not only provide a more effective defence against attack by bombers and air-breathing missiles, but would also go far toward fulfilling the overriding mission of the Canadian Armed Forces, as set out in the Government statement of 3 April 1969, "the surveillance of our own territory and coast lines in the interest of protecting our own sovereignty".

It is expected that the AWACS long-range radars will reach out to a distance of 400 miles in all directions. In theory, then, one

patrol aircraft could keep under observation at any one moment a circular area of half a million square miles. Five such aircraft, in the air at the same time and flying in a proper pattern, would in all likelihood give us better control of our air space than all the radars of the DEW and Pinetree Lines taken together. A good rule of thumb for a 24-hour of an area is six aircraft on the ground for every one aircraft in the air. This is approximate, of course, and depends on circumstances, but one would not be far off if one assumed that 35 AWACS patrol aircraft would give us continuous and thorough control of our air space, with some degree of control of our land and of our sea approaches as added dividend. These aircraft would, of course, at the same time be the early-warning and tracking stations and the air defence control centres of NORAD. They would thus serve the United States at least as much as they would serve Canada.

Since the patrol patterns would generally be well to the north of the densely populated area, these aircraft would most economically be stationed on Canadian airfields, though they could, at the price of unproductive flying hours, also be staged to forward airfields in Canada from bases in the United States. The active air defences—the Americans currently think in terms of the F 106X interceptor-fighter—would definitely have to be positioned in Canada. Especially if the F 106X is in fact adopted (it is debatable whether it should be), these comparatively small aircraft, with a limited carrying capacity and thus limited range when ordnance has to be carried as well, would best be kept at the northernmost airfields which can conveniently be operated the year round. This would ensure that in case of conflict interceptions would take place where nuclear weapons, offensive or defensive, would not do much harm on the ground.

In sum, then, Canada should, if anything, be keen on changing over from the present air defence system, which is imperfect and in a way dangerous, to AWACS.

The objection will be made that in a nuclear war it will not really matter whence the danger comes and, indeed, what defences we have. This is a popular, but overly simplistic view. Defence in the nuclear age implies—to use Herman Kahn's words "thinking about the unthinkable". We do not know what future technological developments will be. We only know what can attack us,

not what will. To give an example, London, Ont., could perhaps come out of a nuclear war undamaged, and its quarter-of-a-million citizens alive. It may not, if a bomber whose load is ticketed for New York is intercepted somewhere in the vicinity of London by a Nike-Hercules missile from the Detroit defences. Inversely, only one enemy nuclear carrier may have Winnipeg as its target. If that carrier is destroyed somewhere over the Arctic Circle, half-a-million Winnipeggers just might survive the war. The same applies to ballistic missiles, or will, if and when some kind of active ABM defence that will work is established.

Denial of one's own air space to intruders and the consequent deterrence of further intrusion, and if the worse comes to the worst, "damage limiting" (see Part I. of Dr. Lindsey's paper) are aims that can not be dismissed, and national responsibilities that can not be shed, just because one thinks that they can not be met. The question really is not whether one should or should not try to achieve these aims, but how to do it most effectively and economically.

8. Cost of change-over to AWACS

Here everything is guess-work. All that can be said is that the book value of the present installations and equipment of Canadian Forces Air Defence Command is about \$800 million; and that some of it would continue to be usable even after the switch to AWACS, or recoverable. That extrapolating from the known cost of our maritime patrol aircraft, the Canadian Argus (\$12 millions apiece, equipped), and assuming that the airframe will be that of the DC-8 or Boeing 707, the AWACS patrol planes might cost \$25 million apiece. That the F 106X fighter might cost five million \$, or so, a copy. And that, based on these fractional figures, the sum of \$12.3 billion mentioned by former U.S. Defence Secretary as the capital investment cost of the new system over 10 years sounds believable.

Now, taking our fair share of the outlays—fair in terms of the respective GNPs—to be about 7.5 per cent, our capital investment would be \$92 million a year for 10 years. This compares with capital allotments to ADC of about \$11 million in the 1968-69 Estimates, and under six million \$ in the 1969-70 Estimates, but then no greater purchases of new equipment were programmed in these last years, and the rainy day when such purchases will become unavoidable must eventually arrive also under the present system.

Even so, there would have to be a substantial increase in the ADC budget if AWACS were adopted, at any rate in the first years. Later on, because in AWACS fewer men can do the job than are needed now, and operations-and-maintenance costs are thus less, the budget would gradually come down to its present level (in 1969 dollars, of course). Finally, once capital investment is completed, the ADC budget should be less than it is now. It should, however, be again stressed that this is speculation, the more unreliable as we do not know as yet what all will be involved in the establishment of AWACS.

9. Space Defence

The mission of NORAD was always to defend North America against attack from the air and from space. "This involves", as he, then, Acting Commander, ADC, put it in his testimony before this Committee on 28 June 1966, "The detection of *all* potentially hostile aerospace vehicles, the determination of their intent, and their destruction if necessary". "All" means just that: bombers, air-breathing missiles, ballistic missiles, orbital vehicles, or any other flying instrument of destruction that may come along.

Thus, NORAD was always engaged in ABM defence, and so was and is Canada as a partner in NORAD. The Canadian government knew that very well when it renewed the treaty in 1963, and showed it by inserting the proviso that we would not commit ourselves to participation in one phase of that defence, the actual interception of missiles. (The wording is: "This agreement will not involve in any way a Canadian commitment to participate in an *active* ballistic missile defence".) This was no doubt done in order not to be bound to paying for part of the Sentinel, or the present Safeguard, ABM system. There can have been no other reason, for we do our share in other respects: land lines and other communications from the Ballistic Missile Early Warning System (BMEWS) run through Canada and information from it is automatically transmitted to us; we help in the detection and tracking of vehicles in space—another means of warning against space attack—in SPADATS; and Canadian personnel in NORAD headquarters is involved in space defence just as it is in air defence work.

Nor can Canadian reluctance to participate in active ABM defence stem from any opposition to a possible invasion of Canadian air space by defending missiles. As pointed out under 6., the probability of this happening is

practically nil, and, in any case, we have raised no objections against the emplacement of U.S. air defence missiles which of necessity would be launched into our air space.

As far as the weapons used in the Safeguard system are concerned, Spartan is designed to detonate in the near-vacuum of outer space, while Sprint is a point-defence weapon with a reported maximum range of about 30 miles. Even this is a slant range, along the hypotenuse of a triangle, the base of which would necessarily be even less than 30 miles. The two announced Safeguard sites, Grand Forks, North Dakota, and Great Falls, Montana, are 75 and 108 miles, respectively, from the Canadian border. Even if the pads from which Sprint would be fired were a little farther north than these locations, it follows from the nature of this weapon that it would be most improbable that they would be so far forward that the missiles could reach Canadian skies.

In his recent testimony before this Committee, General F. R. Sharp gave it as his opinion that, from the military standpoint, the Safeguard system should be part of NORAD. He is undoubtedly right. The space surveillance (SPADATS) and early-warning (BM-EWS) functions can not very well be separated from weapon control and target interception. Also, if it came to a war, there would be only one aerospace battle over North America, with each side using a mix of all types of weapons at its disposal.

This does not mean that Canada would ultimately have to operate part of the Safeguard system. Nike-Hercules, for instance, is also a NORAD weapon system, but we do not operate any of them. The point is that just as through NORAD we are co-responsible for the operation of Nike-Hercules, we will be co-responsible for the operation of the Safeguard system if the latter is put under NORAD, and if Canada is still in NORAD when this happens.

It must also be borne in mind that we can not now disassociate ourselves from the idea of ABM defence, as some people seem to think we can, but at best only from how far this idea is carried. As said earlier, we already are in ABM defence. We could only

say—and with not much logic—that this kind of defence (and why only it?) should be limited to detection only.

It could be argued that since deterrence depends on “assured destruction” (see Part I. of Dr. Lindsey’s paper), it would be best—the situation would be most “stable”—if there were no defences at all, and the nuclear powers lay open to each other’s attack. None of them, however, shows any inclination to stand naked to its enemies. This being so, it takes a lot of sophism to argue that one kind of defence is not de-stabilizing, while the other kind is. What matters is that they are all in use, in one way or the other and to one degree or the other. The question of whether to use any of them should in every case be approached pragmatically.

10. Conclusions

The present North American air defence setup makes it mandatory for the United States and Canada to operate it in common. AWACS could be operated separately, but only at the price of lesser efficiency on both sides, higher cost for Canada, and probably diminished safety for the United States. It would not be practical for Canada to continue on its own the present system on Canadian territory, when the United States changes over to AWACS. Since the latter puts an even higher premium on the availability of Canadian air space, airfields and communications than does the present system, there should be a different arrangement for sharing capital costs from that which prevailed when the present organization was established.

An added bonus from AWACS would be that it would enable Canada to maintain a proper surveillance of Canadian air space, and that it would help in the surveillance of Canadian territory and sea approaches.

The question of Canadian participation in ABM defence does not arise—we already participate. Our continuing as partners in NORAD does not depend on whether or not we take part in the operation of the Safeguard system, but the latter should in any case, even if it is entirely U.S.-operated, come under NORAD.

John Gellner

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament
1968-69

The Clerk of the House of Commons
ALISTAIR FRASER

REPORT TO THE HOUSE

THURSDAY, June 5, 1969

The Standing Committee on External Affairs and National Defence has the honour to present its

EIGHTH REPORT

Your Committee recommends that it be authorized to travel from place to place within Canada and that the necessary staff do accompany the Committee.

Respectfully submitted,

IAN WAHN,
Chairman

(Concurred in June 10 1969)

MINUTES OF PROCEEDINGS

[Text]

TUESDAY, June 3, 1969
(76)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 11.05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members presents: Messrs. Allmand, Brewin, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laprise, Legault, MacLean, Nesbitt, Prud'homme, Ryan, Thompson (*Red Deer*), Wahn, Winch (18).

The Committee met to discuss its future work program and a draft report to the House.

On motion of Mr. Harkness,

Agreed, on division,—That the Committee hear representatives of the Conference of Defence Associations; otherwise, if this is not feasible, that a Subcommittee arrange to hear them.

On motion of Mr. Harkness,

Agreed, on division,—That if Lieutenant General F. R. Sharp is invited to appear again, the meeting will be *in camera*.

With the discussion continuing, at 12:50 p.m. the Committee adjourned until Thursday, June 5, 1969.

THURSDAY, June 5, 1969
(77)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 11.05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacLean, Marceau, Prud'homme, Roberts, Ryan, Thompson (*Red-Deer*) Wahn, Winch (19).

The Committee met to consider a draft report to the House.

Mr. Gibson moved,

That two Subcommittees of this Committee meet during the vacation months with authority to call witnesses and if necessary travel, to further study (a) the entire field of North American Defence in its political aspect, and (b) the progress of the disarmament conference at Geneva so that when Parliament next meets in the Fall, this Committee can receive up to date reports as to information and progress reports in these Fields.

The Committee agreed to refer this motion to the Subcommittee on Agenda and Procedure for its consideration and recommendation.

The Committee agreed to print the *Exchange of Notes between Canada and the United States of America, Signed at Ottawa August 29 and September 2, 1958, In force September 2, 1958*, as an appendix to this day's Minutes of Proceedings and Evidence. (See Appendix FFF)

On motion of Mr. Laniel,

Resolved,—That reasonable travelling and living expenses be paid to Mr. John Gellner, who appeared before this Committee on Tuesday, May 27, 1969, in the matter of its Order of Reference dated January 16, 1969.

Moved by Mr. Cafik,

Resolved,—That the Committee recommend that it be authorized to travel from place to place within Canada and that the necessary staff do accompany the Committee.

Moved by Mr. Cafik,

Resolved,—That the Committee appoint a Sub-Committee on Maritime Forces, to consist of 9 members chosen by the Chairman after consultation with the Party Whips.

Moved by Mr. Legault,

Resolved,—That the report on Maritime Forces prepared by the Department of National Defence be referred to the Sub-Committee on Maritime Forces for detailed study and comments, and that the Sub-Committee hear representatives of the Conference of Defence Associations if the main Committee is unable to do so.

Moved by Mr. Ryan,

Resolved,—That reasonable travelling and living expenses be paid to Mr. Michael Sherman, who will appear before this Committee on Tuesday, June 10, 1969.

With the discussion continuing, at 12:40 p. m. the Committee adjourned until Tuesday, June 10, 1969, when the witness will be Dr. Michael Sherman.

TUESDAY, June 10, 1969.
(78)

The Standing Committee on External Affairs and National Defence met at 11.10 a. m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Brewin, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacLean, Marceau, Nowlan, Penner, Thompson (*Red Deer*), Wahn, Winch (19).

Witness: Dr. Michael E. Sherman, Professional Staff, Hudson Institute.

The Chairman introduced the witness, Dr. Michael Sherman, and made a statement about the Committee's planned trip to North Bay on Thursday, June 12, 1969. The Clerk distributed copies of a booklet containing the itinerary and travel arrangements.

Dr. Sherman made an opening statement on the subject of anti-ballistic missile systems.

On motion of Mr. Gibson,

Agreed,—That Dr. Sherman's advance presentation entitled *A Canadian Perspective On Missile Defence* and his analysis of arguments for and against ABM systems, in catalogue form, be printed as an appendix to this day's Minutes of Proceedings and Evidence (See Appendix GGG).

On motion of Mr. Legault,

Resolved,—That, if necessary, the Committee recommend to the House that it be granted permission to travel to North Bay Ontario on Thursday, June 12, 1969, and that the necessary staff accompany the Committee.

Members questioned Dr. Sherman for the remainder of this sitting. On completion of the questioning the Chairman thanked the witness.

At 1.05 p. m. the Committee adjourned to the call of the Chair.

THURSDAY, June 12, 1969
(79)

(Visit to North Bay)

The Standing Committee on External Affairs and National Defence assembled in front of the Parliament Buildings, Ottawa, at 7:30 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Cafik, Forrestall, Foster, Gibson, Guay (*St. Boniface*), Laprise, Legault, Marceau, Penner, Prud'homme, Wahn (11).

Also present: Messrs. Groos and Schumacher, M.P.'s.

In attendance: Messrs. P. Dobell and J. Payne, Parliamentary Centre; Mr. G. Galbraith, P.C. Party Research Staff; Mr. S. Abrahams, Department of External Affairs; Mr. J. Grant and Lt. Col. L. C. Morrison, Department of National Defence, who acted as conducting officers.

The Committee proceeded by military bus and Yukon aircraft to the Canadian Forces Base at North Bay.

On arrival at North Bay the group was met by Major-General Maurice Lipton, Commander, and Brigadier General Robert B. Hughes, Vice Commander, Northern NORAD Region. They accompanied the party to the SAGE Complex. General Lipton welcomed the Committee and conducted a NORAD Operations briefing which was followed by a question period. The group then toured the operational areas.

At 12:30 p.m., the Committee recessed for a luncheon in the Officers Mess.

At 2.30 p.m., the Committee visited 446 SAM Squadron for a briefing and inspected the BOMARC Complex. Some of those who assisted with the briefings and tours were: Brigadier General W. M. Garton, Brigadier General M. F. Doyle, Lieutenant Colonel Austin, Lieutenant Colonel Corry, Major Randall and Captain Towns.

At approximately 4:00 p. m., the Committee enplaned for the return trip to Ottawa, arriving at the Parliament Buildings at 6:00 p.m. At that time the Committee adjourned to the call of the Chair.

TUESDAY, June 17, 1969
(80)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 11:10 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Brewin, Fairweather, Gibson, Guay (*St. Boniface*), Harkness, Legault, Marceau, Nowlan, Penner, Roberts, Wahn (13).

Witnesses: Lieutenant General F. R. Sharp, Deputy Commander of NORAD and Mr. J. G. Grant, Superintendent Parliamentary Returns, Directorate of Information Services, Department of National Defence.

Members questioned General Sharp on subjects relating to North American Defence during this morning sitting.

General Sharp read answers to questions that resulted from his previous appearance. Mr. Grant read answers to questions resulting from Dr. Lindsey's previous appearances. Copies will be distributed to the Members. Copies of a listing of NORAD Commanders were distributed.

On completion of the questioning, the Chairman thanked the witnesses.

The Committee adjourned at 1:00 p.m., until 3:30 p.m. this day.

AFTERNOON SITTING (81)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 3:40 p.m. this day, with the Chairman, Mr. Wahn, presiding.

Members present: Messrs. Anderson, Barrett, Brewin, Gibson, Gay (*St. Boniface*), Harkness, Laniel, Legault, Nowlan, Penner, Roberts, Thompson (*Red Deer*), Wahn, Winch (14).

Members discussed a draft report to the House, on the subject of North American Defence.

With the discussion continuing, at 4:55 p.m., the Committee adjourned until 8:00 p.m. this day.

EVENING SITTING (82)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 8:15 p.m. this day. The Chairman, Wahn, presided.

Members present: Messrs. Allmand, Anderson, Guay (*St. Boniface*), Legault, Marceau, Nowlan, Penner, Roberts, Wahn, Winch (10).

Members continued their discussion of a draft report to the House, during this evening sitting.

With the discussion continuing, the Committee adjourned at 10:00 p.m., until Thursday, June 19, 1969 at 9:30 a.m.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, June 10, 1969

The Chairman: Order, gentlemen. Dr. Sherman has been retained by this Committee to prepare a study of questions relating to anti-ballistic missile systems. This was circulated to members of the Committee only yesterday. Copies were shipped last week by air freight, but unfortunately they were held in bond by the customs authorities and it took some time to get them out. So it is not the fault of Dr. Sherman, and I apologize to all members of the Committee. It never occurred to us that this could happen; otherwise we might have been able to get them to you sooner. It is that undefended frontier of ours.

In assessing the arguments of those advocating various types of ABM systems, Dr. Sherman has proceeded in the following way: he has set out four statements about strategic weapons that, he believes, would win wide approval with the Canadian public, but are really highly controversial among policy planners. The subjects he has chosen are: (1) the relation of ABM to the "arms race"; (2) the possible impact of ABM on nonproliferation; (3) the question of whether a "meaningful" defence is possible; and (4) the notion that Canada's view of her role in continental defence should be determined solely by her concern for the stability of the United States deterrent. As you will see this goes considerably beyond the material provided by Dr. Lindsey, who stated the limits of his own presentations.

While Dr. Sherman's study is complex, he is to be commended for having taken this complicated theme and relating the issues to the Canadian situation. Those who have had time to consider the paper will see that Dr. Sherman has opened up the subject in an interesting way by questioning certain propositions without, in most cases, taking a position himself. This work relates to the first report of the Subcommittee on International Organization and Disarmament Affairs of the Committee on Foreign Relations of the United States Senate, of which we have copies for

members who wish to study this lengthy document. It is very lengthy and takes a lot of reading.

I might add that if members of the Committee are interested Dr. Sherman would be prepared to make available as a supplement the analysis he had originally prepared of the arguments of those advocating "heavy" ABM systems, "light" ABM systems and those opposed to any ABM system, in the catalogue form in which he had originally prepared it.

Mr. Gibson: Mr. Chairman, may we take advantage of that kind offer and request that it be made available for the Committee?

The Chairman: Yes, that can be done, can it not Dr. Sherman? Perhaps when it is here it might be considered desirable to have it printed as an appendix if it is not too lengthy.

Mr. Gibson: I so move, Mr. Chairman.

The Chairman: Is it agreed that we should have it printed as an appendix?

Some hon. Members: Agreed.

The Chairman: Before asking Dr. Sherman to make any opening remarks if he may wish to, I would like to inform the members that the Committee will be visiting North Bay on Thursday, June 12, to inspect the NORAD facilities there. Arrangements have been made to depart from the Centre door of the Parliament Buildings at 7.30 a.m. and to return here at 5.30 p.m. The details of the itinerary have been circulated to all members this morning. There is place for five journalists to be included if they wish to come on a basis of requests made to me.

Dr. Sherman is a Canadian from Toronto who has retained close connections with Canada. He has specialized in disarmament questions and is author of "Nuclear Proliferation: the Treaty and After". A biography has been circulated to all members of the Committee. I think I should add that Dr. Sherman's paper does not reflect a Hudson Institute viewpoint; when personal views are expressed they are Dr. Sherman's own.

Dr. Sherman will make an introductory statement in which he will summarize his paper's main points and relate them to the relevant parts of Dr. Lindsey's paper.

Dr. Michael Sherman (Hudson Institute, New York): Thank you very much, Mr. Chairman. First of all, let me say that I am very glad to be here, and moreover I was very honoured by the invitation to appear before you.

In some ways I am in a slightly awkward situation because I am a Canadian working in the United States for an organization which is an independent and non-profit one, but which has certain relations with the American government. That in itself makes the position a little bit sensitive.

Second, the issue we are discussing today is a very sensitive one in the United States, both from the point of view of domestic and certainly of international politics. By way of echoing the Chairman's last comment, I would like to reverse the traditional situation

• 1115

in which the prisoner is told that anything he says may be used against him: This prisoner would like to plead that while anything he says may be used against him, it ought not to be used against anybody else, especially those who are still, in the jargon of the underworld, "on the outside".

On the question of what I might talk to you about today, in reading the transcript of earlier testimony which was given before this Committee I noted that there was a concern about being bombarded with a strong advocate position. I was glad to see that you were not expecting one from me, because I do not think I could have delivered on an assignment of that kind. I do not have strong positions of advocacy on almost any of these issues. Therefore, I could not have given you any, for important reasons which I will come to in a moment. I have, however, tried to be a kind of devil's advocate in the paper which was circulated to you, and I would like to make a comment on that issue as it relates to the organization of the paper before I try to summarize the substance of it.

As the Chairman has indicated, I had originally tried to prepare for you a simple catalogue of the arguments containing the pros and cons of various levels of defensive systems. However, in reading it over I had three reactions: I found it rather tedious and I thought it was reasonable to expect that you

might find it tedious; secondly it duplicated, to a great extent, material in the Senate subcommittee and other reports that either have been made available to you or are easily available and thus it would not have added very much to the deliberations of this Committee; and finally it was not, as I had originally prepared it, especially relevant to Canadian concerns.

For those three reasons I sought to restructure the paper without changing much of the substance. At least, I tried to restructure it in such a way that it would be more relevant both to Canadian concerns and interests objectively construed, and to the way the issue has been debated in Canada thus far. As we have now agreed the original form of that will be made available to you.

The structure I have settled on in the presentation which you received is one in which four propositions, or hypothetical statements if you will, central to the ABM debate both in the United States and Canada, are set out. They are then discussed with the end in mind not of proving or disproving, but simply of suggesting that they are very controversial statements. And perhaps I will let this issue of the controversial nature of the debate carry me through to the first point in the paper itself. I think this is so important that I chose on the first page of the paper to try to dramatize it by making a statement that is, I think, stronger than I really believe. It is the statement that there has never been a serious, sustained public debate on arms control in Canada.

I do not think that is a literal statement and even if it were true in the past, I do not think it is true any longer partly, I might add, because of increased activity by relevant committees and other things that have taken place in Canada in the last few years. However, I do think there has always been a habit, and probably one still exists, of jumping to conclusions on issues that simply do not admit of confident conclusions. Thus that first section of the paper is really a plea: Because neither time nor political pressure is yet pushing us into taking strong positions, I think, as Canadians, it is prudent as well responsible to try to go over the alternative possibilities quite seriously other than starting with unexamined assumptions and then proceeding too rapidly to conclusions.

In the United States, of course, a comment like that would not have very much relevance, because the issues have already been caught up in the domestic political debate.

People have staked out political positions, and it is very difficult to be balanced when you are in that kind of a situation. But as I say, this is not yet the case by and large in Canada, and I think that is fortunate for us.

• 1120

In a debate like the one over missile defence, it is sometimes believed that the crucial questions are scientific and the political questions both subordinate and simple. But let me steal a story from a friend, Dr. Ciro Zoppo of RAND. It may be apocryphal but it makes the point, and it is the sort of story that even if not true, ought to be. As you may know, before the Second World War many concerned scientists came to Einstein with a plea that he turn to the President and plead for an atomic bomb program. When Einstein was asked why these people were having difficulty either getting through or making their point when they were the experts on science and should be the best judges of what other nations were capable of and what American possibilities were, he responded by saying, "That is because politics is tougher than physics". And with the ABM, I think the real difficulty of analysis occurs in long-range political judgment rather than in the technical problems, although they are of course very important. But on most of the central issues, especially the type that I want to discuss, political judgments are the crucial ones and they are just very difficult to make.

Let me make one final point on that subject. I think in the nuclear weapons debate that we had in Canada a few years ago there were many parallels to the American ABM debate. Many of the things that have happened in the United States, of people slipping into strong advocate positions before the facts warranted it, did take place, on both sides I might add, in our own nuclear weapons debate and the political effects of that as well as the international effects were considerable.

In the light of that let me turn to the four propositions that I have suggested would probably win fairly wide approval by the Canadian public as a whole but which are very controversial ones in the ABM debate.

The first one is the notion that the Soviet and American decisions to deploy missile defences open a new round in the superpower arms race. First of all, we have a problem in defining what we mean by an arms race and assessing when we are in one. There are some specialists who will argue that what we have experienced in the last few years, at least

until the beginning of the big Russian offensive build-up, has not really been an arms race. They will point to such things as the fact that the 1962 figure for American strategic offensive and defensive forces was \$11.3 billion and that the proposed figure for 1970 is something around \$8.3 billion. Albert Wohlstetter has commented that, adjusted for price changes, the 1962 figure was well over 50 per cent higher than that for 1970, perhaps even as much as two-thirds higher. This is not to say that the high levels of budgets required to sustain existing forces are therefore a good thing. The only point here is that there is problem of definition in deciding when we are in an arms race and when we are not. I think in general, however, it is fair to say that what most people think of when they say that the opening of the ABM age signals a new round in the superpower arms race is that they are afraid of a period characterized by a volatile and open-ended competition between offensive and defensive forces; that is, once one nation (in this case it was the Soviet Union) begins to deploy any form of ABM its adversary will then feel the need to offset this by an offensive increment and, in order to achieve the position that it initially started out to achieve, the country that started first with defence will step up, and you get a spiral of this kind. This is certainly a very reasonable fear, and I do not mean for a minute to demean people who are concerned about it. It is a very serious matter. If it were to happen it would be a very "bad thing"; the best we might get is successively more expensive levels of stability, the worst we might get would be considerable instability.

• 1125

Nonetheless in the debate on ABM in the United States and elsewhere several other possibilities have been examined in some detail. For the moment the only point that I would like to make is that other possibilities, "scenarios" if you will, although I am not fond of that term, exist for the way in which ABM, or BMD, if you prefer, ballistic missile defence, will affect the question of arms races between superpowers. One possibility, for example, is that a superpower will make no response to at least low levels of defensive deployment on the other side. If they do not feel threatened or they do not feel that their requirement for what has been called "assured destruction"—which is another unfortunate term—is called in question by this level of defence, then it will at least be possible for

them to do nothing. Some American analysts, on both sides of the Safeguard question, feel that the Russians will not feel the need to respond either with offence or really with anything. This is just one possibility.

Another possibility is that rather than responding to an opponent's defence with increased offence a government could respond with increased defence. If they set out simply to maintain a certain balance with the other's strategic deployments, a defensive response to a defence could look reasonable, as reasonable perhaps as an offensive increment.

There are people, by the way, who regard what might be called a defence-defence race as a positively desirable thing in the sense that it would reduce the number of effective offensive weapons on both sides. If the defences are reasonably good they presumably degrade the offences up to some level—and the destruction that might be inflicted in the event deterrence should fail would thereby be reduced. This is one feature of what might be called the "ABM as arms control" school, which is directly opposed to the people who might be put in a school called "ABM as arms race"; that is, there are a variety of arguments that can be made and have been made stemming from a feeling that ABM can be made the basis for a more stable world in an arms control sense. This question of bilateral damage limitation is one of them; others are protection against so-called catalytic attacks, accidental or unauthorized launches, things which we can discuss a little bit later on, but all part of a view of a group of analysts who believe that it is not necessarily true that ABM causes arms races. Indeed that it may be the basis for something that we could reasonably call arms control—if one includes in arms control either or all of the objectives of deterring war, limiting damage if deterrence should fail, and also reducing the levels of arms budgets to an extent consistent with those other two objectives.

There are two final points in this area. The question of a defence-defence race without any limitation on offence is open in some ways to the same challenge, once removed as it were, as was reflected in some of my earlier remarks. That is, the defences may at some point get so good that one side or the other will feel a need to offset them with increased offence and an unstable offence-defence race will start. Therefore one feature of this "ABM as arms control" school has been to argue that ABM can be put together with a limitation on offence, whether or not

ABM is itself limited. Indeed, some of these analysts have argued that ABM would facilitate such an agreement; that is, the increased confidence that the country with some defence would feel might make it less likely to insist on as high a level of inspection of offensive forces as it would otherwise have required in the absence of any defence.

• 1130

Again, that is simply a point of view but one which has been stated very seriously and which we should include in our view of the alternative possibilities.

Another point that perhaps I might make on this issue is that the relationships of arms control to ABM and the interactions involved here do not only have to do with weapons procurement. Let me give you an example. Some ABM opponents have argued that in responding to the development of multiple warheads by one side, rather than deploying a defensive system, the other side might make a change, not in procurement, but in strategy.

One suggestion here has been to adopt what has been called a launch-on-warning strategy; that is, if you fire your missiles on radar warning then you do not have any need to defend them with ABM. Most analysts, myself included, feel that this is a very, very irresponsible strategy, but it has been proposed and I just place it on the table for your consideration. Finally I would like to make three comments about analysis of these issues. The first is simply that analytical alternatives to an offence-defence race do exist and we should examine them rather carefully in Canada. Second, in examining them we must maintain distinctions among various types of ballistic missile defence; in particular, the distinction between a ballistic missile defence which aims at the protection of strategic forces, and on the other hand a ballistic missile defence system which is designed to protect people or the industrial base. When you are assessing the possible reaction of one side to another it makes a great deal of difference what one side perceives the other to be doing, and one of the key issues in this debate is how much you can avoid the appearance of trying to protect your cities to the extent that you would then be in a first-strike position. The distinction between what we might call force-protecting and city-protecting systems is a very important one and it has to be kept in mind when

we are looking at the alternative ways in which these things develop.

Third, in Canada in most analyses that I have seen, relatively little attention has been given to the fact that both the American and Russian governments deny that the levels of defensive systems they have in mind will generate arms races. Of course, this is not a prediction that we have to take on faith. But we do have to think about it. The Sentinel system was designed and presented in a way by the Johnson administration that hoped the Russians could be convinced that it was not directed against them. Mr. McNamara pitched on the anti-Chinese formulation which we can talk about later. Under Mr. Nixon there has been an even further attempt to try to stress the fact that this is not the basis for a serious attempt to provide heavy city defence. Whether or not this will be successful remains to be seen.

On the other side as well, there are statements on the record by Premier Kosygin and others to the effect that the Russians themselves do not believe that the planned defensive systems will cause an offence-defence arms race. The best known, of course, is the 1967 statement of Kosygin:

I believe the defensive systems, which prevent attack, are not the cause of the arms race but constitute a factor preventing the death of people.

It is interesting that he even refers here to a system which has some population-protecting capability. There may be various explanations for this and many I am sure you are familiar with. The point here is simply that there is some evidence that the governments of the superpowers believe that this is something that can be controlled.

The Chairman: Gentlemen, I wonder if we could have a formal resolution now that the Committee agrees to print both of Dr. Sherman's advance presentations as appendices to this day's Minutes of Proceedings and Evidence?

Some hon. Members: Agreed.

• 1135

The Chairman: We passed a rather general resolution at our last meeting authorizing the Committee to travel. It may be that it would be desirable to have a more specific resolution directed to our particular trip to North Bay. May I ask someone to move the following resolution, and if it is desirable to substitute

this specific resolution for the more general resolution that we passed the other day would you give me the authority to work out the arrangements with the House Leader? This more specific resolution would be related only to our proposed trip to North Bay, would authorize the Committee to travel to North Bay, Ontario on Thursday, June 12, 1969, and return to Ottawa, and the necessary staff to accompany the Committee. May I have a resolution to that effect, please?

Mr. Legault: I so move.

Motion agreed to.

The Chairman: Have most of the members now had an opportunity to read or to glance through the presentation. If so we could throw it open to questions rather than to go through the entire presentation. What is your wish? Are you ready for questioning?

Mr. Forrestall: I wonder what this recent resolution we have just passed does to the status of your subcommittee?

The Chairman: It may well be that the more general resolution can be passed. I am just not sure, so that I am asking for this at least to authorize us to go to North Bay and then we can take up the other question at a later date. If the more general resolution is passed by the House there is no problem. If it is not passed by the House then we would have to pass a more specific resolution with regard to the subcommittee at another meeting.

Mr. Harkness: Mr. Chairman, if Dr. Sherman has some other points that he would like to make before the questioning I would suggest that perhaps we should hear them first.

Some hon. Members: Agreed.

The Chairman: Right. If you will proceed with the other points then, Dr. Sherman.

Dr. Sherman: Fine. I will perhaps go into these last three main sections in somewhat less detail. The second main section in the paper deals with the question of non-proliferation. The hypothetical statement that I set forth for discussion was that a failure to control superpower weapons would doom prospects for other forms of arms control and particularly for non-proliferation. This I think is another issue that is terribly complicated and very difficult to make judgments about—at least I find it difficult to make judgments about it—but about which one does see some

fairly dogmatic statements on both sides of the issue.

In this section of the paper I have simply tried to go through the possibilities and to demonstrate, first, that there are a great many alternatives, and second, that they depend so much either on data that is not available simply because it bears on events that have not happened yet or that the available data is very difficult to assess.

One is the question, for example, of whether or not countries that are displeased with the superpowers' deployment of missile defences will then proceed as a result of that displeasure to acquire their own nuclear weapons. This has been argued more or less as a straight-line sequence. I would argue that it may happen but it is certainly not a straight-line sequence. It is a long way from the point where a country feels the superpowers are wrong in opening the age of missile defences to the point where it makes a decision to acquire its own nuclear weapons. Some analysts seem to feel that non-nuclear states are going to do this more or less out of spite; that even governments that realize that proliferation is a destabilizing thing for everyone would then go ahead with a nuclear weapons program simply because they are angry with the superpowers. That sort of analysis, I think, is rather dubious.

The question of whether or not the ABM affects proliferation has often been put in terms of the extent to which it raises or lowers the premium that other countries which have not yet got nuclear weapons will place on them. On the one hand, it has been argued

• 1140

that simply by going into a new generation of weapons the governments of the United States and the Soviet Union will make it appear as if nuclear weapons are important things to have, that they are desirable for a variety of reasons, and that this creates a fashion which is really the best term to describe it, in which it seems natural for other countries to go ahead and acquire nuclear weapons. On the other side of that issue it has been argued that some level of ballistic missile defence in the superpowers will lower the premium that nth countries place on nuclear weapons. This could happen in a variety of ways. One which is familiar to you concerns the question of guarantees. Some analysts feel that a superpower cannot credibly guarantee the security of a non-clear country, if it is obvious that in implementing

that guarantee it would be vulnerable to destruction by the country that it is trying to protect against. To these analysts, ballistic missile defence appears as a non-proliferation mechanism, rather than one which enhances proliferation, because it reduces the guarantor's vulnerability. I assume that in the discussion period, many other features of the connection, if there is one, between ABM and proliferation will come up, but I will pass over them at this point.

The third main section deals with the question of whether a "meaningful" defence against ballistic missiles is possible. As I have said in the paper, I think the key issue here, as far as it bears on the Canadian debate, is the almost universal assumption in Canada that if any strategic nuclear weapon is ever fired in anger by anyone, the result is automatically what has been called a—spasm war—this term connotes a very destructive and uncontrolled strategic nuclear war.

But many of the arguments that have been used to defend some level of ballistic missile defence in the United States do so because they call into question that assumption. We cannot really understand a lot of the concern that ABM advocates have unless we too are at least willing to call that assumption into question. Earlier, I mentioned some of the issues which arise in this connection. These include the possibility of accidental or unauthorized launches; the possibility of attacks on a superpower by a country that does not possess a large and sophisticated arsenal, the whole range of limited strategic war between superpowers. This last analytical category arises from the feeling that if a country feels its cities will be struck in retaliation, it will not make uncontrolled strikes on enemy cities and that this will impose certain limitations on the way any conflict is waged. This may be a limitation either on the kinds of numbers of attacked targets, but the general point here is that most discussion of ABM in Canada is based on the assumption that an all-out general war between superpowers is the only type of nuclear conflict that could conceivably be fought. That assumption is disputed by many of the participants in the American ABM debate. And for many of the other cases, the American discussion of whether a defence is meaningful turns to a great extent on what, in Canada, would be regarded as mere details of the conflict. How many forces are left? How much damage has been suffered? Will a defence keep an attacker away

from certain kinds of targets, or force him to use more weapons in order to get through to those targets?

These are very complicated questions which are obviously very dependent on the type of "scenario" one uses. The point here is simply to emphasize there is a wide variety of them, and different types will lead to different conclusions about the meaningful nature of any missile defence which can be provided.

Let me make one other point in that section, and then conclude this summary. If one accepts the assumption that all nuclear wars are spasm wars and then proceeds to design forces in accordance with it, it begins to have a very large element of self-fulfilling prophecy. If the planners feel that this is the only kind of war which can be fought, then in the terrible event that deterrence should fail, that is what we would get. Therefore, the relationship of strategic doctrine to the plausibility of various types of scenarios is a very important one.

• 1145

In the fourth section of the paper, I address a question which came up to some extent in your discussion with Dr. Lindsey but to which I wanted to return. It is the question of whether or not whatever Canada does in the field of continental defence, or whatever response we make to missile defences in the United States, should be governed solely by our concern for the stability of the American strategic deterrent. As an alternative hypothesis, are there things that we should be worried about as Canadians, which are not related only to the stability of the deterrent?

I have listed some possibilities in the paper. Certain ones are implausible, others are plausible enough, at least, to give us pause. To take only one example, consider the assumption that no attacker would have intended targets in Canada. This is widely accepted in Canadian discussions, and while it may be true, it may also be untrue. Some of the Russians' statements suggest that it is not true, because they have made statements which suggest that they do not believe nuclear war makes traditional concerns like productive capacity completely irrelevant. This is an issue for careful Canadian discussion and analysis. The only point I wanted to make in the paper was that we have a special interest in looking at this type of question in considerable detail rather than accepting on

faith certain assumptions which are made about it. I think I should be quiet now. Thank you, very much.

The Chairman: Thank you very much, Dr. Sherman. I have on my list Mr. Allmand, Mr. Nowlan, Mr. Brewin and Mr. Laniel and Mr. Gibson. Mr. Allmand.

Mr. Allmand: Dr. Sherman, in your remarks you stated that you are acting as a "devil's advocate". In your brief you seem to take some of the principal arguments which are raised against the ABM system and you pose counter-arguments and point out that these counter-arguments do exist and that they should be considered. I would like to ask you whether or not you have made any assessment of the arguments on both sides and whether you have not come to any conclusion? Have you not weighed these arguments? For example, the first one with which you deal is the possibility of escalation in missile defences and new rounds in the arms race. You point out that this is not necessarily so, but you do not come to any conclusion. I am now just asking you whether or not you can tell us if you have come to any conclusion that you have not mentioned in the paper? On balance, do you think that the construction of the ABM system, the sentinel system, will lead to an escalation in the arms race which is undesirable?

Dr. Sherman: In the sense of an offence-defence interaction?

Mr. Allmand: Yes, yes.

Dr. Sherman: First of all, you are perfectly correct that I have tried to keep strong personal positions out of the paper for reasons that I indicated earlier. Partly because that was my assigned task, and partly because I, quite frankly, do not have a strong position on the matter. I am not sure I could go beyond the statement that the decisions to deploy missile defences on both sides will certainly be discussed in the approaching strategic arms limitation Talks. We are not exactly sure when they will start but it appears that they will start soon. I do not feel that either side is committed yet to a certain very detailed pattern of deployment, so that in a way you have asked me an unanswerable question. Both sides are feeling each other out, and will test their own instincts as to how important it is, for example, to provide a low level defence against accidents, and that

• 1150

sort of thing. I do not think that the question can be answered at all until these talks have been given some chance. I would like to be able to give you a more direct answer, but in all honesty I do not think I can. I am hopeful, as the governments involved here are hopeful, that an offence-defence race can be avoided. Beyond that I do not really think that I would like to get off that fence, because I do not think it would be responsible to do so.

Mr. Allmand: Then if you, who have studied the arguments on both sides and have more or less dedicated your full time to doing this, do not feel that any hard decision should be made before these talks, do you feel that the same position should be taken by governments?

Dr. Sherman: But they have done so.

Mr. Allmand: I am thinking of Canada here.

Dr. Sherman: I am sorry.

Mr. Allmand: The Parliament of Canada or the Government of Canada has refrained thus far from taking a position with respect to the building of the ABM system. This Committee might make recommendations. We might say that we think this is an unnecessary escalation of the offense-defence arms race. The Government of Canada might do so. I understand they are also making a study of this. I understand you are suggesting that perhaps no statement should be made until these talks take place.

Dr. Sherman: I do not mean to recommend a course of action to anyone, and particularly to the Canadian government. I simply say that the question of whether or not either the decision by the Russians to deploy a defence around Moscow or the decision by Mr. Nixon to go ahead with the Safeguard system taken independently or in combination will cause an offense-defence arms race, it is just not possible to say at this point. It remains to be seen. I do not think there is cause for alarm, if that is closer to a direct answer, but I believe quite honestly that it is too early to say. I think the negotiations on this point will be very long and very difficult, and if we expect within six weeks or two months after the SALT talks—Strategic Arms Limitation Talks—begin that we are going to have a dramatic answer to this one way or the other,

I think we are going to be disappointed. If you look at the history of such things as the Treaty on Non-proliferation of Nuclear Weapons you will see how long it has taken us to work something out that is acceptable to both the superpowers and to the other countries: The better part of this decade, and we are by no means finished. I think we will be disappointed if we expect very early answers to the ABM question from the talks, but both governments have stressed—the United States has certainly stressed this—that they will go into these talks without an irrevocable commitment to a detailed type of deployment of missile defences. The negotiations will just have to proceed on that basis.

Mr. Allmand: I asked you, though, on the balance of arguments if the U.S. were to go ahead with the plans that they now have, which have not been approved by Congress, is this likely to lead to an offense-defence escalation or is it likely to lead to a defence-defence sort of escalation, which may not be very harmful.

Dr. Sherman: I am reluctant to come off the fence, but as you are shoving me off the fence I will say that the present system as announced by Mr. Nixon is not likely to cause an offense-defence race.

Mr. Allmand: I see. That is on the balance. You said that it would be irresponsible if you were to make a recommendation at this time, and if you as a serious person say that I wonder if it would be irresponsible if as a member of this Committee I were to make a recommendation at this time. Many people feel that if we are going to assist those people in the United States who believe that it will lead to an offense-defence escalation, perhaps Canada and the Canadian Parliament should make recommendations, and that if we wait until after the talks it may be too late. In any case, I do not want to push you any further on this point. Thank you, Mr. Chairman.

• 1155

Mr. Gibson: May I ask a supplementary, Mr. Chairman?

The Chairman: Mr. Gibson on a supplementay.

Mr. Gibson: Your address is one of the most scholarly we have received a statement from, and frankly, it is impressive from the point of view of a young member of this Committee to realize the amount of brain

power that has gone into it. With some humility I will ask you, sir, whether you believe that because this is due, and with these talks going on in Geneva about which we have heard virtually nothing, whether there would be any merit in Canada taking the position that there ought to be an interim delay in the process of building up these weapons, and hopefully perhaps the matter could be brought up at the United Nations in September.

Dr. Sherman: I do not know how much more I can say, but in some of the comments about delaying deployment of the Safeguard system there is an assumption that something is going to happen very quickly which will then be irreversible. My understanding is that the first phase of Safeguard, which is largely the protection of two Minutemen and related bases in the northwestern United States, will not be completed until 1973, so it is not as if a ballistic missile defence system there would appear overnight which would then be impossible to dismantle if that should prove desirable as a result of the SALT talks.

Mr. Gibson: Even at that, sir. . .

Dr. Sherman: On the question of whether a Canadian statement should be made on the desirability of delaying even those plans that have been made. . .

Mr. Gibson: I mean on each side. Appealing to both the big powers, not just the United States.

Dr. Sherman: That is something I do not think I ought to comment on. Again, that is an area where a difficult. . .

Mr. Gibson: You see, our hands are tied. . .

The Chairman: Mr. Gibson, I think we should keep the supplementaries fairly short. I have your name on the main list of questioners.

Mr. Nowlan.

Mr. Nowlan: Yes, Mr. Chairman. My questions are rather related to Mr. Allmand's, but they really come from another point of view, and perhaps they are also partly related to Mr. Gibson's questions. I noticed from the synopsis of your career that you have been involved in many other areas of study at Hudson, including the spread of nuclear arms, nuclear sharing, NO strategy, and so forth. The thing that has bothered me, Dr. Sherman, since we started these lengthy

hearings on the ABM—and I appreciate it is a technical subject and lengthy hearings are being held—down South—is that primarily what this Committee or this government decides is really not going to affect the decision of the United States with respect to the program which they have announced so far for their ABM. Is that not correct? In other words, as far as we are concerned this is an academic exercise.

Dr. Sherman: I would regard my participation in it largely as an academic exercise. That is, I would be reluctant to make a policy recommendation. To answer the other part of your question, whether a decision by the Committee or the government would affect a decision by the United States, I think that is very difficult to say. I really would not care to hazard a guess on that.

Mr. Nowlan: I want to refer to the last sentence of your paper, which in my opinion resurrects something that Dr. Lindsey said here some time ago. If Canadians are really discussing this matter as a benefit or as a detriment to Canadians, and if we are talking about the type of missile ABM defence that

• 1200

protects civilians and industries in Canada, then obviously we should not be talking about the Safeguard system that has been announced by Mr. Nixon, we should be talking about whether we want these things to protect our civilian population and industrial base and have them far to the north. In other words, is that the only way we can really participate in a practical way or is there any other way in which the Canadian government is able to participate in a practical way unless it is to look to see, as your last sentence says, if Canada has an obligation to herself, rather than commenting on what our neighbour is going to do. Otherwise it is an academic exercise, is it not?

Dr. Sherman: I believe Dr. Lindsey did mention the protection that the area defence component of Safeguard would provide for Canadian cities, and that is a large technical question on which, quite frankly, I am not competent to judge. It probably is true that for areas other than those within the protective footprint of planned sites some additional protection might be afforded by some moving of those sites. But, first of all, I am not sure that we even know the answer to the first question, how much protection would already be afforded, because we do not know the

precise location of all the sites even in the present plan. Therefore how much protection Canada might get, as far as I am concerned, is still undetermined even in the present plan. The further question of whether more protection would be desirable by moving sites around, is one simply that I have tried, from a devil's advocate point of view, to raise from another perspective, and by no means to recommend that we ask for revisions in the plan or that we place facilities in Canada.

Mr. Nowlan: I agree with Mr. Gibson. I was interested in your paper and the devil's advocate approach perhaps which you took on these four premises that you posed. But now that you have given the paper I am, like Mr. Allmand, going to try to push you off the devil's advocate role into an advocate's position. Is it not correct to say, again using the terminology of your paper, that the plan that presently has been announced by Mr. Nixon is one to protect strategic forces?

Dr. Sherman: Primarily. In the March 14, 1969 statement, which was the Safeguard announcement, the President said :

This measured deployment is designed to fulfill three objectives:

1. Protection of our land-based retaliatory forces against a direct attack by the Soviet Union.
2. Defense of the American people against the kind of nuclear attack which Communist China is likely to be able to mount within the decade.
3. Protection against the possibility of accidental attacks from any source.

So that you are certainly correct that the primary emphasis of the Nixon administration has been on the first point. Of course they have a specific reason for doing this—it is to reassure the Russians that the United States is not in the business of trying to protect its cities to such an extent that they will then be invulnerable to a retaliatory strike by the Russians. That of course would put the Americans in a first strike position. So you are perfectly correct on the emphasis on force protection here.

The second and third points have to do more with the planned deployment of an area defence capability, which of course Sentinel also had, and which would address the possibility of light or unsophisticated attacks as well as a possibility of accidental or unauthorized launches coming from any source whatever.

Mr. Nowlan: But as long as their system is directed to strategic force defence then any exercise on the part of Canada, committee hearings and/or declaration by government, is an academic one, is it not?

• 1205

Dr. Sherman: I think it is probably fair to say that the American debate on whether or not a defence is necessary for Minuteman will not be much affected by Canadian statements. The Americans have as good information as we do, to say the least...

Mr. Nowlan: If not better.

Dr. Sherman: ... on the kind of threat that they are worried about, the projections into the 1970s and beyond of the types of forces that they have and should expect the Russians, the Chinese and others to have. I think you are probably correct in saying that we will not bring much new to that debate. But we do have a responsibility to try and understand that debate. Those of you who have read, or will read the presentations before various Congressional committees will see how terribly complicated the issue is and how much it is based on things like the accuracies of missiles that the Russians will have in the 1970's. This is not to say that we should not make our own independent assessment of such things. But we will not have a decisive effect on the outcome of the debate in the United States.

Mr. Nowlan: I think that is an understatement. I do not think we are going to have any effect on the outcome in the United States at all as long as it is related to the defence of their own strategic weapons. But my real point is this. If all these problems were ironed out in this fast-moving age of technology and advances in science, if witnesses had come in here this year, as they might come in two years from now, and say that these problems have been ironed out and both the missile and the ballistic defence missile have pinpoint accuracy—should not Canadians perhaps be debating whether, with this technology, positioning these stations or ABM sites way to the north of the 49th parallel could protect the continent and not just strategic forces?

Dr. Sherman: Again, as we agreed earlier, there is an important distinction between those two types of missile defences. The ironing out of questions like expected Russian accuracies would probably not solve the ques-

tion that I think you are getting at, how much does Canada need—unless of course there were offensive missiles in Canada. But the ironing out of those technical questions, those expectations, would not make it easier for us to decide what, if anything, to do. It would not solve our problems for us.

Mr. Nowlan: I have one last question, Mr. Chairman, because I do not want to take too much time. It may be an unfair question to put to this witness, but in view of your background, the fact that you are also a Canadian, and the very reasoned paper you gave here today, from your knowledge of these international problems, the fact that ABM is pretty technical and complicated and the debate is going to go along for some time, would it not be fair to say that this Committee could spend its time more profitably, usefully and constructively in looking at more practical and closer problems of defence, for example NATO re-orientation, the problems of the North and how we are going to exercise sovereignty over it, rather than involve ourselves in this academic ABM exercise which is not going to influence the Americans one bit, if it is on strategic force defence.

Dr. Sherman: That of course is only one part of it and other parts of it may affect us.

Mr. Nowlan: Is this not what a responsible defence committee, studying a defence and foreign affairs role for Canada, should have at the top of its list?

Dr. Sherman: I do not know about the top. This is not to say that the other questions you raised are unimportant, they certainly are not, but I do think that the Committee spends its time very profitably when it looks in considerable detail at a question of this kind. That is something on which I, quite frankly, do have a strong opinion. I think that the Committee, this year and in previous years, has added something that Canada had not had traditionally, which is an attempt to think

• 1210

these things through. The ordinary citizen will have trouble in making his own assessments, as you and I do. But I think, especially in the context of the nuclear weapons debate that we had some years ago, that looking at ABM's and strategic arms control is a very useful exercise for this Committee to undertake, even if it did not produce any startling recommendations either to the Canadian government or to the American government or

anyone. In other words, a citizenry that understands the issues as well as having political leaders who understand the issues is a very good hedge against erratic behaviour, against unexpected political situations, some of which I think did come up in the nuclear weapons debate. I think many people were very much confused by those issues and very much surprised by the emotion that it generated, although this is not to say that it should not have been an emotional issue. I think this is one function of a committee such as this, and I think a very valuable one. You might call it academic—and I realize that is a dirty word because it means it does not have any operational output—but that may not always be true and even if it were—I would say it would still be a useful exercise.

Mr. Nowlan: I am not going to ask any more. I would not mind pursuing that bit of history and whether the Doctor suggests that it was all erratic behaviour back in 1963 and 1964 and/or if the Committee had been really debating in an educative way—there is value in education I will be the first to admit—whether we still would have understood the Cuban crisis any better when it first broke.

Dr. Sherman: That may be so. I do not think I said—if I did I did not mean to—that anyone's actual behaviour had been erratic. I meant to say that a good understanding of the issues will protect us against erratic behaviour in future.

The Chairman: Gentlemen, in case we do not finish this morning by 12.45 or thereabouts, we have made arrangements to reserve this committee room this afternoon at 3.30. Would you be available if necessary, Dr. Sherman? Perhaps we should proceed and see how we get along but if necessary we could meet again this afternoon at 3.30.

Mr. Allmand, on a supplementary.

Mr. Allmand: Dr. Sherman, Mr. Nowlan says that whatever decision we make in the Parliament of Canada is academic but in the United States, Congress has not yet voted on the ABM system and from the assessments that I have seen, the decision is up for grabs. It would seem to me that if we in Canada, a friendly ally of the United States, come out with a certain decision on recommendation to the United States on this, it could have some effect. There are Senators like McGovern, Kennedy and many others, Would the recommendation of the parliament of a friendly ally

not have some influence on the Senators' voting in the United States?

Mr. Nowlan: I would like to ask a further supplementary.

Mr. Allmand: Would you wait until that one is answered?

Mr. Nowlan: I can answer it. I can answer that question.

The Chairman: I do not know if Dr. Sherman wants to answer that question or if he feels he is qualified to answer that particular question.

Dr. Sherman: I think since it is a question about legislative behaviour I should let one legislator ask the question and another legislator answer it.

Mr. Nowlan: I can answer, Mr. Chairman, by asking the witness another question which he will not be able to answer.

The Chairman: Mr. Nowlan, on a supplementary to his own question.

Mr. Nowlan: Do you think that what this Committee or the Parliament of Canada does is going to affect the judgment of Senator Ted Kennedy or Senator McGovern and all the other Senators who have been leading the debate pro and con down there?

The Chairman: Perhaps we should get on with the main issues. My guess is that Dr. Sherman feels that he is not qualified to answer that question any more than the earlier one from Mr. Allmand. Mr. Brewin.

Mr. Brewin: Mr. Chairman, I would like to preface my questions by saying that with the latter part of what Dr. Sherman has told us I am heartily in agreement. I think when you are getting an important strategic change in regard to the defence of North America, for a defence committee not to understand it, not to pay some attention to it would be highly irresponsible. Do you agree with that? I see you are shaking your head.

• 1215

Dr. Sherman: Emphatically. I agree with it emphatically.

Mr. Brewin: I might also say in preface that I think you have successfully demolished some of the straw men that have been raised in this but I have a few problems which were

raised in the Gore Committee and other places about this ABM system and with which I am by no means satisfied.

First of all, I understand that the scientific evidence—and I know that with scientific evidence, as with other evidence, you can have some on one side and some on the other—indicates that the development of anti-ballistic missile systems can fairly easily be countered by the development of penetration aids and a whole series of other scientific devices. I would like to suggest that if this is so, it is not a necessary conclusion but is it not a natural one that the deployment of such a system will be nullified or met by the development of more efficiency in the offence? This seems to be the conclusion of a great many distinguished scientists in the United States. It seems to me, as I say, not to be necessary but to make a lot of sense. Do you agree with that?

Dr. Sherman: First of all, the technical details of that issue are very, very complicated and in many areas I am simply not entitled to an opinion. But let me say a couple of things. One is that you are certainly correct that the scientific community in particular, as the American community in general, is very deeply divided on matters such as penetration aids. This, of course, makes it terribly difficult for the layman to know what to do. If a political scientist is asked to judge the scientific merit of competing arguments—let us say you have a Nobel prize winner like Eugene Wigner arguing with a Nobel prize winner like Hans Bethe—to ask a political scientist to come to a competent judgment on such an issue is a little bit difficult. But this, of course, is a problem not just for professional, non-technical analysts but for any citizen interested in the question.

The second part of your statement is a very, very controversial issue; and that is the ease with which a defence can be nullified. I am looking through some of the material with me for a statement by Dr. Charles Herzfeld, a former Director of the United States Advanced Research Project Agency, who is one of the most knowledgeable technical people in the field but by no means the only one. I want to delay for a moment because I want to quote him rather than to try to repeat from memory the statement that he makes on this subject, again simply to present the other

side of the argument. I am sorry I cannot find the specific quotation.

Clerk's note: The witness subsequently provided the following information.

The statement I was thinking off occurs in Dr. Herzfeld's chapter in a forthcoming book on ABM (*Why ABM? Policy issues in the Missile Defense Controversy*, edited by J.J. Holst and William Schneider, Jr.) to be published by Pergamon Press, and is as follows:

It turns out that there are no foolproof, cheap, simple, and high confidence ways to decoy the threat. The best high confidence methods are not cheap nor are they simple to execute. These methods are, however, quite feasible, but at a considerable price in the effort required to install them, and particularly to verify their effectiveness.

The main point that Dr. Herzfeld makes however, is that contrary to widespread opinion, it is neither cheap nor easy to develop penetration aids of this sort. Again one's

• 1220

definition of cheap and easy might vary. The point is simply that many people on the pro-ABM side feel that many people on the anti-ABM side have underestimated the difficulty of this technical problem. The assumption is at least debatable that the Chinese can very easily and at very little cost overcome Safeguard with very simple balloons and chaff and things like that—assuming that, by the way, those are simple, which they are not.

The question of penetration aids is something that the Americans have studied for a long time—have found very expensive and very difficult, and therefore doubt that anyone else with a technical base presumably less sophisticated than their own would find it easier. This issue like so many of these others is highly controversial, even among technical people who much more so than I are entitled to opinions. I would certainly agree with you that there are many very competent scientists who feel...

Mr. Brewin: I find to my surprise that these competent scientists often speak quite clearly in a manner that commends itself to one's reasoning. For instance, Hans Bethe in dealing with penetration aids speaks about the blackout. I think Dr. Rathjens too says that the radar part of this whole ABM system is extremely vulnerable. Surely they know

what we are talking about when they say that. From that one can deduce even without being a great scientific expert if their reasoning seems intelligible and sound that perhaps they have a real point.

Dr. Sherman: One can deduce that there is a serious scientific debate. That is undeniable, I agree with you entirely. This is not to make a judgement on one side of that technical debate as against the other side, it is simply to say that as more than interested observers we should first of all not accept on faith either side. Beyond that all one can do, I suppose, is to use whatever technical knowledge he has along with the confidence he has in other people who have more technical knowledge than he does and come to a judgment. It seems to me that the only inference that can be drawn from those statements is that the scientific community is deeply divided on this question.

Mr. Brewin: That seems to me a very self-abnegating point of view and it seems to me that some of us have to come to a judgment about scientific evidence from time to time because we have to make decisions. However, supposing we get away from the scientific end of it, is it not possible to exercise some sort of historic judgment and to recognize on this question of escalation that each new development, defensive or offensive, is used as an incentive for a reaction or over-reaction on the other side? Is it not a fact that the reputed or actual deployment of an ABM System around Moscow is being widely used as a basis for saying we must have the same sort of system?

Dr. Sherman: It is certainly a very serious question. Several things come to mind. On any issue of this kind, and maybe even more so on one that has a heavy political context, different people may be arguing for the same thing on different grounds. In the context of your remarks, what I meant was that some people in the United States may be defending ABMs simply because they feel that the Russians are in the business and that they should therefore be in the business in some way.

That by the way is not an unreasonable argument if you are worried about the uncertainties of technical developments and so on; that is, you need some sort of base for knowing what the problems are and being able to anticipate advantages that the other side might get. It is a serious concern of many of

• 1225

the proponents. In a way you might distinguish between a serious imitiveness and one which is not so serious; the second kind is the view that simply because the Russians have it we have to have it. The first kind is that you at least have a feeling that you understand the problem, that you can anticipate developments, and that you do not find yourself suddenly at a terrible disadvantage because you have no understanding of the technical problems.

On the other hand, there also were people who were arguing for various forms of ABM before the Russians went into the business. "This is by way of saying that many people will be supporting the same thing for different reasons. The Russian Galosh Missile, I believe, first appeared in the May, 1964 Parade. Presumably there was intelligence information on this earlier. The Nike-Zeus program itself precedes 1964, so that you at least have a group of analysts and planners in the United States who were in favour at least of light ABM, even before the Russians went into business, on prudential or other grounds. They would argue that they were not being imitative but that they just felt that this was a responsible and prudent thing to do for arms control and other reasons.

Beyond that, you get into the question of why is he really saying what he is saying? Is he just being imitative, is he worried about the Russian offensive threat, and so on? I suppose all of these people on both sides would feel that they cannot always choose their friends. Allies often have very different ideological and other backgrounds, and this is true in both pro and anti-ABM camps.

Mr. Brewin: Dr. Sherman, another thing that impressed me when I read some of the American evidence is that a large number of the scientists say that without adequate ability to test these weapons, and even with tests, the performance of the ABM weapons in a crisis is, to put mildly, highly dubious. In other words, they question the utility of the system. Has that been satisfactorily resolved to your knowledge?

Dr. Sherman: It certainly has not been resolved to my knowledge and I very much hope that it will never be resolved, because it will be resolved only if we actually have to use these weapons. I like to be academic in the sense that I do not want to test theories of nuclear war in practice.

The response of the defenders of the Safeguard system to that argument is that the interaction in practice between offences and defences is a very complicated one and that the offence cannot be tested realistically either, except under "battlefield" conditions. While they would certainly admit the truth in your statement that there are great uncertainties in the performance of the defence, they would argue that there is also considerable uncertainty in the performance of the offence. This fact alone, by the way, complicates the offence's job, and as some would argue, makes the system worthwhile on that ground alone.

You are certainly correct in saying that this has not been resolved. The only other comment I might make is that the defenders of the ABM feel that what the critics do is take very optimistic assumptions for the offence and very pessimistic assumptions for the defence. On the other side, the critics of the ABM feel that the defenders take very optimistic assumptions for the defence and assume very backward attackers.

The kind of penetration aids that the Chinese or Russians may have through the

• 1230

seventies and the interaction between that and the defensive system depends a great deal on assumptions. I think people on both sides would probably agree that there tends to be a certain loading of assumptions on both sides consistent with the debating tactic more than with really high confidence scientific judgment.

Mr. Brewin: I would like to change the subject to a degree. However, I am still on the question of the usefulness of this system. I understand the major purpose of the present Safeguard system—I am not talking about some further development—is to protect two Minutemen sites.

Dr. Sherman: Not the present Safeguard system in toto, but simply Phase I of the deployment will be directed by 1973 to protect an area in the northwest, about which Secretary Laird has made the following claim:

Phase I as you know just takes two of our Minutemen bases and up in the northern part of the United States it gives us very concentrated protection over 30 per cent of our Minutemen force and a thin protection over the rest of our Minuteman force.

This is primarily a force-protecting phase.

Mr. Brewin: I would like to read you a paragraph in an article in the paper called *TEMPO* which is published by The National Council of Churches in the United States. In it Mr. Allan M. Parrent says this:

The fact is that our offensive deterrent is so massive and so dispersed that it needs no such protection. . .

He is referring to protection of the Safeguard ABM system.

. . . and in fact, except for two Minuteman sites containing 350 missiles, will not receive much protection under this system. The bulk of our deterrent is composed of 646 Polaris and Poseidon missiles on submarines and 630 long-range bombers. These, combined with the remainder of our 1,054 Minuteman ICBMs and thousands of shorter-range missiles in Europe and elsewhere, provide an arsenal of deterrence to which nothing of significance will be added by the Safeguard system.

As an analyst of these matters, I would like your comment on that paragraph.

Dr. Sherman: I think the SLBM figure is 656 by the way, not 646. That is a small point.

Mr. Brewin: Let us put it this way to complete my question. This suggests that the deterrent is now so massive and so effective that the protection of two Minutemen sites adds nothing of significance.

Dr. Sherman: If it were limited to that, I would certainly agree and I think that even those people who believe that this is now a prudent thing to do are looking to the long run, at least into the nineteen-seventies and beyond. They are concerned about the apparent Soviet intentions to deploy multiple MIRV—which is a term I am sure you are familiar with—which given the accuracies that some analysts, although not all, expect in that time frame could result in a very serious threat to Minutemen. That is one point against.

The second is the question you raised about the multiplicity of strategic systems, and the fact that even if Minuteman were completely destroyed, the bomber force and the Polaris force would still survive. Planners who are friendly to ABM and who therefore support strategic force protection feel that part of the stability of the deterrent itself results from this multiplicity of strategic systems. In other

words, an unexpected failure in one type of system does not leave the country completely vulnerable. Therefore, the systems, which in a sense mutually back each other up, are simply the most prudent way to approach very uncertain problems, such as weapons performance, and so on. While part of your point is certainly correct when you say that nobody feels that—I should not say nobody; there are some—but the majority of the analysts of the community—of people who are active in this field believe that there is no first strike—if you want to call it that—threat to the American deterrent today. Some of them are more concerned about the longer-run, particularly as regards Minuteman. They would argue that this is an important component of the deterrent. In sum, they do not want to depend solely on one system, because they do not feel that it is a prudent thing to do.

• 1235

Mr. Brewin: Mr. Chairman, I have just one more question. One thing that I do not notice in your paper at all is the problem of cost. We, as Canadian parliamentarians, are not primarily worried about the American taxpayers, but we do know that all defence matters involve the disposition of resources, and they are using them on one thing rather than the other. I notice that at the foot of page 24 of your paper you suggest that this system which we now have is sort of “a building block concept” and may be a prelude to an immense diversion of resources.

Dr. Sherman: I simply meant that the final form is not yet determined. But the thrust of your question goes to a very important issue which certainly concerns not only those who oppose any system, but those who are opposing this one in particular because they feel it will not be kept at the stated level. In some cases, I think the primary concern of opponents of the light ABM is that they do not believe it can be kept light. They feel that it will expand of its own momentum.

It is a difficult thing to assess. The friends of ABM would argue that the historical evidence does not support the view that it cannot be kept limited. They point to the air defence system which had a lot of holes in it. People recognized this situation but no serious attempt was made to fix it. This was not only because it was leapfrogged by the missile age but it just got up to a certain point and for one reason or another did not get any bigger. The current figure for Safeguard is \$7.8 bil-

lion. I tried to find out this morning whether that includes operation and maintenance. I do not think it does but I can check that for you. They would argue that it is not an unreasonable expenditure. By the way, many people who are strongly in favour of the light ABM oppose any expansion of it to any heavy system and some who are favourable to Safeguard would argue for expansion.

Mr. Brewin: I just have one more question. I want to preface it by saying I am not questioning your objectivity, but I do notice that Senator Fulbright was questioning your associate, Mr. Brennan—he gave evidence before the Gore Committee—and apparently Dr. Brennan told him that 90 per cent of the Hudson Institute's support came from the United States Department of Defence. I do not know whether that has anything to do with you or if you are, in a sense, just an employee and not concerned with that matter. Is that correct?

Dr. Sherman: I would have to check that figure. I think that is probably correct but it would be something that I could check. I do not think it has much relevance to my own position because no one has ever put any pressure on me from any source to believe or say something that I do not believe. I think any analyst would tell you he believes that he arrives at his conclusions on their own merit. Beyond that, I am not sure it is relevant in my situation.

Clerk's note: The witness later advised the Committee that 70% of the Institute's finances come under contract from the United States Department of Defense. Other support comes from other federal and local agencies, grants, etc.

The Chairman: Mr. Laniel.

Mr. Laniel: Thank you Mr. Chairman. Dr. Sherman, at this stage I am trying to separate completely the question of morale in nuclear proliferation and. . .

The Chairman: Excuse me, Mr. Laniel. Perhaps we had better find out whether or not we wish to continue after lunch or try to finish before lunch. Do other members have questions? I have Mr. Laniel and Mr. Gibson on my list. Do other members have any question, or can we think in terms of finishing by 1 o'clock?

Mr. Thompson (Red Deer): The problem is that some of us have another meeting at 12:30.

• 1240

The Chairman: Would you like to continue this afternoon at 3:30 in case other questions occur to members over the lunch hour? What is your wish?

Do you have any extensive questions, Mr. Laniel?

Mr. Laniel: I do not think so.

The Chairman: Mr. Gibson?

Mr. Gibson: No, I have not.

The Chairman: We can try to finish off now, then; otherwise we can continue after lunch. Mr. Laniel.

Mr. Laniel: As I was saying, I would like to separate completely the question of morale, or the nuclear proliferation question from the military aspect of this. From the answer which you gave to Mr. Brewin at the end, I wonder if the problem of ABM would be, in your opinion, as great as it is military-wise if it were not a question of cost. Is it mainly a question of cost that gives so much importance to the question of morale, or the other aspect of the problem? Do you not think that Americans, Canadians or anybody would look at this problem if the cost were very much lower?

Dr. Sherman: No, I think that while the economic side of it is a very important one, in particular because of other domestic problems of the American States—people are very concerned about the diversion of effort from domestic into foreign and military problems—there would probably be a considerable amount of opposition on other grounds such as the arms race, proliferation and so on. So, if I understand your question completely, I think the economic and social concern is an important part of the opposition to ABM, but only a part. Beyond that it is hard to say how any one of the participants at this stage really weighs it. Very often they do not make explicit, and really could not answer the question as to the importance of the cost factor relative to others.

Mr. Laniel: On the question of the utility of the system, do you not feel that the questions which we are now asking ourselves about the ABM system are the same ones that were asked, maybe differently, over the other systems of defence? For example, let us just take the Bomarc system which was the air defence system.

Dr. Sherman: Many of them are certainly very similar. I think that would be a straight answer to your question. In the problem of strategic defence, continental defence, there are many parallels between the ABM and the Bomarc but across the whole broad problem of continental defence. It has sort of leap-frogged by a new generation of technology.

Mr. Laniel: Then as far as NATO is concerned, if I take your fourth proposition would you come to the same conclusion? I will just change a couple of words where you say that whatever Canada does in the field of defence, she does it in order to protect the American strategic deterrent which is the keystone of stability. Canada itself is not threatened and therefore need not defend herself in the narrow sense, which would apply to NATO, or the contribution of Canada to NATO. Do you not feel that NATO is also some kind of protection to the American deterrent?

Dr. Sherman: The American, Canadian, and so on, forces which are deployed in Europe are not a direct defence of the American strategic offensive systems, so in that sense they are not analogous. In a more general sense I suppose they are. By attempting to provide or hoping that they will provide a deterrent to aggression or war in that area, they protect the deterrent, but I think they are very different types of forces. In a very general political sense, perhaps that is true.

• 1245

Mr. Laniel: Yes, I know they are and I am wondering if I am right in assuming that it is impossible in Europe to have a limited war.

Dr. Sherman: That is a separate subject...

Mr. Laniel: I know it is, but still...

Dr. Sherman: ...and I am not sure whether we should get into it at this point. Maybe one could say that in the same way as you have a wide disparity of opinion on the possibility of fighting a limited strategic intercontinental war, you have a wide disparity of opinion on the question of the possibility of fighting a limited war in Europe. Beyond that, we get into a whole new area of questions which takes us quite far afield from the present concern.

Mr. Laniel: Yes, but do you think it is possible to separate one from another, in the sense that...?

Dr. Sherman: I think it is possible to separate the question of limited war in Europe from limited strategic war, yes.

Mr. Laniel: Yes, but at the same time, by protecting the American deterrent in one way or another, are we not doing more than protecting the deterrent? Are we not preventing worldwide war, and any attacks over North America, in general? Does this not contradict, more or less, your fourth proposition?

Dr. Sherman: By the way, let me stress that those propositions were set out as hypothetical statements which were to be used as talking points. They are not, very definitely, personal statements of my own. I want to make that very clear. I am not sure how much more I would have to add on your other point.

Mr. Laniel: I hesitate to even try to come to any conclusion, myself, because in talking of ABM sometimes I ask myself and I say, "Perhaps there is something wrong with that system, maybe the scientists have not gone far enough, but something else will develop in the meantime". Is it possible to think that the Americans will just sit down and wait for something else to develop and forget about the protection of the deterrent or the giving of that extra protection to their deterrent? I do not know what political influence Canada can have over that. Am I right in that statement?

Dr. Sherman: Again, I think most of that goes to the question which Mr. Nowlan and others raised earlier. I think the point you raised, about not being sure whether the Americans are willing to stay out of the ABM business altogether, because they may be concerned about new technical developments is true. We talked about my views on the question of Canadian influence, earlier. I would not have anything to add.

Mr. Laniel: Thank you, Mr. Chairman.

The Chairman: Mr. Gibson.

Mr. Gibson: When we attended Geneva we were told that President Nixon had been there about 10 days before us preparatory to the disarmament conference and that his policy was consultation rather than confrontation. I would like to ask you, sir, whether you feel, with the drift of events since President Nixon went into office, if the American foreign policy is basically still oriented in that direction or not?

Dr. Sherman: I think their aim is to try to increase consultation with NATO allies. There have been proposals for various arms control groups within NATO, and so on. The United States realizes that the ABM issue had not been sufficiently discussed with the European and other allies, but it must be because it is just too important not to discuss. I think the general answer to your question is that this is probably taken very seriously by the administration. But you would have to talk to allies to find out whether they feel they are being properly consulted.

• 1250

Mr. Gibson: Should we not be urging these governments to do more consultation and to push hard for a conference at the top level?

Dr. Sherman: Do you mean NATO conference at the top level?

Mr. Gibson: A big power conference.

Dr. Sherman: On strategic weapons control?

Mr. Gibson: On everything; on disarmament.

Dr. Sherman: Of course the talks which we discussed earlier will probably fill that bill as much in the short run as can be done, although there has also been talk of multi-power summit conferences.

Mr. Gibson: What do you think causes the delay in getting a summit conference?

Dr. Sherman: A summit or the strategic arms talks?

Mr. Gibson: No, a summit.

Dr. Sherman: I think one thing is that there is a feeling among many analysts of these problems that "summitry" as it is called was over-sold in earlier days and over-sold primarily in the sense that political leaders felt that if they went directly to each other without very careful detailed staff work they could somehow cut the red tape. Now I think a lot of people feel that some very careful preparation for summit meetings—and I emphasize "very careful"—is important.

Another thing is that a lot of people feel that the potential costs of a summit meeting are very great; that is, if a summit meeting gets a lot of play in the newspapers, creates expectations, builds up hopes, and then does not produce any startling breakthroughs, in some ways some of these people feel we are

worse off than we were before. Objectively one might not feel that way, but the dominant reaction is: "We expected a major breakthrough and did not get it." I think this has been one of the primary misgivings on this point.

Mr. Gibson: Do you think a prolonged summit conference would be a good experiment? In other words, a six week one where these leaders could get to know each other really with more confidence?

Dr. Sherman: This is one thing that Geneva may have done for disarmament; that is, regularizing, or making routine, contacts at various levels. If you mean "summitry" in the sense of the American president and his counterparts, that would be a different thing. In general the point that you make about the systematic or regular approach to meetings of this kind is much less vulnerable to the criticism I just mentioned; that is, people go into it with certain hopes, but the talks go on in an atmosphere of business as usual. If something comes out of it that is well and good, if not then there is no dramatic let down such as after Paris in 1960.

Mr. Gibson: Thank you, sir.

The Chairman: Mr. Cafik.

Mr. Cafik: Dr. Sherman, in view of your scholarly efforts here and the testimony you have given today, I only have one question. I think what you have to say is pretty clear and very understandable.

On page 24 of your testimony you say: Also, an effective defence against ballistic missiles could restore some of the bomber's prowess unless AWACS exceeds all expectations.

In our Committee we have had a lot of discussions about AWACS, bomber defence, and so on. I would like you to elaborate on that if you could for a moment.

Dr. Sherman: I realize it is something that you have talked about before and I do not think we should get into it too much. In general, it has been felt that to the extent that a ballistic missile defence system works against missiles, it may make an attacker more interested in other forms of attack. Therefore, he may put more effort into bombers if he feels it is easier to beat a bomber defence system than it is to beat a missile defence system.

It is really a general point that these things are very closely related. Not that the missile

• 1255

defence problem will ever be solved in the narrow sense of the term, but some observers seem to feel that if missile defences ever get very good, that "solves" the problem. But in this constant, dynamic relationship between hypothetical attacker and hypothetical defender, as in anything else, by creating a strongpoint here you may divert him to other efforts, and the bomber would clearly be one of them. It has also been argued, of course, that an effective missile defence would create new interest in even more exotic means of delivery than bomber attack—everything from suitcase bombs up.

The only point I was trying to make there is that the question of missile defence affects not only missiles. It would be nice if it were a complete solution to the problem, but it is not, and that is the only point I was trying to make.

Mr. Cafik: In your view, then, bomber attack is a possibility—you have not said anything about now—and it could become an increasing threat if the ABMs...

Dr. Sherman: I am not sure that it would be a desirable development if it did occur, but I think it is unlikely that manned attack vehicles will disappear completely. As I say, there is some doubt in my mind at any rate about whether it would be a desirable thing that they should, because they do have certain advantages like flexibility, recall ability, and so on over existing missiles.

I think that strategic bomber defence will continue to be a part of continental defences as long as this general problem exists.

Mr. Cafik: Dr. Sherman, one last question. There is an implication here that you do not have much faith in the effectiveness of AWACS. Is that implied in your statement?

Dr. Sherman: No, in some ways mine is a bad sentence. I was alluding to the problem of ground clutter, a rather technical point that the operations research people would be much more qualified to answer. All I meant there was that unless you had a perfect bomber defence the other guy would still be interested in bombers. Presumably in the same way as you are unlikely to have a perfect missile defence against a large and sophisticated attack, you will probably not develop a perfect bomber defence. That was all that was implied.

I had not anticipated what you were going to say. This was not intended as a technical criticism of the performance of AWACS.

Mr. Cafik: Thank you, very much.

The Chairman: Dr. Sherman, I just have one or two very brief questions that I would like to clear up in my own mind. On page 23 of your paper you refer to a statement made by Mr. McNamara suggesting that one function of the Bomarc installations in Canada was:

... to draw Soviet ICBM's away from more important targets.

Could you give us in due course that reference so that we could look it up?

Dr. Sherman: Yes, I would be glad to. It was at one of the Congressional hearings. I would be glad to and I can find it without too much trouble.

The Chairman: Do I understand you correctly when on page 24 you indicate that although that might have been rather unlikely some years ago, yet now with the Soviets having more ICBMs it is perhaps more likely now than it was then.

Dr. Sherman: It becomes more difficult to say. The Americans have not in that time frame increased substantially their own number of launchers, and with the Russians having a significantly large number of missiles confronting the North American continent it becomes more difficult to say how many of those they could spare for anti-bomber facilities.

The Chairman: Is it a fair conclusion from your evidence on pages 23, 24, 25, and so on that the more installations we have on Canadian territory to give some protection to the American nuclear deterrent, the more danger there would be of attracting fire to Canadian territories?

• 1300

Dr. Sherman: Again it is certainly difficult to say, but in isolation a defending facility is dangerous in the sense that it can be a target. It of course meets danger by affording protection. Therefore, there is the question of what it costs you in increased danger opposed to what it gains you in increased protection.

For example, I think Dr. Lindsey addressed this question quite well when he talked about the danger on the one hand that you raise of air defence facilities being targeted and on

the other hand the possibility of weapons going off in Canada which could have been shot down or otherwise met by those defences. It becomes a very difficult interaction to assess. It also involves assumptions about the opponent's targeting priorities.

Therefore, the only thing that I would try to insist on is that you not isolate the danger side of it but put it in a context in which you try to assess the danger that you incur and the possible benefit that you may get.

The Chairman: Deriving directly from that answer, then, do you have any opinion on whether what Canada is now doing in North American defence is making a vital contribution to the defence of the American strategic deterrent? Is what we are doing now vital in your opinion? I gather we are spending about \$130 million a year on it.

Dr. Sherman: Again, that is a little bit aside from the ABM question I was talking about. I think it is a useful contribution.

The Chairman: I have one final question. On page 1 of your paper you say:

Our position under the American security umbrella is the central datum of our national existence.

That suggests that we are, in a sense, protected militarily as a result of our proximity to

the United States. On the other hand, we have heard evidence that the main risk that Canada suffers is the risk of a nuclear interchange between the United States and the USSR. It makes a little bit of difference towards your sense of obligation whether you are being exposed to risk by your neighbour or whether you are being protected from risk by your neighbour. So I would ask you: Which is the correct attitude? Is this another case of having to consider a trade-off, and if so, should that not have been indicated on page 1?

Dr. Sherman: I think that is true. What you say is perfectly true. But I am not sure in the larger sense what the policy implications are besides that we might move to another continent. You are perfectly right that we get protection that we do not have to provide and we also incur certain risks by being located where we are. In that sense I would certainly accept your elaboration of that sentence. As it appears, it does look one-sided, but I did not intend it to be.

The Chairman: Are there any further questions? If not, on your behalf I would like to thank Dr. Sherman for a very thoughtful presentation. Thank you, very much.

RECUEIL DES TRAITÉS

DEFENCE

Exchange of Notes between CANADA and the
UNITED STATES OF AMERICA

Signed at Ottawa August 29 and September
2, 1958

In force September 2, 1958

EXCHANGE OF NOTES BETWEEN CANA-
DA AND THE UNITED STATES OF
AMERICA CONCERNING THE ES-
TABLISHMENT OF CANADA-UNITED
STATES COMMITTEE ON JOINT DE-
FENCE

I

*The Secretary of State for External Affairs
to the Ambassador of the United States
of America to Canada*

DEPARTMENT OF EXTERNAL AFFAIRS

Ottawa, August 29, 1958.

No. 159

Excellency,

I have the honour to refer to recent discussions between representatives of our two Governments concerning the establishment of a Canada-United States Ministerial Committee which would consider periodically important matters affecting the joint defence of our two countries.

In these discussions due note was taken of the intimate co-operation of our two Governments in matters relating to continental defence and of the number of joint bodies of civil and military officials which have been established to consider defence problems of common concern. It was recognized that the agreement of the two Governments to integrated air defence arrangements increased the importance of regular consultations between them on all matters affecting the joint defence of Canada and the United States.

It was agreed that the importance and complexity of these interdependent defence

relationships made it essential to supplement existing channels for consultation and to provide for a periodic review at the Ministerial level of problems which might be expected to arise. It was envisaged that the periodic review would include not only military questions but also the political and economic aspects of joint defence problems.

I have the honour to propose, therefore, that our two Governments agree:

A. That there shall be established a Canada-United States Committee on Joint Defence to consist:

For Canada, of the Secretary of State for External Affairs, the Minister of National Defence and the Minister of Finance; and for the United States, of the Secretary of State, the Secretary of Defence and the Secretary of the Treasury,

together with such other appropriate Cabinet Members as either Government may designate from time to time as the need arises;

B. That the Committee's function shall be:

(1) To consult periodically on any matters affecting the joint defence of Canada and the United States;

(2) In particular, to exchange information and views at the Ministerial level on problems that may arise, with a view to strengthening further the close and intimate co-operation between the two Governments on joint defence matters.

(3) To report to the respective Governments on such discussions in order that consideration may be given to measures deemed appropriate and necessary to improve defence co-operation;

C. That the Committee shall meet once a year or more often as may be considered necessary by the two Governments;

D. That the Committee shall meet alternately in Washington, D.C., and Ottawa, the chairman to be a Canadian member when the meetings are held in Canada, and a United States member when meetings are held in the United States.

My Government believes that this further development in the essential collaboration of our two Governments in continental defence will assist in the maintenance and development of the individual and collective capacity of the two countries to fulfil their obligations under the Charter of the United Nations and the North Atlantic Treaty for the maintenance of international peace and security.

If the Government of the United States concurs in the foregoing proposals, I propose that this Note and your reply should constitute an agreement between our two Governments effective from the date of your reply to remain in force until such time as either Government shall have given notice in writing of its desire to terminate the agreement.

Accept, Sir, the renewed assurances of my highest consideration.

SIDNEY SMITH
Secretary of State
for External Affairs

II

*The Ambassador of the United States
of America to Canada to the

EMBASSY OF THE UNITED STATES OF AMERICA

Note No. 54

Ottawa, September 2, 1958

Sir:

I have the honor to refer to your Note No. 159 of August 29, 1958 concerning the establishment of a Canada--United States Ministerial Committee which would consider periodically important matters affecting the joint defense of our two countries.

My Government concurs in the proposals contained in your note and agrees that this exchange of notes will constitute an agreement between our two Governments effective this date and to remain in force until such time as either Government shall have given notice in writing of its desire to terminate the agreement.

Accept, Sir, the renewed assurances of my highest consideration.

LIVINGSTONE T. MERCHANT

The Honorable

Sidney E. Smith,
Secretary of State for External Affairs,
Ottawa.

DÉFENSE

Échange de Notes entre le CANADA et les
ÉTATS-UNIS D'AMÉRIQUE

Signées à Ottawa les 29 août et 2 septembre
1958

En vigueur le 2 septembre 1958

[Traduction]

ÉCHANGE DE NOTES ENTRE LE CA-
NADA ET LES ÉTATS-UNIS D'AMÉRI-
QUE RELATIF À L'ÉTABLISSEMENT
D'UNE COMMISSION CANADO-AMÉ-
RICAINNE DE DÉFENSE COMMUNE

I

*Le Secrétaire d'État aux Affaires
extérieures à l'Ambassadeur des
États-Unis d'Amérique au Canada*

MINISTÈRE DES AFFAIRES EXTÉRIEURES

Ottawa, le 29 août 1958.

N° 159

Monsieur l'Ambassadeur,

J'ai l'honneur de me référer aux entretiens récents des représentants de nos deux Gouvernements sur la création d'une commission ministérielle canado-américaine qui étudierait périodiquement les affaires importantes intéressant la défense commune de nos deux pays.

Dans ces entretiens, il a été fait état, à juste titre, de la coopération étroite qui a existé entre nos deux Gouvernements en matière de défense continentale, ainsi que du nombre élevé des organismes canado-américains, composés de fonctionnaires civils et militaires et créés pour étudier les problèmes communs de défense. Il a été reconnu que, les deux Gouvernements ayant donné leur assentiment aux dispositions de défense aérienne unifiée, il devenait plus important pour eux de se consulter régulièrement sur les questions touchant à la défense commune du Canada et des États-Unis.

Il a été convenu que, étant donné l'importance et la complexité des rapports d'interdépendance en matière de défense, il était nécessaire de compléter les voies actuelles de consultation et d'assurer, au palier ministériel, une revue périodique des problèmes qui

pourraient se présenter. On a prévu que la revue périodique pourrait porter non seulement sur les questions militaires mais sur les aspects politiques et économiques des problèmes de défense commune.

J'ai donc l'honneur de vous proposer que nos deux Gouvernements conviennent de ce qui suit:

A. Que soit créée une Commission canado-américaine de défense commune qui se composerait:

Du côté canadien, du secrétaire d'État aux Affaires extérieures, du ministre de la Défense nationale et du ministre des Finances, et du côté des États-Unis, du secrétaire d'État, du secrétaire à la Défense et du secrétaire au Trésor,

ainsi que des autres membres du cabinet que chaque Gouvernement pourra désigner périodiquement, selon les besoins.

B. Que la Commission soit chargée:

1) D'étudier périodiquement les problèmes relatifs à la défense commune du Canada et des États-Unis.

2) Plus particulièrement, de favoriser les échanges de vues et de renseignements au palier ministériel sur les problèmes qui pourront se poser, afin de renforcer encore davantage la collaboration étroite entre les deux Gouvernements sur les problèmes de la défense commune.

3) De renseigner sur ces entretiens les Gouvernements respectifs pour qu'ils puissent étudier les mesures jugées nécessaires pour améliorer la collaboration en matière de défense.

C. Que la Commission se réunisse une fois par année ou plus souvent, selon qu'il sera jugé nécessaire par les deux Gouvernements.

D. Que la Commission se réunisse alternativement à Washington, D.C., et à Ottawa, le président devant être un membre canadien lorsque les réunions se tiendront au Canada et un membre des États-Unis lorsqu'elles se tiendront aux États-Unis.

Mon Gouvernement estime que cette nouvelle manifestation de la collaboration étroite entre nos Gouvernements pour la défense du continent permettra de conserver et d'accroître les moyens, dont les deux Gouvernements disposent en vue de remplir, chacun de leur côté ou en commun, les obligations que leur imposent la Charte des Nations Unies et le Traité de

l'Atlantique Nord à l'égard de la paix et la sécurité internationales.

Si le Gouvernement des États-Unis agréé les propositions susmentionnées, je propose que la présente Note et votre réponse constituent, entre nos deux pays, un Accord qui entrera en vigueur le jour de votre réponse et qui le demeurera jusqu'à ce que l'une des parties le dénonce par écrit.

Veuillez agréer, Monsieur l'Ambassadeur, l'assurance renouvelée de ma très haute considération.

Le Secrétaire d'État
aux Affaires extérieures,
SIDNEY SMITH

Son Excellence

Monsieur Livingstone T. Merchant
Ambassadeur des États-Unis d'Amérique

100, rue Wellington
Ottawa

AMBASSADE DES ÉTATS-UNIS D'AMÉRIQUE

Note n° 54

Ottawa, le 2 septembre 1958

Monsieur le Ministre,

J'ai l'honneur de me référer à votre Note n° 159 du 29 août 1958 relative à l'établissement d'une Commission ministérielle canado-américaine qui étudierait périodiquement les affaires importantes intéressant la défense commune de nos deux pays.

Mon Gouvernement agréé les propositions que renferme votre Note et consent à ce que cet échange de notes constitue entre nos deux Gouvernements un Accord qui entrera en vigueur aujourd'hui et le demeurera jusqu'à ce que l'un ou l'autre Gouvernement donne avis par écrit de son intention de le dénoncer.

Veuillez agréer, Monsieur le Ministre, l'assurance renouvelée de ma très haute considération.

LIVINGSTONE T. MERCHANT

Sidney E. Smith

Secrétaire d'État aux Affaires
extérieures
Ottawa

APPENDIX GGG

A CANADIAN PERSPECTIVE ON
MISSILE DEFENCE

Statement by

Dr. Michael E. Sherman

Hudson Institute

to the
House of Commons
Standing Committee on External Affairs
and National Defence

10 June 1969

This paper is submitted to the House of Commons Standing Committee on External Affairs and National Defence in the hope that it will aid the Committee's members in pursuing their own analysis of the ABM controversy. The paper is by no means comprehensive in the sense of presenting and evaluating all the arguments on all sides of this debate; that would be the subject for a long book. Rather, I have tried to select those points at which Canadian discussion of the problem can most usefully be supplemented. My statement does not advocate any course of action on the part of anyone, and if it has any "message" at all to present to the members, it is perhaps only to suggest that there are no easy answers to this most difficult question of the current strategic era. That in itself, of course, may be a useful corrective to some of the responses that up to now have characterized the Canadian debate.

The Strategic Debate in Canada

It is not necessarily a criticism to say that there has never been in Canada a serious, sustained public debate on the problems of modern arms and their control. It is not even especially surprising that this should be the case. Although our men have fought bravely and well whenever asked to fight, as a people we have not shown much taste for military matters. We have no traditional enemies, and most indirect threats that we do perceive are handled quite conveniently by our giant neighbor. Our position under the American security umbrella is the central datum of our national existence. Moreover, no nation depends crucially upon us for its security.

Nonetheless, we do have certain reasons for taking strategic arms problems seriously. We share the concern of all mankind that the weapons that do exist will never be used, as well as the obligation to do whatever we can

to that end. But the fact that we also happen to share a continent with a super-power means we are affected (actually and potentially) more than most nations by its arms policies. Its peacetime attempts to defend itself have involved us intimately for more than twenty years. And, as discussed below, it is not at all clear that in wartime an attacker would choose to ignore the political, economic and military ties that extend across the famous undefended frontier.

Finally, we have learned the hard way that the nature of a nation's strategic debate is never irrelevant to its politics. Only a few years ago, our Government was defeated and our foreign relations strained by a controversy over whether Canadian forces should be equipped with nuclear weapons. It has often been said that the debate on that issue could have been conducted at a higher intellectual level. Like any controversy that gets caught up in the currents of politics, the nuclear weapons debate reflected concerns other than those of strategic analysis. Nonetheless, it can be argued that another contributing factor to the diffuse and often confused nature of the debate was that the public was not prepared for it. The problems raised were new ones to most citizens, and it was unreasonable to expect them to become strategic analysis overnight.

To take just one example, a question often raised in the early sixties was whether Canada's proposed nuclear sharing schemes were inconsistent with her long-standing intention to remain a "non-nuclear power". Now, this is a very complicated question, but it was presented in the press and elsewhere as a very simple one. Those who wanted to acquire the Bomarcas, Starfighters, etc., claimed that because the sharing plans would not give Canada the ability to fire a nuclear weapon on her own, they were entirely consistent with her non-nuclear status. The argument on the other side, as it was usually presented, was that "nuclear weapons are nuclear weapons", a non-nuclear country could not logically have them under any system of control, and that was regarded as the end of the mat-

ter. The pro-nuclear faction reflected little awareness that a nation's non-nuclear virtue could be compromised in ways less direct than the acquisition of an independent capability; the anti-nuclear faction (with some notable exceptions) took a strongly moralistic line, reflected little awareness of the importance of such "details" as the type of control system, and seemed to be using a mechanical model of proliferation that envisaged Canada's two Bomarc squadrons pushing Indians, Japanese and others willy-nilly into new bomb programs around the world.

Without judging the merits of the various positions in that earlier dispute, it is relevant to the present ABM controversy. In particular, there has been a heavily moral tone to much of the Canadian discussion of missile defence. Now, one cannot deny that a question of this kind has a moral aspect; indeed, one can argue persuasively that it is predominantly a moral issue. But it is not *exclusively* a moral issue, and even if it were, that would not relieve us of the obligation to test as well as we can the factual and logical bases of our moral convictions. In following the Soviet-American ABM debate and in carrying on their own, Canadians have not, I submit, tried hard enough to understand or analyze the complexities of the various positions. The superpowers are portrayed as massive arms-producing machines, spending themselves half-consciously to ever higher levels of destructive power without realizing (or, some would have it, even caring) that they merely hasten the day of their own doom as well as everyone else's. The dominant perception in Canada of the recent ABM decisions by the superpowers has been one of steps taken by fools, or knaves, or both. Now, this judgment may be correct, but it must be supported, not merely asserted. And it is a major argument of this paper that if we are going to be responsible both to our own citizens and to our friends we need, first, a more concerted effort to understand others' rationale as well as our own interests before we criticize; and, second, a more concerted effort to understand our own motives and concerns when we do criticize. A paper of this length cannot take us very far, but at least it is a preliminary step in that direction.

Canada and the ABM Debate.

In light of the preceding remarks, I thought that rather than simply cataloguing the arguments pro- and con-ABM, it might be more useful to organize the issues in the following way.

Consider these four propositions:

1. "The Soviet and American decisions to deploy missile defences open a new round in the superpower arms race".
2. "This failure to control superpower weapons will doom prospects for other forms of arms control; in particular, for non-proliferation".
3. "Missile defences are senseless because a nation cannot defend itself against the ballistic missile, or fight a strategic nuclear war, in any meaningful sense of those terms".
4. "Whatever Canada does in the field of continental defence, she does in order to protect the American strategic deterrent that is the keystone of stability. Canada herself is not threatened, and therefore need not defend herself in the narrow sense".

I would guess that a pool of the Canadian public would reveal a rather broad consensus on these statements. But while some or all of the statements may be perfectly true, it is seldom recognized in the public debate in Canada that each of them is highly controversial, and even those that are correct may be only partial truths. Some consideration of the controversy surrounding each one may yield a better understanding of the American debate on ABM, as well as a better balance in our own reaction to it.

1. *"The Soviet and American decisions to deploy missile defences open a new round in the superpower arms race".*

It seems fair to say that the primary concern of opponents of ABM has been the danger that opening of the ABM age will stimulate a new round in "the arms race". The first thing to note here is that there are a wide variety of concepts or definitions of an arms race, and a wide variety of interpretations in any situation of what constitutes an arms race. For example, the early and mid-Sixties, generally characterized in the popular press as an "ever-accelerating spiral", are regarded by many specialists as a rather tranquil period in terms of direct action-reaction arms competition. This may be less true in light of the recent major Soviet offensive build-up, but even then, the proposed budget for U.S. strategic offensive and defensive forces is estimated at \$8.3 billion—compared with \$11.3 billion for fiscal 1962. As Albert Wohlstetter has noted recently "Adjusted for price changes, the 1962 figure was well over 50 per

cent higher than that for 1970, perhaps even as much as $\frac{2}{3}$ higher.”*

In general, however, what ABM critics usually mean when they say it opens a new round of the arms race is a period characterized by volatile open-ended competition between offensive and defensive forces. Here the central assumption is that defensive deployments by one superpower must provoke the other side to try to regain its earlier strategic position by acquiring more offense. And since there is no obvious plateau for this kind of competition if one power decides to keep it up, the best we can hope for (in this view) is a process by which although stability may be maintained by offsetting deployments, the arms race continues in the sense that levels of weaponry and of the budgets that are required to support them keep rising.

As this has been the most popular “scenario” among American opponents of ABM, so it has been the dominant view in Canada for some years. Other possible developments are seldom mentioned. One is that, to many forms of missile defense, there might not be any reaction at all, at least in terms of new weapons procurement by the other superpower. For example, advocates of a so-called “thin” area defence for the United States have argued that its obvious transparency to serious Soviet attacks would make unnecessary any Russian effort to offset it with increased offensive forces. Another possibility is that if one superpower did feel the need to respond in some way to defensive deployments by the other side, the response might be in the field of defence, rather than of increased offence: By acquiring a comparable level of defence, a government might well feel that it had regained the strategic position placed in question by the initial defensive move. Indeed, there are those who argue that up to very high levels, a defence-defence race would be a positively desirable development because it would reduce the number of effective offensive weapons on each side and thereby the destruction that could be inflicted if deterrence should fail.

The objection, of course, is that uncertainties about the effectiveness of the other side’s

defence might lead conservative planners to acquire more offence as well, and the offence-defence spiral would begin, albeit somewhat delayed. Although some advocates of “letting the defense run even without offensive limitations” reply that the defense will never be so good as to prevent one superpower from inflicting unacceptable damage on the other, the objection does raise yet another possibility, namely that the opening of the ABM age might facilitate rather than obstruct progress toward certain forms of strategic arms control. In particular, it has been argued that the confidence induced by even modest levels of defense would reduce the perceived requirements for inspection of offensive forces and expedite an agreement to limit them.

Although space does not permit any detailed evaluation of these alternatives here, three comments are in order. The first is simply to stress again that these alternatives do exist, and that while the offence-defence race scenario may be accurate, it is not self-evidently so. The second point is to insist that in assessing these alternatives, at least a gross distinction be maintained between various types of missile defense. In the public debate in Canada, critics too often ignore the fundamental difference between a missile defense aimed primarily at the protection of strategic forces and one aimed primarily at the protection of the civilian and industrial base. It is true that in practice there would probably never be a pure case of one or the other of these—for example, Safeguard is primarily to protect Minuteman, but when complete it will provide a thin area defense for all of the United States which hopes to protect the American people against light or unsophisticated attacks. Nonetheless, for analytic purposes, this is a useful distinction. That is, in assessing the probable response by one superpower to a defensive deployment by the other, it is important to ask to what extent the system protects population centers and to what extent it protects forces. To take an unlikely but “limiting” example, a system consisting solely of short-range interceptors placed around land-based ICBM’s is largely invulnerable to the charge that it is destabilizing because it undermines the other side’s “assured destruction” requirement. On the other hand, a system that consisted purely of a very heavy area defence along with many interceptors placed around cities might be very vulnerable to this charge. This was, of course, one of the primary reasons in the Nixon shift from Sentinel’s population-

* See Albert J. Wohlstetter, Statement before the Senate Armed Services Committee, April 23, 1969, and supplement of May 23, 1969. This material also appears, in slightly edited version, as Chap. 6, “The Case for Strategic Force Defense” in the volume *Why ABM? Policy Issues in the Missile Defense Controversy* edited by J. J. Holst and W. Schneider, Jr., to be published by Pergamon Press.

protecting character to Safeguard's force-protecting posture. The third point in this connection is that Canadian critics seldom note the available evidence that neither the Government of the Soviet Union nor the United States believes that ballistic missile defenses necessarily cause arms races. Indeed, they have displayed considerable sensitivity to the problem. The Johnson Administration designed a system (Sentinel) which, while largely "population-protecting", was deliberately so transparent to substantial Russian attack that it was hoped the Soviets would perceive no need to offset it with increased offence. In a sense, President Nixon went even further in this direction by emphasizing his own Safeguard's force-protecting character, even to the extent of denying in his extemporaneous remarks such population-protecting character as its area defence component obviously has. And on the other side of the fence, consider the following quotation by Premier Kosygin:

I believe that defensive systems, which prevent attack, are not the cause of the arms race, but constitute a factor preventing the death of people.*

It is especially interesting to note that Kosygin here refers to a population protecting system, which, of the two general types of ABM, is generally regarded as more conducive to arms races. There may, of course, be many explanations for the Soviet attitude: The Russian traditional emphasis on defence, a simple failure to understand the real issues, etc. The point here is simply that we do not have to accept on faith either the image of ABM as producing an offence-defence race or the implications generally drawn from that model. There is considerable evidence that the governments of the superpowers believe that such a volatile race can be avoided, and while we should not accept that belief on faith either, it does suggest that the issue is more complex, and perhaps more hopeful, than has often been assumed.

2. *"A failure to control superpower weapons will doom prospects for other forms of arms control; in particular, for non-proliferation".*

Another feature of the ABM controversy has been its relationship to the effort of the last few years to control the spread of nuclear

weapons. This is again a highly complicated subject that has appeared in a very simplistic form in most Canadian discussions. Most pessimistic conclusions about ABM's impact on non-proliferation are based on the view of missile defense as the generator of a superpower arms race. From the action-reaction cycle, it is inferred that the competition in strategic arms must increase tensions between the superpowers; that the international environment as a whole must suffer because of this; that failure to control strategic weapons must hurt chances for arms control in other areas—for example, in the area of non-proliferation, either because non-nuclear countries will refuse to adhere to a treaty now revealed as blatantly discriminatory, or simply because nuclear weapons appear more necessary in a less stable world.

Clearly, there are some controversial linkages in this picture. For example, the leap from resentment against a discriminatory non-proliferation treaty to a "go-nuclear" decision is rather a long one. Some analysts come close to arguing that non-nuclear states will abandon their nuclear restraint out of spite, even though they continue to recognize the destabilizing character of proliferation. To the present writer, it is not obvious that objective nuclear incentives go up as enthusiasm for a particular non-proliferation measure goes down. There may, of course, be ways in which resentment of this sort can weaken the barriers against proliferation. It may provide a plausible excuse for a government that wants to go nuclear but would otherwise have diplomatic difficulties in doing so. Or, it may provide the pro-nuclear faction in a domestic debate with a powerful emotional argument. Thus, as we shall discuss below, it is in the interests of non-proliferation to minimize this kind of resentment even where analysis suggests that it ought not to give Nth countries a greater objective interest in nuclear weapons. But for present purposes, it is enough to note the main burden of this first model: By generating a divisive offense-defense arms race, the opening of the ABM age will have unpleasant consequences, whether in the long or short run, for the attempt to control nuclear spread.

There are, of course, other aspects of the possible impact of ABM on proliferation. One concerns whether the opening of the missile age will raise or lower the importance of nuclear weapons in international politics. It is generally accepted that if nuclear weapons appear to governments to perform a number of useful functions in world affairs—whether

* Press conference, London, 9 February 1967. Text in *The New York Times*, 10 February 1967. See also the article by N. I. Talensky in the Soviet journal *International Affairs*, October 1964.

these functions are military, diplomatic, or domestic—the premium on having them will remain high and they will continue to spread. For this reason, some analysts have recommended that the nuclear powers themselves try to minimize the role of nuclear weapons on the world scene; and critics of ABM have argued that defensive deployments by the great powers will undermine this effort. These critics feel that American and Russian defensive deployments, especially if highly touted, will enhance the perception of nuclear weapons as a badge of status, independence, or security—fostering a set of attitudes that make acquisition of atomic arms seem only natural to governments around the world. It has even been argued that if ABM's themselves come to be regarded as the new mark of first-rank national status, those advanced countries that do go nuclear will seek not only offensive but defensive nuclear weapons as well. But it could be that the type of nuclear emphasis involved in American and Russian ABM will be irrelevant to all but the most ambitious nations. Not all governments seek superpower rank. The dominant perception might be that just as there are different fashions in different social strata in domestic society, so the same applies to international society; and there may be no perceived reason, at least in terms of status, why Belgium or even Brazil should be moved to seek either offensive or defensive nuclear weapons just because the United States or the Soviet Union has acquired an ABM. More important, probably, than the arms procurement policies of the superpowers is the nuclear emphasis or de-emphasis in the way they use their power around the world.

Another faction in this debate maintains that, considered in a long-term perspective, defensive deployments by the superpowers will reduce, rather than raise, the premium placed on nuclear weapons by most nations of the world. First, they contend that superpower self-protection at least against light or unsophisticated nuclear attacks will make it more credible to provide security guarantees (whether implicit or explicit) in exchange for continued nuclear abstention. Guarantees for Asian Nth countries against China have, of course, been the example usually cited, and this argument was a principal item in the advocacy of the Sentinel system by Messrs. McNamara, Warnke and others*. By exten-

sion, it has also received support from some commentators in important non-nuclear countries. Consider the following statement by a prominent Australian defence critic:

If the United States and the Soviet Union are to provide China's neighbors with an alternative source of security to that represented by national nuclear forces, it is important that they preserve their present military ascendancy over China. If disarmament of the great powers is taken to the point where the guarantees they issue to the non-nuclear states are no longer credible, a more important bulwark against the spread of nuclear weapons that the treaty itself will have been removed.**

It is worth emphasizing that this statement calls into question the conventional wisdom of most Canadian observers that any step that lowers the levels of superpower weaponry is a move towards greater stability, and a step that maintains or raises those levels is a move toward instability and perhaps to major war.

A variation of this argument holds that through protection even against light nuclear attack, it can be demonstrated that the price of gaining nuclear leverage against a superpower is beyond all but the richest and most advanced nations. In particular, it is hoped that by undermining the expected Chinese claim to have such leverage against the United States (or even against the Soviet Union), the number of states inclined to emulate China will be diminished. It may be, however, that this line of argument is either irrelevant or counterproductive in the effort to check nuclear spread. It may be irrelevant because it is doubtful that many Nth countries would regard rudimentary nuclear forces as usable, even for threats, against one of the superpowers.* And it may be counterproductive because governments will certainly take note that a relatively backward country such as China could force the world's strongest nation into a whole new generation of weapons simply by acquiring a primitive nuclear force. If such a force can threaten to alter the fundamental strategic relationship between two such nations, others may see new reasons for having one. This objection was in fact made by critics of the Johnson Administration's "anti-Chinese" orientation of

** Hedley Bull, "On Non-Proliferation," *Interplay* (Vol. I, No. 6), p. 10.

* More persuasive is the view that this argument would be prominent in some Nth country domestic debates on whether or not to go nuclear.

* See for example, Mr. Warnke's address before the Advocates Club, Detroit, 6 October 1967. (News Release, Office of the Assistant Secretary of Defense (Public Affairs) #950-67.)

the Sentinel system, and the criticism seems to this writer a persuasive one. Rather than demeaning primitive nuclear capabilities in the eyes of non-nuclear nations, a superpower move to deploy defenses against such forces may do more to dignify them. If this happens, the premium placed even on "oxcart-bombs" will rise, and ABM will have had the effect of fostering rather than restraining nuclear spread.**

The Role of the Superpowers: Will AMB lead to a World of "Fortress Superpowers" or "Superpower Condominium"?

The final pair of alternative models concerns the question of whether defensive deployments will be read by the rest of the world as a "turning in" or a "turning out" on the part of the U.S. and the U.S.S.R. Both are plausible interpretations, and each has given analysts cause for hope or concern, depending upon their biases. On the one hand, it can be argued that ABM will be construed around the globe as symbolic of, and instrumental to, a weakening of superpower support for distant allies and friends. This line has been especially popular with Americans critics of ABM, who feel that it will be taken in Europe as a diminution of the United States' commitment to NATO: As the capability for strategic insularity from European conflict increases, runs the argument, the American willingness to intervene will decrease proportionately—or, equally unfortunate, this will be the dominant perception among NATO nations (especially Germany) who will then feel an increased need for national nuclear weapons of their own.

A pessimistic inference, of course, is not only one that can be drawn from the premise of superpower insularity. A world in which the superpowers made no attempt to extend their power around the globe could conceivably diminish nuclear incentives, either because it bolstered a tradition of defensive foreign policies or because it reduced the broad role of nuclear weapons in international relations. Also, a sense that the superpowers had turned inward might reduce at least one type of nuclear incentive, namely the desire for a modest nuclear capability just big enough to trigger one's superpower ally into the war. It should be noted, however, that the fear that a superpower's protection of its own

population will make it insular applies with diminished force to the Safeguard system, which looks primarily (although not exclusively, since it does provide area defense for the whole country against light attacks) to the defence of the strategic forces. But even if one admits the possibility that not all allied observers will make this distinction, a further observation is in order.

Although there are opportunities for compromise in many areas of the ABM debate, this may be a point of genuine irreconcilability. On the one hand, there stand those analysts who believe that America cannot credibly extend nuclear deterrence to others so long as its own population remains hostage to nuclear retaliation. Another group seems to believe that the credibility of American guarantees cannot be maintained *unless* the population of America remains hostage. Thus a policy judgment must be made here. My own guess, albeit a tentative one, is that the more American friends and allies think about the issue, the more they will come to share the view familiar in Europe since the late fifties: They will come increasingly to feel that a guarantee is incredible if the guarantor risks destruction in implementing it. It is uncertain, of course, how influential such calculations are in governments' decisions to go nuclear or not to. Some states, for example, may be so skeptical of outside guarantees that nothing could make the assurances credible to them. But to the extent that this issue does play a part, it seems in the interest of the guarantor, the guaranteed, and the cause of non-proliferation in general to reduce the guarantor's vulnerability to retaliation. If that is true, then superpower ABM deployments (especially if they develop as part of an over-all strategic arms control plan) can be regarded not only as consistent with non-proliferation but as a cornerstone of it.

As an alternative to the possibility that ABM might signal superpower insularity to the rest of the world, it could be seen as the basis for a continuation or even extension of Soviet-American dominance in world affairs. Thus, Pierre Gallois wrote of the superpowers' entry into the ABM age, that it is hardly surprising that they insist missile defences are not destabilizing, when those defences aim only to preserve the duopolistic stability of the past few years.* Although such charges bring cries of righteous indignation from the

** It should be stressed that this last point addresses a question more of declaratory policy than of deployment. It was a mistake to say that Sentinel was prompted by China, even if that was the case.

* Pierre Gallois, «La défense contre missiles (DCM) Américaine et Russe et la 'prolifération',» *Revue Militaire Générale* (February 1968) 139-150.

governments of both superpowers, perhaps a friendly Canadian may be permitted the observation that there is more than a grain of truth in the charge, and probably more than a grain of truth in the prediction that many non-nuclear countries will perceive the defensive deployments in this light. It is far from clear, however, what the impact of such a perception would be on the process of proliferation itself. If crucial non-nuclear states come to see the superpower dominance as a threat to national interests that can be protected only by the acquisition of nuclear weapons, that is one thing. But it is not obvious that they will do so; indeed, the arguments made concerning superpower deterrence of China can be generalized to a rather plausible theory that the determination of two well-protected superpowers to stop proliferation might create the most stable framework that could be devised. I am not arguing that this is necessarily the case, or that stability is the only criterion by which we should judge international systems. The point is simply to warn again against analyses that see a clear and straight line from resentment against superpower dominance to extensive nuclear spread.

3. *"Missile defences are senseless because a nation cannot defend itself against the ballistic missile, or fight a strategic nuclear war, in any meaningful sense of those terms".*

Of all the hypothetical statements listed above, this is perhaps the one that would gain the widest approval in Canada. It is central to the widespread Canadian hostility to the concept of missile defence. It is also, however, the one that would be disputed most hotly by a large group of American experts, especially those friendly to ABM. And thus an appreciation of the rationale for ABM depends importantly on an understanding of the difference between the two points of view.

The key issue here, it seems to me, is the almost universal assumption in Canada that if a strategic nuclear weapon is ever fired in anger by anyone, the result will be an uncontrolled, city-busting horror in which each side expends every available weapon to the sole end of inflicting political, economic and military destruction on the other. Assuming as they do, such enormous levels of destruction, it is understandable (although even then perhaps not justifiable) that most Canadians cannot share many of the American concerns that make even a light ABM appear sensible.

These would include (to name only a few): The possibility of attack (either in a bilateral crisis or in an attempt to catalyze a superpower war) by a nation that does not possess an immense or sophisticated nuclear arsenal; the possibility of an accidental or unauthorized launch, especially in a period of crisis when such an incident could precipitate a major war; the possibility of exemplary or demonstration attacks by the other superpower, aimed at communicating determination or willingness to run risks in a crisis; or finally, the possibility that in an effort to avoid the high destructive levels of a counter-city war the superpower governments might tacitly or explicitly settle on one or more of the distinctions within the concept of limited strategic war. Such limitation could apply to the type of targets attacked (e.g., cities versus strategic forces) or to the number of targets attacked, or to both. In such a case, several things would be true. First, the war would have phases, in which one side responded to actions by the other, rather than being a single exchange of total forces on each side. Secondly, the willingness of either side to terminate the war would be influenced by how much it had suffered in both civil and military terms; how much damage it had inflicted; its ability to control surviving forces, etc. In other words, the data usually referred to in Canada as the "details" of the conflict would become central, not marginal. And in such a context, a defender may indeed think his defence has been "meaningful" if (again, to suggest only a few considerations) it keeps the attacker away from certain heavily defended targets of high value; it requires him to use a very large number of weapons to penetrate to those targets, thus sparing other targets he would have had available; it reduces the payload of his boosters because of the need to carry extensive penetration aids.

Clearly, this is a subject too complex to be more than hinted at here. The essential point, however, for a paper which seeks merely to provide a "road map" to help the Committee members follow the debate, is that one cannot understand the controversy at all so long as one clings to the assumption that the first nuclear detonation is the beginning of Armageddon. That assumption must be strained to apply to confrontations between a superpower and a smaller nuclear power. As for confrontations between superpowers, one may of course argue that even a war that begins under control will too soon get out of control, and Armageddon is what we shall get

anyway, albeit slightly delayed. But that is a political judgment, not a self-evident truth. It is also a judgment with a large element of self-fulfilling prophecy: If the two superpowers believe it to be true, pitch everything on deterrence and design their forces accordingly, then they virtually guarantee that *any* war will be the last one. For a planner who likes to gamble everything that his plan for deterrence cannot fail, it is an attractive strategy. To the friends of missile defence, it is not a responsible one. As I have written elsewhere, to the Canadian consensus that "You cannot fight a nuclear war", many in other countries (friends and foes of ABM among them; would reply, "You may have to", in one or more of the contexts described above. But the present purpose has not been to defend that view, merely to elaborate it.

4. "Whatever Canada does in the field of continental defence, she does in order to protect the American strategic deterrent that is the keystone of stability. Canada herself is not threatened, and therefore need not defend herself in the narrow sense".*

As the ABM debate in the United States has developed, there has naturally been some concern in Canada over whether any of the components of the planned systems or the operation of them would have direct implications for Canadian territory or airspace. Dr. Lindsey of the Defence Research Board has addressed most of the features of this problem, but there is one that I would like to discuss a little further. It concerns not so much any detail of the design or operation of the American ABM, as it does the overall way in which Canadians seem to regard the issue of Canadian participation or non-participation in continental defence.

I have always been struck by the prevalence of the assumption, sometimes explicit and sometimes unstated, that Canada's efforts in the field of continental defence are made (and should be made) almost solely because of her obligations to the United States. Canada must not, it is said, jeopardize American security but without any nuclear strike forces capable of an offensive nuclear war or any external policies likely to provoke one, she has little to fear for herself. The present section attempts merely to show that, like so many features of the Canadian debate, this assumption may be correct but it is not self-evidently so.

* The author is grateful to participants in the 1968 CIAA-Glendon College conference for comments on a presentation on this subject.

Analysts have suggested a variety of ways, of varying plausibility, in which Canada might become a target for nuclear attack. First, there is a case based on fear of an enemy strategy of so-called "bypass attacks". At an early stage of the American debate of the merits and drawbacks of ABM, some critics of Sentinel maintained that one way of end-running the system would be to burst offensive weapons upwind of the defended area and outside the range of the defences. The object would be to attack the inhabitants of a defended city with fallout rather than with blast and fire, and the relevance here is that bypass attacks on the northern United States would lead an enemy to burst at least some of his warheads over or on Canadian territory. An attack of this kind on Seattle, for example, would involve bursts very close to Vancouver, given prevailing wind patterns. This argument received attention less because it was persuasive than because Mr. McNamara used it in his own justification for delaying defensive deployments he did not want to approve. But it was never very popular among strategic analysts; most observers felt that neither in the Soviet Union nor anywhere else would a strategy based for its effect on the direction of the wind at a certain time, win much favour with professional military planners. And the case for it has been weakened further by the improvement of long-range interceptors that promise (or so their designers tell us) considerable protection for the entire United States (as well as some of Canada) against a small or unsophisticated attack.

A second possibility is that an attack on North America might involve attacks on continental defences in Canada. Some years ago, Mr. McNamara supported this notion before a Congressional committee by saying that a major contribution of Bomarc anti-aircraft missiles would be to draw Soviet ICBM's away from more important targets. This seemed unlikely in the early sixties because of the then relatively small number of Soviet missiles. It was doubted by the critics that the Russians could afford to waste missiles against such targets. With the much enlarged arsenal of the U.S.S.R. today, it becomes more difficult to say. It is true that under a counterforce or countervalue strategy, the Soviet missile target list might give relatively low *initial* priority to the Bomarc, manned interceptor bases, and their support facilities. The Canadian debate, however, as noted above, usually stops with the "beginning" of any

hypothetical conflict. And the danger that air defence installations might be targeted by Soviet missiles clearly applies with more force to a protracted war in which the flexibility and "re-usability" of bombers are more important. Also, an effective defence against ballistic missiles could restore some of the bomber's prowess unless AWACS exceeds all expectations. And, of course if ABM interceptors or related facilities such as radars should ever come to Canada, these might have a much higher place on the Soviet list of preferred first-strike targets, and this will continue to be a prominent argument among opponents of any direct Canadian involvement with ABM.*

How one feels about such involvement, of course, depends in part on whether Canada might draw some fire for other reasons. One of these concerns the notion that from the viewpoint of a potential attacker, the United States and Canada constitute what is known in the jargon as a single target system. The assumption here is that "Owing to the close integration of the American and Canadian economies, an attempt to destroy the productive capacity of the United States would almost certainly result in some Canadian targets being attacked. . . (It) would not make sense to attack the United States and leave Canada alone".* One may wonder, of course, whether in a nuclear attack on the U.S., a primary or even secondary objective of an enemy: confronted by the immense American nuclear arsenal would be to destroy the productive capacity of the United States. In a war that is largely a test of wills, either the forces or the people (or both) of the United States might be more likely targets. Here the concept of a single target system may not apply. But the Soviets have often suggested that a nuclear war is not so different from a conventional war that traditional issues such as productive capacity and the ability to recover become irrelevant. If they really believe that, they might well have fairly high priorities for industrial targets in Canada in a protracted war. And a case can be made that at minimum, the responsible course for a Canadian Government is to hedge against this possibility by encouraging a design of U.S.

ABM deployment that maximizes the derivative protection Canada might get.

A related fear has been that Canada might be attacked under an enemy strategy of holding American allies as hostages. If it were impossible or difficult to hurt the United States directly, would an attacker look around for ways to exert pressure indirectly on the U.S.? This argument, of course, became familiar in connection with the supposedly anti-Chinese nature of the projected U.S. Sentinel: Opponents of the plan contended that protection of the American population created an incentive for China to use undefended Japanese or Australians as proxy Americans. In the present context, the analogy is that a defended United States and an undefended Canada could create a similar predicament for the latter. The standard response has been that the United States would respond to an attack on Canada precisely as if it had been attacked itself, but if such a response meant nuclear war for the United States, cynics may be forgiven for their doubts. And moreover, the fact that they had been avenged might be small consolation to any allies that had been struck. The point made by the defenders of continental defence is that they do not want to tempt fate or test the indivisibility of American and Canadian interests, by making Canada an obviously hostage ally if it seems possible to defend her.

Finally, we return to the problem of "accidental" or unintended strikes in Canada. Here the concern is not so much that Canada will be deliberately targeted, as that she may be hit even if she is not targeted. We read a great deal about the excellent control that the nuclear powers have over their forces, and about the impressive accuracy of their missiles. Could an attacker be so incompetent as to hit the wrong country? Well, unlikely as it seems, it is not inconceivable. First, unless the non-proliferation effort succeeds (and the present treaty is only a first step to that end), intercontinental nuclear weapons may spread to countries that cannot master or afford the technology of advanced control and accuracy. Second, even for those weapons that exist today, most optimistic calculations are made for forces at an alert but peacetime status: Even experts are less confident of what happens to command and control after a force has been considerably degraded by heavy nuclear attack. Thus some observers doubt that a Canadian Government could responsibly leave its people hostage to the assumption that Canada's inoffensiveness will always

* This possibility should not be excluded just because the present plan for the Safeguard system involves no facilities in Canada. Systems have a way of changing, especially those designed as this one, on a building block concept.

* R. J. Sutherland, "Canada's Long Term Strategic Situation", *International Journal*, Summer 1962, 204.

make her proof against nuclear weapons falling on her soil.

In conclusion, let me repeat that there is no suggestion here that there are any immediate candidates for attack on this continent; or, that an attacker would adopt any of the strategies that would result in strikes on Canada; or, even if there is a chance of such strikes, that the chance is great enough to warrant the expenditure of very large amounts of money to defend against them.

The present purpose is simply to raise for discussion the possibility that in considering her response to the age of missile defences, beyond obligations to her neighbour, Canada may have an obligation to herself.

MICHAEL E. SHERMAN

Professional Staff, Hudson Institute

Michael E. Sherman is a Canadian political scientist with a primary interest in international affairs. His studies at Hudson have included such subjects as controlling the spread of nuclear weapons, nuclear sharing and NATO strategy, the problem of communications and bargaining in strategic nuclear war, and third party peacekeeping in local conflicts.

Before joining Hudson, Dr. Sherman was a Defence Research Fellow under the auspices of the Canadian Institute for International Affairs. Earlier, he taught in the Department of Government at Harvard, and served as rapporteur of the Harvard-MIT Joint Arms Control Seminar, of which he remains a member. He has been the recipient of a Woodrow Wilson Fellowship, a Harvard Resident Fellowship, and research grants from the Canadian and West German Governments.

Dr. Sherman has contributed to the Institute for Strategic Studies' (London) series of *Adelphi Papers*, and to the Canadian periodicals *International Journal* and *Behind the Headlines*. He is also the author of *Nuclear Proliferation: The Treaty and After* (Canadian Institute of International Affairs, Toronto, 1968) and *Nuclear Sharing: The Canadian Experience*, to be published in 1969.

Born in 1937, Dr. Sherman received his B.A. from the University of Toronto (Honours Philosophy and History) and his Ph. D. from Harvard (Government).

Structuring the ABM Debate

These notes are submitted to the House of Commons' Standing Committee on External Affairs and National Defence as a supplement to my prepared statement of 10 June 1969. At that time I indicated that I had originally intended to submit to the Committee a simple catalogue of the arguments put forward in The American debate by (a) those analysts who oppose any ABM deployment at this time (b) those who support only a "light" ABM (c) those who advocate an American deployment of "heavy" ballistic missile defenses. In this context a "heavy" defense is defined as one designed to protect a sizable proportion of the American population against a large and sophisticated nuclear attack. By "light" defenses I refer to a system such as Safeguard which does not attempt to protect American civilians against a large and sophisticated attack, but does attempt to provide a cover capable of dealing either with accidental, unauthorized, or exemplary attacks by the Soviet Union, as well as any nuclear attack that could be launched by any other country within the next decade or so. The Nixon Administration's Safeguard system is the current example, but it should be emphasized that that part of it devoted to hardpoint defence of strategic forces rather than population centers does not fit neatly into the "light" or "heavy" classification as it is normally used. It is logically possible, of course, to apply the terms "light" and "heavy" to ABM systems which protect strategic forces only, and to use those terms simply to designate the level of effort involved.

Since it is my understanding that the Committee members wish to use these notes as a rough system of reference rather than as a comprehensive analysis, I have used below a tabular form which necessarily loses in completeness and in elegance what it gains in convenience.

CHART 1 — Will Safeguard start a new offense-defense arms race?

Analysts Who Oppose Any ABM Deployment At This Time

Safeguard will start a new round of the offense-defense arms race because the Soviets will be forced to react to U.S. ABM just as U.S. responded to Soviet ABM with MIRV;

or:

Light ABM will inevitably become heavy and then Soviet need to increase offenses to offset U.S. ABM will become clear.

Advocates of Safeguard

Safeguard does not threaten the Soviets assured destruction requirement since it is largely a force-protecting system and its population-protecting capability is transparent to serious Soviet attack; therefore the Soviets need not respond to Safeguard with increased offense.

Advocates of Heavy Defense

Even a heavy ABM would not reduce expected fatalities in a large nuclear attack to acceptable levels, therefore the Soviets need not respond even to heavy ABM with more offense;

or:

Heavy ABM can be allowed in the context of a negotiated freeze on offensive forces.

CHART 2 — Effects on Deterrence

Analysts Who Oppose Any ABM

A false sense of security will encourage superpower leaders to run risks. Increased danger of miscalculation, especially as compared with the starkness of large numbers of clear hostages on each side.

Advocates of Safeguard

Safeguard will not reduce expected fatalities to levels that should even slightly increase superpower risk taking.

Safeguard will provide a sufficiently higher nuclear threshold against the Soviets (e.g., against exemplary or symbolic nuclear attacks) to provide better crisis assurance and better extended deterrence.

Increased deterrence against Nth countries.

Greater assurance concerning U.S. second-strike capabilities will reduce need for hair-trigger responses by U.S.

Advocates of Heavy Defense

Even a heavy ABM will not reduce expected fatalities in large nuclear attacks to extent that risk-taking increases.

CHART 3 — Implications for the Strategic Arms Talks

The "No ABM" School

The new developments in multiple warheads and missile defenses will complicate SALT (strategic arms limitation talks) and possibly block agreement.

Light ABM School

Safeguard is unlikely to block agreement at SALT and may even facilitate it. The first point is illustrated by the Russians' initial expression of interest in SALT after the 1967 Sentinal announcement. This has been maintained after Safeguard. Defensive systems may reduce the perceived inspection requirements for offensive systems and thereby facilitate agreement on limiting them.

Heavy ABM School

Basically same arguments as for light ABM.

CHART 4—*Catalytic and Accidental Launches**"No ABM" School*

These events have such a low probability that no system is required to insure against them.

Light ABM School

These are serious concerns. Even if low probability, their consequences are so great as to make it necessary to buy insurance against them.

*Heavy ABM School*CHART 5—*Intra-war Arms Control**"No ABM" School*

The tendency here is to give less attention to the "details" of a nuclear conflict. The issue is how to prevent war, not how to fight one. This is exemplified by suggestion of some ABM critics that response to Russian offensive buildup should be not in procurement but in strategy, specifically in adoption of a U.S. launch on warning doctrine.

Light ABM School

Arms control must seek not only to prevent war, but to limit damage on both sides if war occurs. Defenses may facilitate war termination, enable government to ride out attacks or crises, reduce need for hair-trigger responses.

Heavy ABM School

Heavy defense may facilitate certain types of intra-war arms control, such as "no cities" rule.

CHART 6—*Impact on Proliferation**"No ABM" School*

American ABM will signal a "turning in," a lessening of commitment to allies and neutrals who will then feel need for nuclear weapons of their own.

or:

Superpower defenses will be perceived as a flouting of NPT's Article VI, and weaken the chance that others will sign the treaty.

or:

Continuing emphasis on the role of strategic nuclear weapons in international relations will raise the premium placed on them and indirectly lead others to acquire them.

or:

By dignifying primitive nuclear capabilities, superpower defenses will raise premium on such capabilities.

Light ABM School

Safeguard will show potential Nth countries they cannot get nuclear leverage on a superpower with primitive nuclear capabilities, and thereby reduce nuclear incentives.

or:

Safeguard will enable superpowers to provide more credible guarantees and enable Nth countries to relax about nuclear security.

or:

Defenses will enable nuclear issues to be coupled from international relations.

Heavy ABM School

Basically same arguments as for light ABM but made more strongly, especially concerning guarantees against major nuclear powers—e.g., for Germany against Soviet Union.

CHART 7 — *Economic Implications**"No ABM" School*

Domestic and other problems are such that scarce resources should be spent in non-military areas wherever possible and certainly not in areas where requirement is so conjectural. Even \$5-10 billion projected for Safeguard is too much.

or:

\$5-10 billion will grow to 30 or 40 billion or more.

Light ABM School

While some cuts in defense budget may be desirable this is not the place to make them. Safeguard or any light ABM system can be kept light (and the costs under control) if analysis dictates this is desirable.

Heavy ABM School

The cost even of heavy ABM is not open-ended. In any case this is a top priority matter.

or:

Heavy ABM will not necessarily raise overall defense spending since it may permit reductions elsewhere, for example, in the field of offense.

CHART 8 — *"Being in the ABM Business"**"No ABM" School*

Safeguard is motivated by a mindless desire to imitate the other side. Thus when Soviets entered ABM age many Americans felt the need to follow suit.

Light ABM School

American desire to be in the ABM business if Soviets are in it is not simple imitation. Must maintain a competence in the technology, reduce danger of temporary instabilities favoring the other side, reduce the lead time for crash deployment of heavy cover if that is ever necessary.

CHART 9 — *Penetrability of ABM**"No ABM" School*

Penetration aids are cheap and easy for any country, even a relatively backward one, to develop.

Light ABM School

Penetration aids are not cheap or easy to develop, especially for a country such as China or for any country other than a superpower.

Heavy ABM School

Even for superpowers, the cost exchange ratio between offense and defense is about unity against heavy systems. That is, a dollar spent on defense buys about as much as a dollar spent on offense.

CHART 10 — *Nuclear Blackout**"No ABM" School*

Nuclear environment makes it impossible for radar to find targets.

Light ABM School

System software can utilize interrupted PAR track data. Higher frequency MSR's do not suffer as much from this.

or:

An attacker cannot count on achieving blackout with precursor bursts.

or:

Chinese will not have enough ballistic missiles for precursor attacks for several years.

STANDING COMMITTEE ON EXTERNAL AFFAIRS
AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn

Vice-Chairman: Mr. Perry Ryan
and Messrs.

Allmand	Guay (<i>St. Boniface</i>)	Nesbitt
Anderson	Harkness	Nowlan
Barrett	Howard (<i>Okanagan</i>	Penner
Brewin	<i>Boundary</i>)	Prud'homme
¹ Buchanan	Laniel	Roberts
Cafik	Laprise	Stewart (<i>Cochrane</i>)
Carter	Legault	Stewart (<i>Marquette</i>)
Fairweather	Lewis	Thompson (<i>Red Deer</i>)
Forrestall	MacLean	Winch—(30)
Gibson	Marceau	

Hugh R. Stewart,
Clerk of the Committee.

(Quorum 16)

Pursuant to Standing Order 65(4) (b)

¹Mr. Buchanan replaced Mr. Goyer on June 20, 1969.

REPORT TO THE HOUSE

Thursday, June 26, 1969.

The Standing Committee on External Affairs and National Defence has the honour to present its

NINTH REPORT

Pursuant to its Order of Reference of Thursday, January 16, 1969, your Committee has heard evidence on and has considered Canada's policy with reference to Canadian Air Defence, including NORAD. Your Committee has also conducted a preliminary examination of the implications for Canada of American anti-ballistic missile defence.

Your Committee held 19 meetings from May 6, 1969, to June 20, 1969, and heard the following witnesses (listed in order of appearance before the Committee):

1. Major General F. R. Sharp, Deputy Commander of NORAD.
2. Brigadier General N. L. Magnusson, Deputy Director, NORAD Combat Operations Center, Colorado Springs.
3. Colonel Henry M. Walsh, Director Continental Plans, Canadian Forces Headquarters.
4. Honourable Mitchell Sharp, Secretary of State for External Affairs.
5. Honourable Léo Cadieux, Minister of National Defence.
6. Dr. George R. Lindsey, Chief, Defence Research Analysis Establishment, Defence Research Board.
7. Dr. J. C. Arnell, Assistant Deputy Minister/Finance, Department of National Defence.
8. Mr. John Gellner, Editor, the *Commentator*, Toronto.
9. Dr. Michael E. Sherman, Professional Staff, Hudson Institute, Croton-on-Hudson, New York.

The Order of Reference of June 10, 1969, authorized the Committee to travel within Canada. Accordingly, the Committee travelled to North Bay on Thursday, June 12, 1969. They visited the SAGE Complex, participated in NORAD briefings, toured the operational areas of SAGE and received a briefing and tour of the BOMARC Complex.

The following documents were printed as Appendices to the Minutes of Proceedings and Evidence:

- XX – Text entitled *North American Air Defence* prepared by the Department of National Defence for the use of the Committee, together with a biography of Lieutenant General F. R. Sharp.
- YY – Notes of agreement dated March 30, 1968, between the Governments of Canada and the United States of America, concerning North American Air Defence Command.
- ZZ – Text entitled *Strategic Weapon Systems, Stability, and The Possible Contributions By Canada* (Part I and Part II) prepared by Dr. George R. Lindsey, and his biography.
- AAA – Agreement between the Government of Canada and the Government of the United States of America concerning the Organization and Operation of the North American Defence Command (NORAD) (1958).
- CCC – Text entitled *Strategic Weapon Systems, Stability, and The Possible Contributions By Canada* (Part III) prepared by Dr. George R. Lindsey.
- EEE – Memorandum on North American air and space defence prepared by Mr. John Gellner.
- FFF – Exchange of Notes between Canada and the United States of America, signed at Ottawa August 29 and September 2, 1958, In Force September 2, 1958.
- GGG – Text entitled *A Canadian Perspective on Missile Defence* prepared by Dr. Michael E. Sherman, his biography, and his analysis of arguments for and against ABM systems, in catalogue form.
- HHH – Comments on the Committee's working papers received from Professor Albert Legault, Queen's University; Professor P. J. Arnopoulos, Sir George Williams University; Professor K. H. W. Hilborn, The University of Western Ontario; Professor D. M. Thomas, The University of Calgary; Professor C. F. Schuetz, St. Patrick's College, Carleton University.
- III – Supplementary replies to questions asked by the Committee, presented by Lieutenant General F. R. Sharp and Dr. George R. Lindsey.

PART I – INTRODUCTORY

Historical Background

The North American Air Defence Command (NORAD) was formally established by an agreement between Canada and the United States which was signed May 12, 1958. Originally, it was effective for a ten-year period. It was renewed on March 30, 1968 for a further five-year period. However, it can be reviewed at any time and following such review it may be terminated by either Canada or the United States on one year's notice.

Before the establishment of NORAD, the Canadian and United States air defence forces had acted in close co-operation and co-ordination. With the development of a nuclear capability by the Soviet Union combined with the development of a long-range bomber force, it was decided that the effective air defence of the North American continent would require the unrestricted use of Canadian and United States air space by defending air forces under an integrated command.

Basically, therefore, the NORAD agreement set up an integrated command for the planning and operation of the air defences of Canada and the continental United States. The Commander-in-Chief is an American, the Deputy Commander is Canadian. They are responsible to the Joint Chiefs of Staff of the United States and the Chief of the Canadian Defence Staff, who in turn are responsible to their respective governments.

The NORAD agreement does not impose any specific commitment on either country to allocate military forces to the NORAD command. The NORAD command includes only such individuals and combat units as the two Governments from time to time choose to allocate to it.

Basic Functions of NORAD

NORAD fulfills two major functions which are quite distinct. Its first function is air defence. This includes the surveillance and detection of all unknown aircraft in the NORAD area and the interception and, if necessary, the destruction of any enemy bombers seeking to penetrate North American air space. The second function is the surveillance and detection of hostile Inter-continental Ballistic Missiles (ICBM's). At the present time NORAD has no facilities to intercept or destroy hostile ICBM's.

The Soviet Bomber Threat

The size and character of the Soviet threat to North America have changed very significantly since the inception of NORAD in 1958. The emphasis has shifted from a solely bomber threat in 1958 to a massive missile and more limited bomber threat in 1969.

At the present time the Soviet Union has about 150 subsonic jet and turbo-prop bombers of intercontinental range. These bombers have a two-way mission capability to any target in North America. The Soviets also have about 700 medium bombers which are believed to be targeted on Eurasia, but a few might be committed to an attack on North

America. In an unusual situation it is conceivable that something less than half of these bombers might be used on one-way missions but in view of the growth of Soviet ICBM and Submarine Launched Ballistic Missile (SLBM) capability, this is not considered to be very probable. In this unlikely case, the obvious targets are in Hawaii, Alaska and Canada.

Although there is still no evidence of Soviet introduction of a new bomber of inter-continental range in the early 1970's, improvements in the present Soviet bomber force continue to be noted. These include the use of air-to-surface missiles with improved survivability and stand-off strike capability of several hundred miles, the development of low-flying capability making detection more difficult and the use of sophisticated electronic counter measures designed to complicate air defence.

NORAD Forces

NORAD operational forces are made up of some 144,000 personnel at some 350 locations. These figures do not include figures for the Alaska Command. Of the 144,000 personnel, 14,000 are provided by the Canadian forces and 130,000 by the United States forces. There are approximately 700 American NORAD personnel attached to Canadian forces in Canada and approximately 250 Canadian NORAD personnel in the United States.

Command Arrangements

The Commander-in-Chief of NORAD (CINCNORAD) is an American. The Deputy Commander is a Canadian. The continent is divided into five regions (Western, Eastern, Central, Northern and Alaska). Alaska is in a different position than the other four NORAD regions. It includes only American territory, and is a separate United States unified command under its own commander-in-chief.

American officers command the Western, Eastern and Central regions with Canadians as vice-commanders in the Western and Central regions. A Canadian officer commands the Northern region.

Each regional commander is responsible to CINCNORAD for the air defence of his region. He monitors and co-ordinates the air action, plans the use of assigned forces, and supervises the methods and procedures by which an air battle would be fought in his region.

The NORAD regions are subdivided into divisions, there being 13 NORAD divisions in all at this time. The division commanders exercise direct control over the defensive forces which include, for Canada, manned interceptors and Bomarc's, and, in addition for the United States, Nike-Hercules and Hawk missiles. All divisions with the exception of those in Alaska and the 37th NORAD Division at Goose Bay, Labrador, are integrated into the SAGE (Semi-Automatic Ground Environment) system. The system includes computers which are capable of accepting a large volume of information and transposing it into a readily usable form for air battle management.

Under the existing arrangement of NORAD regions and divisions, with the exception of Quebec, and Nova Scotia, Prince Edward Island and New Brunswick practically all of the populated area of Canada is under the operational control of American officers.

Effective September 15, 1969, changes will be made in the regions and divisions by extending the Western, Eastern and Northern Regions and eliminating the Central region. Among other effects, these changes will extend operational control of Canadian officers to Northern and Western Ontario as shown on the attached map.

Interceptor Force

NORAD has at present assigned to it three Canadian air defence command fighter interceptor squadrons totalling 48 aircraft situated at Chatham, New Brunswick, Bagotville, Quebec and Comox, British Columbia. These squadrons are equipped with the CF 101 Voodoo Interceptor. The U.S.A.F. provides 18 squadrons of F 106 Delta-Dart and F 101 B Voodoo Fighter Interceptors deployed around the perimeter of the continental United States and in Alaska. In addition, the U.S.A.F. provides 21 other fighter interceptor squadrons manned by the National Guard and equipped with first line aircraft such as the F 102 Delta-Dagger. All Canadian NORAD interceptors are equipped to carry air-to-air missiles with nuclear warheads and also have conventional capability. The fighter interceptors are directly controlled by the NORAD divisional commanders within whose area of responsibility they are located.

Bomarc Missiles

NORAD has a total of eight Bomarc B missile squadrons in its inventory. Two squadrons—one located at La Macaza in Quebec and one at North Bay, Ontario, are provided by Canada. The remaining six Bomarc squadrons are in the northeastern United States. The Bomarc missiles are on a constant state of alert and are ready to be launched within seconds if hostile forces penetrate North American air space.

Bomarc squadrons are under the direct operational control of a divisional commander. The operational concept includes a "fail-safe" system of control which assures that the launching of a Bomarc missile can only be actuated from the SAGE direction centre.

Nuclear Weapons Control Arrangements

A "two-key" procedure is employed whereby a Canadian and an American officer are each required to turn a key to make the Bomarc launch system operative. The officers carrying the two keys are on duty in the SAGE direction centres 24 hours a day. The launch system can only be activated on receipt of properly authenticated instructions from the NORAD Combat Centre. These instructions would be given by the CINCNORAD only after he had obtained authority from the Governments of Canada and the United States. The equivalent control procedures apply to all nuclear-equipped interceptors, Canadian and American, operating over Canadian territory.

Nike/Hercules Missiles

There are no Nike/Hercules air defence weapons situated in Canada. These short-range weapons are used to provide point defence of 24 major cities, industrial areas and SAC bases in the continental United States including Alaska.

Surveillance, Warning and Control Facilities

The Distant Early Warning (DEW) line is intended to provide the first detection of a manned bomber attack. This warning line consists of six major stations and 23 auxiliary stations. Four of the main stations are located in the Canadian Arctic. The military commander of each of these four stations is a Canadian and he exercises operational control for NORAD.

Warning provided by the DEW line permits NORAD to alert civil defence agencies of Canada and the United States and provides time for the strategic retaliatory bomber force of the United States Strategic Air Command to become airborne. At the same time NORAD defence forces would be brought up to an alert status prepared to meet an attacking force.

A second method of detection is provided through the Pine Tree Line of long-range radar positions in southern Canada and in the United States. At the present time there are 27 long-range radars manned and operated by the Canadian Forces Air Defence Command and 99 operated by the United States Air Force. These radars also have a control function in relation to the interceptor and Bomarc squadrons.

Canada — United States Cost Sharing

It has been recognized that the defence of the North American continent is a co-operative effort and that air defence costs incurred by Canada are for the benefit of the United States also. Accordingly, the United States and Canada entered into a series of cost-sharing agreements for certain North American air defence facilities in Canada under which, generally speaking, the United States paid two-thirds of the capital costs and Canada paid one-third. These included the headquarters, SAGE system and other facilities for the Northern NORAD Region and 41st NORAD Division situated at North Bay, the long-range radar sites in Canada, the telecommunication requirements and the Bomarc squadrons. The overall capital cost of this programme was approximately \$450,000,000, of which the Canadian share was about \$150,000,000. The DEW line facilities in Canada were entirely constructed and paid for by the United States and are maintained by the United States through a civilian contract with the Federal Electric Company. The United States bore the entire capital costs of all NORAD facilities in the United States including the capital costs of the combat operations centre at Colorado Springs (approximately \$142,000,000).

At the present time the annual operating and maintenance costs to Canada for its participation in NORAD total approximately \$135,000,000 allocated as follows:

Interceptors	— \$ 38.9 million
Bomarc	— \$ 4.2 million
Radars	— \$ 67.7 million
Control Centres	— \$ 3.4 million
Space detection tracking	— \$.6 million
Command Headquarters	— \$ 20.2 million

Rough estimates indicate that at this time Canada pays 8% to 10% of all NORAD operating and maintenance costs — roughly in proportion to population.

Suggested Improvements in Air Defence

Certain improvements have been suggested by the United States to remedy weaknesses of our existing air defence system. ICBM's could destroy any of the existing installations before the bombers arrived. Bombers with radar-homing missiles could destroy the control radars. Moreover, any system depending on ground-based radars is limited in its ability to track aircraft flying at low altitude because the line-of-sight from radar to target is cut off at the horizon.

Fixed radars determine the active defence belt in which interceptors and missiles can be controlled. If the bomber were equipped with a long-range air-to-surface missile, it might be able to launch it from just outside the active defence belt. The air-to-surface missile (ASM) is a much smaller and faster target than the bomber. However, it has a smaller pay-load and is probably less accurate. The defence problem is also complicated by the development by the Soviet of sophisticated electronic counter measures designed to complicate air defence.

The suggested air defence system designed to overcome these weaknesses would require the development of an Airborne Warning and Control System (AWACS) which basically consists of aircraft equipped with radar and various sophisticated equipment for communication, computing, data storage and display. It would also require the development of Over-the-Horizon Radar and improved interceptor aircraft.

If the new system were introduced, it might be possible to effect a reduction in the SAGE system and in ground-based radars. There would be fewer squadrons (with the improved interceptors) to maintain and it might be possible to make reductions in the Pine Tree Line.

The Committee has been informed that the original American estimates of the total capital and operation and maintenance costs of the United States programme (including operation and maintenance costs of the residual portions of the present system) for the 10 year period 1967-77 amount to approximately 12.3 billion dollars. When the system is fully operational, the annual operating cost is estimated to be \$690,000,000 which is substantially less than the annual operating cost of the present system.

USSR ICBM Capability

It has been estimated that the Soviet Union will have achieved numerical parity with the U.S. in land-based intercontinental ballistic launchers by mid-1969 and will have a larger inventory than the United States in 1970. The Soviet Union has between 950 and 1,000 ICBM launchers operational including a significant number of SS9 which can carry a warhead in excess of 20 megatons and is the missile in which the USSR has been testing Multiple Re-Entry Vehicles.

The Soviet Union also has about 45 ballistic missile launch tubes in their nuclear-powered submarine force and a new class of submarine having 16 missile tubes is in series production. It is expected to have the capability of firing a missile at 1500 miles range therefore markedly improving Soviet strike capabilities.

A number of developments in ICBM's are now possible which are referred to in detail in testimony forming part of the record of the Committee. These include Multiple Re-Entry Vehicles (MRV), Multiple Independently Targeted Re-Entry Vehicles (MIRV), the Fractional Orbital Bombardment System (FOBS), The Multiple Orbital Bombardment System (MOBS) and the Depressed Trajectory ICBM (DICBM).

Other developments are designed to improve the probability that the missile will survive attack before it is launched. The main methods of reducing vulnerability are dispersion, hardening, concealment and mobility. Already missile sites have been dispersed and hardened. Concealment of a fixed land installation is difficult in these days of reconnaissance satellites. However, it is quite possible that ICBM launchers could be made mobile, on railway cars, on road vehicles, canal barges or ships. It is also possible to mount them on underwater launchers resting on the bottom of lakes or the sea.

The NORAD System For Detection and Surveillance Of ICBM's

NORAD's capability for detection of the approach of ICBM's is provided by the Ballistic Missile Early Warning System (BMEWS) located in three sites — at Clear in Alaska, Thule in Greenland, and Fylingdale Moor in England. These were established by the United States at a cost of approximately \$920,000,000.

The warning capability of the BMEWS is between 15 and 20 minutes. The information gleaned by the BMEWS sites is sifted and correlated by computer system and relayed automatically to the computers in the NORAD complex at Colorado Springs, over cables and radio circuits, many of them in Canada. At the NORAD Combat Centre in Colorado Springs the data is processed by the NORAD computers and displayed instantaneously. Processed warning information is passed to all user agencies such as National Defence H.Q. in Ottawa, the National Military Command Center in Washington, SAC, SHAPE, RAF Headquarters, etc. In addition, NORAD headquarters receives information from a number of ancillary sources not under its direct command. These include the Space Detection and Tracking System (SPADATS) to which Canada's contribution consists of manning a Baker-Nunn camera at Cold Lake, Alberta and various sensors.

In summary, NORAD has a capability to detect, identify and give warning of ICBM and SLBM attacks against the North American continent. It has not been technically feasible to intercept or destroy ballistic missiles. In this situation, the preservation of the retaliatory force, through hardened MinuteMan Sites, Polaris submarines and airborne SAC bombers has been considered the best counter against any ballistic missile attack and the most effective deterrent to a pre-emptive first strike.

The "Safeguard" ABM System

An anti-ballistic missiles system (ABM system) is designed to intercept and destroy enemy ICBM's. It is believed that the USSR has installed an ABM system surrounding Moscow.

In 1967, the United States announced that a light ABM system later called "Sentinel" would be deployed in the United States. This programme encountered considerable opposition and was suspended. In March 1969, however, President Nixon

announced that a modified system called "Safeguard" would proceed — subject to Congressional approval and an annual review. The Safeguard system consists of perimeter acquisition radars (PARS) missile site radars (MSR's) and two anti-missile weapons — Spartan and Sprint.

The Spartan missile has a range of several hundred miles. Its effectiveness depends on the detonation of a very large nuclear warhead in the near-vacuum of outer space. It is expected that most decoys accompanying the ICBM enemy warhead would be cleared out of a large volume by the explosion of the Spartan. The explosion of the Sprint missile complements the Spartan by intercepting at low altitudes those missiles not destroyed by Spartan. Sprint has a much shorter range than Spartan — about 25 miles. Since it is designed to be used at low altitude, the Sprint has a very much smaller warhead yield than the Spartan.

The plan for the Safeguard ABM system is in phased steps. The first step is planned to be operational in 1974 and involves sites which are near Great Falls, Montana and Grand Forks, North Dakota. They are intended for the protection of ICBM and bomber bases in those areas. Subsequent options could be (a) to extend the defence of the deterrent forces against ICBM attacks, (b) to provide defence against submarine launched missiles (SLBM's) and (c) to provide light area protection for all of the United States including the population.

The totality of these options, labelled "full deployment" include twelve sites in the continental United States. If full deployment is carried out, the estimated cost is 7.8 billion dollars.

The Strategic Concept of Mutual Deterrence

The greatest military danger to Canada is a nuclear war between the USSR and the United States in which Canada would be involved because of its geographical position and because of its relations with the United States. Due to the inability of the United Nations to guarantee peace through collective security as originally contemplated when the United Nations charter was signed, the avoidance of all-out nuclear war between the superpowers has depended upon mutual deterrence. This principle may be most simply explained as follows: In order for the USSR to be deterred from aggression by the United States, it is necessary that the USSR must believe that, no matter what the USSR does, the United States will retain the means and the will to be able to destroy the cities of the USSR. In other words, the United States must maintain a capability for "assured destruction" of the USSR. Assured destruction has been defined as the ability to inflict at all times and under all foreseeable conditions an unacceptable degree of damage upon any single aggressor, or combination of aggressors, even after absorbing a surprise attack.

At the present time, it is believed that both the USSR and the U.S. do possess this capability for assured destruction of the other and it is therefore said that there is a stable system of mutual deterrence. Basically, this means that if the USSR, for example, were to launch an all-out nuclear attack or first strike against the U.S., the United States would still have and be able to use sufficient nuclear weapons, whether intercontinental ballistic missiles (ICBM's) submarine launched ballistic missiles (SLBM's) and Strategic Air Command (SAC)

bombers, to destroy the cities of the USSR and inflict unacceptable damage upon that country.

This system of mutual deterrence would become unstable and dangerous if one side developed such an overwhelming strength in nuclear weapons that by a surprise attack it could destroy the other side's capability of launching a counter-strike which would inflict unacceptable damage upon the aggressor or if one side developed such effective means of defence, (whether active defences such as ABM and anti-bomber defences or a passive defence such as civil defence) that it could launch a nuclear attack without fear of having unacceptable damage imposed by the other side. The condition becomes even more unstable and dangerous if one side developed such improved offensive and defensive capability while the other side's offensive and defensive capabilities remained the same.

The more advanced techniques of both offense and defence are very complex and it takes several years to develop and put them into operational status. Even though the balance is stable and robust rather than delicate at the moment, it is natural for each superpower to look several years ahead and to ensure that it will not find itself with its "assured destruction" of its opponent gone as a result of substantial changes. It is difficult for each adversary to assess far in advance what the effectiveness of the opponents' moves is going to be — consequently, there is a natural tendency for each side to take steps now to prepare for the worst that his opponent might have ready for him a few years hence. It is easy to see how the arms race can accelerate under these circumstances. It seems probable that both superpowers will seek to react in such a way as to maintain stability so long as each has the economic ability to bear the ever-increasing military expenditures. The unfortunate situation into which they may be drawn is that each spends a great deal of time and money reacting to the other, with the only result being that a new stable balance is struck.

PART II – ARGUMENTS

In Part II of this report, your Committee has considered what it regards as the principal questions relating to North American Air Defence. The report takes up these questions in sequence and sets out the important arguments presented before the Committee on all sides. Where appropriate the Committee has drawn conclusions from the evidence presented, although the Committee has recorded its specific recommendations in Part III.

Does North American Security Require Anti-Bomber Defence?

It is within the strategic context of mutual deterrence that the question of anti-bomber defence must be considered. The original purpose of anti-bomber defence was the protection of North America and the Strategic Air Command airborne retaliatory force. The development, improvement and proliferation of intercontinental ballistic missiles on the part of both superpowers since the 1960's has transformed the strategic role of the bomber. For it is not possible – at least at the present time – to intercept and destroy enough attacking missiles to prevent the large scale destruction of population and industrial capacity. Nor, given the number, protection and dispersal of ICBM's on both sides, is it possible for either superpower to destroy the effective retaliatory power of its opponent through a pre-emptive strike. As a result the balance of deterrence now rests upon the mutual invulnerability of ICBM response. Bomber attack is no longer the primary threat to the safety of either superpower.

Such considerations lead some commentators to argue that bomber attack – and thus bomber defence – have become obsolete. They argue that any bomber attack would trigger a retaliatory response by the defender. Knowing this an attacker would launch its ICBM's immediately should it decide on a nuclear attack – and not wait until its bomber force had made a strike. This would undoubtedly call into play the defender's deterrent. Thus, on this argument, the bombers would arrive after the ICBM exchange had taken place, and it is extremely unlikely that either the bomber defences – or the bombers' targets – would still exist by the time the bombers arrived. The bomber threat is, therefore, redundant, and expenditure on bomber defence is wasted since it counters a non-effective threat.

Supporters of anti-bomber defence argue that bomber attack will only be ineffective if adequate systems of detection and interception are maintained. To dismantle anti-bomber defences – or to fail to develop adequate defences against the new capacity for low level bomber attack coupled with air to ground missiles – would revive the possibility that a bomber attack could arrive sufficiently close to its target to launch an effective air strike against the United States deterrent. Anti-bomber defence must therefore be maintained, otherwise an inexpensive and effective bomber threat would be operative. Moreover, if an effective anti-ballistic missile system were developed, bomber attack would again become the primary threat against North American security.

The maintenance of anti-bomber defence thus ensures that the bomber is no longer credible as a primary first strike weapon. Its effect is to convert bomber attack into a retaliatory, second strike force or a supplement to a first strike.

It is further argued that expenditures beyond the level necessary to transform the bomber threat to a second strike force, will either produce marginal improvement in interception which will not diminish the second strike capacity of the bomber attack or — much more dangerous — improve bomber interception to the point where the credibility of the Soviet second strike force would be brought into question.

Such expenditure would thus either be wasteful or dangerous since—as explained above—the existence of a credible second strike force in the hands of both the United States and the Soviet Union is essential to the balance of mutual deterrence.

In addition to the foregoing arguments, it is stated that the manned bomber continues to be the cheapest means for delivery of nuclear weapons. The bomber is generally more accurate than a missile, can carry a larger payload and is more flexible. The recent increase in Soviet training flights to the borders of North America may suggest a renewed interest in this means of attack, or on the other hand, the purpose of this increase may be only to collect information on North American defences or encourage North America to increase its expenditure on an expensive anti-bomber defence system.

It is further argued that without an anti-bomber defence, North America would have no capacity to exercise a policing function or to detect and intercept hostile aircraft. In the event of a bomber attack retention of anti-bomber defences gives North American defenders more flexibility and avoids the necessity of a split-second or automatic response. Moreover, North American bomber defences serve to “put up the price of admission” by forcing a would-be attacker to either concentrate all his weapons against fewer targets or to produce more sophisticated delivery systems in an attempt to circumvent the defence. For these reasons a defence against bombers will be needed as long as bombers represent either an existing or potential threat to second-strike forces.

The Committee accepts, in principle, the argument that North America must maintain sufficient anti-bomber defence to prevent bombers being used primarily as a first strike weapon but considers that expenditures on anti-bomber defence beyond that level would not be desirable.

Should Canada Contribute to North American Anti-Bomber Defence?

Having recognized the necessity for North American anti-bomber defence, the Committee considered whether or not Canada should participate.

The Committee has been informed that the avoidance of a nuclear war between the USSR and the United States depends basically upon a nuclear stalemate or balance between the USSR and the United States and that if this balance is disturbed on either side the maintenance of peace will be seriously endangered. Evidence presented to the Committee indicated that the United States has at least as much nuclear weapon capability as the USSR. It has therefore been argued that Canada should not throw its weight into the scale on behalf of the United States because this would be destabilizing.

It is further argued that in any war between the USSR and the United States, the primary targets would be in the United States rather than in Canada. Moreover, there may be disadvantages to Canada in intercepting and destroying bombers destined for targets in

the United States particularly now that the USSR has developed bombers carrying air-to-surface missiles. If intercepted over Canadian territory, Soviet bombers might discharge their missiles, which can travel for several hundred miles and destroy Canadian cities rather than their original United States objectives.

It is also argued that the United States must in any event maintain anti-bomber defences and this raises the question of whether Canada with its limited resources, should pay substantial sums for a programme which may involve serious losses to Canada and its citizens, and has as its primary function the protection of the deterrent of another country.

It is suggested that Canadian participation in North American anti-bomber defence involves serious danger to its national independence. The responsibility for defence of any country's territory and air space is an important attribute of that country's independence.

On the other hand it is argued that, while the United States would obviously be the primary target of any potential nuclear attack on the continent, Canada might be subjected to bomber attack in the event of conflict if the United States had a bomber defence and Canada did not have one. This would result from the fact that any attacker of the United States would regard North America as a single target and use the cheapest available means to conduct its attack.

It is also asserted that even without United States co-operation, Canada would still need to be in a position to deny its air space to foreign bombers intended to attack targets in the United States and not in Canada. Moreover, Canada would require a force of interceptors to inspect and identify unknown aircraft entering its air space without permission. Canada therefore should maintain an air defence system in any event. If this system were completely independent and unco-ordinated with that of the United States, it would either have to be much less sophisticated and effective than the present system, or alternatively much more expensive than the present system and probably too expensive for Canada to bear out of its own resources.

The Committee accepts the principle that Canada must maintain an air defence system and should co-operate closely with the United States on a continental basis subject to the conditions set out in the concluding part of this report.

What Should Be The Relationship Between The Canadian and The U.S. Anti-Bomber Defences?

The NORAD agreement describes the relationship between the Canadian and the United States air defences as an integrated command, under a supreme commander who, in practice, is an American officer, with a deputy commander who is a Canadian. The present NORAD regions and divisions are such that, with the exception of Quebec, New Brunswick, Nova Scotia and Prince Edward Island, most of the populated area of Canada is defended by American interceptors and by American crews under the command of American regional and divisional officers.

It is asserted that the present integrated command arrangements are best calculated to protect Canadian independence in a situation in which Canada is contributing less than

10% of the men, equipment and costs. Other possible arrangements open to Canada within a framework of cooperation would be

- (a) to provide all the forces necessary to defend Canadian territory, which would be excessively expensive to Canada or require a large American financial contribution; or
- (b) not to make a Canadian contribution and to give United States forces the right to operate in Canada as required, which would be a virtual abdication of sovereignty.

Given the relatively small Canadian contribution, exponents of this view argue that Canada has been able to negotiate with the United States a command arrangement which has secured at least a fair share of the command posts for Canadians. They further point out that all active Canadian units, other than the squadron in Comox, operate in NORAD divisions commanded by Canadians; in contrast several United States squadrons both of aircraft and of BOMARC missiles are placed under Canadian operational control. These same persons admit that Canada is not contributing to the active defence (i.e. Canada only contributes radars) of a large portion of Canada from Manitoba to Alberta. However, they argue that it is preferable that the limited Canadian forces should be concentrated in the most heavily populated regions of the country and where the populated areas extend further north of the border. By not dispersing the aircraft throughout the country, Canada is able to achieve the greatest operational control which is feasible given the size of the Canadian contribution. These exponents note that the capacity of the enlarged computers in North Bay will be completely absorbed in monitoring the Northern region which will be extended (effective September 15, 1969) and therefore that a further extension is technically impossible; and that even if the technical problem were overcome by enlarging the computers, a further extension of the region would distort the command arrangements and degrade the effectiveness of the overall system.

Finally, they stress that the divisions commanded by Americans which are responsible for the air defence of Canadian territory have Canadian deputy-commanders and have been chosen because the inhabited regions are sufficiently far south that United States defence forces can carry out their assignment without being based in Canada. In sum the Canadian exponents of this view, while maintaining that the air defence of the continent has to be considered as a single system, insist that the command arrangements have been carefully devised in order to protect Canadian sovereignty and that the terms of the agreement represent a considerable achievement for the negotiators on the Canadian side.

From a military point of view the Committee recognizes that the present arrangements are the most convenient and efficient method of co-operation between two anti-bomber defences.

However, in any partnership or co-operative arrangement between Canada and the United States, the Committee feels that Canada, as a very much smaller partner, must be particularly careful not to prejudice its independence unnecessarily within arrangements which, closely examined, might turn out to be not so much of a co-operative as a "take-over" relationship. Canada must be especially careful to examine very closely any joint arrangements suggested by the United States which involve such highly sophisticated

or costly facilities that their command and control can only be exercised conveniently or efficiently by a country as large and powerful as the United States, and not by a country with limited capacity such as Canada.

The Committee believes that wherever technically and economically feasible, surveillance, detection and interception facilities over Canadian territory should be under Canadian operational command. In other words, the Canadian contribution to continental air defence should, in principle, constitute a Canadian component within a framework of co-operation rather than a dispersed contribution within a basically United States structure of command.

Are Present Cost Sharing Arrangements Fair?

The Committee found it difficult to determine whether consistent principles have been followed in allocating total NORAD costs between Canada and the United States up to the present time. Cost allocation for each facility and programme appears to have been determined on an *ad hoc* basis. Canada's overall share of NORAD operating costs is between 8% to 10% at the present time. The Committee does not have specific information with regard to the percentage of capital costs.

The use of Canadian territory and the interception of bombers over Canada confer an advantage to the United States. The destruction of bombers over Canada however, would pose risks of loss from discharge of missiles upon Canadians. All expenditures for anti-bomber defence over Canadian territory benefit the United States while expenditures made by the United States to protect cities and targets south of the Canadian border do not in all circumstances confer additional protection upon Canadians.

The Committee believes that these considerations are relevant to establishing fair cost sharing arrangements.

The Committee also emphasizes the importance of establishing the principle that a clear distinction must be made between operational responsibilities and cost responsibilities. Because of its geographical position, Canada may have very extensive operational responsibilities which for sound political reasons should be carried out by Canadian forces under Canadian command. It does not follow, however, that in a co-operative arrangement for continental air defence, the entire costs involved in carrying out such responsibilities should be borne by Canada.

Should Canada Participate In The Proposed New System Of Anti-Bomber Defence?

The Committee has been told that the development on the part of the Soviet Union of a capacity for low level bomber flights coupled with air to ground missiles has seriously diminished the capability of the NORAD anti-bomber defence. Low flying bombers can under certain conditions approach to within two hundred miles of ground radar installations before detection—a range which enables them to release airborne missiles on important targets.

To meet this threat it is suggested that an airborne warning and control system be implemented—coupled if technological developments permit, with the use of over-the-horizon radar. The advantages of the airborne system are a great extension of the

effective detection range of the radar and the placing of the detection and control centres on a mobile—and therefore less vulnerable—basis.

This system might well require United States command installations and personnel on or over Canadian territory. Such an airborne system—if it is established—would become operative in the mid 1970's, probably 1974. It would involve large new capital costs. Some witnesses claim that the annual operational costs of the system would be less than at the present time.

Should the United States decide to proceed with this system in the 1970's, and should the Canadian government decide to co-operate, the Committee believes that the operational responsibilities in Canadian territory and over Canadian air space should be under Canadian command.

Should Consultation With The United States Political Authorities Form A Regular Part Of The NORAD Process?

Under an exchange of notes in 1958 a Canada-United States Ministerial Committee on Joint Defence was established. The exchange of notes concluded:

“that the importance and complexity of (the new) interdependent defence relationships made it essential to supplement existing channels for consultation and to provide for a periodic review at the Ministerial level of problems which might be expected to arise.”

However, this Ministerial Committee has only held 4 meetings, the last of which occurred in 1964.

It is argued that the Committee ceased to meet because relations between the foreign and defence ministers of Canada and the United States are already so intimate, and contact so frequent and easy that formal meetings are redundant. Among the occasions on which the Ministers involved meet regularly are the NATO Ministerial meetings, which provide regular semi-annual occasions for both group meetings at which international, political and security problems can be discussed, and informal contacts at which bilateral questions can be taken up. In this view formal machinery for Canada-United States political and security consultations serves no useful purpose.

Advocates of the contrary position base their case on actual experience during the 1962 Cuban missile crisis. They note that in spite of the close relations between the responsible ministers of the two countries, the Canadian government was only informed of United States decisions by a diplomatic emissary at the same time as the other NATO countries. The advocates of this view argue that advance notice would have been given had it earlier been made clear to the United States Government that the activation of NORAD in circumstances other than a direct attack on North America would normally require prior consultation through the Joint Defence Committee. They also suggest that NORAD as presently constituted compares unfavourably with NATO in that it has no political forum for the joint consideration of international, political and security problems. The Ministerial Committee would be a suitable forum for the discussion of important questions of mutual concern such as the ABM System.

Should Canada Participate in the Proposed ABM System?

It is argued that the ABM system is a defensive system, that Russia has installed a similar system around Moscow and that such a system is essential to protect the American deterrent and the security of North America.

It is further argued that from a strategic point of view anti-bomber and anti-missile defence are part of a single problem and therefore the ABM System should be under NORAD. To determine whether North America is being threatened and should alter its state of alert, many types of information are wanted and should be assessed as a whole rather than piecemeal.

Strategic decisions and operations are most effectively handled as a single aerospace activity. If Safeguard or some other ABM system is deployed in North America, arrangements will have to be made for its operational control. Also, the information necessary to assess the overall strategic situation and make the major strategic decisions regarding aerospace defence must be provided. The necessary type of information is very much the same as that already collected by NORAD today; although five years hence there would probably be additional sources from new systems of missile detection and space surveillance. For this reason it might be argued that it would be desirable for any new ABM system to be under NORAD command. On the other hand, it is argued, that the detailed command and control of an ABM system are likely to be different in character from those for air defence units. ICBM's will approach speeds above 250 miles a minute as compared with aircraft unlikely to be moving faster than 10 miles a minute.

It is also argued that the cost of an ABM system may be greater than anticipated and its effectiveness somewhat doubtful in view of possible improvements in ICBM's. Although it is technically possible for a defensive missile to intercept and destroy an ICBM, it does not necessarily follow that the ABM system is an effective and advisable system to construct. With the use of penetration aids, (such as decoys, multiple warheads or jamming) or indirect trajectories (depressed, extended range, fractional or multiple or orbital) the offense may be able to overcome the defence. Although it may be technically possible for the defence to defeat the measures mentioned above, the cost of such counter-measures may be much greater than that required for offensive measures.

In addition, it is argued that the development of a "thin" ABM system is unlikely to serve its purpose while the development of a "thick" or effective ABM system might affect the present system of mutual deterrence and might set off a new arms race.

PART III – CONCLUSIONS AND RECOMMENDATIONS

Your Committee has reached the following conclusions and recommendations. These are based on the facts reported in Part I and on an examination of the conflicting arguments which are set out and assessed in the relevant sections of Part II above.

(1) The nature of the bomber threat has changed greatly, and its relative importance has diminished in recent years owing largely to the development of ballistic missiles and the increase in their number.

However, since the major powers continue to maintain long-range bomber capability, the continuation of a system of air defence involving surveillance, detection and interception is an important component of North American security.

(2) The Committee notes that under existing NORAD arrangements, the air defence of Canada's most populated area is carried out by United States aircraft, manned by United States crews under United States commanders and directed from regional and divisional combat and directional centres located in the United States.

The Committee also notes that under existing arrangements Canada has only limited capability to carry out, with its own forces, routine policing (as distinct from defence against enemy attack) and surveillance of its air space.

The Committee recommends that Canada should remain in NORAD and does not recommend fundamental changes in the existing arrangements due to the great expense which would be involved at this time (for regional and divisional combat and directional centres and additional interceptor squadrons) in making such changes and particularly in view of the decline in the relative importance of the threat from enemy bombers.

However, in the re-organization of NORAD regions and divisions which will become effective September 15, 1969, the Committee recommends that the principle be accepted that there should be Canadian commanders in those areas where essentially all the territory is Canadian. The possibility of extending, at reasonable cost, the Northern Region (which is under Canadian command) to include the heavily populated and industrialized area of Southern Ontario should also be considered carefully.

The Committee also recommends that any future co-operative arrangements with the United States should take into account military convenience and efficiency and also Canada's status as an independent nation and the principle that, to the largest extent feasible and consistent with Canada's security, the defence (including routine policing and surveillance) of Canada's territory and air space should be performed by Canadian forces under Canadian command.

(3) The Committee has learned that at present a system for controlling Canadian civilian air traffic by the use of computers exists only over the Eastern approaches of the country. It is expected that there will be a rapidly growing requirement for such a system.

Consideration should be given to the feasibility of a common computer system for both military and civilian air control activities to minimize the costs of its introduction.

(4) Since their function is defensive, the Committee does not object to the use of nuclear weapons by Canadian interceptors or Bomarc squadrons; or to the "two-key" system of control.

(5) The Committee is concerned about the vulnerability to enemy missile attacks of the two Bomarc squadrons, the likelihood of their attracting enemy fire and the possibility that bombers intercepted by them might discharge their missiles, including their air-to-surface missiles, on Canadian cities or populated areas.

On the other hand, the Bomarc squadrons do give some additional depth to Canada's air defence and the relative cost of continuing them is not great. Accordingly, the Committee recommends that the Bomarc squadrons should not be discontinued at the present time.

The Committee notes that the Bomarc squadrons will probably become obsolete if a decision is made to establish the proposed new system of air defence referred to in recommendation (6).

(6) The Committee believes that the new air defence system now being considered by the United States which involves the Airborne Warning and Control System (AWACS), Over-the-Horizon Radar and improved interceptor aircraft would overcome some of the weaknesses of the present air defence system.

However, bearing in mind the fact that this new system is still under investigation in the United States, the uncertainty with regard to costs and the possibility of increased costs and the decline in the relative importance of the bomber threat, the Committee believes it is not desirable to make a decision at this time regarding Canada's participation in the new system. If eventually a decision is made to participate, this should be done only upon the basis of the principles outlined in recommendation (2) above.

(7) The Committee recommends that the Government should undertake promptly a review of NORAD costs, bearing in mind the principles referred to in Part II above.

(8) The detection of ICBM's does not at the present time involve important installations on Canadian territory or military operations over Canadian territory. The Committee does not recommend any changes at this time.

(9) The Committee has received conflicting evidence on the desirability of establishing an ABM System for the protection of the United States nuclear deterrent or United States cities against nuclear attacks. In view of the uncertainty of Congressional approval for the ABM System and the uncertainty of the extent to which Canada might be asked to participate, if at all, the Committee is unable to make any recommendations concerning Canadian involvement in such a System.

However, the Committee notes that the evidence presented to it indicates that these installations, as now planned, will not increase the danger to Canada.

(10) The Committee notes that the Canada-United States Committee on Joint Defence has not met since 1964. The Committee believes that the present practice for political

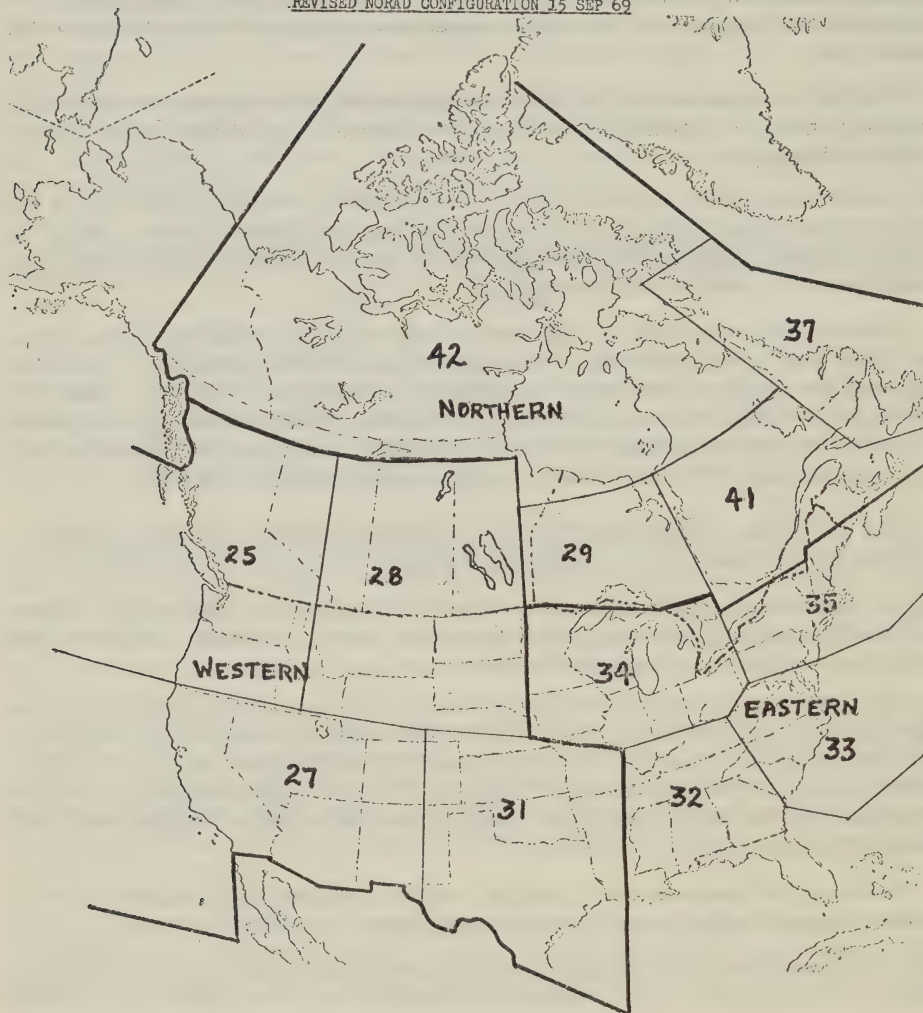

consultation within NORAD has proved to be inadequate in the one serious test to which it was put. The Committee urges that the Canada-United States Committee on Joint Defence should be re-activated.

A copy of the Minutes of Proceedings and Evidence relating to this aspect of the Order of Reference dated January 16, 1969 (*Issues Nos. 41, 42, 43, 46, 47, 48, 49*) is tabled.

Respectfully submitted,

IAN WAHN,
Chairman

REVISED NORAD CONFIGURATION 15 SEP 69

MINUTES OF PROCEEDINGS

Thursday, June 19, 1969.

(83)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 9:45 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Fairweather, Forrestall, Gibson, Legault, Marceau, Penner, Ryan, Roberts, Thompson (*Red Deer*), Wahn-(12).

The Committee agreed to print the following papers as appendices to this day's Minutes of Proceedings and Evidence:

Comments on the Committee's working papers received from Professor Albert Legault, Queen's University; Professor P.J. Arnopoulos, Sir George Williams University; Professor K.H.W. Hilborn, The University of Western Ontario; Professor D.M. Thomas, the University of Calgary; Professor C. F. Schuetz, St. Patrick's College, Carleton University. (*See Appendix HHH*)

Supplementary replies to questions asked by the Committee, presented by Lieutenant General F. R. Sharp and Dr. George R. Lindsey. (*See Appendix III*)

Members continued their consideration of a draft report to the House, on the subject of North American defence.

With the discussion continuing, at 12:40 p.m., the Committee adjourned until 3:30 p.m. this day.

AFTERNOON SITTING

(84)

The Standing Committee on External Affairs and National Defence met at 3:40 p.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Anderson, Barrett, Fairweather, Forrestall, Gibson, Harkness, Laprise, Legault, MacLean, Penner, Prud'homme, Ryan, Roberts, Thompson (*Red Deer*), Winch-(15).

Witnesses: From the Conference of Defence Associations: Brigadier General W. A. Howard, Chairman; Brigadier General J. P. Charbonneau, Vice-Chairman; Commodore J. W. F. Goodchild, Past Chairman; Colonel B. A. Howard, Honorary Assistant Secretary.

The Vice-Chairman made an opening statement, introducing the representatives of the Conference of Defence Associations.

Brigadier General Howard explained the aims of the Conference of Defence Associations and read a brief submitted by his organization. He made a further statement on the subject of Reserve Forces.

General Howard, General Charbonneau, Commodore Goodchild and Colonel Howard answered questions for the remainder of this afternoon's sitting.

The Vice-Chairman thanked the witnesses for their testimony.

On completion of the questioning, at 5:40 p.m., the Committee adjourned until Friday, June 20, 1969, at 9:30 a.m.

Friday, June 20, 1969.
(85)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 9.35 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Laniel, Laprise, Legault, MacLean, Marceau, Nowlan, Penner, Ryan, Roberts, Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch—(22).

Members resumed consideration of a draft report to the House dealing with North American defence.

At 11.10 a.m., with the discussion continuing, the Committee adjourned until 2.30 p.m. this day.

AFTERNOON SITTING (86)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 2.45 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Legault, MacLean, Marceau, Nowlan, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn—(16).

Members continued their consideration of a draft report to the House. Their discussion of the draft report was completed at approximately 4.45 p.m.

Mr. Allmand moved,

That there be a recorded vote on the report as a whole, to indicate the extent to which it was accepted in principle by the Members.

The question being put on the motion, it was negatived on the following division: Yeas 1; Nays 15.

It was agreed, *on division*, that the Chairman present the draft report, as amended, as the Ninth Report to the House.

The Committee then discussed a future program of work.

At 5.00 p.m., the Committee adjourned until Thursday, June 26, 1969 at 11.00 a.m.

Thursday, June 26, 1969.
(87)

The Standing Committee on External Affairs and National Defence met, *in camera*, at 11:10 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Anderson, Barrett, Brewin, Buchanan, Cafik, Forrestall, Gibson, Harkness, Howard (*Okanagan Boundary*), Laprise, Legault, MacLean, Marceau, Prud'homme, Ryan, Roberts, Thompson (*Red Deer*), Wahn, Winch (19).

Members noted that the Ninth Report to the House will be presented at 2:00 p.m. this day.

On motion of Mr. Brewin,

Agreed,—That the Chairman be authorized to issue a Press Release, concerning the Ninth Report to the House.

On motion of Mr. Brewin,

Agreed,—That the Clerk be authorized to purchase 20 copies of a pamphlet entitled *Soviet Naval Power*, from the Center for Strategic Studies, Georgetown University, for the use of the main Committee and the Subcommittee on Maritime Forces.

On motion of Mr. Gibson,

Agreed,—That the verbal progress report made by the Chairman of the Subcommittee on Maritime Forces at this meeting, be adopted.

Following a report by the Chairman, from the Subcommittee on Agenda and Procedure, concerning the motion made by Mr. Gibson on Thursday, June 5, 1969, Mr. Gibson requested and the Committee agreed that the motion be withdrawn.

The Committee agreed to the general work program suggested for the main Committee during the fall months, as outlined by the Chairman.

On motion of Mr. Roberts,

Resolved,—That a *Subcommittee on Foreign Aid* and a *Subcommittee on the United Nations* (as a peace maintaining and peacekeeping organization) be appointed, to consist of 9 members each and who will be chosen by the Chairman after consultation with the Party Whips.

On motion of Mr. Cafik,

Agreed,—That the Subcommittee on Maritime Forces, Subcommittee on Foreign Aid and Subcommittee on the United Nations each have the power to make small purchases of publications for their own use, during the course of their deliberations.

On motion of Mr. Roberts,

Agreed,—That the Committee print the evidence taken by members of this Committee while in Europe, during the period March 8 to 22, 1969, as a separate Issue of its Minutes of Proceedings and Evidence, at the appropriate time.

On motion of Mr. Cafik,

Agreed,—That the Committee print the comprehensive subject index to be prepared by Mr. Dobell's office, covering Issues Nos. 36 to 50 inclusive, as an appendix to Issue No. 50 of the Minutes of Proceedings and Evidence.

The Committee agreed that the following documents be filed as *Exhibits* in its records:

1. Brief from the Voice of Women, entitled *Some Aspects of Canada's Foreign and Defence Policies*, presented to Honourable Mitchell Sharp on February 19, 1969. (*Exhibit No. 4*)
2. Brief from the Voice of Women, concerning the "Safeguard" ABM System, dated May 23, 1969. (*Exhibit No. 5*)
3. Brief from The Congress of Canadian Women entitled *Canada's Withdrawal From NATO*, dated March 17, 1969. (*Exhibit No. 6*)
4. Brief from The Pentecostal Assemblies of Canada, entitled *Canada and The China Problem*, (*Exhibit No. 7*)
5. Brief from Canadian Aid For Vietnam Civilians, concerning the subject of aid to Vietnamese civilians, dated November 13, 1968. (*Exhibit No. 8*)
6. Brief from Canadian Friends Service Committee, entitled *Canada and the North Atlantic Treaty Organization*, dated January 24, 1969. (*Exhibit No. 9*)
7. Brief from the Polish Political Ex-Prisoners Association, Inc., entitled *Canadian-Polish Survivors of Nazi Camps*, dated December 31, 1968. (*Exhibit No. 10*)
8. Letter to the Chairman from Mr. Richard Gaunt, concerning the "1.2 Billion Maritime Strategy". (*Exhibit No. 11*)
9. Brief from the Assembly Of Captive European National, entitled *The International Situation and East-Central Europe*, dated March 19, 1969. (*Exhibit No. 12*)
10. Brief from the Ottawa Committee to End the War in Vietnam, dated February, 1969 (*Exhibit No. 13*)
11. Appeal from the National Women's Committee of the Association of United Ukranian Canadians, to the Prime Minister, February 1969. (*Exhibit No. 14*)
12. Letter from Mr. D. Orchard, Borden, Saskatchewan, dated March 20, 1969, with a covering letter from Mr. A. P. Gleave, M. P., concerning the proposed missile defence system. (*Exhibit No. 15*)
13. Letter dated February 14, 1969, and enclosed correspondence from Mr. Healey Ballans, Chairman, Friends of Rhodesia Association. (*Exhibit No. 16*)
14. Letter dated February 19, 1969 and enclosed correspondence relating to South East Asia, from Professor G. G. van Beers, University of Guelph. (*Exhibit No. 17*)
15. Letter dated April 22, 1969 from Lawrence S. Cumming, Kampala, Uganda, concerning the foreign policy review. (*Exhibit No. 18*)

16. Brief from Professor N. A. Nyiri, Waterloo Lutheran University, concerning defence policy. (*Exhibit No. 19*)
17. Brief from The National Council of the Navy League of Canada, dated April 3, 1969, concerning defence policy. (*Exhibit No. 20*)
18. Appeal from The Freedom Committee Of West Papua/West New Guinea, to the Prime Minister, dated June 2, 1969. (*Exhibit No. 21*)
19. Brief from The Communist Party of Canada, dated June 3, 1969, concerning Canada, NATO and NORAD. (*Exhibit No. 22*)
20. Memorandum on Foreign Policy, submitted by Mr. G. E. Mueller, Principal Supply Officer of the Department of Supply and Services, Koblenz, Germany, dated January 6, 1969. (*Exhibit No. 23*)

It was agreed that Mr. Dobell's office should summarize the material contained in the above-mentioned documents, for the information of Members.

It was also agreed that the Clerk should list the books and pamphlets dealing with questions of North American defence, which the Committee had obtained, and send the information in a memorandum to the Members.

Following a further discussion concerning future activities of the main Committee, the Chairman thanked Members for their past co-operation.

The Committee adjourned at 12:15 p.m., to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, June 19, 1969.

The Vice-Chairman: Gentlemen, I would like to call the meeting to order. Today the Committee will be hearing evidence of representatives of the Conference of Defence Associations on the general theme of Canadian defence policy.

I would like to say how grateful the Committee is to have this opportunity to hear and to question representatives of the Conference.

The Conference of Defence Associations is representative of a group of citizens who are important in the community, and who are closely concerned with development and effects of Canadian defence policy. It is unfortunate that because of our extremely heavy schedule the Committee was unable to arrange for them to testify earlier. I would like to mention that on March 18 Brigadier General Howard, the Chairman of the Conference, submitted a very professional brief to the Committee and that the Clerk has circulated copies to members. The Clerk has extra copies with him here should any member wish to have one.

● 1540

Representing the Conference before this Committee today are: on my immediate right, Brigadier General W. A. Howard; on his right Brigadier General J. P. Charbonneau, Vice Chairman; Commodore J. W. F. Goodchild, Past Chairman; and Colonel B. A. Howard, Honorary Assistant Secretary—in that order.

General Howard, would you like to make an opening statement before members put their questions to you?

Mr. Winch: If I may, Mr. Chairman.

The Vice-Chairman: Yes, Mr. Winch?

Mr. Winch: Before we hear the presentation may I raise a matter that has been raised upon more than one occasion. Would the witness be kind enough to introduce and explain what the Conference of Defence Associations is, its makeup, what it represents and how it works? I consider it most important, sir, that we have that first.

The Vice-Chairman: Yes; the Brigadier has that in mind, I hope. Brigadier General Howard?

Brig. Gen. W. A. Howard CD, QC (Chairman, Conference of Defence Associations): Mr. Chairman and gentlemen, we appear before you today representing the Conference of Defence Associations of Canada. The Conference of Defence Associations, which has been functioning since 1932, has a membership consisting primarily of 15 corps associations in Canada. Such member associations are formed of the various reserve units, sea, land and air. Accordingly, the Conference directly represents some 30,000 reserve force personnel, approximately 50,000 cadets, and a considerable body of informed military opinion. It reflects the views of persons from all walks of life and from coast to coast.

The objects of the Conference are to consider the problems of national defence, to assist the government of Canada in placing these problems before the people of Canada, to co-ordinate the activities of the environmental associations in matters of interest common to all environments, to make such recommendations to the government of Canada as may appear expedient, and generally to promote the welfare of the defence forces of Canada as a whole.

Here today we have, as the Chairman has said, Brigadier General Pierre Charbonneau. General Charbonneau is Vice Chairman of the Conference of Defence Associations, and is currently in the Reserve Force, being Senior Militia Adviser, Quebec Region, to the Deputy Chief, Operations and Reserves. General Charbonneau is an insurance executive in Montreal.

Commodore Goodchild is immediate Past Chairman of the Conference of Defence Associations. As a member of the Royal Canadian Naval Reserve he was former Senior Naval Officer, Toronto Area. Commodore Goodchild is the naval representative on the executive of the Conference of Defence Associations, and is a practising lawyer in the City of Toronto.

Colonel B. A. Howard was, until January of this year, Commander of the Air Reserve Wing in Toronto. He is the air representative on the executive of the Conference, and is an industrialist in the City of Toronto.

My name is, also Howard, and I hold the reserve rank of Brigadier General. I am Senior Militia Adviser to the Deputy Chief, Operations and Reserves, for Western Canada, the four western provinces. I am the current Chairman of the Conference, and I am also a practising lawyer in the City of Calgary.

Mr. Winch: Before you proceed, may I ask whether you are officially connected with the Militia, or, as Reserve officers, what is your status with the Defence Department? I presume you understand why I ask the question.

Brig. Gen. Howard: General Charbonneau and I are in the Reserve. We are actively engaged in the Reserve, in each case as an adviser to the Deputy Chief. We are not appearing here in our capacity as members of the Conference of Defence Associations. We are appearing as interested citizens and as members of the Conference.

Mr. Winch: Thank you. As Reserve officers . . .

Brig. Gen. Howard: But we are also Reserve officers.

Mr. Winch: And are retired officers, in substance?

Brig. Gen. Howard: No. General Charbonneau and I are currently in the Reserve. Commodore Goodchild is a recently retired officer. Colonel Howard has been on the Supplementary Reserve since January of this year.

Mr. Winch: Thank you.

Brig. Gen. Howard: Have I answered your query?

The Vice-Chairman: That is fine. Thank you.

● 1545

Brig. Gen. Howard: Since March 10, the date of the brief, which we understand has been circulated to the members, there have been certain developments which will require amplification or collateral comments during the presentation. We of the Conference are grateful to the Committee, Mr. Chairman, for giving us the privilege of being present here today.

Turning to the brief, the Conference of Defence Associations represents the views of a large body of responsible men who have made, and continue to make, a contribution to the defence and security of our country. The Conference of Defence Associations, through its members, has followed with a great deal of interest the representations made to your Committee and the comments which have appeared in print as a result of your review of defence and foreign policy.

The basic threat or dilemma which faces Canada today in the area of defence matters is the question of arriving at an estimate of the threat. The first problem is, is there a threat, and, second, if there is a threat,

what is the nature of it and what can we as Canadians do about it?

The Dilemma: We believe there is still a threat to world peace in 1969, and that this threat is two-fold—first, the Communist threat, and, second, the problems of world unrest.

After twenty years of NATO, Europe is wide open to Soviet attack. The alliance is outnumbered on the central front by two to one in infantry and aircraft, and three to one in armour. The argument, therefore, follows that NATO's conventional defence would crumble in a few days, after which the West would have to use nuclear weapons or surrender.

From this argument flows the confusion within NATO about when, and in what circumstances, tactical nuclear weapons would be used—to say nothing of strategic weapons. Viet Nam proves that the Americans are unwilling to be dragged willy-nilly into a nuclear holocaust, and Europe does not wish to be first ravished conventionally and then annihilated unconventionally. In the past this argument was rejected as being alarmist, while the escapists seek false comfort in unrest among the satellites and dissensions in the Kremlin.

NATO's policy is to keep enough conventional strength to secure its frontiers, and to urge its members to co-operate in the hope that this effort will avert the threat of American and Canadian troop withdrawals.

Collective control over decisions to use nuclear weapons has eluded agreement for years and is likely to do so until NATO relies more on self-defence and less on America's nuclear umbrella.

The basis of safety is to be found only in the creation of forces roughly of the same strength as those at the disposal of the Russians.

Accepted Foreign Policy and Defence Doctrine: Canada's national aims and aspirations have been stated to be:

- (a) Maintenance and preservation of world peace.
- (b) The improvement and development of the standard of living of her people.
- (c) The preservation of law and order in society.

As a developed nation, one which is ranked as having one of the highest standards of living in the world, and as one which has contributed much of her resources and man power in two world wars in the maintenance of the democratic way of life, we cannot opt out of being interested world citizens. Not only would this be contrary to Canada's national character and destiny, but it is not possible by virtue of our geographic position, cultural heritage and highly developed economy. In the face of the threat of communism and the unrest in other areas of the world Canada has done what any prudent person would do—she has associated

herself with like-minded people in the pursuit of her national aims—thus providing Canada with an opportunity to pool her resources and energies in the attainment of a common goal.

The foreign policy of any country is concerned with its relations with other countries and defence policy is one aspect of foreign policy. Historically, in peacetime, Canada's foreign policy has been one of "non-involvement," and a Canadian delegate to the League of Nations once summed it up by saying that Canada was like "a fire-proof house, far from inflammable materials".

After World War II, however, there was a shift in policy towards measures in support of collective security.

In June 1950, Canada provided substantial forces to the United Nations command in Korea. She has furnished men and equipment for peace-keeping duties under United Nations command. She has taken part in disarmament conferences, and support for the United Nations has been a cornerstone of Canadian foreign and defence policy.

Nato and Mutual Aid: Canada's first contribution to NATO, after it was formed in 1949, was in the form

• 1550

of a mutual aid programme. By 1967 Canada had contributed equipment and services to her allies to the value of some \$1,896.5 million. As Canada's allies have become more prosperous, the size of this contribution has been gradually reduced.

Membership in NATO has to a large degree dictated the size and composition of Canada's Armed Forces. The anti-submarine warfare ships and aircraft of Maritime Command, the Brigade and Air Division in Europe, and Mobile Command at home all carry out missions required to meet NATO commitments that Canada has assumed.

One overlooked area in which NATO has been effective is pointed out by Leonard Beaton in a recent article in *The Times* where he says, "In forging a weapon for securing Western Europe in the cold war, the western allies have produced what is undoubtedly the most significant disarmament organization in the world. . . No government west of the Oder Neisse line feels really insecure. And when governments do not feel insecure they are very reluctant to spend huge sums of money on armaments. They, in effect, disarm themselves from the levels of forces they would otherwise maintain." Canada is not the only victim of the disease of freedom from insecurity.

The economics of defence are more often misconstrued as the strategic enemy rather than the armed threat of our potential enemies. For Canada to evade the realism of the price of security runs contrary to national character and experience.

In our opinion, unless the threat of war in Western Europe is kept at a low level, it could well escalate to nuclear war. The fact that it hasn't for the past twenty years is because NATO, its will, its forces in being, and its integrated command structure have provided the instrument for curbing Soviet aspirations. Until a peaceful settlement is reached in Europe, until a climate of confidence and trust has been achieved, NATO and NATO forces in being will be required. Canada must continue in the alliance and must continue to provide visible evidence of its intentions by providing forces in Europe as part of NATO's integrated force structure.

Canada in North America: The policy of co-operation with the United States in the defence of North America had its inception in the Ogdensburg Agreement. Its economic corollary was the Hyde Park Declaration of 1941. The former policy culminated in the formation of NORAD in 1957 and the latter in the defence development and production sharing arrangement entered into by Canada and the United States in 1959. By the end of 1967, Canada had *bought* from the United States \$1,608 million worth of goods and had *sold* to the United States \$1,798.9 million worth.

Tasks of the Armed Forces: The regular forces must have the basic responsibility of the defence of Canada quite apart from their role in collective security arrangements or their support of United Nations peace-keeping missions.

The reserve forces must also be maintained to provide a body of trained men who are available to assist the civil authorities in local emergencies and disturbances.

If, as the Prime Minister fears, riots and disorders should spread across the border into Canada, then local reserve units must be called out to help control and suppress civil disturbances. Not only can they be quickly on the scene, but they will be local men familiar with the area and its problems.

The Defence White Paper 1964: Although the emphasis may have changed, the policy stated in the White Paper is as valid today as it was in 1964 in outlining four methods by which the objectives of Canadian defence policy have been pursued. They are:

- (a) Collective measures for maintenance of peace and security as embodied in the Charter of the United Nations, including the search for balanced and controlled disarmament;
- (b) Collective defence as embodied in the North Atlantic Treaty;
- (c) Partnership with the United States in the defence of North America;
- (d) National measures to discharge responsibility for the security and protection of Canada.

The Conference of Defence Associations wholeheartedly supports these policy objectives.

● 1555

Reserves: The size, provision, equipping and location of Canada's regular forces must be consistent with the defence and foreign policy decision of the government. Whatever the size of these forces, the Conference of Defence Associations is firmly of the opinion that Canadian regular forces must be backed up by a strong, well-equipped and well-led reserve. This reserve should reflect the three environments—land, sea and air. The reserves must be trained and capable of providing replacement for the Regular Forces and of undertaking local defence and internal security tasks at short notice. The reserves also provide and area of involvement for the young men and women of our country. The strength of the reserves has developed to a considerable extent through the policy of encouraging and supporting a system of senior reserve commanders responsible to senior regular commanders.

In view of the financial constraints that are being imposed on the Department of National Defence, the importance of the reserves as an integral part of our defence posture deserves serious consideration, and upon that we intend to elaborate at the conclusion of this formal brief.

Land Forces: From our support of NATO as described in the White Paper, we have considered Canada's land contribution. To be of any real significance, the size of our NATO force should not be less than a brigade group, while any larger contribution would be out of proportion to the strength of Canada's land forces. This Canadian NATO brigade should be equipped and trained to the highest possible level with up-to-date equipment.

The brigade's organization should be similar to, and certainly not incompatible with, other forces with which it is deployed. As an elite Canadian Brigade, it must be maintained at full operational strength and every organizational effort should be made to provide economical logistical support in concert with our allies.

The deployment of the Brigade is a matter for the NATO Council and the Supreme Commander, but wherever deployed it should be used to its maximum effectiveness and as evidence of real solidarity with our allies.

The present strength of the regular forces is about 98,000 of which approximately 38,000 are army. Considering the present acceptable commitments, this is undoubtedly a minimum manpower ceiling. The Conference of Defence Associations accepts the present theory of forces in being in order to react quickly and effectively.

Canada has commitments for collective roles with the UN, NATO and NORAD. Canada has also its national tasks for defence of its sovereignty. It must

maintain at home sufficient mobile forces to reinforce its overseas commitments and it must have the capacity to deal with direct military incidents on national territory.

Above all, Canada must have the capacity to expand its Forces with reserves in case of emergency. The regular forces must, therefore, have the direct task of training the reserves, maintaining communications, aiding the civil power and assisting in civil defence. It would, therefore, be difficult to lower the present manpower ceilings.

Indeed, if Canada were called upon to fulfil several of its roles simultaneously, it would be hard put to mount the effort required from its regular forces.

Equipment: The White paper sets out that the budgetary objective for provision of hardware should be 25 per cent of the defence budget. For various reasons the present provision in the budget has been reduced to about 12 per cent. This is not consistent with the maintenance and development of the effectiveness of our Forces.

Economics must be found in the defence effort, but if that fails the budget must be increased.

Militia: Subsequent to the Suttie Commission, the army reserve establishment was reduced from 50,000 to 35,000. Subsequently, the White Paper at page 24 set out the role of the reserves. The Conference of Defence Associations knows that the reserves provide real value for the defence dollar, and much can be done to increase the effectiveness of the reserves.

The general configuration of the reserves should roughly follow that of the regular forces. The primary role of the militia is to support the regular army, but the actual constitution of individual reserve units needs not be identical with the regular army since they will be deployed as individual and sub-unit reinforcements to the regular forces.

The Conference of Defence Associations supports the policy of training the reserves with the regular army and with modern equipment, and urges the further implementation of this policy.

● 1600

Naval Forces: There is no substitute for conventional naval forces, that is, ships, in upholding considerations of sovereignty in territorial waters and, in general, deterring the mounting Soviet maritime threat. Ships are the only equipment which have the capability of maintaining their presence through all weathers.

No Instant Navies: The Conference of Defence Associations contends that a modern navy uses highly technical and complex equipment which cannot be created overnight, and even the "moth-balling" of

ships does not provide a sufficiently ready response. This is in sharp contrast to such land oriented military organizations as Switzerland and Israel, which mobilize citizen armies into immediately effective formations, because their primary weapons are literally in their homes. Thus, any effective sea effort should be constituted on the classic concept of a "fleet-in-being". Certainly the complexities of operating ships is reflected in the fact that many countries with conscription require longer terms for naval than for army service.

Regarding the sea threat, some critics argue that efforts directed toward anti-submarine warfare have no logical place in defence, as the principal protagonists are engaged in a nuclear standoff. This is refuted by the fact that the U.S. and others continue to make great efforts, both in men and money, to increase conventional ASW forces in the face of the substantial submarine threat of the USSR. Canadians have demonstrated their capabilities in this field, and our expertise is well recognized and valuable. Our effort may not be large, but the fact remains that everything we do in this field helps to share the burden of continental defence which we bear with the U. S. A.

Because of the "fleet-in-being" concept, the constitution of the U. S. A. provides that Congress has a responsibility to maintain a navy, but raise an army. The army cannot be budgeted for more than two years, but no such limitation applies to the navy. This recognizes the impossibility of generating an instant navy. Certainly Canada's experience in two World Wars proves this, and it was fortunate that our coastal areas were not subject to hostile action in the early stages of those wars. Because the sea threat is now greater, our sea needs have increased; the Cuban crisis demonstrated the importance of sea power in respect to North American defence.

Thus the maintenance of an ASW force with an effective air component is the quintessential maritime defence. The loss in manpower of the navy may place its efficiency in question. The Conference of Defence Associations is also concerned that we have almost abandoned measures for local defence, and have practically no mine counter-measures capability nor sufficient ships capable of performing surveillance and patrol in the extensive coastal waters of Canada. It cannot enhance Canadian sovereignty to have mine-sweepers coming to Halifax from the U. S. A. for exercise purposes, particularly when in an emergency support is unlikely to be available.

With respect to the Maritime defence task, Canada has the longest coast line of any nation in the world and faces on three oceans with the Arctic being an area of great strategic, as well as economic, importance. Like the Arctic, our coastal waters must be deemed to include the continental shelves, and the

areas over which we claim jurisdiction in respect to fishing rights. Canada's sea front is a vast area.

The Conference of Defence Associations urges that a program should be embarked on to give our maritime force the capability to cope with the functions of local defence by building a suitable type of unsophisticated vessel.

Sea transport is important and the question of providing sea-lift for the ground forces cannot be ignored. This task is primarily the responsibility of a merchant marine, as is the case with the U. S. A. and Great Britain. Although Canada now has very few deep-sea ships registered under our flag, the need for sea transport still exists. This is particularly obvious if much heavy equipment is to be transported, and in this regard the Americans have found that 98 per cent of what is sent to Vietnam has been carried by ships. Thus while a merchant shipbuilding programme would not necessarily be chargeable as a defence expenditure, it is certainly one aspect of maintaining mobility for the forces. On several UN peacekeeping missions, recourse has had to be made to the use of highly

● 1605

specialized aircraft carrier which, of course, effectively eliminates the purpose for which that vessel is maintained.

We understand that since the date of this brief the matter of the merchant service is now under study, and we hope that the national defence aspect will not be ignored.

Concerning naval reserves, normally ships do not carry a full war complement and a pool of reserves is available to fill the vacancies in complements. Furthermore, the control staff and other shore installations make demands on manpower in an emergency. The manning of a proportion of small vessels required for patrol, or local defence is a task which might well be entrusted to a certain degree to the reserves, especially in coastal communities. This policy has been followed with other maritime nations which results in a ship availability approaching that achieved for army reserve organizations such as Switzerland. In view of the high cost of maintaining Canadians in uniform, this alleviation of cost while maintaining effectiveness is recommended.

Against the declining strength of the maritime forces with the attendant reduction in maritime capability, the Conference of Defence Associations supports the concept of a Canadian maritime force with a strong reserve component.

The RCAF emerged from World War II with a distinguished reputation of having followed the singular achievements of Bishop, Collishaw, Barker and Brown in World War I. Canada's contribution to

air warfare progressed from solely individual achievement to self-sustaining air forces for strategic bombing, air defence, air transport and tactical air support. In fact, the RCAF acquired the sophistication to join in NORAD and NATO.

Our Air Forces are committed to the support of international agreements like NATO and NORAD, based on the concept of collective security. Our NORAD membership also protects our sovereignty in helping us to challenge intrusion of our airspace, and to augment the means for surveillance of our coastline and national boundaries.

Canada does not require a configuration which would permit us to "go it alone" in a war, and the Conference of Defence Associations supports the concept of collective security with a posture complementing the structure of the combined air forces of our alliances. The air instrument contributes to the means of preserving our sovereignty within these alliances.

With regard to Canada's aviation industry, the RCAF pursued a policy of aircraft designed and built in Canada, based on the lesson of World War II when the lack of an aviation industry in Canada sometimes denied Canadian airmen the best quantity and quality of equipment required for its roles. These industrial adventures became economically burdensome and politically unpalatable, and contributed to the lack of sympathy for air forces which are costly both in terms of capital equipment and technical support.

It is logical that we standardize our aeronautical weaponry with the United States on the grounds of economic supply.

An objection to such a policy could be anticipated from the Canadian aviation industry who might assume that it would be put out of business. The cost of U. S. military aircraft would be much less through volume production than the cost of a comparable Canadian aircraft. An arrangement like the auto pact would allow the Canadian aviation industry a share of military aircraft production resulting in economies for both the U. S. and Canada.

Our inventory of military aircraft is approaching the twilight of its usefulness, and planning is required to meet attrition. It would be folly to embark on an independent program for replacement without considering the requirements defined by SACEUR, Commander-in-Chief NORAD, and SACLANT. Whatever these might be, Canada should attempt to obtain roles which would permit the use of a "multi-purpose aircraft" which is not, to say, an all-purpose aircraft.

The Air Reserve has proven its ability to man sophisticated equipment ranging from high performance fighters to tactical utility transport. When there was a naval air Reserve, it also showed its capability of operating carrier borne ASW aircraft. The

adeptness of the Air Reserve was further demonstrated in the build-up to an operational status within Air Defence Command. The operation of these radars, and the control of air defence missions by personnel of these units showed the technical adaptability and capability of the citizen partner in the RCAF.

● 1610

Under the adopted NATO concept of "flexible or (conventional) response" and the success of the nuclear deterrent, the value of effective reserves becomes credible. The Conference of Defence Associations believes that "One thing seems almost certain. If nuclear general war becomes less likely, lesser forms of warfare become more." This was a quote from General Sir John Hackett. We urge the maintenance of a reserve response to the Regular Force for conventional warfare.

NATO AND NORAD

To preserve the solidarity of NATO's air warfare capability, it is essential that Canada's Air Division remain in Europe and that it have a nuclear capability in both support and strike roles.

Our air component in Europe represents a significant part of the NATO deterrent. Although numerically the Canadian Air Division may not be a formidable force, the high quality of the Air Division has consistently been demonstrated. An example of this is the fact that it has won the annual air weaponry competition among all the NATO air forces for many years. The achievements of the Air Division has established it as the "elite" both to the potential enemy and to our allies.

Any reduction in this force would be cause for grave concern to our allies in creating a gap in the NATO air capability far in excess of the apparent numerical loss.

CANADIANS AND THEIR COUNTRY

Canadians can no more live by giving to foreign aid, and by doing without a defence force, than can good people live by giving to the Red Feather, and by doing without a police force.

Because of our diffuse and sparse population, Canada must build up her Reserves as have the governments of Sweden, Israel and Switzerland. Indeed it is in the Canadian tradition to abhor compulsion and to adhere to the type of voluntary participation which constitutes our Reserves.

In summary, the Conference of Defence Associations believes that:

- (a) Canadians want world peace and are prepared to pay for their role in the maintenance of it. For the foreseeable future there will continue to be threats to world peace.

- (b) Our support of collective security arrangements with NATO and the UN contributes to the maintenance of peace and stability and we must continue to support and participate in them.
- (c) Canada does not want a "free ride" and should continue to provide forces to the active defence of North America and NATO.
- (d) Collective defence and security arrangements make eminently good sense and are the most economical way for Canada to pursue her national aims.
- (e) An alert, well-equipped and well-led reserve force based on regular support and participation is a necessary and logical adjunct to our regular forces in being and, in addition, provides young Canadians with that degree of identification in the affairs of our country which is so earnestly desired by our leaders.
- (f) Finally, Canada cannot opt out of participation in world affairs. By geography, heritage and economics, she is involved and she should continue to be involved because involvement is in Canada's vital interest.

As I mentioned earlier, we would like to make a comment in connection with the matter of the reserves and the financial constraints, referring in particular to the Reserve Force. If the financial constraints result in a reduction in the armed forces, the Conference of Defence Associations recommends the greater use of reserve forces to fulfil those unsophisticated functions that are currently being performed by the regular force. The cost of maintaining reserve persons in such functions would be approximately one-sixth of the cost of maintaining regular persons in the same functions. This policy is currently in effect to some extent, but we are recommending further extension of the policy. The advantages of this concept are manifold, some of which are:

● 1615

- (a) Maintenance of an effective military posture at a reduced cost.
- (b) Participating patriotism from a greater involvement by citizens of all geographic regions in Canada.
- (c) The exposure of our young Canadians to an imaginative and stimulating adventure in a disciplined environment.
- (d) To develop a greater sense of unity and national responsibility by involvement of Canadians in a national program.

We believe that it behooves the government of our country to explore in depth the attractive possibility of realizing our country's national aims and aspirations to an increased reserve contribution.

Mr. Chairman, that concludes the formal part of our presentation. We are available to answer questions.

The Vice-Chairman: Are there any further submissions from the officers who are with you General? If there are none then we will . . .

Brig. Gen. Howard: None at the moment.

The Vice-Chairman: . . . proceed with the questioning. The list I have is as follows: Messrs. Harkness, Gibson, Forrestall, Winch and Legault. Mr. Harkness?

Mr. Harkness: Yes, Mr. Chairman. You have no doubt noted that it has been announced the strength of the regular forces is to be reduced by approximately 10,000, which will bring their effective strength down somewhere between 85,000 and 90,000 men. In view of this reduction, and what you have just said in regard to making up the deficiency thus created by an increase in reserve forces, have you made any estimates as to how much the reserve forces should be increased from their present limit of 35,000 in order, we will say, to fill this gap to some extent?

Brig. Gen. Howard: Mr. Harkness, I cannot give you a detailed estimate. Those of us here today are satisfied that an analysis should be made to look at the operation of the regular force with a view to their possible reduction and see wherein the reserve forces, possibly in base operations and elsewhere, could do the same job with no standby time being paid. I cannot tell you the numbers at this time that could be done but we think that a concerted effort should be made to study it and we think the numbers would be considerable.

Mr. Harkness: Have you any views on where the emphasis should be placed in regard to any increase in the reserve forces whether the sea, land or air components?

Commodore J. W. F. Goodchild, CD: Mr. Chairman, I think the answer to that question involves different considerations affecting the three environments you might say. From the naval point of view, or from the Maritime Command point of view, the Naval Reserve responds to the needs of the Maritime Commander. In other words, the Maritime Commander has made a study and has said, "For my war plan I need reserves in the following billets," and it is this requirement to fulfil the needs of the Maritime Commander that dictates the complement of the naval reserves. Those who serve in the Naval Reserve have a general idea to which billets they will be posted in the event of an emergency. The situation here is possibly somewhat different, a little more refined because of a smaller number than obtains in the other two environments.

● 1620

Mr. Harkness: Do you feel confident that if a strength increase, say, of 15,000 were authorized to bring it back up to the previous authorized strength of 50,000 that you could raise these forces?

Brig. Gen. Howard: Mr. Harkness, I believe it can be done if it is combined with an increased challenge and opportunity for the people in the reserve forces; I think they go hand in glove.

Mr. Harkness: That brings me to the next question which arises from the phrase down toward the bottom of page 8 where you say: "... much can be done to increase the effectiveness of the reserves." What are some of the things which you gentlemen believe can be done to increase the effectiveness, which, of course, would also tie in with increasing the willingness on the part of men to serve in the reserves?

Brig. Gen. Howard: General Charbonneau would like to comment.

Brigadier General J. P. Charbonneau (CD ADC, Montreal, Quebec, Vice-Chairman, Conference of Defence Associations): Mr. Chairman, to increase the interest and to reduce the attrition of reserve forces, there is one glaring area which should be looked at. The equipment is just not there; we are still training with 20 year old equipment. Any of the new equipment is sometimes shown to the people with a red sign saying, "Do not touch or handle in any way". The regulars, apparently, are restricted as to the availability of this equipment; therefore, the raw reserve recruit, although he has heard about all this, never gets to see it and soon loses interest. I think if you had the equipment on loan, or what have you, I think you would see quite a bit of renewed interest. Equipment is one factor.

The other factor, I think, is that the reserve being commanded by their own people could be established without the stringent requirements that are sometimes imposed in the regular force. It would certainly take much longer to train a reserve person than a regular force person, but that has to be taken into consideration and some patience shown. I think the equipment and the leadership and the pay incentive, although it only amounts to one sixth of what we consider in regard to the regular, would be quite enough to have and keep this increase we are talking about.

Mr. Harkness: I have only one other question arising from a phrase on page 11 in regard to the "Maritime Defence Task" in which you urge a program of emergency.

What would be the approximate number of personnel required to man this unsophisticated type of vessel you are talking about?

Commodore Goodchild: Mr. Chairman, we are getting into a technical problem here but I would visualize the cutter-type vessel to be somewhere in the 275 to 300-foot length with perhaps a crew of 10 to 15 officers and 175 to 200 men, depending upon the nature of the operational commitment.

Mr. Harkness: Would you envisage a great majority of those being reserve personnel?

Commodore Goodchild: We would envisage a substantial number of them. Even today our fleet has a considerable number of reserve personnel serving with it. If my recollection is correct of the last winter exercise, the fleet had approximately 130 reserve personnel serving with it in the Caribbean this winter. Of course the less complicated the vessel, the more use you can make of reserves. If the hydrofoil development turns out appropriately, although it is not the most unsophisticated vessel, it might be suitable for coastal work and, of course, it carries a much smaller crew than a destroyer or cutter-type vessel.

Mr. Winch: It only carries 25.

Commodore Goodchild: That is right.

The Vice-Chairman: Have you finished, Mr. Harkness?

Mr. Harkness: Yes.

The Vice-Chairman: Before we pass to the next questioner, I understand that Colonel Howard would like to add to an answer to one of Mr. Harkness's questions.

Colonel B. A. Howard (CD, Toronto, Ontario, Honorary Assistant Secretary, Conference of Defence Associations): Thank you, Mr. Chairman. I would like to comment on the potential contribution of an air reserve. In order to do this I might just refresh some memories with regard to the Air Force Auxiliary contribution subsequent to World War II, when the force numbered in the area of 2,500; I might add that it now numbers 840. During that time it maintained 16 front-line fighter defence squadrons, and were the first jet equipped squadrons in the country. I do not think this is inconsistent with our allies utilizing reserve personnel in "building a suitable type of unsophisticated vessel" for local Maritime patrol and so on. What type of vessel do you have in mind?

Commodore Goodchild: Mr. Chairman, this is a technical problem, I am speaking personally here, and my own opinion would be something similar to the United States Coast Guard cutter which does have an ASW detection capability, but at the same

time does not have the sophisticated equipment that is presently installed, and will be installed, in the new DDH's. I also think very close co-operation between the naval forces and the department charged with the operation of ice-breakers to protect and patrol the Arctic seas to the extent that they can be used for that purpose would be desirable. It may even require the use of armed ice-breakers in order that Canada can enforce its sovereign rights over those parts of the Arctic waters that are claimed by Canada, as well as those parts lying over the Continental Shelf and in the coastal parts of Canada.

We do not feel it is essential for this surveillance duty to use the most sophisticated type of AS vessel

• 1625

that might be required in time for war or other front-line situations. Where air reservists cannot be used are in environments which require, by the nature of the environment, full-time patrol-type occupation or employment. Maritime considerations, remote deployment such as the Air Division in Europe are obvious areas which cannot be fulfilled by air reservists, but the degree of sophistication within the capability of the air reserve is of a relatively high order. The build-up of personnel and the number of air crew that is available by virtue of previous cut-backs in the regular force, would be sufficient to take on a significant contribution. The exact nature of that, however, would have to be determined by the professionals who determine the exact tasking and the degree of urgency.

Mr. Forrestall: May I ask a supplementary, Mr. Chairman, and I will give up my place in the order of questioners. It was essentially that phrase that caught my attention. I would like to pursue with the Commodore, if I may for a moment or two, the general line of Mr. Harkness's questions. Commodore, would you care to comment in light of the interpretations that have been placed upon the Prime Minister's statements in Calgary in April, in which he dealt with the surveillance of our coastal and territorial waters, in terms of the capacity of this extra fleet that you see to do any work in our northern waters. I ask the question

• 1630

from the point of view of support. For example, would you envisage this requiring the opening or the establishing of support bases in our northland, or indeed would you see this type of craft as being operational up there at all, or some modification of this type of craft.

Commodore Goodchild: Mr. Chairman, obviously the most successful Arctic patrol vessel is probably a nuclear submarine, but the cost of this for Canada, I think would be prohibitive. The next best operational vessel would be some form of icebreaker, possibly

an armed icebreaker, as I mentioned. Whether or not this would require bases in the Arctic would depend to some degree on the extent of the operational commitment. The ice-breakers that do operate, operate out of southern ports, and the commitment and the amount of traffic passing through the Arctic will presumably depend upon the results of the Manhattan project that has been happening this summer.

Therefore, it is very difficult at this stage—and I am now speaking personally, as an observer of this—to decide what the nature of the requirement is. Presumably it would be in the form of armed ice-breakers, and would depend upon the nature of the operations that were being carried on in the Arctic.

Mr. Forrestall: When you speak of the armed ice-breaker, would you extend your thinking to include the possibility, or the desirability, of the Department of National Defence taking over more than an indirect operational control of perhaps all of the Department of Transport and the oceanographic institutes vessels?

I ask that question because the Canadian government must have 300 to 400 ships under the Canadian flag. It is the largest Canadian 'armada' ever amassed; and the Canadian navy has a rapidly dwindling fleet. For the purposes of the build-up and the maintenance of the reserve, have you given any consideration to this as a possible, or desirable, direction for the government to take?

Commodore Goodchild: Mr. Chairman, probably I can best answer that question—and here again I am speaking personally—by saying that the *Labrador* started out as a naval vessel, and I know personally that reserve personnel from time to time served in *Labrador* and obtained considerable Arctic experience serving in that ship.

I do not feel at liberty to comment on inter-departmental policy of the government.

Mr. Forrestall: You are involved. Why not?

Commodore Goodchild: My own impression would be, of course, that I would like to see ice-breaking under naval control. I think it would possibly be more effective to have the vessels under one operational control than split between two departments. This is my own personal opinion. I think it would lead to greater efficiency. And it certainly would provide more vehicles for employment of reserve personnel.

Mr. Forrestall: Thank you very much.

The Vice-Chairman: Mr. Gibson?

Mr. Gibson: General Charbonneau, I wish to ask you some questions on the reserve army, first of all

in relation to current recruiting in the reserve army. Have you any information on the present state of recruiting in the reserve army? In other words, are those units that are seeking recruits able to get them or not?

Brig. Gen. Charbonneau: I can speak for the region where I operate, which is the Province of Quebec. The recruiting program is done individually by units. It is not centralized. We found that when it was centralized across the country it did not bring results. It is actually an individual, the officer com-

Mr. Harkness: But in the case of some other corps, they are not spread around in the regular force units? They actually go and fire as units?

Brig. Gen. Charbonneau: That is right; or as groups of trained militiamen.

Mr. Gibson: I would like to continue a little further on this, sir. You mentioned the Province of Quebec. From your knowledge and experience, and from discussing it with other officers, do you feel there is a fairly common standard in the reserve units throughout most of Canada, from Victoria, B.C. to Halifax?

Brig. Gen. Charbonneau: I think, generally, the same problems exist. As an example, in rural areas you get a number of other ranks or men, and in cities you get a preponderance of officers—sometimes more officers than a unit really needs. The professionals tend to go to the urban air.

The problems are the same across the country, I would say, in general, yes.

Mr. Gibson: Are you in favour of the government's current plans and policies in relation to Royal Military College and collège militaire, of graduating fairly large numbers of cadets as officers into the services each year? Do you think this is a good policy?

Brig. Gen. Charbonneau: You ask this as a personal question?

Mr. Gibson: Yes sir. That is right. Is it working out?

Brig. Gen. Charbonneau: You mean the rate of retention?

Mr. Gibson: Yes.

Brig. Gen. Charbonneau: I do not think it is working out to the satisfaction of those who conceived the plan. But I suggest that there would be a closer relationship between these cadets, that they have some sort of affiliation to specific regiments of the general geographical area from which they come and that through being knit closer in their course, they might, if not to the regular forces, contribute quite a bit to the reserve. This liaison between regiments across the country and RMC or CMR does not exist now.

Mr. Gibson: Thank you very much.

The Vice-Chairman: Mr. Winch?

Mr. Winch: Mr. Chairman, I find this brief by the Conference of Defence Associations most interesting. I

● 1635

manding the battalion, who invents,—because he has to—means of attracting recruits.

There are ups and downs in the recruiting graph during the year. The spring always is good because there is summer camp, where there is a bit more equipment. There is canvas and there is fresh air and there is pay over a certain period of time. I am talking about young Canadians still studying.

Mr. Gibson: Is the policy much the same as it was when some of us were in the army after war and were still in the reserve, with two weeks at summer camp and the infantry training that was given in the infantry battalions?

Brig. Gen. Charbonneau: Yes; except that you now sort of skim the cream off the top and you send all the trained soldiers to a group which is in direct support of Mobile Command. Therefore, the advanced class, if you like, trains company by company to be on the first-line reinforcement for Mobile Command. The identity of the unit at camp is pretty much subdued and the groups, by qualification, are put together and trained on that basis. But they do go back to their family or their regiment. However, it is the same problem as always, with less equipment than we used to have.

Mr. Gibson: And from your knowledge, sir. . .

Mr. Harkness: May I ask a supplementary, Mr. Gibson?

Mr. Gibson: Yes, certainly.

Mr. Harkness: This does not apply, does it, to artillery units? They still fire as batteries?

Brig. Gen. Charbonneau: They are still firing the guns they had during the 1939-45 war—when there are guns. Regiments at times have one or two guns—and when there is ammunition.

could ask a vast number of questions, but I will restrain myself, sir, because I know if I do not you will be after me.

First of all, I wish to refer to page 8 of the brief where the statement is made:

Economies must be found in the defence effort but if that fails the budget must be increased.

I am interested in the remark that "economies must be found in the defence effort". Mr. Chairman, we have before us four of the pretty high brass, Brig. Gen. Howard, Brig. Gen. Charbonneau, Commodore Goldchild and Colonel Howard.

● 1640

Will one, or all, of you tell us, first of all, whether you have any recommendations to make to this Committee about where economies can be made in the defence effort? You made this statement. Have you any recommendations to us on that matter?

Brig. Gen. Howard: Thank you, Mr. Winch.

Brig. Gen. Charbonneau: You may not be aware of exactly our responsibilities.

Mr. Winch: No, I am going on what you know.

Brig. Gen. Charbonneau: As reserve officers we advise the regulars but we have no access to budget deliberations. There is a militia vote, Mr. Harkness surely remembers that, and we are told there are so many man-days to train so many people and we have to do the best we can with that. Concerning economies, we are not entitled to go in and say we should reduce the temperature in this armoury down to 65 or 60 and therefore save. We are not equipped to do it. We advise strictly on the training end. As individuals, I think personally, if I might answer that, I find that periodically a revision of all establishments usually uncovers a little fat and . . .

Mr. Winch: Are you prepared to tell us where that fat is now? We would be interested in that.

Brig. Gen. Charbonneau: From the reserve standpoint we feel that some reservists, I will take an example, drivers doing specific hours could accomplish this task as against standby drivers who are obviously paid on a regular scale basis. This is one small example. There are administration functions that could be done at night by reservists, thereby training them into the inner workings of the paperwork. This could be done.

Mr. Winch: Oh, I am sorry. I am sorry there is a misunderstanding here. I was basing this on your statement of equipment where it sets forth that 25

per cent "The White paper sets out that the budgetary objective for provision of hardware" that is the entire armed forces, 25 per cent now reduced to 12 per cent and then you definitely stated "Economies must be found. . ." You are not just discussing there, I presume, the reserves, you are discussing the total defence effort and the fact that the budget now only makes provision for 12 per cent on equipment. So my question was based on that. Have you any suggestions to make because of your statement that economies must be found, any recommendations of where we can make them, in order to increase our 12 per cent on the purchase of equipment? That is the point, sir, that I was after.

Brig. Gen. Howard: Mr. Winch, part of the problem, or the answer maybe, is as General Charbonneau has said that we are convinced there is an economic problem. We have in the Canadian Armed Forces a very large plant in effect on standby that we believe—I cannot delineate these for you at the time but we think they can be delineated—could be reduced in cost by using reserves; it may well be by using civilian or contract operations with civilian organizations. From a businessman's approach, it may be that we have a lot of plant that is not being used to its full capacity.

Mr. Winch: Do you probably mean too many chiefs compared to Indians?

Brig. Gen. Howard: This could well be a field that should be looked at.

Mr. Winch: Thank you. May I now, then, come to what I think is a most important matter, Mr. Chairman, and if I am wrong I know that our four witnesses will correct me. My interpretation of the entire brief is that you do not think there should be any reduction in our NATO commitment and forces. In part, I base my interpretation on page 14, where you state, and I quote:

● 1645

To preserve the solidarity of NATO's air warfare capability, it is essential that Canada's Air Division remain in Europe and that it have a nuclear capability in both support and strike roles.

If I take the entire brief, Mr. Chairman, and I am just tying that in as a point because we do have a separate brigade and air division in Europe, could I ask whether or not our witnesses with their experience from the Conference of Defence Associations have made a study of the change in Mobile Command? I would like to ask in particular whether any were present at the armed services demonstration at Petawawa last Saturday, where we, who were able to be present, saw the meaning of Mobile Com-

mand with the air force being the support of the Entity. Have you made a study of Mobile Command, and the new role of the air force and the army and do you think it is necessary to maintain 9,000 personnel armed in NATO, whereas it is my belief, and my interpretation, of government policy and military policy that we can greatly reduce it, not by maintaining our air division as it is now in Europe, which you ask that we maintain, but on this different basis of mobility and relationship between the army and the air force? Is my question understandable?

Mr. Barrett: I thought you were making a speech there.

Mr. Winch: No, sir, I am asking a question. I am sorry you were not at Petawawa.

Col. Howard: Mr. Winch, may I reply to that question?

Mr. Winch: Sir, any one of you could.

Col. Howard: Mr. Winch, the statement that has been submitted in this brief with regard to the retention of the air division is based on the present role that is assigned to Canada in support of the NATO alliance.

Mr. Winch: The present role.

Col. Howard: The present role. It is quite obvious that if the Supreme Allied Commander Europe elects to request a different role than is presently handled by Canada's Air Division obviously the equipment and numbers would have to be adjusted in light of that new requirement. The one thing that must be remembered is that mobility means the ability to move and Mobile Command with air power can move 400 miles now. It cannot move with the present ground support aircraft that it has in its inventory, or hopes to have to be able to support a limited conventional conflict, beyond 400 miles without taking them apart and putting them on ships.

Mr. Winch: Oh, I am sorry. I was going by what you said. I am going by what you said in your brief:

To preserve the solidarity of NATO's air warfare capability, it is essential that Canada's Air Division remain in Europe. . .

You did not say in a changed position or anything else. You just made a blunt statement.

Col. Howard: Yes. At the time of the preparation of this which was some months ago, Mr. Winch, it was prepared in light of the present roles assigned to Canada within that alliance. Obviously any change in circumstances would. . .

Mr. Winch: May I ask you, do you support the idea of Mobile Command?

Col. Howard: Yes, I do, sir.

Mr. Winch: You do?

Col. Howard: Personally I do.

Mr. Winch: May I just ask one further question, and I am sorry that Mr. Forrestall has gone because this might interest him. I had the privilege, and I want to say, Mr. Chairman, it was a privilege of being in Petawawa and seeing the exercises going on. It was one of the most fantastic things I have ever seen in my life and I want most certainly to compliment those who arranged it. Never in my life have I been so damn close to or talked to so many generals, whether they are called navy, army or air force, and I had some most interesting discussions.

● 1650

One point intrigues me very much, and I hope that the four gentlemen can perhaps assist me, because of my discussions there and because of what we anticipate is in the mind of the government about expanding North American defence. There have been statements made about going up to the Arctic. I was told that not one—not one—of our present navy ships or planes is capable of arctic work or surveillance, not even the four new destroyers or the two supply ships because the bow structure is not such as to be able to function, and that our aircraft—and I am speaking now of navy aircraft, the *Argus* and the *Tracker*—will have to be phased out by 1972, 1973 or 1974. They are finished.

Have you four gentlemen before us now, members of defence associations—and we appreciate your coming—given consideration to this factor of a greater North American defence moving into the Arctic when we do not have at the present time the ships with their bows or the aircraft able to undertake that? Have you given any thought to the cost and the types of ships and aircraft required if we do move into that field? I think that is a most interesting question, sir, and I would like to have the answer if you can give it to us.

Commodore Goodchild: Mr. Chairman, I think it is very obvious that a destroyer type vessel and a frigate type vessel, which the *DDH* is, are not suited for arctic work. They are thin-hulled and, as I have pointed out, the ideal vessel for arctic work is a nuclear submarine. As far as . . .

Mr. Winch: At \$53 million apiece we cannot afford it.

Commodore Goodchild: It is not the initial cost so much as the support logistics in setting up the com-

mand structure and the communications for the nuclear submarine which would really start to make the cost mount; so, as I suggested, perhaps what we should be considering is an icebreaker program. There are icebreakers already in existence and this is probably the next best type of vessel for operations in the Arctic.

Mr. Winch: Armed icebreakers.

Commodore Goodchild: Armed icebreakers if you intend to exercise sovereignty.

Mr. Winch: May I ask with what kind of armament?

Commodore Goodchild: Here you are getting into a technical field, but there are several types of armament. Here again it depends upon what you are going to try to do and what you will require to control your own area of the Arctic. At the moment . . .

Mr. Winch: What type of defence should we have in the Arctic? You say it depends on it. Have you any idea what type of defence we should have if we expand North American defence and Canada moves into the North? Have you any ideas on that, sir?

Commodore Goodchild: I have lots of ideas on that, yes indeed, Mr. Chairman. I thought I was trying to make them clear. If we are going to exercise surveillance, which I suggest we do, since we cannot afford the best we should try the second best, which is by means of properly equipped icebreakers. Also, there must be suitable aircraft in the inventory of the NATO nations. I do not purport to be an expert on aircraft . . .

Mr. Winch: United Nations or Canada?

Commodore Goodchild: I said NATO—in the inventory of NATO countries. Or an aircraft could be developed, but the problem of the exact type of equipments you require is one that would require a considerable amount of study by those versed in the technique of arctic operations. This is a very specialized field in which I do not feel I have the competence to give you a detailed answer and to suggest a ship design or an aircraft design that would be suitable for that purpose, but certainly it can be developed.

● 1655

The Russian probably lead the world in the development of icebreakers. They have some very sophisticated icebreakers. So do the Finns. I am sure they have aircraft also that are suitable for that type of work, because they try to keep their arctic sea lanes open as long as possible to pass ships right across the north part of Russia. But as far as saying to you that we should have this particular type vessel of this

particular design, I am just not competent to do that because this would require a study of the requirement. There is a lot of development work going on in arctic shipping and shipping design. As I say, the Manhattan project is one. The normal tanker is not suitable for arctic operations and the *U.S.S. Manhattan* is being restructured and rebuilt with a redesigned bow in the hope that it will become suitable for operations across the Canadian Arctic. They give it, I understand, a fifty-fifty chance of success. Whether it will be a success, the outcome of that event will be awaited with a great deal of interest among those who have studied the subject.

Mr. Winch: I have one more question, sir. Is it the view of your association that a proposal to change Canadian policy to expand North American defence, including the Arctic, is a reasonable one and one that you would support, even if the cost meant reducing our financial commitments under NATO and NORAD since we can only operate in Canada according to our economic and financial capabilities? What would be your opinion on that?

Commodore Goodchild: Was the question that it would obviate the release of funds to NATO and NORAD if we . . .

Mr. Winch: No. I mean that you take the view, which is now being discussed by the Cabinet in its investigation, of a greater emphasis on North American defence, which would necessarily include the Arctic, involving great expenditures both on ships and aircraft. Would you support that if it meant a reduction, because of our financial limitations, in NATO and NORAD commitments?

Commodore Goodchild: It would not reduce NORAD because the Arctic is part of NORAD; and it would not reduce our contribution to NATO because the borders of Canada are within NATO.

Mr. Winch: No, I am sorry. We do not have this expenditure on this type of aircraft and ships for that. Now if, as has already been pointed out by the Commodore, we have nothing now to do it and are expected to do it, and Canada has certain limitations in how much money it can spend, if moving into that realm meant that we had to cut somewhere on our contributions and it could be NATO or NORAD, would you support the movement into North American defence in the Arctic?

Commodore Goodchild: I would support any move that would bring more security to Canada, but I suppose that more security for Canada is more security for our allies in NATO and more specifically for NORAD because the Arctic is part of the NORAD area of operations.

Mr. Winch: That is my point. In order to do that you may have to reduce the direct commitment in Europe of our forces. Would you agree to a reduction there in order to do this?

Brig. Gen. Howard: Mr. Chairman, does Mr. Winch mean a direct commitment on site in Europe or the availability in Canada?

Mr. Winch: On site in Europe. In order to do this, on North American defence, with an improvement to our navy and our aircraft to take care, a greater participation in North American defence.

Brig. Gen. Howard: I do not think it is a matter of black and white, but within bounds I would think that the Conference of Defence Associations would be interested in expanding that field at possibly some changes in NATO, because we think they are tied together, really.

Mr. Winch: Thank you.

Commodore Goodchild: I might add to that, Mr. Chairman, from the maritime point of view, that your ships committed to NATO are also your ships that operate in defence of the Canadian waters, the Cana-

● 1700

dian sea approaches. In other words, your escort vessels, although they are committed to NATO in time of an emergency, are still the same ships that are patrolling off the east and the west coasts of Canada. When you ask about reducing a commitment to NATO, I presume you are talking about the pure commitment—

Mr. Winch: I am talking about our brigade and our Air Force on European soil.

Commodore Goodchild: It seems to me, Mr. Chairman, that we are getting into a very hazy area here and, as Brigadier General Howard pointed out, it is hard to put it down in black and white because although you have troops and aircraft in Europe, if you bring them back and keep them here in Canada they are still going to cost you something. Now if you are talking about eliminating the troops and the aircraft that are now in Europe entirely from the Canadian inventory—

Mr. Winch: No, I am thinking of a mobile command—about 3,000 men.

Commodore Goodchild: Then you would have to figure out just how much a saving this would be and I do not think in the over-all defence budget it would be a very high percentage.

Mr. Harkness: Mr. Chairman, might I just point out that the return to the Navy of the *Labrador* which was built, to begin with, to have a naval presence in the Arctic and the possible transfer of a few other ice-breakers would mean that we could have a Canadian naval presence in the form of a patrol in the Arctic at no greater cost than at present.

Mr. Winch: We are talking about armed vessels and surveillance vessels.

Mr. Harkness: All right. All you have to do is put on these same vessels a certain amount of armament and so on. So that the whole thing really, as far as the Arctic is concerned, could be carried on at very little increased cost to the taxpayer than at the present time by the operation of these vessels by DOT.

Mr. Winch: I would just add that my hon. friend here should recognize that on the hydrofoil the armament cost is \$10 million—for one ship.

Mr. Legault: Mr. Chairman, my questions are supplementary to those raised by Mr. Winch.

Did I understand that the four witnesses are all retired today? I am sorry but I arrived a few minutes late.

Brig. Gen. Howard: No, two of us are.

Mr. Legault: Would it be possible to know the present occupation and interests of those retired?

The Vice-Chairman: Would you repeat that, Brigadier General Howard?

Brig. Gen. Howard: Mr. Chairman, of the four present, I am active in the Reserve, being an advisor to the Deputy Chief, Operations and Reserves, for Western Canada. I am still in the Reserve.

Mr. Winch: I understand you still operate a business.

Brig. Gen. Howard: Oh yes. I endeavour to be a practising lawyer.

Mr. Winch: That is what I meant.

Brig. Gen. Howard: Brigadier General Charbonneau is in the same category. He is not a lawyer but an insurance executive from Montreal. He is the advisor to the Deputy Chief, Operations and Reserves, Province of Quebec. Commodore Goodchild is recently retired from the Naval Reserve and is a practising lawyer in Toronto. He was formally the Senior Naval Officer in the Toronto area. Colonel Howard has gone to Supplementary Reserve from commanding the Air Wing in the City of Toronto. He is an industrialist from Toronto. Of the four of us, there are two still in

the Reserves, one on supplementary and Commodore Goodchild is retired.

Mr. Legault: But all the witnesses have interests outside the military at the moment. The reason for my asking this question, gentlemen, is that the Committee

● 1705

is trying to search for something practical and, in my view, you are, in a sense, the wisemen who can advise us. However, such advice must necessarily, take into account all other considerations. Mr. Winch has brought out the expenditures that have to be put out. The brief, as it stands, sets out the ideal thing. If I was in agriculture I would certainly present a brief and ask for all the money necessary to put out the program that I want. Naturally Defence is interested in the best suitable situation that we could have. Being in business on your own, do you not feel that you have to take into consideration the question of expenditure and then bring about the best solution with the means at our disposal? This is what I had in mind when listening to your brief. We definitely all support what you have advocated here, but we have to be practical.

Brig. Gen. Charbonneau: We know what you are looking for. We are citizen soldiers and our time is given abundantly because we are interested. You are seeking from us our personal views or the views of the majority of our Conference on how we would go about it. If there remains with this Committee one thought it is that the Reserves can do a job at one-sixth the cost of regular forces. If you must reduce regular forces then we supply an alternative. We would go further, we would say that there is a pool of good will in Canada towards the Armed Forces, but the Armed Forces operate in such a closed club that the citizen soldier does not always get the co-operation that he feels he should get. If we could interest more Canadian young people, and I specify the very young, in a program of adventure training, call it what you want but something that is more than parade square drill—if we could get *les gens de Montréal ou de Québec* to train in the summer, say, in British Columbia, it would be adventure training. In this way we would gain because it would do something for national unity. A well-led program would be healthy for these boys. It would also produce a measure of summer employment which would perhaps obviate the need for many bursaries. In addition, it would bring the defence problem closer to every individual household in the country. This is not being done now. People look at defence and say: "That is for a special crowd". They are surprised to see that there are still people interested through a patriotic sense of duty in what is called "Canada", ready to defend it, to organize defence and possibly youth with the same sense of being Canadian.

Mr. Barrett: Could I have a supplementary?

The Vice-Chairman: A supplementary, Mr. Barrett.

Mr. Barrett: If a volunteer program did not function properly would you advocate a specific draft and suggest that we incorporate this thing in our defence?

Commodore Charbonneau: I think, politically, you would all be in hot water if you reheated that one. But I would say that incentives should be given. I will use an example. If a grocery store clerk wants to go and train for two months, why cannot his employer give him a leave of absence he would be paid by the army—and then he could be trained and callable at any time in case of emergency. However, I would not advocate conscription.

Mr. Barrett: The same here.

Commodore Charbonneau: Incentive would produce large numbers, possibly more than you could handle with the facilities that exist today.

Mr. Winch: Could I ask a supplementary on Reserves.

The Vice-Chairman: You have had your turn. Mr. Legault has been interrupted a second time now.

Mr. Legault: I would permit Mr. Winch to put his question and then I will continue afterwards.

Commodore Goodchild: I have a comment on a previous question, whether the members of the Conference have considered the economic implications of the brief. As pointed out by Brigadier General Howard's opening remarks, the Conference represents a constituency of some 30,000 Canadian men who are concerned with the problems of National Defence, but

● 1710

who carry on full-time occupations not involving defence and they come from every walk of life, from every part of the country. In the Conference there are academics, doctors, lawyers, actuaries, industrialists, and men from all categories of Canada's national life. They are certainly very much aware of the economic implications of what they propound in this brief. We admit that we are aiming at the ideal, but we are concerned and we think we should put forward our views about Canada's defence posture.

Mr. Legault: Commodore, the experience of the members of the Conference is of great value, and can be of great help to a committee such as this. But about 90 per cent of your brief is what we would expect to hear from the present active military establishment. This is the point I want to make. Because of your occupations, interests, and experience you can

indicate, as Mr. Winch had mentioned, where to cut off the fat. The suggestion made by General Charbonneau is very practical, but an entirely new mentality must be developed. Because of your experience in commercial and civilian life, you should perhaps offer practical solutions to these problems, rather than concentrate on the ideal goal which is sought by all.

Commodore Goodchild: Well, I can only say in answer to that, Mr. Chairman, that this brief offers opinions for consideration. I personally had a hand in drafting it, and I might say that suggestions for the draft were made by a number of persons, none of whom is actively associated with the Department. The brief was composed entirely by men who carry on full-time professions and occupations but who are seriously concerned about national defence and who feel that if we do not have national security, then all our national life can fall by the wayside. We feel very strongly on this point.

I would suggest to you, sir, that there is no implication that this brief was ghost-written by the Department. It is strictly a brief prepared by civilians who happen to have an interest and a concern in national defence matters.

Mr. Legault: Thank you.

Brig. General Howard: Mr. Chairman, we as a Conference would be delighted to have a further opportunity to investigate this field of greater use of reserves. But you must appreciate that being citizen soldiers, as General Charbonneau has said, we are initially not privy to many policy decisions. We really end up on the receiving end of the decision having been made. We think that maybe the Conference of Defence Associations can render a service to Canada in further exploring these fields the member mentioned. But, as I mentioned, we today are not in a position to take this apart piecemeal and show this Committee some of these things in dollars and cents. But we

● 1715

would go so far as to say that we think this group which we represent has the capability to do a fair job in looking at it.

Mr. Legault: There is no doubt in my mind about that, but I wanted to know about your position today with regard to being independent and being free to criticize and perhaps to suggest to us where this fat can be cut off. Some suggestions have been made, but I thought perhaps there should be more emphasis in the brief on that particular matter from your own experience in that field and your responsibilities today as taxpayers.

General Charbonneau: I agree that this would be very desirable, and we are willing to make up what we

think is a workable plan. We can not assume the regular duties of all the regular soldiers, but we can assume some. And we think that we could participate more in matters concerning defence.

Mr. Legault: Thank you.

Col. Howard: Mr. Chairman, a further comment that I would like to add to General Charbonneau's is that by virtue of a greater reserve participation there is a side benefit here that I think is a desirable feature in our national life, and that is that our young people would be identified with a national purpose. They would be exposed to a disciplined environment. These are points which have been emphasized by Brig. Gen. Howard. This gives them an opportunity to see the other side—the other point of view—and I think it might substitute for what otherwise are undesirable influences in our society today.

Mr. Barrett: Very well stated.

Mr. Thompson (Red Deer): I would like to discuss something about air reserve policy. You have discussed the army and the navy, but there is very little about air reserves. The expensive aspects of maintaining operational air reserve units have been brought to our attention. With the continuing technical sophistication of operational aircraft and the expense and difficulties involved in keeping up with such sophistication on a reserve basis, it has occurred to me that there is another role the reserve air forces could usefully play. Air transportation and aviation in general has in the past been of great importance to this country. Because of the nature of our country, and the distances involved, it is still important, and it will continue to be so.

It has been suggested that our reserve squadrons should be related not to operational functions but to training or, search and rescue or to small aircraft transport. Have you considered the possibility of a reserve air force carrying on an initial flying training program, perhaps under subsidy from the military or from civilian transport, and the training up to commercial license standard of young people who would form an air reserve corp, something like the Civil Air Patrol in the United States? It might even include not only basic training up to that standard but training in relation to soaring and search and rescue, including the

● 1720

possibility of air transport with the light civilian-type aircraft that are becoming ever more predominant. Have you considered this at all?

Col. Howard: Yes, the full spectrum of aviation employment has been investigated by the Air Reserve association and any tasking which would involve a greater reserve contribution is welcome. However, I

would like to refer to the initial assumption in your question that the cost of maintaining a reserve operational squadron is expensive, and therefore I assume from your question that you are seeking economic alternatives. The object of the exercise, in investigating any of these possibilities by the Air Reserve association, is not to find and make a work program for the reserves, either expensively or economically.

Mr. Thompson (Red Deer): May I interject to say that I am not looking for an economic alternative, I am looking for a realistic alternative.

Col. Howard: Mr. Thompson, the lesson that has been shown to us in the past is that operational squadrons can be manned by reserve personnel. In fact, a great preponderance of the front line fighter defence of the United States Air Defence Command is manned by Air National Guard. The cost of standing those fighters on defence on a reserve basis is much less than on a regular basis, provided they can be effective and operative. The Canadian air force auxiliary maintained 16 front line fighter squadrons shortly after the war. It was not until the regular force assumed those functions that they were disbanded. The sophistication required to operate them is inherent in the organization. The cost of maintaining them and their effectivity is realistic. The only time the air reserve cannot be employed in a front line operational task is when 24-hours a day, seven-days-a-week, service is required away from the reservist's home. At one particular stage in the history of the Royal Canadian Air Force Defence Command eight operational squadrons were on 24-hour standby around the clock and they were manned by Reserve pilots with operational airplanes. So, the capability of the Reserve to do this at a lesser cost is inherent in the structure. The full spectrum of aviation employment is welcomed with open arms by the air reserve, provided the criterion of effectivity is met.

Mr. Thompson (Red Deer): All right, I will accept your answer in regard to my preliminary statement but you have not replied to what I believe is—I was going to say “more”, but let me be fair about it—an equally important contribution that the air force reserve and the air force auxiliary can carry out, which is related to the other end of flying. I believe we have 55 Chipmunks left in this country and spare parts are becoming critical, and as far as I know the Chipmunk—and as I knew them at the end of the war—is pretty well going off the board. It is a real problem, as I see the training situation in the present armed forces. Why could the basic training that the Chipmunks have performed, and the obvious failure of *ab initio* training in economic terms, as well as in other terms, not be met to a large extent from a reserve basis? Why could it not apply to search and rescue as well?

Col. Howard: It can, Mr. Thompson. The search and rescue function was the responsibility of the air reserve up until a year ago. That was one of the roles or tasks assigned to the Air Reserve. I think you have to look into the nature of the beast when you consider employing a pilot in a military capacity to train pilots *ab initio*. If you have a pilot who is going to be employed in that fashion, he really does not identify himself with a military effort and he would just as soon go to the nearest commercial flying school and be paid a lot more for doing the same job for a commercial requirement. So, in order to stimulate the interest of air reservists they have to be identified with a purely military operational function. That is not to say that the Air Reserve does not have the capability of assuming this kind of role. However, if it was a major role, from my personal association—and this is not the position of the association—I would predict the demise of the Air Reserve through a lack of interest.

Mr. Thompson (Red Deer): But you have not researched this matter through, as far as the feasibility of such a thing as I am suggesting is concerned. I go back to what happened in Germany in pre-World War II. Look what we did in Canada during the early years of the Empire training scheme through the employment of civilians who could very well have been air reservists, could they not?

Col. Howard: Yes.

Mr. Thompson (Red Deer): Is this not something that we really should be considering on the same basis that we have been talking about, the militia, as far as land forces are concerned?

Col. Howard: Mr. Thompson, I again must revert back to the theme that you must have employment for these people which is of an operational military nature and which is associated with real . . .

Mr. Thompson (Red Deer): What do you mean by employment? I do not follow you; I am not on your wave length in that regard.

Col. Howard: Perhaps I can describe it by saying that these people are sophisticated pilots. I am sure a great many of you have flown with them while they were at the controls of an Air Canada flight into Ottawa. These pilots are not interested in being employed in training *ab initio* pilots.

Mr. Thompson (Red Deer): Some of them might be. I have a picture here of Captain Wendell Reid who takes off from the Montreal International Airport in his 1929 Travel-air biplane.

Col. Howard: He is retired, sir.

Mr. Forrestall: That is a pleasure.

Mr. Thompson (Red Deer): That is a pleasure, and he is pretty sophisticated because he flies a DC-8.

Brig. Gen. Howard: I think he checks out pilots on DC-8s, which I think is perhaps slightly different from a Chipmunk.

Col. Howard: Right now the air reservist is a very sophisticated air crew member who, by virtue of the standards imposed by the military, meets the operational readiness in the particular task he has, which is close tactical logistic support with Otters.

Mr. Thompson (Red Deer): That is your concept of one phase of air reservists. There might be another concept of them.

Col. Howard: I prefaced my remarks by saying that in the full spectrum any way in which these people could be employed and still have their interest stimulated is welcomed with open arms, Mr. Thompson, and I gave you my personal opinion that I felt the interests of these very sophisticated aircrew people might not be stimulated to perpetuate the Air Reserve if they were employed strictly within that capacity.

The Chairman: Mr. Forrestall on a supplementary.

Mr. Forrestall: From what you said a moment ago, Colonel Howard, you left me with the impression that you had a fear that we might lose the expertise that we have in our reserve corps. Under the present status, how soon would this spin-out take place?

Col. Howard: Unlike the militia, by virtue of having real hardware on inventory, the turnover in the Air Reserve is very low. The average age of our pilots is climbing, and with the present means of meeting attrition we can see the end of the road and steps will have to be taken to bring in younger and recently-trained pilots.

Mr. Forrestall: Do you mean now or within five years or within ten years?

Col. Howard: If I speculated at all it would be a personal speculation. I would say that the beginning of the dilemma is upon us.

Mr. Thompson (Red Deer): Mr. Chairman, I would like to suggest that perhaps there is a role for an auxiliary—call it an auxiliary air force, if you wish, rather than reserve air force—that would not only do a

force at the lower training level or search and rescue level or as we mentioned even light transportation to form what might be a civil air patrol like they have had in the United States.

There is just one further question with regard to the reserve military aspect and this is militia. I noticed in today's Toronto *Star* an article about one Randy Hardy, president of the Winston Churchill Collegiate students council who could not get a summer job so he joined the militia and he has gone to camp. It seems to me that if there is one source of inspiration and practical advice in the armed forces of Canada it should be the organization that you represent in proposing a realistic militia training program. My background is air force but I started in the militia. It seems to me this Committee would welcome a report from an organization such as yours that affects the whole area of reserve and militia training whether it is army, air force, or navy, and I have in mind the civilian organizations that are doing such a good job today through cadets. It seems to me this even involves the cadet programs because there are a lot of us, I am sure it includes some of you, who look back to your own training when you were teenagers in high school before you went on further than that when the cadet program meant a lot to you; it did to me. I would like to hear something like that from your organization; maybe not now but later on.

Brig. Gen. Howard: Mr. Chairman, we endorse completely the extension of summer training for the reservists. It is difficult to ask a young lad to take one week out of the middle of the summer to attend a training concentration when if it were not for that he could have been employed for the summer.

Mr. Thompson (Red Deer): Put him in for two months?

Brig. Gen. Howard: Right. We agree with that, Mr. Thompson.

Mr. Thompson (Red Deer): Might I ask one more question Mr. Chairman relating to NATO? I know it would interest your own support of Canada's NATO role. Have you given any consideration to a different aspect of a role for Canada's NATO contribution that rather than being a center-heavy contribution, as we have now both in our brigade and in our air division, would be what might be called a flanking role; a role that might be tied into the defence of northern Europe? It might be a very mobile type of force which would be ideally suited to our own defence needs in the northern part of our country; a completely new role for NATO as far as Canada's contribution is concerned, that would be more realistic here at home and more in keeping with our own needs.

Brig. Gen. Howard: That is our present system Mr.

• 1730

lot to encourage the whole aviation industry in Canada but would provide a tremendous incentive and interest to our young people who want to have a reason for flying and at the same time take over in a very economic way a certain function from the regular air

Chairman. We have an air transportable brigade tagged in Canada to go to the northern plant.

Mr. Thompson (Red Deer): I am thinking of an increase in that.

Brig. Gen. Howard: In fact all the armed forces of Canada are available for that same commitment.

Mr. Thompson (Red Deer): Yes, but the role of our brigade in central Europe can hardly be fitted into that category either as it relates to equipment or to the role that it fits as far as I understand the need in Europe. It seems to me there ought to be a chance for us to develop a much more suitable role for Canada beyond where we are even today, a flanking role I suppose.

● 1735

Col. Howard: If I may comment, Mr. Chairman, any role Canada could assume, perhaps more economically than the present roles, would be desirable provided that we do not lose sight of the main thing, that we subscribe to collective security and that we do not do anything unilaterally, that we do it in concert with our allies.

Mr. Thompson (Red Deer): The reason I suggest it is because I see that we are not doing that very thing. Perhaps if we were concentrating on a little different role we would have less difficulty in convincing certain aspects of military policy that we do have a realistic role.

An hon. Member: We might become believable.

Mr. Thompson (Red Deer): We might become believable.

Mr. MacLean: Mr. Chairman on a point of order?

The Vice-Chairman: Yes, Mr. MacLean?

Mr. MacLean: It may not be known to Committee members but there is supposed to be an organization meeting of the subcommittee following this and I am afraid that we will not be able to stay very much longer.

The Vice-Chairman: We have notification of a subcommittee on Maritime forces to be held at approximately 5 o'clock after the termination of this meeting. It is now later than 5:30 so if there are no further questioners I would like to be in a position to adjourn this meeting. Are there any further questions?

Mr. Winch: I will let my questions go, sir.

The Vice-Chairman: Thank you, Mr. Winch. We will sit again tomorrow morning at 9:30 but not in this room. We will sit in room 371 in the West Block and notices have already been sent out to your offices in this respect. There being no further questions I would like on your behalf to thank the officers who have come before us as witnesses from the Conference and tell them how much we appreciate their efforts and their patience in answering our questions.

Mr. Winch: I think you would be interested in knowing that the meeting which follows immediately—now four minutes late—is the organization of a subcommittee of this to go into depth on Maritime Command.

● 1737

Brig. Gen. Howard: Mr. Chairman, I would like to say we appreciate very much the opportunity of being present.

The Vice-Chairman: Thank you, General Howard. The meeting is adjourned.

APPENDIX HHH
DEFENCE OF THE NORTH AMERICAN CONTINENT
AND THE STRATEGIC IMPLICATIONS

by

Prof. Albert Legault, Queen's University, Kingston

In his working paper Lieut. General Sharp undertakes to paint an historic picture of the reasons behind NORAD. Pages two and three appear to me to be essential to a proper understanding of the problems dealt with. You will, then, permit me to complete this introduction by a wider presentation of the strategic facts involved in the defence of the North American Continent.

One must at the very outset try to understand the meaning of the word "defence". Then it is permissible to ask oneself "against what?"

Let us state a fact: the spectacular launching of the first Soviet Sputnik considerably simplified the terms of the nuclear equation. Indeed, since at the time we had no effective defence against the ballistic missile, the only possibly security lay in the capacity of the United States, in case of attack, to inflict on the adversary intolerable damage. The terms "first strike" and "second strike" appeared; populations became more than they had ever been in the past exposed to the menace of an immediate nuclear holocaust; meanwhile the military leaders became preoccupied, at the highest level, with the survival of their reprisal forces by burying them in concrete underground silos, if not putting them in submarines, and by dispersing them over vast geographic spaces, or in the oceans.

In 1969 the situation remains very much the same. The population is still as much exposed as it was in 1959, and the necessity for ensuring that reprisal force has a sufficient degree of assured survival (a concept that was expressed at the time of Mr. McNamara by the idea of "assured destruction") remains urgent. The eventual development of an anti-missile system, destined to protect American rocket launching pads from attack, proves in any case that we have in this concept a very live reality. It is not our intention to labour here the contradictory arguments that have been advanced to justify putting such a programme into its initial stages. Let us however retain the following point: we are not thinking of defending ourselves, much less of protecting the population, but of ensuring a sufficient back-strike to inflict on the adversary punishment to fit the crime.

The distinction seems to me important. Because, if in 1969 we are essentially preoccupied with setting up

a *defensive system* destined to ensure the survival of our *offensive forces*, we can quite properly ask ourselves what was the situation strategically at the time of the establishment of NORAD.

Let us keep in mind three arguments advanced by General Sharp on page 3 of his working paper:

- (1) "... an active air defence made penetration of North American air space by hostile bombers extremely difficult and costly".
- (2) "to guard against this danger (surprise attack) a detection system was developed to provide maximum warning for SAC bombers to get off their bases and be launched on retaliatory mission".
- (3) "the principal function of the air defences of North America during this period was to enhance the survivability of the U.S. deterrent forces (SAC) and to minimize the damage caused in any attack by destroying as many bombers as possible before they could reach their target".

In other words, the two great components of the equation were as follows:

- (1) To what extent would it be better to dissuade the adversary from any attack, through the capacity of the North American Continent to make the cost of aggression very high, if not prohibitive?
- (2) Or to what extent would it be better to dissuade the adversary by perfecting means of alert and survival of North America's own strike-back force, so as to be in a position, no matter what happened, to return blow for blow?

The first component was by nature distinctly defensive; the second was distinctly offensive. Now, as one should have expected, it soon appeared that hypotheses 1 and 2 were not at all contradictory, but that they were essentially complementary. So, they were combined in one: increase the degree of invulnerability of one's means of attack and set up a vast system of defence, destined to limit the extent of nuclear destruction. It was the easier to make a choice

favouring this third hypothesis because it was impossible to:

- (1) ensure the survival of our means of attack, and
- (2) develop a system of efficient defence without setting up a gigantic network of aerial detection.

General Beaufre, an informed expert in these matters, describes in a gripping way the period that we have just considered:

"American strategy hesitates, then, between several courses. Should we maintain dissuasion by an offensive reinforcement of the threat of reprisals, or, on the contrary by a partial neutralization of the adverse menace by creating an air defence in America? ... The great debate that opened up in 1955 ended in the defeat of offensives calling for the launching of a great programme of uninterceptable rockets. General Gavin, who advocated that solution, resigned. On the contrary, we were going to build a gigantic air defence covering America, we would develop the anti-surprise tactic of the SAC (alerted planes, etc) and we would provide it with intercontinental planes which, from the American fortress could escape the first Soviet attack ... The 1955 decision which achieves provisionally a certain stabilization, was clearly too conservative. It was to prove to be an error that would be a heavy burden on the next phase.

In 1957, the Soviets had the intercontinental missile ... they thus had a chance to catch up with, and to surpass, the Americans in the strategy of dissuasion, for the menace of their rockets could no longer be countered by the American air defence that had just been set up at such great cost and which was effective only against planes ... Strengthened by this situation, they relaunched the problem of Berlin ... and could enjoy direct defiance of the United States with regard to the Congo and Cuba"*

*General Andre Beaufre, *Introduction à la Stratégie* (introduction to strategy, Armand Colin, Paris 1963, pages 83-84

Is this to say that NORAD was the fruit of an error in assessment of the strategic situation at the time of its establishment? That would be saying a great deal, but after all, one could have evaluated better, at that same time, the superiority of the offensive compared with the defensive, and the consequences of it with regard to nuclear dissuasion. One thing is certain, the famous debate between the offensive advocates and the defensive advocates is far from finished. Two factors combine to becloud the issue.

The first, technical by nature, has already been mentioned. It is the absolute necessity, no matter 20551-4

what inclination one professes regarding the "defensive" or the "offensive", of having available a vast system of alert which alone can guarantee the survival of our means of attack, which means our nuclear strike-back. The temptation is, then, great, when one has available such a system, to join with it a defensive component whose effectiveness depends in practice, on the same military infrastructure. (a) (strike-back), alert, detection, counter attack, or (b) (defence) alert, detection and active defence, or (c) (defence-offence) alert, detection, active defence and counter attack. We find again here the three hypotheses that we brought up at the outset of this analysis. The reader has only to go back for an instant to the field of the anti-submarine struggle, to realize the complexity of the parameters of the equation involving such variable combinations.

The second factor is psychological. Both countries—the United States and the USSR—frightened by the apocalyptic vision of a world convulsed by the unleashed atom, made every effort to attenuate the effect, by taking shelter under the umbrella of gigantic air defences. In the case of the former country this was because it, for a moment, thought it could complete the horizonatal security that would confer control of the oceans by the setting up of a new vertical defensive dimension; in the case of the latter country it was because, for a moment, it thought itself menaced by capitalist encirclement and thought that war was inevitable. Now, technical progress caused such illusions to collapse.

Defence—or interception—makes no sense, in 1969, except to the extent that it works toward, not protection of the population, but reinforcement of the degree of invulnerability of our means of striking back. It is, moreover, in this context that we have put the American decision to proceed with the construction of the "Safeguard" system. Now, this system is at the same time contradictory and paradoxical. Paradoxical in the sense that we are ready to invest billions of dollars to protect our means of attack, whereas it would cost less to multiply them, or to bury them deeper in the ground. But also contradictory, because, after all, if the game is to be forever able to subject the adversary to identical devastation, it is indeed useless to multiply our means of nuclear interception, which will only add to the destruction already caused, or which is in the process of being caused, by the assailing nuclear heads. If, on the other hand, one contends that, no matter what the degree of interception-probability, to reinforce in this manner nuclear dissuasion by the fact that such an apparatus would be able to save human lives, then it would be more logical in the last analysis to build nuclear shelters.

Under these circumstances, either the American decision will prove to be an error in strategic appreciation, an error whose consequences will soon be felt, or

else the Americans are not telling the whole truth. In other words, either they do not see that they run the risk of being outclassed by their adversary in the race for strategic superiority or else they are aware of the risk but do not say so because they are completely convinced of their superiority. After all, one could not seriously think of having the luxury of a costly system of defence that could only be, in the present state of techniques, an immense accessory appendix and a superfluity, unless one is already convinced of the value and superiority of one's own offensive forces. In view of the number of experienced experts that surround President Nixon, it is difficult to believe that there could be any mistake on this point.

It is certainly in order to note, as General Sharp does on pages 8 and 9 of his brief, the considerable increase in Soviet defensive forces, but one cannot at the same time pass lightly over the comparable developments by the Americans. Indeed, all the present Minutemen (650 Minutemen I and 350 Minutemen II) will eventually be replaced by a third generation of missiles with multiple heads, each one with an independent guide system (MIRV). The same is true of the POLARIS rockets that will be replaced by a more highly perfected version, also with multiple heads—the Poseidon. If to that must be added the fact that it is highly improbable that multiple heads will be given to a rocket (the Polaris) that cannot also serve for attack purposes in first-strike, one sees that the Soviets have as many reasons to worry as have the Americans. Note too that American aviation also has at its disposal a system of multiple-head penetration, the SCAD (Subsonic Cruise Armed Decoy).

The multiple-head tips, although not revolutionary, represent an important technical development, no doubt comparable to the one that appeared when the gun was replaced by the machine-gun. All these reasons, and many more, which we have no time to deal with, show clearly that there is certainly no neglect, on either side, in perfecting means of offense. These are no doubt also the reasons that lie at the base of America's confidence in the quality of her offensive arms, which would explain why there is more disposition to talk about a "defence gap" (ABM) than of a new "missile gap".

What conclusions are we entitled to draw from this analysis of the evolution of modern techniques?

- (1) The value of defence or of interception varies according to whether it is a matter of defending one's self against bombers, submarines or intercontinental missiles.
- (2) Interception makes no sense except to the extent that it contributes to reinforce the degree of survival for our means of striking back.
- (3) Only the perfecting of our means of offense can guarantee strategic equilibrium.

- (4) In any case, a gigantic system of surveillance and detection is an urgent necessity.

It is with these considerations in mind that we now tackle the problem of "defence against what?". It is possible, in the present state of affairs, to distinguish four kinds of menace:

- (1) The bomber.
- (2) The sea-launched ballistic missile (SLBM),
- (3) The intercontinental ballistic missile (ICBM),
- (4) The orbital bomb (FOBS)

Let us, then, examine the type of menace posed by these systems.

(1) *The Bomber*

This threat varies depending if we are (a) in peacetime, (b) in wartime.

- (a) *In time of peace* the adversary has some advantage in approaching our detection system as often as possible, so as to:
 - (i) discover its weaknesses (defects in the armour);
 - (ii) analyse the rapidity with which we can react;
 - (iii) gain better knowledge of our systems of command and communications.
 - (iv) perfect his own instruments of penetration and of electronic jamming (parade, counter parade, counter-counter parade, etc.).

This type of menace presupposes that NORAD is able to detect the apparatus that is approaching, to identify such apparatus if necessary and to destroy it, if necessary. In other words this is a case of strict protection of our air space; each nation, in accordance with usual recognized principles of international law, seeks to protect its own air space.

- (b) *In wartime* the menace presents itself in a completely different light. Two hypotheses are worth remembering. Either one considers the threat from bombers taken independently, or else one considers such a threat in the context of overall strategy. The first hypothesis is itself divided into two sub-divisions:

- (i) interception for purposes of defence properly speaking, and
- (ii) interception with a view to reducing the rate of destruction and of reducing our means of striking back. Technical considerations have rendered obsolete the first sub-division. It is certainly possible to obtain a high rate of interception, but, considering

that a single bomb would be enough in most cases to obliterate an entire city, one can scarcely see any advantage in such a formula. Actually, it is toward protection of our means of attack that we have been orientating our efforts for a long time, that is to say, toward interception to reduce the rate of destruction of strike-back power. Here again one can scarcely see any advantage in such a formula, considering that the United States has neither strategic bomber bases in Canadian territory nor launching ramps for intercontinental missiles.

This leads us, then, to put the bomber threat into the context of overall strategy. Strictly speaking, it would certainly be conceivable to justify the setting up of a vast system of air defence, if the strategic stakes could be put into the one equation (dissuasion equals capacity of interception plus capacity of attack). Now, as we have seen, the intercontinental missile has completely changed the components of the problem. Indeed, the strategic situation remains stable as long as the "duopolists" can ensure survival of their means for striking back.

Under these circumstances. American rockets would have left their launching ramps long before, if ever a large number of Soviet bombers appeared over the Canadian frontier. It is certainly possible to conceive that a wave of attacking bombers would be preceded by an overall nuclear salvo aimed at destroying the American strike-back rockets. But this is a situation completely different, and one that we shall deal with very soon. The arguments advanced by General Sharp on page 11 of his working paper seem to me to miss the point. Indeed, with or without interception, it is improbable that the USSR would build more bombers in future, unless it were to meet other considerations of strategic interest that have nothing to do—or very little to do—with strategic equilibrium. Actually, the USSR could double or multiply by ten its flotilla of strategic bombers, without causing any change in the nuclear equation.

In brief, the maintenance of a system of surveillance and identification is an absolute necessity. This is the only context in which it would be rational to examine the advantages and disadvantages of AWACS (Airborne Warning and Control System) that is at present under study in the Canadian and American Capitals. Canada, for its part, should examine the advantages with a view to ensuring protection of her air space and of satisfying the requirements of American security with regard to detection and identification. If, on the other hand, the United States intends to complement this system by a vast defensive component (interception and destruction), it is not at all in Canada's interest to participate, unless Canadians can have, in exchange, major concessions either in the field of new interceptors, which Canadians must acquire in future

to assure protection of their air space, or concessions in other fields which need not be specified here.

(2) *Sea-launched ballistic missile (SLBM)*

The situation with regard to SLBM is today one of the most complex and one of the most difficult to straighten out. On the one hand, there are available very few elements to make appreciation possible, and, on the other hand, technical progress in this field is kept largely secret.

The best way to proceed with an analysis is no doubt to question oneself on the objectives and motives for Canada's participation in SLBM defence. Two main objectives are worth remembering here:

- (1) Ensure protection for our territorial waters.
- (2) Detect, identify and destroy, if necessary, enemy craft.

Here we leave aside the problem of protection to be given to marine convoys in time of war. Let us rather focus our analysis on the problems of force equilibrium and the problems of strategy.

Here, once more, it is quite evident that Canada does not participate in SLBM defence to protect its population and its industrial potential from nuclear attack. It is, on the contrary, a matter of protection given to means of intercontinental striking back, as possessed by our neighbors to the south. Now, detection, identification and destruction play here a primary part, for the warning period available to the American high command before striking back against a nuclear attack launched from missile-launching submarines, is much shorter than the warning available in the case of intercontinental missiles (which is something like from 15 to 20 minutes). Indeed the warning period could be reduced by three or four minutes, depending upon the trajectory of the missile fired from the submarine and the distance separating it from its military objective. In other words, the further the nuclear submarine has to fire to reach its target, the longer will be the warning period. All this means, then, that SLBM defence is today of capital importance, mainly along the seacoast of continental North America. We shall see why, in a moment.

One must however realize the political effects of our participation. On the one hand, it is quite evident that Canada thus becomes an entrant in the armaments race. Thus, exhaustion of the war budgets of the great powers is today one of the reasons most likely to lead to an understanding on the reciprocal limitation of armaments. The United States in any case is no longer at the stage where it has to count on the support of Great Britain, Greece and Turkey, in order to install American medium range rockets (IRBM, Thor and Jupiter). This means, then, that our participation in the anti-submarine struggle is seen more favourably in

Washington, and it means that we have in this regard some liberty of political manoeuvre.

Since it is also probable that the Russians will develop in future some attack techniques that will be quite comparable to those of America, it is quite clear that anti-submarine detection becomes daily more important, and that Canada's contribution in this regard is indispensable. Just as in the case of NORAD, this participation no doubt permits us to make more certain the protection of our sovereign space, in this case our seacoasts. Under these circumstances, the questions that arise in one's mind seem to me to be the following: To what degree does our participation in the defence against sea-launched ballistic missiles...

- (1) entail expenses greater than those we envisioned in the first place to ensure protection of our territorial waters?
- (2) permit some specialization in functions, which at the same time reduces the investment that would otherwise be necessary if we had to ensure territorial-waters protection alone?
- (3) is it greater than our participation in NORAD, or vice versa? In other words, in what sphere is our political bargaining position best?
- (4) is it for us something that will bring political influence equal to our participation?
- (5) could it evolve into a role that is wider, or even more specialized, upon condition that other factors be considered, such as prospecting of sea-bottoms and oceanographic research?
- (3) *Intercontinental Missiles and Orbital Bombs*

No effective defence has yet been found against intercontinental missiles and it is very probable that, even if such defence were possible, it could easily be "saturated" by the enemy's offensive forces. The same problem presents itself with regard to orbital bombs, although it would be quite easy to intercept them if they had to be put into orbit around the earth (which would be a violation of the United Nations Agreement prohibiting the orbiting of military objects). In any case, it remains true that what constitute the best protection against surprise attack, preventive war or anticipated (pre-emptive) attack, are still two factors: detection and surveillance (BMEWS and SPADATS). Canada participates only very indirectly in the two systems mentioned above.

As General Sharp has so well pointed out, "NORAD has a capability to detect, identify and give warning of ICBM and SLBM attacks against the North American continent. NORAD does not, however, have any capability to intercept or destroy ballistic missiles." It is hard to see what, under these circumstances, could be the advantages of Canadian participation in the new AWACS system, unless they be those we have already mentioned during our analysis but which are notwith-

standing, less important. Actually, only an effective defence against intercontinental missiles would justify the setting up of a vast air defence against the bomber menace. The result is that Canada finds itself in an excellent position for political bargaining, either to obtain compensations of a major nature in exchange for limited participation in such a system, or to continue, to diminish, or to enlarge, its participation in SLBM defence.

Although General Sharp has succeeded in demonstrating the indivisibility of the problem of defending the North American continent (his excellent description of the detection and surveillance systems shows clearly the indivisibility of the problem), we venture to believe that this brief study will also contribute to clarification of the overall strategy context, which must be understood if we are to be able to make a pronouncement on the soundness of Canadian participation in the security of the North American Continent.

A Proposal for Revising NORAD

The implied assumption in establishing and maintaining NORAD has always been that the S.U. is an aggressive power and the U.S. a defensive. This assumption is becoming less and less valid, so that in the dawn of the new decade of the 70's it should be revised. Canada must no longer implicitly prejudice the guilt of the S.U. and the innocence of the U.S., but rather treat both its great neighbours equally.

Canada's participation in NORAD is predicated on the assumption that it enhances the security of Canada. Canada's security however does not only depend on the security of the U.S. but also of the security of the S.U. It is therefore to Canada's advantage to contribute to the security of both the superpowers, and not side with one against the other.

As it stands now the *raison d'être* of NORAD is to provide a detection system which would warn the U.S. in case of a S.U. attack. The argument is that the vulnerability of the U.S. deterrent might serve as a temptation for the S.U. to launch a preemptive attack. To guard against this danger NORAD was developed to provide the maximum warning time for SAC bombers to get off their bases and be launched on retaliatory missions. The principal function of NORAD was therefore to enhance the survivability of the U.S. deterrent forces and to minimize the damage caused in any attack by destroying as many enemy bombers as possible before they could reach their targets.

Canada's role in such scheme is to act as a forward defence appendage of the U.S., rather than as an independent entity in itself. If Canada does not aspire

to anything more than being an American buffer state this role may not be very inconvenient. But if we are to have a state identity, we must look at our security in a wider context than North America. This context must necessarily include the S.U. as well as the U.S.

Canada's geographic position is such that the only threat to its territorial integrity can only come from either of the superpowers, and more likely from the South than from the North. So far we chose to secure ourselves by virtual subservience to the U.S. We could of course continue this policy and hope that the wisdom of our great neighbour to the south will save us from anybody else.

Another way however to maintain our security without sacrificing our independence would be not to put all our eggs in the U.S. basket. Without estranging our southern neighbour we should also cultivate our northern. Rightly or wrongly the Russians are just as afraid of an American attack as the Americans are of a Russian. Since in either case Canada, being in the middle, loses, our policy should be to make sure that neither is credible. So far we have helped the U.S. in minimizing such danger to itself, but this is only half the task. We should now offer the same services to the S.U. to increase their sense of security, and thereby improve the overall security of the world.

Specifically, Canada should offer reciprocal information to both the U.S. and S.U., and convert all detection facilities on Canadian soil to warn both sides. In other words widen the North American system to include Siberia in its defence perimeter. The new SINORAD would be able to detect, identify and warn ICBM; SLBM; and Bomber attacks coming from either inside or outside its security area. It would not have the capability to intercept or destroy any such attacks. Thus Canada should stay out of any ABM or other arms buildups. Such military defense arrangements ought to be left to the superpowers. Canada should be declared a nuclear free zone and all Bomarc Missiles withdrawn.

As a middle power at best, Canada cannot aim at an independent nuclear deterrent; its best defense is an amicable foreign policy and an imaginative diplomacy. Our defense policy therefore should be predicated within the greater principles of foreign policy. Only thus will we be able to avoid the danger of military considerations dictating our political interests.

P. J. Arnopoulos
May, 1969

COMMENTS

on

STRATEGIC WEAPONS SYSTEMS, STABILITY, & THE POSSIBLE CONTRIBUTIONS BY CANADA

This paper prepared by the Department of National Defence opens its argument with a fundamental error. As the title of its first part indicates, the paper equates Strategic weapons systems, stability, and the prevention of Nuclear War.

Thus on the second page the report speaks of a "solution" that "has been found, which not only preserved frontiers and prevented the use of nuclear weapons, but has permitted a considerable degree of detente." The grave error here is a classical case of *post hoc ergo propter hoc*. The argument goes that since nuclear weapons systems have coexisted with general peace in the past two decades, the former have caused the latter. Such blatant misuse of logic can hardly be excused in an official paper prepared by a government department.

It may of course be the case that the "mutual deterrence at the strategic level" has in fact prevented nuclear war. This case however is at best hypothetical. We simply do not know what are the causes of peace nor what constitutes the prevention of war. To say that Nuclear deterrence is responsible for world peace is to plead a one sided argument. An equally valid argument could be made by choosing any other fact present in the world and claiming that it has saved the world from holocaust.

The Department of National Defence could have chosen the United Nations as the saviour of the world, and there would be no way of disproving that something which did not happen (i.e. war) would have happened if something else did not exist (i.e. UN or nuclear deterrence). As it is the officials of the Department singled out deterrence and made a fair, if not an entirely convincing, case, on its behalf.

This however disqualifies the paper as an objective report of background information to be used by a legislative committee for its deliberations. In spite of its factual appearance, the paper is a disguised advocacy of a particular cause. It is quite obvious that the Department of Defence wants Parliament to endorse the present policy and continue voting funds for its extension into the foreseeable future.

It is for this reason that the first paragraph of Part I of the Report contains the unashamedly rhetorical sentence:

"If a 'solution' had been offered that would guarantee existing frontiers and prevent the use of

nuclear weapons, at the annual cost of 10% of the GNP in perpetuity, it would have been seized with gratitude and alacrity."

Is it any wonder that the Defense officials expect a grateful country to buy their guaranteed solution for perpetual peace and at such bargain instalment plan.

The military of course, know that the government is reviewing its defense policy so this paper is their plea for the *status quo*. Before we alter their proven solution for the sake of change per se, or allow it to slip away through neglect and preoccupation with other problems, they tell us to "reflect on the 15 years of peace, consider how badly (we) want another 15 years of peace, and what risks (we are) prepared to accept that an abandonment of a successful solution could lead to the loss of peace." Being put in such way what sane man would opt to risk the peace.

The military naturally enough, do not want us to be preoccupied with "other problems" such as "arms control", "non-proliferation treaties", and "comprehensive test bans" since these might rock the boat of the stable nuclear deterrent. The "stable deterrent" of course, has to be continuously fed by a perpetual arms race. The report does not tell us where will all this escalation lead the world. Just because we were able to live with such policy so far, can we live with it forever?

One wonders why the report consciously avoided presenting other methods of international relations including disarmament, peacekeeping, & collective security. If as the report claims, "nuclear deterrence is not the official policy of the Department", why was it this policy alone that was advocated and all others ignored. Perhaps the members of the Standing Committee should also raise these questions.

P. J. Arnopoulos
May, 1969.

The proposed U.S. ABM system—comment by Kenneth H. W. Hilborn, Associate Professor of History at the University of Western Ontario and contributing editor, *Canada Month* magazine.

In the controversy over anti-ballistic missile (ABM) defence, it is important to be clear about the definition of two terms—"first-strike" and "second-strike" capability.

"First-strike" capability does not mean merely the ability to unleash a nuclear attack against another nation similarly armed; any government with an

H-weapons stockpile and a delivery system can do that, if it is irrational enough to be willing to see its country annihilated by the victim's retaliatory blow. "First-strike" capability means the ability to initiate nuclear war as a rational act of policy—that is, without suffering more damage and casualties than the decision-makers on the attacking side would consider a tolerable price for global supremacy.

"Second-strike" capability means the ability to respond to an enemy's first strike with such effectiveness that the resulting injury could not be regarded as acceptable.

It follows from these definitions that in order to retain second-strike (deterrent) capability, the United States must prevent the Soviet Union from achieving a first-strike one. Mutual deterrence (the present "balance of terror") rests on two basic assumptions—that nobody has a first-strike capability, and that nobody imagines he has it. In other words, mutual deterrence depends on each side possessing second-strike capability, and on each believing (or at least fearing) that the other possesses it too.

There is more than one way in which a country can endeavour to eliminate a rival's second-strike capability, thus acquiring for itself a first-strike capability and upsetting the balance of terror to its own advantage. Obvious methods include:

(1) Strengthening of one's missile striking force in numbers, in accuracy, in power ("yield") of warheads, and in sophistication of decoys and other devices designed to thwart enemy detection systems and anti-missile defences. In any or all of these ways a potential attacker can improve his chances of wiping out much of an opponent's retaliatory forces before they can be launched.

(2) Deployment of an ABM system to protect one's cities from whatever retaliatory missiles the victim is still able to fire. (A retaliatory blow—a "second strike"—would have to be directed against cities; the prospect of retaliation against his missile bases would be little deterrent to a potential attacker, because in launching the first strike the bases would already have performed their function.)

(3) Civil defence measures, such as provision of fallout shelters, to reduce casualties from any enemy missiles that are neither destroyed by the first strike before being fired, nor intercepted in flight by ABM weapons.

The Soviet Union has been doing enough of these things on a sufficient scale to worry the Nixon Administration. In addition to developing their own ABM screen (now in place around Moscow), the Russians have been proceeding with large-scale deployment of a huge intercontinental ballistic missile (ICBM) known as the SS-9, which is believed to be capable of carrying either multiple warheads or a single warhead with a

yield as high as 25 megatons—equivalent to 25 million tons of TNT. Such a warhead is far more powerful than anything in the American missile arsenal.

If you intend merely to pose the threat of a retaliatory second strike against cities, thereby deterring attack, the only warheads you need are relatively small ones of the American type. To use an expensive SS-9 to devastate a city would make no sense; a smaller missile could do the job more cheaply. It seems, therefore, that the major SS-9 deployment can be explained most logically in terms of a Soviet attempt to achieve first-strike capability against the U.S. deterrent. The Americans have installed their ICBMs in "hardened" underground silos intended to protect them from nuclear explosions, but no hardening will suffice against a 25-megaton warhead delivered with reasonable accuracy.

Just as there is more than one way in which a potential attacker can seek a first-strike capability, so there are several methods which a potential victim can use to maintain his second-strike capability and thus preserve the balance. The most obvious are:

(1) Improvement in the concealment and mobility of one's retaliatory forces—in particular, a greater emphasis on missile-firing submarines in preference to ICBMs in fixed sites. But in the light of Soviet anti-submarine research, the present relative invulnerability of the U.S. submarine fleet may be only temporary.

(2) Deployment of more ICBMs, so that there will continue to be too many for the Communists to knock out in a surprise first strike even with the expanding missile force at Moscow's disposal.

This policy involves risk. A rapid increase in the number of American ICBMs might lead the Soviet régime to conclude that the *United States* was trying for first-strike capability. From the Western standpoint, of course, such a capability in American hands would be highly desirable; lacking it, and thus facing the prospect of perhaps 100 million dead from Soviet retaliation, the U.S. could not rationally launch a nuclear attack on the Soviet Union even in response to all-out Red aggression against Western Europe. But since U.S. public opinion is plainly in no mood to tolerate the expenditures which an effort to achieve true first-strike capability would entail, there is good reason not to give Moscow the impression that first-strike capability is the American goal—an impression which the Kremlin's hawks would doubtless exploit in arguing for further acceleration of missile production.

(3) Protection of existing ICBM launching sites with ABM weapons—the plan put forward by the Nixon Administration. Unlike an increase in the number of ICBMs, this step cannot be misinterpreted as part of a drive for first-strike capability. Whereas ABM defence for cities would help to blunt a Soviet second strike,

thereby contributing to an American first-strike capability, a similar defence designed primarily to shield missile sites is useless against the Soviet Union except for blunting a Russian first strike; thus, as far as the Soviet-American strategic relationship is concerned, it contributes only to U.S. *second-strike* capability. (After all, if the *Americans* had unleashed a first strike, the silos protected by the ABM system would already be empty.)

The probable effectiveness of an ABM screen is something that can be reliably estimated only by scientists with access to secret data derived from the most recent tests. Attempts by persons without such information to question the system's value are inherently unconvincing.

Talk about a danger from ABM fallout is merely puerile—if enemy ICBMs (especially SS-9s) were allowed to explode on target, the fallout would be immensely greater than that created by ABM interceptions. As for the view that an *American* ABM system would "escalate the arms race", the view is one that makes no sense whatever—in the light of the fact that the *Soviet Union* has *already taken the initiative* in the ABM field.

I conclude that the deployment of the ABM system proposed by the Nixon Administration would be a wise precaution for the security of the American strategic deterrent, and thus for the security of both the United States and Canada. Any Canadian official stand on the ABM question should be based on that reality.

Comments on Working Paper on NORAD

The following is a brief critical evaluation of the working paper. As requested, reference will be made first to its objectivity and contents, at least in part, and then an alternative method of analysis will be suggested.

There has been no attempt to discuss the 'extremes' of policy, i.e. independence/neutrality or total dependence/integration. To do so would involve considering Canadian Foreign Policy almost in its entirety. Whilst this has to be done in order to place the NORAD question in perspective, the underlying premise of the working paper—continued Canadian-U.S. defence co-operation of some sort—has been accepted.

Criticisms

The study assumes that "the air defence of North America is a single indivisible problem." This can be challenged on the grounds that as long as Canada plays a role in *detection* she need not maintain interceptor

and missile forces as these would draw Soviet fire which otherwise might not be directed at her. However, one can reject this line of thought (for political as well as military reasons) and still disagree on the form that Canadian participation in "indivisible defence" should take.

It is these other available options that the study has failed to elucidate and consider. In part they consist of choices between various weapon systems and their deployment, but nonetheless the choice of such systems will be dependent upon the *role* that is to be played.

Roles

The study discusses the need for *active* defence against enemy air attack, as well as the need to co-operate in detection systems. We can agree with the latter point whilst wishing to modify the stand that has been taken on active defence. The premises upon which such defence is based are outlined on pp. 11-12—but they are given under the heading "what would happen if one side abandoned its bomber defences?"—thus implying that we are faced with two choices only:

- 1) Maintain full anti-bomber defences and forces capable of shooting down attackers at considerable distance from their targets.
- 2) Abandoning all anti-aircraft defences and thus giving enemy aircraft a free run which would be "destabilizing" (p. 12) as it would threaten the "land based second strike forces" (p. 12) of the United States.

This neglects a third possibility.

- 3) Retain joint detection and tracking facilities and retain a limited number of aircraft for a SURVEILLANCE and IDENTIFICATION role. These aircraft could act as a *tripwire* force and thus the land-based retaliatory forces' second strike capability would not be impaired, as warning time would be adequate. This approach would also, if necessary, entail improvements in radar coverage.

To advocate this third posture is to try and:

- a) Limit Costs—Less, and different, aircraft might be needed.
- b) Preserve Canada's ability to survey her own airspace.
- c) Canada's nuclear role could be dropped if desired. Bomarc and air to air nuclear missiles could be phased out.

It might be objected that there is a negligible difference between this course and full participation in active defence. The number of aircraft required for

surveillance might be close to the number contemplated for option (1), and the aircraft type might be similar. But one should attempt to *establish* that this is indeed the case, and if it is so then at least the attempt will have been made to maintain Canada's contribution at a *minimum* level, and to avoid significant increases. The minimum level arguments also take into account one other aspect that the study ignores, and that is the possibility that large scale defence forces would be wiped out in a first strike (by missiles). In spite of the fact that such 'defensive targets' could draw fire away from other areas (e.g. cities) the very large number of Soviet missiles presently deployed reduces the value of this stratagem, and also it is a very expensive way to create targets. This observation admittedly raises issues which are outside the scope of the present argument, e.g. the ABM system; Civil Defence; germ/bacteriological warfare, but does illustrate that one should not consider bomber defences with only one question in mind, i.e. How can we prevent the great majority of Soviet bombers from getting through? One must determine whether significantly increased costs and activity *will* significantly reduce the status of the threat—and in this case it may not.

Therefore I am in favor of:

- a) Continuing co-operation,
- b) Continuing detection systems,
- c) Running a redesigned detection system, should this be necessary,
- d) Performing a surveillance function,
- e) Phasing out present equipment.

Possible Options

The range of options has been illustrated diagrammatically. Each option will be discussed briefly below but all reasons for choice have not been included and arguments could be developed at greater length if required. It should be remembered that Chart 2 does not illustrate all variables and combinations. To do so is virtually impossible in diagrammatic form, e.g., inclusion of Soviet/Canadian relations would add a third dimension. All that has been done is to illustrate in diagram 1 the area of U.S.-Canadian concern as I see it. This area of concern has then been placed in diagram 2 as part of the independence-dependence continuum. This is simply to argue that in the case of the acquisition of new weapons and co-operative systems we *can* think in terms of independence-dependence. It is not a generalization with regard to the whole of Canadian foreign policy, although it may be indicative, i.e. full co-operation in NORAD *may* not mean full co-operation in other important foreign policy and strategic areas.

The ABM system has been placed on the chart but has not been discussed as it is a subject for separate and detailed consideration.

Option (1)

Independence/Opting out of defence role—Neutrality.

This is judged to be unacceptable both because of the International repercussions and the domestic consequences.

Option (2)

Independent Defence—armed.

An adequate level of defence would be *extremely* costly and difficult to maintain, and could impair Canadian/U.S. relations.

Option (3)

A gradual *phasing out* of Canadian forces is one move that should receive serious consideration. The greatest drawbacks of this approach are:

- a) U.S. pressure to use Canadian airspace for over-flights.
- b) U.S. reactions to such a policy.
- c) Canada's inability to control her own airspace.
- d) Effect on the status of the deterrent depending upon Canadian reactions to (a).

Option (4)

Continuation of NORAD as at present, with the minimum possible increase that would ensure adequate radar coverage and the maintenance of 'aerial sovereignty'. This has been *recommended* previously.

Option (5)

Play a larger and more active role. The difficulties here are:

- a) Cost,
- b) Questionable military value,
- c) Continued nuclear role,
- d) Use of resources in other more profitable military areas.

Option (6)

Dependence.

This is judged to be politically unacceptable.

Any significant increase in the Canadian contribution to North American air defence is likely to prove expensive, and its military value is far more questionable than the working papers indicate.

Yours very truly,

D. M. Thomas.

Diagram 1

Diagram 2	INDEPENDENCE ←				→ DEPENDENCE	
	Independence 1. (disarm.)	Independence 2. (armed)	Recommended Options 4.		Options 5.	Dependence 6.
Items Maintenance and Acquisition						
New aircraft for active role. New AWACS.	None	Run independent system. No joint control.	No new aircraft. Gradual phase-out of F-101	No	Obtain	U.S. given the task. (officially)
New aircraft. Surveillance only.	None	Covered by above.	None	Yes	Covered by above.	U.S.
AWACS for surveillance	None	Covered by above	Perhaps	Probably	Covered by above.	U.S.

Recommendation	Reject	Reject	Possible	Recommend	Possible	Reject
Comments	Total revision of all previous policies and commitments. Damaging.	Prohibitive cost and militarily ineffective.	U.S. needs not met. Overflight problem. Airspace control lacking.		High cost, uncertain strategic value, nuclear role.	Politically unacceptable.

Some Implications of the Current
Soviet Military Posture Relating
to the Defence of North America

by

C. F. Schuetz
Faculty of Arts
St. Patrick's College
Carleton University
Ottawa, Ontario

Prepared for the
Standing Committee on External Affairs
and National Defence
1st Session, 28th Parliament

May 1969

In his working paper on NORAD which Lieutenant General Sharp has submitted to the House of Commons Standing Committee on External Affairs and National Defence, three developments in Soviet military policy have been mentioned which warrant further analysis. These three developments are:

- 1) the continued improvements in the present force of intercontinental range bombers of the Soviet Union, (p. 8)
- 2) the recent increase in Soviet training flights to the periphery of North America (p. 10), and
- 3) the fact that the Soviet Union is expected to have achieved numerical parity with the United States in land based intercontinental ballistic launchers by mid-1969, and that the Soviet Union will have a larger inventory than the United States by 1970 (p. 7).

It could be argued that these or any other point relating to the Soviet military posture have little bearing on Canadian air defence because the United States is the main target of the Soviet Union, and because a missile attack could destroy most centers of the United States without doing much damage to Canada or even without trespassing on Canadian air space. Yet, even if, as a consequence, the basic assumption underlying the NORAD agreement of 1958 that 'the air defence of North America is a single, indivisible problem' is no longer as indisputable a fact as it has been in 1958, Canadian geographic and military conditions are such that a practical separation of

Canada and the United States in terms of air defence would be self-defeating.

From the testimony presented to the House of Commons Standing Committee on External Affairs and National Defence by the Department of National Defence, recent Soviet military policy in relation to North America presents the following pattern: firstly, a period beginning with the mid-1950's when long range bombers were equipped to carry nuclear bombs; secondly, a period between about 1960 and 1967 when some intercontinental ballistic missiles were added to the Soviet arsenal, but at a much slower rate than it was done in the United States; and thirdly a period from 1967 onward in which the installations of ICBMs has been tripled so as to create a numerical superiority over US installations by 1970.

Surely to a certain extent it could be claimed that this development of Soviet nuclear missile capacity represents a defensive build-up aimed at counterbalancing US capacity. But a purely defensive policy would be pursued on a continuous basis, it would try to aim at an approximate balance, and it would stress defensive systems like the GALOSH system rather than offensive ICBMs or MRVs.

In contrast, the development of the Soviet military posture reveals significant lulls and spurt which obviously aim at a margin of aggressive superiority. Particularly the pre-1967 lull in missile installations has its main explanation in Soviet unwillingness to waste resources on less effective weapons. Hence the current rate of installation of essentially offensive ICBMs indicates a very aggressive design.

With regard to the continued improvements in Soviet long distance bombers and especially in the light of the recent production by the Soviet Union of a supersonic long distance transport plane which could be adapted to military use, a similar pattern prevails. Indeed, the increase in training flights to the periphery of North America makes it difficult not to agree with the conclusion of Lieutenant General Sharp that this state of affairs seems to suggest a renewed interest in bombers as a means of attack (p. 10).

In this connection it is necessary to point out a major discrepancy between various estimates of Soviet submarine missile strength. According to the submission of the Department of National Defence "the number of SLBMs which could be brought to bear against North America is probably of the order of 45 as compared to 656 of the US" (p. 9). In contrast, the US Senate Preparedness Subcommittee has reported on September 23, 1968, that the Soviet Union has more than 350 submarines, both conventionally and nuclear powered, and that in recent years Soviet shipyards have been expanded for an accelerated programme for construction of improved nuclear submarines. This report certainly fits more definitely into the overall aggressive pattern of Soviet military policy

than the estimate in the submission by the Department of National Defence.

All these developments in the current Soviet military posture suggest as a principal implication that a far-reaching accommodation to the concept of deterrence has taken place in Soviet military strategy. Or, in other words, the main pillar of North American defence, the reliance on the preventive effect of US retaliatory action, is gradually becoming less effective the more the Soviet nuclear missile capacity grows.

The parallel expansion in the capacity of all attack systems further suggests that Soviet planning is preparing for the possibility of a highly coordinated all-out strike to produce the greatest destruction possible. Such planning would be in keeping with Prof. Henry Kissinger's theory that "in the nuclear age, a general war fought by purely military criteria must have catastrophic consequences". ("Problems of National Strategy", p. 16)

Finally, within the context of such an all-out attack, the training flights of Soviet aircraft to the periphery of North America could also be interpreted as preparatory of a second stage of an attack which would consist in bringing commando units or even occupation forces to this continent for purposes of achieving complete control. To many American strategists this possibility seems to be unthinkable, perhaps as a consequence of their faith in deterrence or their belief that devastation would make occupation impossible. Yet, in the logic of an all-out nuclear attack, territorial possession of North America would still represent the main prize.

In such a setting Canada cannot remain neutral but would have to coordinate her defence with that of the United States. But it should be a truly defensive design capable of facing even a highly coordinated attack. It must be recognized that the concept of deterrence is not really a defensive policy. At best it is preventive, at least as long as the enemy has not obtained equality or superiority of weapons. But basically deterrence is an aggressive concept, and as such would consume resources for a purpose to which Canada does not subscribe—to say nothing of the inherently despicable nature of the entire concept. In its actual application, the destruction of another country is not going to defend, i.e. preserve Canadian or American cities. A true defence must be based on the destruction of the attacking forces. An anti-ballistic missile system, an effective anti-submarine and anti-bomber defence, and a highly mobile military force capable of handling commando raids as well as occupation attempts should provide the best protection for Canada.

In the submission to the House of Commons Standing Committee on External Affairs and National Defence by the Department of National Defence such a policy, especially one using ABM systems has been described as "destabilizing" (pp. 10 and 11) meaning

that it would increase the likelihood of conflict or pre-emptive attack. Such a conclusion would be an unfortunate interpretation of Professor Rathjens' paper on "The Future of the Strategic Arms Race" quoted on page seven of that submission. What he meant to say was that the logic of deterrence requires maximum destruction for destruction's sake to make deterrence really effective, i.e. 'stable'. Elsewhere Prof. Rathjens also states that the simultaneous deployment of ABM and MIRV systems would have a 'destabilizing' effect because the combination of effective defensive and offensive systems would put a country in a position where it could disregard deterrence and use pre-emptive warfare. But to argue that a good defence might be an inducement to attack must remain a contradiction in terms even in the peculiar logic of nuclear strategy.

There are some excellent examples of relatively small countries having successfully kept an overwhelming enemy from attacking them e.g. Switzerland vis-à-vis Hitler, or Tito vis-à-vis the Soviet Union. But in all those cases the price of their freedom has been an absolute commitment to use any defensive means available.

Unfortunately Canadian commitment to defence is not as convincing as it could be.

In terms of morale, the difficulty of defending all of Canada induces a general apathy which is even further deepened as there is no real feeling of insecurity nor any feeling of hostility against any other country in the world. And the proximity of a protective big brother does not help matters either.

With regard to the existing defensive installations Canada is not particularly well protected. In the case of an all-out attack, they can do little else than tell people to say their last prayers—that is if the warning system has not been sabotaged which should not be too difficult in a highly centralized and skin-deep affair. Although centralization is necessary and useful to counteract a coordinated attack, such centralization also increases vulnerability as a few strategic hits could paralyse the entire system. In this respect even hardening of the command centers might prove futile as the entire radar and communication system might be put out of action by the electro-magnetic pulse which is produced by nuclear explosions and which can be effective over considerable distances from the impact area. To reduce the effects of such blackouts, it might be desirable to provide individual units of the defensive apparatus with an independent operational capability. Such decentralization would also permit the creation of a second or third line of defence where population and topography would warrant it.

To sum up then, the current Soviet military posture reveals a concerted effort to obtain a highly diversified capacity for a coordinated nuclear strike which would even offer a likely capability to take

possession of North America. As the adequate accomplishment of such a capacity would probably still require a few more years, Canada's defensive system, though at present inadequate, could be improved in its truly defensive aspects to be able to handle the diversity of weapons likely to be used, and the kind of

coordination to be expected if a country takes the risk of a nuclear attack against North America. It would indeed be of no advantage if her love of peace would turn Canada into a neutral backdoor through which an enemy could destroy the main supporter of her freedom.

APPENDIX III

1. *Question:* Annual United States NORAD anti-bomber defence costs excluding NIKE/HERCULES missiles, and other point defence items which cannot be of any benefit to Canada.

Answer: The answer to the question is \$1.42 billion. The premise that NIKE/HERCULES missiles cannot be of any benefit to Canada is not accepted. If NIKE/HERCULES add to the credibility of the deterrent and in this way contribute to the prevention of war, then this is of benefit to Canada. NIKE/HERCULES missiles are situated close to SAC bases to provide these bases with a close defence against Russian bombers. In providing this defence, the missiles also provide some protection to the surrounding population. Four missile locations thus protect some Canadian territory, that is, Victoria and the Kingston-Toronto-Hamilton-Windsor complex.

If the cost of the four NIKE/HERCULES locations that protect some Canadian territory is added, the cost is \$1.45 billion. If all NIKE/HERCULES defences are included the cost of U.S./NORAD anti-bomber defences for FY 69 is \$1.63 billion. These costs do not include capital or R & D.

2. *Question:* Annual Canadian NORAD anti-bomber defence costs.

This should not include the cost of military detachments which are not really performing a NORAD function as mentioned in Mr. Gellner's memo.

Answer: Approximate FY-69/70 costs: \$135 million.

3. *Question:* Annual United States NORAD anti-ICBM and space costs. This should not include any costs of the S.A.C. or nuclear deterrent.

Answer: Approximate FY-69/70 average costs:

a. Excluding SAFEGUARD — \$240 million.

b. Including SAFEGUARD — \$1.14 billion.

4. *Question:* Annual Canadian NORAD anti-ICBM costs.

Answer: Nil. (Satellite detection — Baker-Nunn Camera — \$600,000.

5. & 6. *Questions:* Is the Commander-in-Chief of the Alaskan Command under the Command of Lieutenant General Sharp in the absence of CINCNORAD and is the Commander-in-Chief of the Alaskan Command in exactly the same position vis-a-vis NORAD as the

Commanders of the Western, Eastern, Northern and Central Regions?

Answer: There are two Commands in Alaska—Alaskan Command, a joint U.S. (Army and Air Force) Command, responsible for the defence of Alaska; and Alaskan NORAD Region, responsible for air defence. The Commander-in-Chief, U.S.A.F. Lieutenant General Breitweiser, is the Commander of both Commands. As Commander of Alaskan Command he is responsible to JCS Washington. As Commander of Alaskan NORAD Region he is responsible to CINCNORAD in the same way that other NORAD Region commanders are responsible; when the CINCNORAD is absent all are responsible in the same way to the Deputy CINCNORAD, General Sharp. The situation with Lt. Gen. Breitweiser is somewhat analogous to Maj. Lipton at North Bay. General Lipton is the Commander of Air Defence Command, Canadian Armed Forces, and as such is responsible to the CDS. General Lipton is also the Commander of Northern NORAD Region, and as such is responsible to CINCNORAD.

7. *Question:* Is there an American deputy commander of the Northern NORAD Region?

Answer: Yes. Brigadier General Robert B. Hughes.

8. *Question:* Which two of the 13 NORAD Divisions have Canadian Commanders?

Answer: 41st NORAD Division and 36th NORAD Division.

Question: Do they have American Vice-Commanders?

Answer: Yes.

9. *Question:* What are the two Regions and Four Divisions where Canadian officers are Vice-Commanders?

Answer: Western NORAD Region, Central NORAD Region, 25th NORAD Division, 28th NORAD Division, 29th NORAD Division, and 34th NORAD Division.

10. *Question:* What is the meaning of a perimeter type of defence as compared with an overall defence as referred to on page 7 of Lieutenant General Sharp's working paper?

Answer: A perimeter type of defence places all of the detection apparatus, weapon control facili-

ties, and weapons along the periphery of the vital area being defended. An overall defence includes the peripheral defence but extends it in depth both inwardly and outwardly to increase the length of time the attacker is subjected to defensive action.

11. *Question:* In what NORAD Region and Division is Ottawa located?

Answer: Northern NORAD Region, 41st NORAD Division, both under Canadian command.

12. *Question:* In what NORAD Region and Division will Ottawa be located after the revised areas become effective on August 15th?

Answer: Northern NORAD Region, 41st NORAD Division.

13. *Question:* Will Alaska continue to be a separate NORAD Division after August 15, 1969?

Answer: The Alaskan NORAD Region remains unchanged.

14. *Question:* Are the following facilities "in command NORAD" or do they merely cooperate with and feed information to NORAD? The BMEWS system, the Coastal RADAR System operated by the United States Air Force, the Space Detection and Tracking System, the Space Detection "Fence" provided by the United States Naval Space Surveillance System.

Answer: All systems mentioned are under the operational command of CINCNORAD. This means that the operational activities are directed by NORAD. It does not mean that NORAD administers or logistically supports these organizations. This applies to all NORAD forces.

15. *Question:* Lieutenant General Sharp's NORAD working paper at page 22 states that approximately one-third of the capital cost of the Pine Tree System was paid by Canada. Does this mean one-third of the total cost of the total System or one-third of the cost of the Canadian section?

Answer: One-third of the cost of the NORAD system in Canada (exclusive of the DEW Line and interceptor squadrons) was paid for by Canada. The Canadian monetary investment in NORAD outside of Canada essentially is Zero.

16. *Question:* If the present air defence system were continued, it is estimated that the total cost of air defence in the US would be \$11.7 billion from mid-67 to mid-77. At the end of this period, the annual costs would be \$1.12 billion. There would be little capital expenditure, so that most of the \$11.7 billion would pay for operations and maintenance (O and M).

The modernized air defence system would have new equipment. During the first half of this period (67-77) this new equipment would be developed and procured but at the same time, present forces would have to be maintained, so that annual budgets would be greater than at present. However, during the last half of this period, after the new equipment is paid for, obsolete equipment has been phased out and the number of operating personnel substantially reduced, the modernized system is expected to operate on \$.69 billion per year. (This is roughly one half to two thirds of the present annual O and M costs). The total cost from mid-67 to mid-77 to maintain the current level of defence and to effect the transition to the modern air defence system is estimated to be \$12.3 billion. This is for the US portion of the system, and about one quarter of it would be for capital acquisition.

Over the next ten years, the costs of either maintaining present forces or modernizing appear to be nearly equal, but for longer terms, probably after 1979, the modernized air defence option should result in significant total savings due to the lower annual O and M costs.

17 (a) (i) The Spartan warhead is designed for use at very high altitudes beyond the atmosphere, and its effectiveness against ICBMs is diminished if the radiation must pass through air, but it is known that damage on the ground will begin to be appreciable if bursts were to be much lower than 25 miles. We have been assured that the burst will be well above that altitude. It does seem possible, however, that if time and space permitted an interception over the sea or over uninhabited territory, and if the warhead still retains some effectiveness below 25 miles (which we do not know), that the defence would wish to conduct an interception at a lower altitude.

17 (a) (ii) It is certainly possible that both the yield and the range of Sprints could be increased in the future. DND will endeavour to maintain a close watch on US developments in ABM defence where there are Canadian implications.

17 (b) In order to explode before it was destroyed by a Spartan, an ICBM would have to possess a trigger mechanism which could either

- (i) detonate it beyond the range of the Spartan defences,
- (ii) sense the approach of a Spartan, and explode before the Spartan exploded, or
- (iii) sense the initial radiation from the Spartan explosion and explode before the Spartan radiation had rendered the ICBM warhead inoperative.

Method (i) would cause the explosion to be too high to cause significant damage.

Method (ii) is not considered at all probable. Elaborate sensors and controls would have to be built into the ICBM re-entry vehicle, which is otherwise a simple protective casing for the warhead.

Method (iii) may be technically possible. It would depend on the millisecond reaction times of the damaging Spartan radiation and the triggering of the ICBM warhead. To judge this would require knowledge of the design and detonation process of the Russian nuclear weapon. In any case the combined effects on the ground of the two warheads detonated at such high altitude would still not be serious.

18. If an ICBM were aimed at a target in the northern USA, succeeded in penetrating the defence, and burst on the ground, then the danger from fall-out would extend into Canada. If it were intercepted by Spartan at high altitude over either country, there would be no serious danger to anyone. If it were intercepted by Sprint at low altitude, this would have to be close to the target, and therefore in the USA.

19. *Question:* Does the two-key system apply to American interceptors operating over Canadian territory or only to Canadian interceptors (Mr. Cadieux is going to give the Committee a memorandum outlining the arrangements)?

Answer: No nuclear armed interceptors may operate over Canada without the prior permission of the Canadian government and United States Presidential release. Thus the "two-key" concept is carried out. Unarmed and conventionally armed American interceptors operate over Canada routinely, but only under the control of NORAD as a part of the unified continental air defence effort.

COMMAND AND CONTROL OF WEAPONS SYSTEMS

Command and control of weapons systems in NORAD is exercised under the "two keys" concept. No interceptors or Bomarc's can be launched with nuclear weapons over Canadian territory without the authority of both the Canadian and American governments. If hostilities were to occur the CINC NORAD would first have to obtain permission from the President of the U.S. to release nuclear weapons to Canadian forces and would then require the explicit authority of the Canadian government and the President of the U.S. to employ such weapons against attacking forces. Strict procedures have been developed for soliciting these authorities. The Combat Operations Center at Colorado Springs would be directed by the CINC NORAD to contact the National Military Command Authority (NMCC) of the Joint Chiefs of Staff in Washington and the Canadian Forces Operations Center in Ottawa to request the necessary authority to act from the Canadian and American

governments. These request from the NORAD COC are transmitted in a coded form. The validity of the messages are checked by the recipients against the appropriate code and the messages would be invalid and not acted upon if encoded improperly. Reliable procedures and systems have been devised which ensure that governmental decisions, at the appropriate level, will be taken without introducing any significant delay in the military response system.

Once properly authenticated authority to use nuclear weapons has been obtained by CINC NORAD from both governments the command and control of nuclear armed interceptors and Bomarc's would be delegated down through Region commanders to division commanders. The transmission of the necessary authorities is accomplished by coded messages to the "two key" recipients who must provide the proper coded response before the authority is valid. Different codes are used for each member of the "two key" teams and no collusion is possible, i.e. each must respond independently and properly to make the authorities valid. When the validity of the authorities passed from the NORAD Combat Operations Center, on behalf CINC NORAD, have been established by the holders of the "keys", then, and only then, can the locks be turned which will make nuclear weapons available. Therefore, before any nuclear weapons can be employed in Canadian airspace:

- a. Canadian governmental authority must be obtained.
- b. The authority of the President of the U.S. to use nuclear weapons must be obtained as well as the authority to release such weapons to the Canadian forces.
- c. Canadian military personnel must receive a properly authenticated message from the CINC NORAD providing the authority to employ nuclear weapons.
- d. The U.S. members of the "two key" teams must also receive properly authenticated messages from CINC NORAD authorizing the release of nuclear weapons to Canadians and the use of nuclear weapons against attacking forces.

There are extensive physical security measures taken to safeguard nuclear weapons. In addition, there are safeguards in terms of personnel selection and operating procedures.

Any person who has duties in any way related to nuclear weapons must satisfy the following requirements:

- a. He must be security cleared.
- b. He must pass the HRP (Human Reliability Programme) in which he is extensively researched as to his emotional stability and indoctrinated in relation to his tasks.

- c. He must demonstrate knowledgeability of his task.
- d. He must be authorized to perform his task.
- e. He must monitor the actions of the person with whom he is teamed.

The "two man" concept applies to all nuclear weapons actions. That is to say that no action in connection with nuclear weapons may be performed by one person alone. This includes actions relating to controlling or authorizing, arming, releasing, deployment, jettisoning, transporting and actual access to the weapons and the concept is applied at all stages from the stockpile to the target.

20. *Question:* Are any NIKE/HERCULES/HAWK or other missiles sited now in the United States in such a way that they might intercept bombers over Canadian territory? If so, how many such locations are there and where are they?

Answer: Yes. See answer to question 1.

21. *Question:* US interceptors over Canadian territory—how often do they fly? Do they need flight plan clearance and any other special clearance?

Answer: US interceptors operate in Canadian air space and Canadian interceptors operate in US air space under the close control of NORAD. Arrangements for such flights are fully coordinated in advance with the air traffic control agencies of both Nations. Both Canadian and US interceptors operate as required by NORAD to perform air defence functions such as peacetime identification and to participate in frequent air defence exercises of varying magnitude. The frequency of cross border operations is daily. However, they are not armed with nuclear weapons. When armed with nuclear weapons see answer to Question 19.

22. *Question:* What are the technical reasons why Southern Ontario is under Eastern NORAD Region, rather than Northern NORAD Region?

Answer: For 41 NORAD division at North Bay to effectively control intercepts over Southern Ontario would require information from radars that the North Bay computer is not now receiving.

The capacity of each computer is limited—it can accept only a limited amount of radar information, it can control only a limited number of intercepts and it can display the air situation over only a limited area of land. The North Bay computer is already loaded to capacity, and to put Southern Ontario under North Bay would require another computer. There are other technical aspects. The area covered by a computer must be laid out in squares—a look at the map of Southern Ontario will show that in order to cover Southern

Ontario, more than Southern Ontario would be involved—this would either be wasteful of scarce computer space, or would enlarge the area covered by the North Bay computer even greater than the area of Southern Ontario. In addition to the extra computer and expensive communications that would be required, additional operator consoles would be required at North Bay, and additional people. I have not been able to obtain a cost estimate, but the cost would be considerable—in the millions.

Question: What percentage of Russian bombers, under existing defences would get through if one assumed 150 to start off?

Answer: This is a difficult question to answer for two reasons—the answer depends on which of a great many variables are assumed. Also an answer, other than a very general answer, is highly classified information.

If the 150 bombers approached in a wide front for example, some via Labrador, some via the central Arctic and some via Alaska, and if they approached at high level, and if they carried free fall bombs (and therefore had to penetrate to their targets) a very high percentage would be destroyed. If on the other hand, the bombers all approached via the same route, if they carried air to surface missiles, if they came in low, a very significant percentage might get through.

The above are the two extremes—probably neither extreme tactic would be chosen. Which one would be chosen would depend on Russian estimate of the effectiveness of NORAD. The high level attack, if it could be successful, would be the best because the biggest bomb load could be delivered most accurately. The low attack on the other hand has, in my estimation, but perhaps not Russian estimation, the best chance of being successful.

If AWACS, OTH and modernized interceptors are deployed, then effectiveness against low level attack, including air to surface missiles, is planned to be as good as it is today agreement high level attack with gravity bombs.

NORAD ORGANIZATIONAL CONCEPT

The NORAD organizational concept provides for the integrated control of U.S. and Canadian forces in the defence of the continent. NORAD Regions, with the exception of Alaska, include both Canadian and American territory and airspace. The manning of Regions and Divisions is dictated largely by the forces made available for defence. For example, in Central Region Canada provides radars and geography while the U.S. provides the active defence forces, i.e. inter-

ceptors, Bomarc and Nike/Hercules batteries. Therefore, it is logical that the Commander's position at Central NORAD Region is allocated to a U.S. officer while a Canadian acts as deputy commander. On the other hand Northern NORAD Region also encompasses Canadian and U.S. territory but Canada provides a larger percentage of radars, weapons and command and control facilities. In this instance the command of the Region is allocated to Canada and the U.S. provides the deputy commander. This manning

philosophy is used throughout the NORAD system. Normally Canadians command in Canada and Americans at those control locations in the U.S. However, there are variations on this theme at the 36th NORAD Division with HQs at Topsham Maine, which is commanded by a Canadian and the 37th NORAD Division at Goose Bay Labrador which is commanded by an American. Again the relative contribution of weapons and facilities is the most important determining factor.

MEMORANDUM

V3010-26 (DConP)
15 May, 1969

PARLIAMENTARY RETURNS

NORTH AMERICAN AIR DEFENCE
OPERATION AND MAINTENANCE COSTS

1. At the 6 May session of the Parliamentary Standing Committee on Defence and External Affairs, a breakdown was requested of the O&M costs of the Canadian contribution to NORAD.

2. The breakdown is as follows:

<i>Element of Cost</i>	<i>Estimated Annual Cost (\$ million)</i>
Interceptors	\$ 38.9
Bomarc	\$ 4.2
Radars	\$ 67.7
Control Centres	\$ 3.4
Space Detection and Tracking	\$.6
Command Headquarters	\$ 20.2
TOTAL	\$135.0

3. It is recognized that in the paper presented to the Committee before General Sharp's testimony the annual cost for the two Bomarc squadrons was stated to be \$3.4 million per year. In para 2 above, the annual cost of the same two squadrons is shown as \$4.2 million. The reason for this is that financial authorities have adjusted the earlier figure to reflect support costs provided by CFB North Bay to the adjacent Bomarc Squadron.

Hugh R. Stewart,
Clerk of the Committee.

Fernand Despatie,
Assistant.

ORDER OF REFERENCE

HOUSE OF COMMONS,
MONDAY, March 3, 1969.

Ordered,—That the Members of the Standing Committee on External Affairs and National Defence be granted leave to travel outside Canada between March eighth and March twenty-second, 1969, for the purpose of furthering their work; and that the necessary staff accompany them.

ATTEST:

ALISTAIR FRASER,
The Clerk of the House of Commons.

EVIDENCE

Nicosia, Cyprus, March 10, 1969

Mr. J. C. G. Brown, Canadian High Commissioner: I should like to welcome you to Cyprus, this island of Aphrodite and sunshine where for some years a serious problem has not only dominated the lives of the Cypriot people but also attracted the attention of the entire world. Briefly the problem of Cyprus is that since independence was attained in 1960 and in spite of the international guarantees given by the Zurich and London Agreements, the two communities of Cyprus, Greek and Turkish, have not yet found a *modus vivendi* capable of assuring peace and stability on the island and the welfare of its people. And this situation persists despite Aphrodite and the sunshine.

May I first explain briefly the programme that we have arranged for your visit to provide you with a basis for reflection on peacekeeping in Cyprus. You have already heard from General Martola and Mr. Osorio-Tafall about the role of UNFICYP and the functions of the Secretary-General's special representative. There may be some overlap between their remarks and those of Brigadier-General Leslie and myself. I can only say that they have had the advantage of speaking first and without the benefit of advice from the General and me. Tomorrow's programme has two objectives: firstly to expose you to the Contingent so that you may see the peacekeepers at work and secondly to let you meet and question the island's political leaders: His Beatitude Archbishop Makarios, President of the Republic, His Excellency Dr. Fazil Kutchuk, Vice President of the Republic and the two negotiators in the current talks, Messrs. Clerides and Denktash.

This evening, Brigadier-General Leslie will follow on immediately after me with a description of the military task of UNFICYP. After he has concluded his remarks he and I will be glad to answer questions but I must remind you that at 8:15 our guests for the working dinner will be here and the time at our disposal is therefore limited. However, both of us as well as officers of the High Commission and the Contingent will be available at the tables for questioning during the evening and there will be similar opportunities tomorrow for you to put your queries to us.

The scenario for peacekeeping on this troubled island is set by its long and involved history. I intend to go back only ten years. I have already referred to the agreements of Zurich and London on which the independence of Cyprus was based. Having regard to the complicated genesis of modern Cyprus and the immensely intricate negotiations leading to the agreements, it is not surprising that the constitution was a very delicately balanced mechanism requiring the best of goodwill to work. Basically, the historic separateness of the two communities was recognized and perpetuated within the institutional framework of the Republic. For example, the president was to be Greek-Cypriot and the vice president Turkish-Cypriot, each being elected by his own community. Of the cabinet of ten ministers, seven were to be Greek and three Turkish. This ratio was used also in the membership of the House of Representatives and the public service, police and gendarmerie. For the army the ratio was set at 60/40. Separate communal chambers were established to exercise legislative power on religious, educational and cultural matters and on personal status, and taxation powers were accorded to the chambers to provide funds for these purposes. Separate Greek and Turkish municipalities were created in the five largest towns.

Independence was attained on August 16, 1960 and in the following three years a number of serious constitutional problems were encountered. Some provisions of the constitution were in fact never implemented and when the Turkish ministers vetoed the budget in August 1963 because they believed that they were not receiving their constitutional rights, President Makarios sought a way out of the financial impasse. He proposed constitutional amendments involving thirteen measures "for facilitating the smooth functioning of the State and for the removal of certain causes of inter-communal friction" but these were rejected by the Turkish side. The first shot in the intercommunal war on December 21, 1963 put an end to constitutional discussions of a constructive nature for the next four and a half years.

The constitution of 1960 was only one of a series of basic documents signed when Cyprus became independent and these and the consti-

tution are still legally in force. Safeguards were spelled out in great detail to guarantee the rights of Greece, Turkey and the United Kingdom. Under the Treaty of Alliance, Greece and Turkey were given the right of intervention and the right to station contingents in Cyprus; these troops—950 Greeks and 650 Turks—are still here. Under the Treaty of Establishment the United Kingdom retained sovereignty over two areas totalling ninety-nine square miles known as the Sovereign Base Areas. These external interests in Cyprus, guaranteed by treaties, have been in play throughout the history of the troubled Republic. Although *Enosis*—union with Greece—and partition were ruled out in the Agreements, some elements of the Greek-Cypriot community have never given up *Enosis* and some in the Turkish-Cypriot community still think in terms of partitioning the island. Pan-Hellenism dictated to Greece support for the Greek-Cypriots while strategic considerations and the protection of the Turkish-Cypriot minority determined Turkey's attitude. When the fighting broke out, both countries supported their respective communities with arms and men and, as it had been during the fifties and earlier, Cyprus was once more a flashpoint in relations between Greece and Turkey.

Shortly after the outbreak of trouble Britain acted quickly, at the request of the Government of Cyprus, to stop the fighting and to forestall the threat of an invasion of the island by Turkey. The famous "Green Line" was established on December 30, 1963 and in January the British called a conference in London to be attended by delegates from Britain, Greece and Turkey and by the leaders of the Greek- and Turkish-Cypriots. This conference failed but meanwhile the United Nations sent an observer to the island. Plans for a NATO peace-keeping force were amended to include United Nations participation and after its rejection by the Cyprus Government this scheme was eventually superseded by the Security Council resolution of March 4, 1964 recommending the establishment, with the consent of the Government of Cyprus, of a United Nations peace-keeping force. On March 13 the Canadian Government agreed to take part in the Force and the first Canadian troops arrived in Cyprus three days later.

UNFICYP was first authorized to stay for three months. It has been here now for almost

five years, and the current six-months' mandate runs until June 15 of this year. The first months of the "Blue Berets" were not uneventful but by May 1964 UNFICYP had gained the respect of the Cypriots and had established some control of the situation. Since then there have been two very critical periods—in August 1964 and November-December 1967 when large scale local battles occurred and invasion by Turkey was imminent—and there have been innumerable local incidents throughout.

The fighting of November-December 1967 marked a watershed in the situation because Turkey, having made it very plain that it held Greece responsible, demanded and achieved the removal from the island of General Grivas of *EOKA* fame along with several thousand Greek troops who had been here irregularly. There was also a mutual realization by Turkey and Greece that they had come very close to war over Cyprus. When on March 7, 1968, the Cyprus Government lifted its economic blockade of the Turkish-Cypriot enclaves, the stage was set for Mr. Bibiano Osorio-Tafall, the Special Representative of the Secretary-General of the United Nations, to persuade the leaders of the two communities to stop shooting and start talking.

The principal actors in the inter-communal talks have been on the Greek-Cypriot side Mr. Glafcos Clerides, President of the House of Representatives, and on the Turkish-Cypriot side Mr. Rauf Denktash, President of the Turkish Communal Chamber. Tomorrow you will meet these two intelligent, moderate men. In their initial contacts, which were arranged in June 1968 by Mr. Osorio-Tafall, they established that there existed a sufficient identity of views to proceed to a second phase in which written proposals were exchanged on the major constitutional issues. The two interlocutors, who are soon to be aided by sub-committees, have now begun a process of painstaking negotiation in an effort to arrive at workable and just solutions.

It is certain that the talking stage would not have been reached if the United Nations were not here. Great credit is due to the patient diplomacy of Mr. Osorio-Tafall working in a quieter atmosphere created by the equally patient efforts of UNFICYP to restore normal conditions and to erode tension. Yet—and I think that you will appreciate this bet-

ter after listening to General Leslie and after your briefings tomorrow—conditions are still far from normal on the island. Mutual suspicion and fear remain and the possibility of renewed fighting must not be discounted. In these circumstances the role of UNFICYP is perhaps even more important than it was before the talks began because the smallest incident must be prevented or contained if the negotiations are to progress.

That in effect means that the job of peace-keeping has to continue so that the more delicate enterprise of peacemaking may be undertaken. This is a subject which Mr. Osorio-Tafall has already discussed with you. In terms of the island itself it involves the search for a reasonable and workable arrangement under which the Greek-Cypriot majority and Turkish-Cypriot minority may live and work together in peace. Such an arrangement must obviously provide the Turkish-Cypriots with every assurance that their cultural, linguistic and religious individuality will be protected and enabled to flourish. It must also provide the one community with assurances that the other community will not obstruct the governing of the state or the development of the economy. These are difficult objectives but their attainment is made even harder by the need to satisfy Greece and Turkey that their national interests in Cyprus will be safeguarded. And going beyond that, the ultimate solution of the Cyprus problem must be viable enough—at the very least—to withstand comment in the world at large and particularly in the United Nations. All of these factors make it seem unlikely that peacemaking will be a rapid process.

I do not claim that the Canadian High Commission in Cyprus plays an active role in the job of peace-making though this possibility should not be ruled out. However, the High Commission does provide diplomatic support to the Canadian Contingent and to the peace-keeping effort of UNFICYP generally. I should like to say here that just as you in the committee have brought the fields of External Affairs and National Defence together, the foreign service and the armed forces have worked very closely together in Cyprus. The assignment of a Canadian Forces Adviser to the High Commissioner, at present Lieutenant-Colonel W. D. Little, has been of special value in this joint task.

Since my arrival in Cyprus, just three months ago tonight, I have had the privilege

of getting to know the officers and men of the Canadian Contingent and of seeing them at work. I have heard from the island's leaders, and from others, expressions of praise for the conduct of these Canadians and gratitude for their presence. Tomorrow, at the outposts, you will see Canadian soldiers on the basic job of keeping the peace. I am sure that you will, as I do, sense the high state of discipline and efficiency which characterises the Third Battalion of the Royal Vingt-deuxième Régiment.

May I now introduce Brigadier-General E. M. D. Leslie, the Commander of the Canadian Contingent and Chief of Staff to General Martola, the Commander of UNFICYP. Since his arrival in Cyprus last August General Leslie has played a leading part in taking the heat out of the situation on the island and in moving the parties concerned towards a peaceful solution. His energy and ability have won wide praise and I have much appreciated the collaboration of this outstanding Canadian soldier.

It is as Chief of Staff that General Leslie will speak. In this capacity, for reasons that you will understand, he is privy to information which is not circulated outside the United Nations: he may therefore be inhibited from replying to questions falling within this privileged domain.

Brigadier General E. M. D. Leslie, Chief of Staff and Commander Canadian Contingent: As the High Commissioner has told you I have a dual function in UNFICYP. I am Chief of Staff; General Manager if you will; of UNFICYP and Commander of the Canadian Contingent. I am sure you will not take it amiss if I say my second job, Canadian Commander, occupies but a fraction of my time. In truth, perhaps because the battalion commanders I have been given are so thoroughly efficient, I have, in so far as Military Regulations permit, turned effective command of the Canadians over to the resident battalion commander. This, you will understand, is not because I am idle for the fact is I really am fully occupied as Chief of Staff and, of considerable importance, by keeping clear of all but essential Canadian matters, I am enabled to treat all eight contingents alike. In view of this and because you will be briefed by Lieutenant Colonel Riffou tomorrow, I will direct my remarks towards my main task and speak tonight on the broad aspects of UNFICYP.

Since the time the Committee has available is short may I, purely in the interest of indicating areas on which I am sure you will wish to question me more fully, give you some confidential opinions on the Force, its successes and its future. All these opinions are based upon and derived from personal knowledge acquired from 15 August 1968 to date—the period I have been Chief of Staff of UNFICYP. However you will appreciate that none of the opinions expressed, despite my position in UNFICYP, necessarily reflect the exact thoughts of the Force Commander or of New York. I speak here as a servant of Canada to Legislators of Canada.

Before entering into my subject proper may I, with the aid of the simple maps and charts displayed, refresh your memory on some of the salient points that effect UNFICYP. The map shows Cyprus which, for simple comparison purposes, is 3,572 square miles, that is one and a half times the size of Prince Edward Island which is 2,184 squares miles, and has a population of 110,000. Cyprius as a population of 614,000 of which 80 percent are of Greek origin and 18 percent Turkish. UNFICYP has been in business since 27th March 1964 and, since that date, perhaps 93 Greek Cypriots have been killed and 190 wounded, and 100 Turkish Cypriots have been killed and 106 wounded in the intercommunal strife. In addition some 190 Turkish Cypriots and 40 Greek Cypriots are missing. Depicted on the map are the main deployments of UNFICYP and the more important Turkish enclaves. Turkish Cypriots have with minor and, one might almost say, normal reservations, freedom of movement throughout the island. Greek Cypriots cannot enter or pass through Turkish enclaves except under UN escort. Enclaves are ringed with two rows of deployed and dug in troops—Turkish fighters inside, Cypriot National Guard outside, but otherwise are unmarked and, in many places, it is not hard to stray into no-man's land—not hard but dangerous. In places no-man's land is one narrow lane wide which, I do not have to tell you, is uncomfortably close quarters but you will see some of this for yourselves tomorrow. Seeing—you will have no trouble understanding why I seldom have an undisturbed night.

The first chart gives you an idea of the military and para-military forces on the island with an approximation of their strength. In addition to the forces shown there are British forces in the SBAs but these

are quite separate from UNFICYP's problem. You will note that UNFICYP, at least numerically, holds nothing like a balance of military power.

The last chart shows the assigned tasks of UNFICYP and it is in relation to these that most of the remainder of my remarks will be directed. Let me do this by posing questions to myself.

Has UNFICYP materially contributed to the attainment of Task 1?

Quite apart from the ceaseless watch and ward, of which you will see more tomorrow, which has a constant but immeasurable deterrent effect against what we call the local or accidental incident—the nervous sentry who shoots at shadows—I will give you two incidents where, had it not been for UNFICYP and UNFICYP actions, I consider serious intercommunal fighting might have broken out. While, obviously, since intercommunal fighting did not break out, it is possible to question the validity of this opinion, I do state to you that I am not alone in considering these two incidents were potentially very dangerous.

(a) At Meladhia on 15 January 1969 over a question of the investigation and arrest of a Turkish Cypriot villager who allegedly murdered three of his fellow villagers, who were also Turkish Cypriots. This incident is what I would describe as an accidental confrontation that escalated and, had it not been abruptly dealt with would certainly have led to local intercommunal fighting.

(b) On Naousis Street on 10 11 and 16 February over a question of patrolling by the Cyprus Police (the police of the Government of Cyprus who are all Greek Cypriots) in a very sensitive area. This incident was not, in my opinion, perhaps an entirely accidental confrontation—certainly we in UNFICYP saw it coming and, perhaps, understood some of the circumstances behind it.

Since it would be most improper for me to give public expression of my personal opinions, I would ask the Committee's indulgence that any further questions you may care to direct at me regarding these two incidents be conducted "in camera" and off the record.

In addition to these two incidents I have, perhaps because I am over-cautious, thought

it wise to raise the alert status of all, or a portion of, UNFICYP a total of nine times since I have been Chief of Staff. In other words I have feared violence and further fighting a total of nine times since August last.

What contribution has UNFICYP and its allied organization UNIVPOL, made to the maintenance and restoration of law and order?

While it is not possible for me to give a precise description of what UNFICYP and UNCIVPOL have contributed towards fulfilling this second task, I consider that we have contributed much. Certainly the mere presence of the UNFICYP military has given a degree of security, a sense of security, to many of the Cypriots. In addition UNFICYP personnel have, by persuasion and negotiation, solved innumerable disputes over such things as cattle rustling, illegal cultivation of fields, arrangements to permit both sides to harvest crops in disputed areas, questions of water rights and ownerships, and all the innumerable other difficulties which arise in any society that is seriously divided. We have arranged to transport doctors into areas normally forbidden by one side or other, escorted ambulances through enclaves, pursued the search for missing peoples presumably killed in earlier and more vicious times, arranged for the transmittal from one side to the other of public documents and records that are so essential to modern life and acted as impartial police observers in many criminal and civil investigations. Even antiquities come under our eye and UNCIVPOL has done much to inhibit the highly illegal, and detrimental, practice of tomb robbing. As you know this island is an archaeological paradise and much valuable loot is, with much wanton destruction, stolen by grave robbers.

What contribution has UNFICYP made to the return to normal conditions?

I do not think there is need for me to say more than the answers to the two previous points in a measure cover the contribution we are making towards the desired day when normal conditions will return to the island.

Another question I am sure you will ask is what is the situation now — where have we reached in the process of establishing normal conditions?

To this my view is that we have attained a

state wherein it is not likely that either side will deliberately resort to widespread violence to achieve their aims. Accidental confrontations such as Meladhia are always possible but even these, in my view, could now be contained and should not spread throughout the island. Furthermore, less accidental confrontations, such as the Naousis Street incident, are becoming less credible. By this I mean that whilst it is possible that such incidents can arise, I doubt if the responsible political leaders will permit these affairs to escalate into island-wide violence.

Another question I am sure you will ask is how UNFICYP has adapted itself to the changing situation?

As you probably know the original UNFICYP was 6,369. In May 1964 UNFICYP was strengthened by its sister organization UNCIVPOL at 173. Over the years the strength of UNFICYP has steadily declined—the last decrease was 25 per cent of the then existing Force and the strength of UNFICYP today is 3525 and UNCIVPOL 174. Hand-in-hand with the reduction in UNFICYP there have been very considerable reorganizations and redeployments. For example we are just now completing a massive static OP reduction programme wherein some 60 static OPs that have been in position for up to four years have been eliminated. We are now effecting a new deployment for UNCIVPOL which will see them deployed throughout the Island in what I call rural constabulary type posts. The object of this redeployment of UNCIVPOL is to get our police living with the people so that they, knowing the people and their territories intimately, can anticipate problems and developments. Further than this UNFICYP is constantly pressing on both sides the advantages to be gained from disengagement/disarmament measures and programmes. While these plans are not being accepted with the eagerness we had hoped, we continue pressing them at every opportunity.

Finally we are quietly moving towards a general removal of the obvious presence of UNFICYP military—this of course is allied with the redeployment of UNCIVPOL—so that the people will see much less of what is, no matter how one looks at it, an obvious foreign military presence. At some stage in the not too distant future we hope to have our soldiers withdrawn into barracks or cantonments outside of the main population cen-

tres, and Camp Maple Leaf is an example of this programme.

Perhaps it would interest you to know that all these reductions and reorganization are initiated at HQ UNFICYP and are advocated to UN HQ in New York as desirable military adjustments required to meet a changing, and improving, situation. The point I am trying to make is that while we, UNFICYP, are very much alive to the necessity for reasonable economy, the reductions we have advocated are based on a military appreciation that we can, in view of changing circumstances, carry on our task with less resources. I will even strengthen that and say that for political tactical purposes, a visible indication in the form of reduced presence, we want less troops at this stage. Later on we will want even less than now. No doubt our UN masters appreciate, as do we, the consequential economies but, forgive my saying this, economy is a by-product in our eyes.

You will, I am sure, wish to question me on UNCIVPOL

UNCIVPOL is a new organization in UN work and it has a very great potential. However, I would caution you that it is not a universal cure. Remember UNCIVPOL are unarmed policemen without powers of arrest or interrogation. Their prime duty is to effect a liaison, a police type liaison, between organized police forces. Under circumstances where there is only one, or no, police force, the UNCIVPOL concept might have little validity. Furthermore UNCIVPOL must not be taken as a substitute for UNFICYP any more than at home we would regard police as a substitute for the armed forces. Frankly I give you as my personal opinion that UNCIVPOL are now coming into their own—that prior to the last six months UNCIVPOL did many things that could have been handled by the military, which, of course, is not to say that UNCIVPOL were idle or unproductive in the past. Incidentally, policemen cost a lot more than soldiers. Now, however, UNCIVPOL are definitely coming into their own and I see the day when, as at home, the military, that is UNFICYP, will come into support of the police, that is UNCIVPOL. As a personal opinion I think this day is in sight and, again, this explains why we are redeploying UNCIVPOL right now.

I am sure you will ask me for an expression of opinion as to the future of UNFICYP AND UNCIVPOL

While you must understand that this is a personal opinion and is predicated upon my personal reading of developments—in other words despite my office as Chief of Staff it must not be taken as an official or binding commitment—these are the developments I see:

(a) Given some progress in our disarmament/disengagement programme, in particular a disengagement in the Larnaca/Scala area which is our model, I believe there is a reasonable chance that the Force could be cut by something of the order of 1,000 men. Perhaps a word on the basic planning criteria on which I am working would help. If we get a reasonable measure of disengagement, I feel perhaps the main requirement would be to position about a company of infantry into troubled areas within 30 minutes. It then becomes a question of time and space and a function of available equipment. If we had enough helicopters we could possibly meet this time and space criteria with a relatively small infantry force—however we do not have enough helicopters. At the same time, even with very considerable success in disengagement, we will still require a certain number of static observation posts covering critical areas. Without taking you through all the processes of military planning, I estimate that a military force of about 2,500 would suffice once we get well into the disengagement/disarmament programme we have proposed.

When will all this take place? Gentlemen I am sorry I simply do not know.

(b) With respect to further reductions, that is below 2,500 men, I am of the opinion that a force of 2,500 is the minimum that has a viable military potential—again this is a question of complicated military thinking related to equipment and the time and space factor I mentioned before. I think that if there were any further reduction below the 2,500 men mentioned before, a military force as such is no longer the answer. If the situation warrants a force smaller than 2,500 men it also perhaps warrants switching right straight through to a Military Observer/UNCIVPOL type of Mission. My personal estimate is several

hundred military people and about 200 UNCIVPOL.

Again, however, I caution you that this is my thinking and there are political and other reasons which could demand the retention of a small military force during at least the early stages of the Observer-UNCIVPOL phase. Undoubtedly the mere existence of such a small force might give a sense of security to the population, but, speaking as a soldier, I find it hard to visualize what effective military role it could fulfil. Having said that I hardly need to say to this Committee that soldiers are often deployed for reasons that are more political than military and that I can think of a number of very sound, in my perhaps untutored view, political reasons for keeping a small UN military force on Cyprus for as long as the troubles last.

With your indulgence Gentlemen I will, because my knowledge of French is not yet as good as it should be, respond to questions in that language after translation and in English.

Nicosia, Cyprus,
March 1969.

Dr. Fazil Kuchuk, Vice-President of the Republic of Cyprus: In welcoming you to the Turkish Sector of Nicosia I wish to thank you for giving us this opportunity to acquaint you with the Turkish Cypriot view on United Nations Peace-keeping operations in Cyprus which I understand is the main object underlying your visit. I also wish to thank His Excellency the Canadian High Commissioner and his staff for arranging this meeting.

Needless to say that UNFICYP has made valuable contribution in preventing local incidents from developing into major clashes between the two communities and in bringing about the peace and quiet that is now prevailing in the Island but for which the exploratory talks between representatives of the two communities would have never commenced. It is very important that the peaceful atmosphere which had enabled the commencement of the talks should be maintained if these talks are to continue and to come to a successful conclusion.

It is my firm belief that to maintain this atmosphere UNFICYP's presence in the Island is essential. Another factor requiring the presence of UNFICYP is that the situation is still

very delicate and precarious and with the withdrawal of UNCIVPOL the Greeks might be tempted to renew their attacks on the Turkish Community with very grave consequences and a possible war between Turkey and Greece.

In order that you may be able to make a proper assessment as to the effectiveness and the need for a United Nations Peace-keeping Force in Cyprus it is necessary to have some background information about the problem of Cyprus and the factors which have brought about this problem. I shall request my friend Mr. Denktash, who is well conversant with all the aspects of the problem of Cyprus and is indeed representing the Turkish Side on the intercommunal talks, to give you this background information and answer any questions that you may wish to ask on the matter.

Before doing so, however, I would like to take this opportunity to express my and the Turkish Cypriot Community's gratitude to the Canadian Government for its very valuable contribution to the United Nations Peace-keeping Force in Cyprus and for the active interest it has always shown in the problem of Cyprus.

Thank you.

Mr. Rauf R. Denktash, President of the Turkish Communal Chamber: Your Excellency, Gentlemen, it is a great pleasure for us to welcome you here in the Turkish sector of Nicosia.

It gives me much pleasure to inform you that the word "Canada" brings to us, the Turks of Cyprus, and specially the Turks of Nicosia, pleasant memories. It brings back to us Mr. Justice Wilson, a Canadian High Court Judge, who became our first Chief Justice under the 1960 Constitution and who sat in our Courts as an honoured, respected and impartial judge bent on doing good for Cyprus. Even during our darkest days Mr. Justice Wilson did his best to keep the Courts functioning and tried to keep justice out of the political arena. He had to leave in 1964 when he found out that he could make no headway—I hope not as a disappointed man. Mr. Justice Wilson symbolized for us Canada, as a civilized country, eager to help those in need of help, eager to set up the rule of law without which there can be no peace, no settlement and, indeed, no civilized society.

"Canada" and "Canadians" also bring back memories of Canadian Officers, Sergeants and men in Cyprus, who used to enter the Turkish Sector carrying sweets and chocolates to half-starved Turkish children, while an inhuman Greek Cypriot blockade hit us all for weeks and months on end. These soldiers knew that if the Greek administrators found out what they were doing they would be ostracized and even "punished" for their good deeds; but they did not care. The starved looks of Turkish children and the sullen forbearance of their parents were too much for their civilized Canadian hearts. Being impartial but also not being able to overlook such suffering with cold indifference, are not always incompatible. We are grateful to our Canadian friends but we do not make that public, lest your boys fall into disfavour with the other side. Yes, this is, unfortunately the facts of life in Cyprus. Sympathizing with us may upset the other side...

So, Canada meant for us civilization at its best; a civilized impartial approach to our problem. And what is this problem? Why is Nicosia divided into Greek and Turkish sectors? Why the dividing "green lines", "blue shaded lines" and "red shaded lines"? What has happened to this beautiful island?

It is difficult to answer all these questions in a short space of time. I'll, therefore, try to give you a brief sketch with sufficient basic details in order to put you in the picture.

The Cyprus problem is projected by the Greek Cypriot side as a political problem which arose from Constitutional difficulties. This is not so. The Cyprus problem is a moral problem and has arisen because the Greek Cypriot side has deliberately dishonoured its signature to international agreements. Dishonesty lies at the very root of our problem.

Cyprus was part of Turkey from 1571 to 1878; in 1878 Great Britain took over the administration of Cyprus under a special agreement with the Sultan, the sovereignty still vested in Turkey. Cyprus became formally and legally a crown colony when in 1923 with the Treaty of Lausanne Turkey recognized the unilateral British annexation of 1914. So from 1571 to 1923 Cyprus belonged to Turkey.

After the British arrival in Cyprus a very limited number of Greek Cypriots, under the leadership of the Greek Orthodox Church, began to agitate for enosis (union of Cyprus

with Greece); to us, the Turks of Cyprus, this would mean changing colonial masters for the worse. So we opposed it each time this policy was brought up by the Greek side. The two communities had lived for three centuries under the Turkish rule in harmony; but inter-communal relations began to get disrupted from the day "enosis" was made an issue by the Greek side. Over the years this policy gained ground amongst the younger Greek generations who were constantly indoctrined in this "ideal". The two communities completely differ in language, tradition, ethnic origin, religion and political aspiration. But these differences did not prevent peaceful co-existence as long as juridical and political equality was maintained between them. It is only when the Greek Cypriot side hits out for achieving "enosis", that the two sides find themselves in deadly conflict.

It is because of this "enosis" policy that the Greek Cypriot leadership rejected all offers of self-government by the British.

It is when the determination of the Turkish Cypriots to defend their homes, their historic rights and juridical status became apparent to the Greeks that a new way out was considered by their leadership, and that was a dishonest way—and that dishonesty lies, as I said earlier, at the root of our problem.

Shortly this is the position: From 1955 to 1958 the Greek Cypriot leadership had embarked upon terrorist activity against "the British" and "all those who would oppose the drive for enosis". Death was the reward for doing so. Eoka (the underground Greek organization) declared that Turks of Cyprus who opposed "enosis" were enemy No. 2, to be dealt with—

"Swiftly and effectively as soon as the fight against the British was over". We could not stand idly by and wait for our approaching fate. We organized and took all necessary defensive measures. Greece was helping the Greek Cypriots to grab and re-colonize Cyprus; we turned to Turkey for assistance. Greece was "the motherland" for Greek Cypriots; Turkey was our fatherland.

Turkey made it known that she could not stand idle while a policy of genocide against the Turks continued in Cyprus at the instigation of Greece.

It became apparent that "enosis" could not be materialized while the Turks of Cyprus continued to defend their juridical and political status and rights with full vigour.

So, the Greek side pretended to agree to a settlement on the basis of an independent Cyprus.

And the Republic of Cyprus became a reality in 1960.

This republic lacked one thing: the goodwill of the leadership of the majority to keep it as a going concern! The Independent Republic of Cyprus was doomed to die the day it was born because the Greek leadership had agreed to it as a means to an end; they were to get hold of power in Cyprus and then use it for achieving "enosis"!

That is why I say that our problem is neither political nor constitutional. It is moral.

What was the nature of the Republic of Cyprus? What was its Constitution? The Greek Cypriot side complains that Cyprus did not have "true independence": is this true? They also complain that the agreements which created the Republic and the Constitution were unjust. What do they mean?

I shall try to answer these very briefly.

The Republic of Cyprus, its agreements and Constitution were based on the realities of Cyprus.

The cause of intercommunal trouble had been the Greek drive for "enosis" and its consequential result of denying Turkish rights in Cyprus. So, the Constitution prohibited the annexation of Cyprus, in whole or in part, with any other country and set up a fair balance of administrative partnership between the two communities.

Could this arrangement work?

Yes—and indeed, it did work satisfactorily for 3 years from 1960-63, during which period the two communities separately and Cyprus as a whole made tremendous headway. Had the Greek leadership waited for another two years and allowed Cyprus to have its second election in 1965 the Republic of Cyprus would have become a strong, viable project. That is why a plan of action was prepared and put into effect at the end of 1963. The object was to remove Turkish Cypriots as a political stumbling-block on the way to enosis by a direct armed attack. Hence our problem. We proved to be immovable; Turkish resistance which was estimated by the Greek leadership to last not more than 6-8 hours still continues. And why the Turkish enclaves, the green lines and the separation?

The so-called Turkish enclaves are areas into which the Greek bandits of the early days (now they have been properly organized into a Cyprus Army under the direct command of Greek officers from Greece) were not able to penetrate because of our resistance. The green lines which mark the boundaries of these enclaves pass, in most cases, over red Turkish blood of our young men who fell defending their backyards, homes or villages. This green line, in no place, passes through Greek territory. It marks the last point of defence for our homes.

Thus the separation which you now see in Cyprus came about as a result of Greek action. Greek attacks on us gave birth to our defence lines and to the defenders of these lines, the Turkish Fighters; Greek leadership chose to declare us "rebels" because we did not succumb to their attack on us; so, we had to declare to the world that we would not recognize such a leadership as the lawful government of Cyprus. Hence the political separation. Again, in order to induce our speedy capitulation the Greek leadership, which had usurped all powers of government, refused to pay the salaries of Turkish civil servants and utilized all the budget-funds of the Republic for the Greek sectors and for maintaining an army to hit us with. We on our side had to organize into an administrative unit, as life would be chaotic without such organization. Hence the administrative separation.

More than once Turkey had to come to our rescue when overwhelming Greek Cypriot and Greek mainland troops tried to wipe us out from our homes or villages and, but for Turkey's determination to protect us, the Greek leadership would have settled the Cyprus problem over the dead bodies of 120,000 Turks long ago—hence, our determination not to cast off our ties of guarantee from Turkey.

And what of the future? Is there any change of heart in the actors of this drama? In November 1963 Archbishop Makarios gave to the Turkish Vice-President his proposals for amending the Constitution. Had we accepted these proposals our community would have become a minority in Cyprus and the Greek Cypriots would have become masters of Cyprus to the extent of choosing to unite Cyprus with Greece. Greek Cypriots claim that the 1960 regime did not give Cyprus "full independence" because preventive clauses and guarantees were worked into it in order to prevent them from destroying the

regime and re-colonizing Cyprus. I am sure you will agree with me on the proposition that each Constitution has its own self-protecting clauses and these, in no way imply that such countries do not enjoy full independence.

Be that as it may, we refused to accept any modification of our Constitution because we saw the purpose behind this request. That is why we were attacked.

This is the background story. Can anyone expect us now to agree to Archbishop's 1963 proposals after all has happened in Cyprus? I believe no fair man will do so.

What do we want?

We want peace. And we know that the way to seek peace is by having an open mind and a compromising attitude while keeping yourself constitutionally strong and ready for any eventuality.

I think I can honestly say that we have entered into the present negotiations with an open mind. We have shown willingness to compromise wherever we could. We have tried to understand the other side's difficulties and problems and we have sought ways and means of accommodating these.

But we cannot yet afford to disband our forces or eliminate the green lines, nor can we afford to disband our administrative set up. Life has to go on in administrative strata and legislative, executive, judicial functions cannot be stopped. We have to be strong if we are to be treated by the other side as worth talking peace to. We have to maintain our fighting forces because the Greek side continues to maintain its attacking force in full swing.

But can we compromise on all issues? Can we agree to all Greek Cypriot demands? I am afraid we cannot. There are fundamental issues on which we cannot compromise; questions relating to security of life and property, and the ways and means of guaranteeing these are fundamental issues for us. And can you blame us for this stand after all that has happened to us?

How do we intend to plan the future structure of our regime?

I think we must start with a Central Government in which the Turkish element will be adequately represented; we must have an independent Republic of Cyprus, the

independence of which will not again be put into jeopardy in the name of enosis; which will have adequate, satisfactory guarantees so that the 1963 performance cannot be repeated. For us the only acceptable guarantee is the only guarantee which has worked effectively during the 1963-68 period and that is Turkey's guarantee.

Each time we faced grave danger it was Turkey's action which saved us. The Greek Cypriot leadership felt itself free to interpret Security Council's resolutions in such a way as to give it the right to continue to attack the Turks in the name of good government and keeping the peace; protestation to the contrary from the Security Council and the Secretary General himself would fall on deaf ears if the Greek leadership felt that it could get away with what it was doing to us; the U.N. peace keeping force in Cyprus would be defied and even trifled with, or manhandled, once the Greek leadership decided to proceed with a pre-planned line of action. Both in 1964 and 1967 it was after such defiance of the UNFICYP by the Greek armed forces that the Turks were attacked. No one could prevent a carnage. UNFICYP could only watch and plead. In both cases Turkey had to take a limited police action before the Greeks would stop.

So we feel that there can be no better guarantee not only for us but also for the independence of Cyprus than this national guarantee. Greece should, naturally, in spite of her record on Cyprus, continue to guarantee the Greek "fears" about alleged "Turkish plans for partitioning the island".

Partition, by the way, has never been a policy per se of the Turks. It meant that Turks would allow Cyprus to be united with Greece, provided that Turks of Cyprus and their lands (we own more than 30 per cent of the arable land in Cyprus) are left out of it, in which case Turkey comes in. Partition is the Siamese-twin counterpart of enosis; it is as much alive, or as much dormant, as is the enosis campaign.

So, we want to have—

- (1) a Central Government in which we will have a fair representation with agreed rights;
- (2) our independence and security of life to be effectively guaranteed;
- (3) we should continue to enjoy our constitutionally recognized communal rights in the

field of education, religion, cooperatives etc, and

(4) we should have local autonomy; local authority government so that daily friction between the two communities is reduced to the minimum while the people are given the right to rule themselves in agreed spheres as is the case in a number of civilized countries. The extent and nature of such local autonomy must be adequate and the spheres on which the Central Government may be involved in local authority affairs must be kept at its minimum;

(5) security in Local Authority areas must be the responsibility of the local authority involved.

Are we asking too much? I don't believe so. I believe that we are not being unrealistic. I feel that we are searching for an honourable settlement in the light of our bitter experiences. And I feel that this search must continue at all costs.

And this brings me to the role of the U.N. in Cyprus.

Your forces in Cyprus are doing a splendid job. It is costing you a great deal of money, we know. But an untimely withdrawal of these forces or reduction in their numbers may well be fatal. Only some ten days ago U.N. was able to avert an incident (at Omorphita) which could easily have escalated into a major clash. I feel that we need an effective U.N. force in Cyprus until the very day of a settlement. It will be catastrophic to think otherwise and it may render valueless all your sacrifices so far, if an untimely decision of withdrawal is made.

Your boys here mean comparative safety for us. They are the eyes and ears of the international world in Cyprus and this help to keep the parties at bay; it is true that once the Greek side decides, as a matter of policy to attack us, the U.N. force—being outnumbered and outgunned—cannot do much; it has to step aside and watch. But such occasions are rare and they are not likely to occur in the future. But there are local skirmishes, misunderstandings, or attempts to pull a fast one on the other side—all these are dangerous flickers of flame in this powder-keg of a place and that is where your boys come in. They are capable of extinguishing such flames immediately and thus save the situation from escalating. We are grateful to your boys and thankful to your Government for the help rendered to Cyprus.

When is a settlement likely? I do not know. I don't think anyone can give you even an approximate date. We are trying not to waste time. But it is not an easy task that we have. We are doing our best.

Question—I wonder if you can tell me whether in your opinion the Greek Cypriots are still in some future time want to bring about Enosis?

Denktash—They have just formed, or they are forming their own parties now. The rightists. Two of the parties have declared openly that their political aim is enosis, the Union of Cyprus with Greece, and they will fight for it. These are the two political parties. Makarios has declared that in politics it is not what is desirable but what is attainable, that is achieved, and although what is desirable is there, for the moment they can only attain a particular settlement so that they must attain it. He has not come forward to say "My aim is not enosis". And he is a leader, a church leader, devoted to Enosis. When he was enthroned as an Archbishop he took a holy oath that he should achieve enosis before his death and he has never stated against it. So, as the Turkish community we feel that this enosis cause is there; it only needs an opportunity or an opportune time to flare up and to devour us. That is what we believe and suspect; that is the belief in us and that is why we want sufficient fundamental guarantees in any future settlement on the basis of an independent Cyprus.

Question—On the other hand, Sir, is there a nationalist movement in Cyprus which says, I am a Cypriot, I am not a Greek neither a Turk but I am a Cypriot?

Denktash—Unfortunately there isn't, yet There is a little talk about it. Very very mildly. I don't blame anyone for not coming out strongly because guns and not brains speak more loudly in Cyprus; and the gunmen who have the guns, who have the power are on the side of Enosis. So, that feeling that we must be Cypriots, we must work for a Cypriotism is always overshadowed. And any idea of Cypriotism is attacked immediately by the Greek Minister of Education, mind you, (not any irresponsible person) as something which de-hellenises Cyprus. And it was only two or three days ago in the press here that he categorically stated that he would oppose any idea of a university in Cyprus, a university in English language, because it would de-hellenise Cyprus and we

must stick to our Greekness", he says. We feel and believe that in saying all these things he is acting with the full consent and knowledge of his leader, Archbishop Makarios.

Question—Mr. Denktash, in view of the fact that Cyprus is divided into this Turkish Cypriot area and, of course, the Government of Cyprus, I am wondering if you can explain me something which I am finding rather difficult to understand; and this is that the Turkish Cypriots are allowed to leave your area and go into the Greek areas and yet this is not true for Greeks. Could you explain why?

Denktash—As I told you our Green Line, or the 'Lines' which demarcate our areas, are completely defensive lines. There are Greek areas in Cyprus—and these are extensive areas—into which not only we the Turks but even the United Nations are not allowed to go. Only two weeks ago about ten Turkish families tried to move to an area, close to Nicosia, where their houses had been burnt during the incidents and these people, tired of living as refugees, wanted to go and settle in their homes; this area was not even a military area and yet they were checked out and, because of it, we nearly came to clashes. Greek Cypriots said, "you can't come." Why? Because they argued, if Turks come to this area (their own homes, I repeat) and settle in this area, they will be a military menace to the Greeks of Cyprus! On our side, this area in which you are now, is where we have all our defences. This is our only military area. And we are afraid that if we open the country to the Greeks they may come in and we shall not be able to know how many have come. We shall not know whether they have come with guns or what. And if they choose not to go out and stick us from behind then what are we to do? I mean, these are areas which we have kept and maintained at great loss of life, and great loss to our people. We cannot just open them. And also the existence of these areas is the only factor on which we can bargain with these people, for a settlement. Once we open these areas we are left with absolutely nothing. Everything will be gone. Everything which the Greeks have been trying to get from us for the last 5 years. So we say if we are going to open these Turkish areas which the Greeks do not like, (they call it a government within a government and so on), if we are going to open these areas, we are going to open it after a full bargaining

and a fair settlement. Otherwise we have to stick to our areas.

I would like to take a little more time over this. It is an important point. When we go into the Greek areas we accept the *de facto* position there as it exists. But the Greeks want to come into our areas without recognizing our *de facto* position. They want to come in our areas pulling with them their *de facto* authority and pushing our administrative structure out. We have offered them to come subject to our control. This offer was turned down by the Greek administration, although a great number of individuals do come in after obtaining a permit from us.

Question—About your own taxation system. Do you levy taxation against the Turks who are in mixed villages or this only covers your own area?

Denktash—Now, taxation under the 1960 Constitution works in two ways. First the direct taxation, the income tax. The income tax was, under the 1960 Constitution, a matter for us. Each community collected its own income tax, and it is that taxation we are now collecting. We collect this from our people whether they live in Turkish areas or in mixed areas. But the indirect taxation which we pay to the revenue on cigarettes, on alcohol and everything else, necessarily goes to the Greek Revenue. And it is estimated that we pay over to that revenue about four or five million sterling a year but from 1963 onwards we have received absolutely nothing from them. And in addition we have been paying them another seven million pounds a year which we have been getting from Turkey as aid in order to be able to live.

Question—What kinds of guarantee would you get to make sure that your interest are upheld should the United Nations...?

Denktash—Well, we have lived during these five years and we have tried out several things in Cyprus. We have had for example the British for a short time trying to protect us, and to defend our rights. After two or three months they said: "This is beyond us. We give up, let's pass it on to the United Nations." We had the Security Council take a hand in our affairs, and we saw how the Security Council meets, and how those meetings can be postponed by a few members, how decision can be undermined or delayed. We live very precariously in a very small place and we are a small community. We

can't afford all that waste of time. So Security Council Guarantee is nothing for us. Then we have had the United Nations actually present in Cyprus as a force and as I told you, once the Greek leadership decides to launch an attack as a matter of policy, the United Nations can do nothing. Absolutely nothing. They are powerless, they withdraw aside and they watch and report. So, all through these years it has only been Turkish Government's interest, Turkish Government's action and guarantee which have prevented our complete annihilation. And, naturally, all these events have made us believe that there is no other guarantee for us except Turkey's guarantee.

Question—Speaking about the services that you paid for now by the Turkish community Government about taxation so forth, what about services that are necessarily provided by the official government of President Makarios such things as water, electricity, telephones and things like these, you are using these and how do you pay?

Denktash—Yes. It depends on the area in question. In some areas because they have kept our Turkish employees (in some electricity or water boards they have kept the Turkish employees working, like Famagusta) we have been paying them our dues. In Nicosia where they have kicked out all Turkish employees (they are still out of work) we use the electricity, we collect the money and put it in a deposit account pending a settlement. And our argument is that the Greek side has to pay us so many millions of pounds of compensation that it can afford to wait for our electric and telephone bills until we come to a settlement. And indeed they are affording to wait because if they cut down our electricity they know that there will be a sabotage elsewhere and they will not have electricity. It will all escalate, you see. In using electricity we are not stealing electricity from them, we are accounting, we are keeping proper accounts, we are collecting the money, we are depositing it and we are waiting for the day of settlement. We have offered them to settle these things now. We have asked them to take back the Turkish employees, and start paying our dues. But the answer is: "Oh no. Not until a final settlement". Why? Because they feel that if they accept this offer then we shall be more at ease and, therefore, we shall be prolonging our resistance to them. Whereas this is not the objective. This is not the object with which we ask them to start something for normalisation. It is because we

feel and believe that once this sort of process starts, of going back to normal services and so on, it will help other matters to come to normal. And it will help our political atmosphere, it will help our talks better. But they don't see it that way.

Question—Is it the same for electricity telephone and water?

Denktash—Not in all places. Telephones for example in the Nicosia sector were cut-off during the first days of the fighting and very few have been connected since. And those which have been connected pay their dues. Otherwise we have our own internal telephone arrangements.

Question—What about Public transport, etc?

Denktash—Public transport is private, buses and so on, of which we have adequate numbers in the Turkish areas.

Question—From what we see there is an economic gap between the two groups, with the prolongation of the present situation we have been told that this gap has increased instead of being reduced. Does this put you in a difficult situation and, also I wanted to complement this question by asking you, did that disparity exist before the troubles and what were the causes?

Denktash—The disparity existed before the troubles but not to that extent. It is because that disparity existed that in 1960 constitution we wanted to put special protection clauses into the constitution to give us the right to develop ourselves, to give us the right of having our own cooperatives and so on. Because that disparity existed due to the fact that the economic life being in the hands of Greeks we were always squeezed out of everything. There was always discrimination, there was always taking away from us and not giving to us. That is why we had the changes; that is why we wanted these protective clauses. Because we had these clauses in 1960 constitution, our community began to make headway during 1960-63 period. But, since the troubles, as I said, no development fund of even a single penny has come over to the Turkish side. All government funds were withdrawn from us and "government" which gained from Turks by not paying the Turks and from what Turks returned to it; and, also, gaining from the United Nations and from the Tourist trade the Greeks naturally surpassed us in development. I think that Cyprus is the

only country which has prospered in a civil war. Now this is one of the reasons why they will not settle it. Why they will not accept my offer to start the electricity authority, (the telephones and so on) putting these back to normal, because they believe that if they keep us in this way for a longer period, our political resistance will also collapse. And it is because we know this that we turned to Turkey and requested increased aid, not only for current expenditure but also for development, so that we can withstand this economic and political pressure on us. And that is what we are trying to do. We are quite aware of the dangers of the situation and we are fighting against it. We are fighting against it with the means we have in our hands.

Question—How is the morale of the Turks?

Denktash—Well, our morale is very strong. Our morale is very strong and I don't know why. I don't see the reason why it should be so strong but it is, and there we are. We have proved to be tougher nuts than even we ourselves believed we were.

Question—Is Turkish an official language in Cyprus? And what is the present Court structure.

Denktash—Yes. The official language of Cyprus under the 1960 Constitution is Greek and Turkish. The court language was English. Since the troubles the Greek side has gone back completely to Greek and they have discarded Turkish from everything. From my talks with Mr. Clerides my impression is that they want to speak of Turkish not as an official language but as a language acceptable in pleas, letters to the Government and so on and so forth. Which is not good enough for us. It is a major point for us. We want Turkish as an official language. Now on our side, since the troubles, our Courts use English and Turkish according to the nature of the case and that is the position about the language. As to the Courts, there was a Supreme Court with a proportionate number of Greek and Turkish Judges with a Canadian on top and this Supreme Court had under it Turkish Courts, in the sense that Turkish Judges looked at all the Turkish cases; Greek Courts, in the sense that Greek judges looked at Greek cases, and mixed courts, Greek and

Turkish Judges sat together when the question was between a Greek and a Turk. This was a practical arrangement which prevented not only discrimination and injustice but also gave some confidence to the people. The Greeks did not want this. They plotted against this although it was the only part of our constitution which worked quite smoothly without any difficulty. Now we have completely separate Courts. Completely Turkish Supreme Court, Turkish Lower Courts. What will happen in future? We say let us go back to the 1960 arrangement with certain little modifications. They say no. They insist that in spite of the language barrier, etc., a Turkish litigant whose witnesses are Turkish, whose lawyer is Turkish should appear before a Greek Judge. Why? We say that is not good enough. The 1960 arrangement was not an innovation by the makers of the Zurich Agreement. It was an existing custom which had come down to us from history. All through our judicial history Greek and Turkish Judges always set together with a British President as a kind of Umpire and they decided cases together. That was the basis of justice for so many years in Cyprus. Why change it all of a sudden? And we have real fears that injustice may be done, not in ordinary cases but when the question is a political one. Indeed, during 1955-58, when the EOKA troubles started, the British had to import their own British Judges, because on political issues these Greek Judges could not act judicially. If they did, then there was a gun at their backs. And one or two judges had to leave the island. A Supreme Court Judge was shot. Greek Cypriots are a politically minded people. Political factors will necessarily creep into the Courts for a long time to come even after we settle this dispute. The 1960 formula provides against this eventuality.

Mr. Wahn (Head of Canadian Delegation)—

Your Excellency, Mr. Denktash,

We all thank you for making so much of your time available to us this afternoon and giving us so much information, and particularly wish to thank you for your kind remarks about the Canadian U.N. Force who are on the island. We are very sorry that we cannot spend more time in this lovely country and we sincerely hope that the problems will soon be resolved.

—Thank you very much.

(Provided by the Cypriot High Officials)

Ramstein, Federal Republic of Germany,

March 12, 1969

General J. R. Holzapple, Commander 4th Allied Tactical Air Force: May I extend a very warm welcome here to Ramstein and to the 4th Allied Tactical Airforce. We are delighted to have you here and we plan to have, what we hoped is a useful informative briefing as to what we do, how we do it and the situation as we see it here in Germany. 4th Allied Tactical Airforce, one of the major air elements in NATO and of course the Canadian contribution is a very significant one to our forces here at 4 ATAF and so if you are ready we will have the first briefer who is going to give a little background as to what we see the enemy or the opposition's military position here in this sector of NATO and this will be done by Major Schaffert of the German Air Force.

Major Schaffert:

(The following briefing was of a *classified* nature and is deleted from the record.)

(Slide) Mr. Chairman, this concludes my portion, the next speaker is Lt Colonel Savage of the United States air force.

Lieutenant Colonel Savage: Mr. Chairman, gentlemen, in this portion of the briefing I will discuss the nuclear or strike operations, non-nuclear or conventional operations, the reconnaissance tasks associated with these programs and the command and control or our forces.

But first I would like to review the parameters within which our offensive operations are developed. Historically, 4 allied tactical air force was equipped, trained, and postured to implement the massive nuclear retaliation strategy espoused in the early military doctrine of NATO. Guidelines for this strategy were formulated in the military committee paper MC 14/2. In 1967 the National Defence Ministers agreed to a new military doctrine that called for a balanced range of appropriate responses to cover any aggression, which was promulgated as military committee paper MC 14/3. This required 4ATAF to have a response capability throughout the spectrum of warfare: I.E. be prepared to counter any aggression from minor incursions to nuclear attack with conventional or nuclear weapons as directed and authorized by the North Atlantic Council, through SACEUR. This change in strategy was not accompanied by a commensurate change in force structure,

rather, the emphasis was placed on exploiting the total capability of all our vehicles and crews, the dual capability concept that is a major part of all of our plans today. For that reason, we must consider our offensive operations in their entirety as far as our aircraft resources are concerned, and as you will see as I discuss our preplanned programs, for both conventional and nuclear warfare, that we must utilize many of the same aircraft for either operation.

The NATO nuclear strategy is comprised of a series of preplanned programs which are further subdivided into options and categories of targets. The highest priority is given to destroying the enemy's offensive nuclear capability and those targets which are critical to the land commander in the defense of central Europe. When released by SACEUR, those aircraft and missiles on alert will launch automatically against these targets. Because of their all weather capability, which is essential for this program, and the proven reliability of the weapons system, by system I mean the aircrew, ground crew, and air frames, I.E. The total weapons system, the Canadian CF-104s are targeted against these high priority targets.

Slide—Map of Central Region

This map depicts the scope of our strike effort. 4ATAF forces of 3rd AF based in the United Kingdom, 17 AF, CANAIRDIV, and German air force southern command based in the Federal Republic of Germany, will strike targets across the central region as well as targets north and south of the 4ATAF area.

Supporting the strike programs there will be, of course, a large scale reconnaissance effort.

After the strike aircraft and missiles are launched, reconnaissance aircraft will conduct post strike target coverage requested by SACEUR and the surveillance targets designated by COMFOURATAF in support of follow-on programs.

Slide—Black

To support these programs a number of aircraft and missiles are on alert at all times. This quick reaction alert forces maintains a peace time capability to launch within minutes. SACEUR may direct the generation of the strike force to any state of readiness by specifying the number of strike aircraft to be placed on alert.

Having reviewed the strike programs I would now like to discuss the conventional mission of 4ATAF.

Slide—Mission statement

The direct support as used in the mission statement is that air action against enemy targets which are in close proximity to our ground forces and which requires detailed integration and coordination with the fire and manoeuvre of our ground forces.

The indirect air support is that air action against objectives other than enemy forces immediately engaged in the tactical battle. It includes the gaining and maintaining of air superiority, and the interdiction of targets beyond the active front.

The indirect effort is often preplanned whereas the direct support cannot be preplanned, except in general terms due to the constant movement of the land battle.

There are three fundamental areas that must be considered in the development of the conventional strategy. They are planning, aircraft resources, and command and control. We have developed plans for the control of the employment of our conventional forces from the war headquarters at Kindsbach, or a mobile facility or our alternate headquarters at Messtetten. Our plan or concept of operations that would be employed during a conventional war condition would be to launch preplanned counter attacks against enemy air fields and missile sites in an attempt to gain air superiority by destroying enemy aircraft on the ground with conventional munitions.

Slide

This is a simplified depiction of the targets and conventional mission of 4ATAF. The red triangles are the preplanned targets within 100 km of the border and the black arrows represent the interdiction missions and brown arrows the close air support missions for the central army group along the border. This shows the 4ATAF region, the area of our primary interest, but I would like to point out however, should the ground attack be concentrated in the northern army group area, our forces can and would be diverted into that area in support of the northern army group and 2nd Allied Tactical Air Force. The concept of using all assigned tactical air power where it is most needed, rather than national air forces supporting national ground forces,

is a basic premise of all our planning. The allocation of forces and control of the execution of the close air support mission will be discussed later.

Supporting the conventional battle will be the reconnaissance effort requested by the land and air commanders.

Slide

When directed by COMFOURATAF, reconnaissance missions will be flown on the NATO side of the political border, shown by red line to the west of the border. The primary mission of this reconnaissance program will be to provide the commander with updated information on enemy troop build ups, movement along the border, as well as any border violations. This reconnaissance effort will increase in magnitude as the situation escalates until, when authorized by SACEUR, reconnaissance will be extended across the border.

This expanded reconnaissance task will be to confirm or update intelligence data for use in the battle plans.

Having looked at our attack operations, let us now look at some of the forces available to support the conventional mission.

Slide—Attack Capability

Earlier you saw a slide similar to this showing our capability in all the roles. Here we see the 4ATAF attack capability only. Remembering that SACEUR has the flexibility of establishing the number of aircraft on nuclear alert which will give him the mix that he needs for a particular military situation (i.e. aircraft configured for nuclear or conventional missions). We see we have a rather large force capable in the attack or conventional role. This capability is limited in some cases by logistics or personnel training as mentioned earlier.

Slide—Black

We have discussed the nuclear and conventional missions of 4ATAF, the associated RECCE missions and the forces available to execute these programs.

Slide—Command and Control

I would now like to discuss the command and control of these forces and the tactical air control system that may be used for the direct air support mission.

Slide—Headquarters

The 4ATAF HQ's with its planning staffs for strike, attack, and air defence operations may be located at the war HQ at Kindsbach, a mobile facility or the alternate HQ at Mess-tetten in southern Germany. The signal support group is responsible for establishing communications with higher, lateral and subordinate commands with the 4ATAF headquarters.

The principle of centralized control and decentralized execution is utilized in the command and control structure of 4ATAF. Normal control of forces will be through the National Headquarters, for example 1 Air Division, and the Air Defence Sector Operations Center. 4ATAF HQ will assume tactical control of forces only when subordinate headquarters are unable to perform their functions.

Tasking of nuclear forces, both in peacetime and in war will be effected when authorized through the National Headquarters. Changes to numbers of aircraft on alert, launch plans, and additional targets will be directed by COMFOURATAF in operations orders or voice message to the National Headquarters through the National Combat Operations Centers.

For conventional war tasking, nominations for targets will come from various sources. After consideration of the nominations, in conjunction with other requirements, the allocation of conventional effort will be directed to national headquarters for execution.

For Air Defence Operations, tactical control is delegated to the commander of the Air Defence Sector Operations Center, who will direct the operation from either a primary or an alternate operations center. Tactical control, by the SOC commander will be directly with the air defence units and not via National Headquarters.

To provide direct air support for land forces, certain numbers of national forces are allocated daily to the direct air support role. The direct air support for ground forces is made the previous day. How those forces are used, pre-planned/immediate, is based on the land commanders requirements. The execution and control of the close air support mission will be shown in more detail in the next series of slides.

The tactical air control system is the organization that is used by commander 4ATAF in the integration of his air operations with the ground forces in the direct air support role.

The color code we use here reflects the national systems used in the control and execution of the tactical air missions in support of the ground forces. The red is for those units integral to German Air Force Southern Command and the blue for those units of United States Air Force Europe. Yellow is for the U.S. control and surveillance system used by all assigned tactical aircraft. These systems are primarily oriented to support of the ground forces. The air support operations center/or the direct air support center is normally co-located with the army corps it supports. Our Third National Force, The Canadian Forces, do not have ground forces of corps strength, precluding the necessity for a separate tactical control system. Any resources of CANAIRDIV that may be committed to support of the ground forces would use one of these systems for control in the direct air support role. Procedures and terminology are being standardized, to further this capability, so that all assigned tactical units can use either National Tactical Control System on an English language basis.

I would now like to discuss each of these sub systems and show how they function within the ground forces support mission of 4th Allied Tactical Air Force.

Slide

First the command and coordinating system. As I mentioned earlier, the air support operations center or the Direct Air Support Center is normally co-located with the army corps it will support. It is an Air Force staff with its own communications that works with the corps commander's staff in the coordination and control of the immediate close air support and reconnaissance effort. The Tactical Control party is a small air force forward operation team that is assigned to the ground commander at division, Brigade or Battalion level.

Slide—Tactical Air Control Party

This is a picture of a U.S Tactical Control Party M-107 jeep and communications. This officer acts as an air advisor to the ground commander and relays the ground commanders request for air support over the air request net.

Slide

The second system is the control and surveillance system. The U.S. Radar and Communications system is the one used by all forces flying in support of the 4ATAF mission. The control and reporting center is a mobile radar facility that provides continuous air situation information to the commander and performs radar control of traffic in its assigned area.

The control reporting post performs the same functions as the control and reporting center we just mentioned but it is subordinate to it. The forward air control post is a highly mobile radar facility.

Slide—This is a picture of a Forward Air Control Post

In the foreground you see the vehicle with the selective identification feature antenna and in the background the truck with the acquisition radar antenna. This unit accepts control of the Tactical Aircraft from the control and reporting center or the control and reporting post and positions it for delivery of the conventional munitions in support of the army.

Slide—Black

Having looked at the separate systems, I would like to put it all in context with this next slide.

Slide

At first glance this may appear complex but the execution of the air support mission is really quite straight forward.

The land commander originates the request for air support, the air force team assigned to him, the tactical air control party, relays his request to the staff colocated with his corps HQS, the air support operations center or the direct air support center. The ASOC or DASC will direct the launch of the tactical aircraft, utilizing pre allocated resources, the aircraft will go under the radar control of this system with that mobile radar I showed you, the FACP, positioning the mission for delivery of their weapons.

Overall, quite an efficient and effective system to give the air support they need, and equally as important, when they need it.

Slide—Blank

We have discussed our overall offensive operations with our planned concept of both nuclear and conventional operations our aircraft resources and our command and control elements. Putting this all together you can see that by the appropriate assignment of strike aircraft to an alert posture and the realistic use of our dual capable aircraft, we can, within certain limitations, fulfill our responsibilities through the entire spectrum of warfare.

Slide—Shield

Mr. Chairman, gentlemen, I wish to thank you for your kind attention. That concludes the briefing; I understand there will now be a short break before the discussion period.

The Chairman: We are pleased in having General Holzapple and General Ball with us this morning and making themselves available for this period. I believe General Holzapple has a few introductory remarks before we start the questioning.

General Holzapple: Mr. Chairman and gentlemen of the Committee, I thought it might be in order to perhaps set the stage for the questions by making a few remarks.

As you know, the NATO strategy has been essentially the nuclear trip-wire concept and that was embodied in the military committee document—14 days—which has been the sort of overall strategy for NATO for many years. A couple of years ago, recognizing that from a practical standpoint there are many, many military situations which could and may well occur which would be much under the nuclear exchange probability that serious consideration was given and finally, the NATO strategy was amended to include the conventional operations which would be under the nuclear exchange.

The Warsaw Pact forces which are on the other side of the curtain here have certainly understood and have taken prudent action consistent with the new NATO strategy and as the Intelligence briefing indicated they have actually hardened many of their aircraft shelters. They have made it more credible. Their force is a conventional force because it takes us, under a conventional method of attack, a great deal more effort to reduce or to eliminate those aircraft on the other side of the Curtain.

We are doing the same thing. In the United States Forces we have a very active program under construction right now for the hardening of our aircraft. The Canadian forces that are moving into that are going to be stationed at Lahr and Soellingen have programs, hardened shelters for their aircraft and it is going to take a real effort on their part to actually come in and really knock out the aircraft so protected. So that, in effect, the posture that we are placing ourselves in here with our aircraft and taking prudent precaution for a surprise attack by keeping them protected, we actually have here in the 4ATAF area a very significant conventional force and I believe that this will serve as a credible deterrent in conventional areas of operation precisely as it has been in the past under NATO strategy 14.2 which certainly has been a political stabilizer in the last 20 years.

Now, with the 2500 air defence missiles, with the locations of our bases as they are, particularly the Canadian ones, which are well back in the rear of the West German area and a great many of the Warsaw Pact aircraft are going to have a hard time—it will stretch their range to even get to those bases and with the number of anti-aircraft missiles we have and with the efficient, effective organization for air defence that we have in 4ATAF I believe that we have a solid credible, non-nuclear capability here, which will force them if they exceed the thresholds of our capabilities to be a clear indication that they want to escalate it on to higher levels of warfare. The Canadian forces in particular because they are a volunteer force and an extremely high level of confidence and capability, coupled with the German forces and the U.S. forces here—the 7th U.S. army and the German ground forces here, we have and can maintain a very credible non-nuclear capability in the 4ATAF area. This does not mean that it changes at all what we have had and have been able to maintain in the past a nuclear deterrent and a nuclear capability if they opt to exercise that.

I just wanted to make these few remarks and tell you that I feel we must maintain a credible, effective, efficient non-nuclear as well as nuclear force here at 4ATAF. I think we have it. I think if we reduce to a very low level to where it would be ineffective or inefficient or unable to protect ourselves that this might encourage operations on a non-nuclear basis which we would have only the nuclear

response available to us which I do not think would make much sense from our standpoint.

I just wanted to make a few of these statements here and certainly the floor is open for you, sir, for any questions that you want to ask and we will do the best we can to field them.

The Chairman: I have about 10 or 11 questions all ready so I hope we can keep our questions short and to the point. First, Mr. Laniel.

Mr. Laniel: Thank you, Mr. Chairman. General Holzapple, it has been said here this morning and in the brief that was distributed to us on the plane that the national units under command are earmarked to NATO to train and so on. However, it is only in the case of emergency that NATO takes over full command of these national units. I would like to ask you what does this mean "full command". Does it go as far as what is said in our first presentation where we would attempt to contain any aggression but this might develop to the use of nuclear weapons. Is there any means of restriction from the political point of the countries involved in the use of the two?

General Holzapple: Yes, indeed, there is. As you know, any nuclear response or any request for the use of nuclear weapons must be approved by the Council of Ministers of which the Canadian political folks are members and would have a voice in the decisions to use or not to use.

Mr. Laniel: Although you said that you should maintain a credible non-nuclear capability, do you feel personally that a conflict of any kind can be contained here in Europe where you have the two big powers confronting one another?

General Holzapple: Well, I do not know; this is certainly speculative. Anyone has their opinions. There could well be situations where it could be contained with less than a nuclear exchange. I do not want to drop a particular scenario because it might be misleading. But I can conceive of local situations here in which conventional weapons might be used and might be contained and resolved before it reached the nuclear stage. And I think that the only way you can do that is to have a viable, credible force here, a non-nuclear force, and it must be large enough that the other side takes it seriously.

Mr. Laniel: To look at the Syrian war there, the four days war actually, the destroying of the Egyptian aeroplane was a main factor in that war and the same thing would apply here I think in Europe and the fact that both sides were trying to protect their aircraft against air attack. Do you think that either side can wait long enough until they can get directives on these aircraft shelters.

General Holzapple: I hope this does not sound facetious, but I certainly would consider the Canadian, the German, and the U.S. Air Forces a bit more capable than the Arab air forces, one. And two, I think that the things we are doing here in the way of hardening and using shelters and utilizing the air defence system we have, which includes up to 2500 Hawk and NIKE, that we could do a very credible job here against even numerically larger forces that potentially could be used against us. I do not think we are vulnerable here, I do not think we are going to be just put out of the way in two or three days.

Mr. Laniel: Do you have a program of dispersion as they would...

General Holzapple: Yes, sir.

Mr. Lewis: I would like a supplementary, Mr. Chairman.

The Chairman: I have quite a number of people on the list. I wonder if...

Mr. Lewis: It is my...

The Chairman: A short supplementary then.

Mr. Lewis: Did you do any more than change the role of the forces and equipment that were here, did you actually change the equipment, or change the forces?

General Holzapple: In 1967 we changed the strategy, more than change the role. That is a good question. And it takes awhile. I must admit you just cannot change the strategy and then suddenly have it all the way down the line. But a great many things are being done. The F-4 which is the bulk of the U.S. forces here in West Germany is dual capable. I mean they are, they can be used as atomic strike or they can be used in conventional roles. We use them in southeast Asia all the time and very, very effectively, and so the fact that we use them in close and in a conventional role, they are just as effective in that role as they are in a strike. To a large extent the same thing applies with the

Canadian equipment. The fact that they were here, had been trained and had been used in a strike role does not mean that that aeroplane does not have a great deal of capability for a conventional role. And right now the Canadian forces are every day of the year going out and training the pilots and exercising these aeroplanes in the attack role and in the conventional role and they are doing really a fine job. Regard the chart there, these aircraft have a great deal of capability if you just use them in another form. It does not mean that you have to change all the equipment. Now it does mean you have to have bigger stockpiles of conventional weapons. There is some additional equipment for certain types of conventional weapons and so forth that requires an effort and these are being done, and these are moving ahead. Training, stockpiling of conventional weapons and some minor equipment changes, and so forth. But they are relatively minor compared to the basic aeroplane.

The Chairman: Mr. Harkness.

Mr. Harkness: As far as air defence missiles are concerned, what proportion of them are conventionally armed, what proportion nuclear armed, and what proportion can be armed either way?

Brigadier General Meyers: I might answer that. The missiles we know as the Hawk are conventional. Currently NATO planning has a Hawk bill. It extends from Innsbruck down to the Austrian area clear on up into Norway. Now these are all conventional. In our case we have 48 batteries after we bring them all up. Thirty employed in depth and width. Now the nuclear aspect is in the making. Over here you get about $\frac{1}{3}$ per cent new. But the difficulty here is that if you have nuclear warheads abroad you must have a NATO council approval to use it. So you could assume that under a surprise attack or an attack that occurred before the NATO Council could make a decision we strictly have to go with conventional weapons. We do have the nuclear weapons. We do load certain numbers, but they are held and you cannot raise them without some approval. They can be used also in a surface to surface role by putting the arming clauses in and re-programming the computer. So basically we are prepared initially on both weapon systems to go conventional. We could phase over into a nuclear role. However, remember the kind of aeroplanes we are talking about here, we are talking about fighter bombers. Actually his

aeroplanes basically are converted air defence fighters. They do not have a tremendous range and they do not have a tremendous carrying capacity. So they are going to come low. So this means that the only time you can use a nuclear to any advantage is to break up large formations and keep him from out of the high skies and keep him down low so you can get at him with your Nike and with your Hawks and your other weapon systems that are assigned to the army.

Mr. Harkness: Roughly speaking, at least three-quarters of your air defence missiles would be conventionally armed.

General Holzapple: Probably more than that. More like 90 per cent. There would be a small number held back for use as a possible nuclear air defence missile, but only after the Council had approved the use of them. But I would say that over 90 per cent of them would be conventional.

Mr. Harkness: The same question as far as aircraft are concerned, what proportion of them cannot be used in conventional roles.

General Meyers: All of them can be used conventionally, except the F-102 does have a nuclear capability, and 26-B. We do use 26-A which has almost about the same kill capacity as the nuclear head, so air defence, aircraft-wise the German F104 has the machine gun and the sidewinders. The F4 and the F100 have machine guns plus the spiral and the sidewinder. The 102 as you know has a 2.75 rocket and the A26's. So essentially our air defence is conventionally oriented, because we are not against mass bomber formations. As a consequence your non-nuclear ordnance is almost as effective, except when you get into the business of nuclear flux and killing the weapon.

Mr. Harkness: As far as your aircraft which would be used in direct support of the ground forces, are they chiefly armed now with rockets or with bombs?

General Meyers: This would be a variation. It depends on the type. If you were going close air we probably would have them basically with iron bombs set at 50 lbs. or higher and also your BLU fire bomb, with rockets as backup. But when you get into close air you almost have to make a pattern because you cannot anticipate what kind of target you are going to hit. It could be a troop concentration. It could be tanks or it could be a fortification. Not many fortifications. So that would mean

that you have a tremendous problem of deciding what you are going to put on this aeroplane. Now ordinarily you could get a computer to come out with the exact type ordnance against that target, but you do not have that kind of time. That aeroplane has to be armed so that when the army commander requests it we are talking 15 minutes or less. So you would have to pick a pattern or a standard combat load as we call it. Now this would consist of iron bombs, BLU's, the fire bomb, and probably CBU, these cluster bomb units.

Backed up by rockets and backed up by machine guns. So you have a complete spectrum of flexibility. If you do get out there he changes the target on you which about 60 per cent or 70 per cent of the time he will change targets on you. Then you would have ordnance with the appropriate 2 degrees to that. It would not be optimized but it would be in the ball park.

The Chairman: Mr. Stewart.

Mr. Stewart (Cochrane): General Holzapple I just have three small questions that need clarification. You were saying a few minutes ago that we have a solid non-nuclear capability and I think mentioned the figure of 2,500 air defence missiles and in the presentation what was required was a stockpiling of conventional munitions which would indicate to me that we are short, that you would like to have more. Is this the case? Did I understand this correctly?

General Holzapple: Yes. You did understand it correctly. If you are going to use your force in the conventional role, in an attack role where they use nuclear weapons, it does require a stockpile of weapons for any protracted period. Right now I think all of the NATO forces have probably read and what would be prudent to have as a munitions backlog or stockpile and I know in the case of the American forces we are attempting right now to build up the stock of conventional weapons and certainly this would be a prudent thing to do with the others too. Right now we have been in a bind because of our activities out the other direction, but we are making steps to increase the stockpile of conventional weapons.

Mr. Stewart (Cochrane): We could interpret this then as a recommendation.

General Holzapple: I think so, yes.

Mr. Stewart (Cochrane): The second question has to do with the comparative figures. I know Colonel Savage in his presentation made a special point of singling out the numbers of attack capability aircraft and he mentioned the number 846 as being the total number. How would this compare with the Warsaw Pact attack number?

General Holzapple: I think it would be considerably less. I do not recall the exact number of all those that are potentially available in the Warsaw Pact. But it would probably be maybe one to two. But let us assume that that is the proportion. As General Meyers indicated practically all of the Warsaw Pact aircraft are converted air defence fighters and their munitions carrying capability is considerably less than any of ours. For instance the F4 in their daily operations in Viet Nam carry probably five times as much as a MIG could carry in conventional ordnance. So that the fact that they have two to one does not necessarily mean that that proportion should apply across the board. Because many of the aircraft that we have here in the 4 ATAF area are capable of carrying considerably greater loads than theirs are. The same way with range too. The F-4's have considerably longer range than the MIG-17, the MIG-18, and that is why the location of the two Canadian bases is I think very significant. It is back in practically the French quarter and a great many of those great numbers of aircraft that could be used against them are going to be hard-pressed by range to even get there and then with the NIKE or the Hawk belt that you have to go through plus the fact that we are seriously considering relocating some of the Hawks that we have back to where they can be more effectively used in the protection of the airfield. I think that we do have a credible force here and even though they are numerically outnumbered by those across the curtain, that performance-wise and organization-wise that we have a really credible force.

Mr. Stewart (Cochrane): I wonder General if you could give us some idea of the other part of what used to be called the Air Defence team and maybe you could indicate if this is still the case. My experience in the Service was ten years ago when part of the Air Defence team was the radar net, the ADDC's and so on, and I wonder do you have such a thing around here, do they still carry out identification of the aircraft that are flying in the air? Do you send up our fighters to identify at this time?

General Holzapple: Yes indeed we do. We have a very effective air defence net here in 4 ATAF and it is also being combined with the NAD System which is going into West Germany north of here and there is an effective crosstel, the radar surveillance is such that we are able to flush and to get up aircraft in less than five minutes and actually identify those which come in which are not on a proper flight plan or give the proper identification. It works very well and we watch this surveillance border very effectively.

Mr. Brewin: General, I would like to preface my question by saying that I want to make clear that I do not want to cast any doubt on the efficiency of the forces here. I am very happy to hear the tribute paid to the competence of the Canadian component, but it is our duty to inquire into the basics that are involved here and the great criticism that has been made to our committee in regard to this role has to do with vulnerability and the suggestion that possibly in the case of high tension the forces involved might be destroyed on the ground before they could be used. Now I understand you to tell, we heard in the briefing, that the Russian Forces, the Warsaw Pact forces were stressing the active and passive defence, the hardening of sites, and so on. The question I would like to pose is whether or not, despite all that can be done, whether the sighting or the targeting of our IBM's on the site where we have our air division for example, still despite all that is done, are they not basically vulnerable to an action that might be taken? Is it possible in other words to reduce the vulnerability to a sufficiently low point that it does not remain a danger to the whole effectiveness of the operation?

General Holzapple: Well, as I tried to make clear in my opening remarks, there is no question but what if they really want to pre-empt with nuclear forces, as you have suggested here, the targeting with our IBM's and using NIKES on a pre-empt force they could probably do us all in. But, on the other hand this presumes that they are prepared to follow through with a nuclear exchange that this kind of overt action would imply. I do not think that they would do this lightly, in fact, the fact that we are all here indicates that the total capability of exchange is such that it has created a political stability here for the last twenty years. Now, what we really need is the additional capability and this is really the purpose of this enlarged or

maybe broadened NATO strategy as applied under 14-3, is to discourage them from taking less than nuclear actions, moving in with conventional forces. If we could not have a credible force and really have a reasonable change—a stalemate with them at least, that we would have only the nuclear option to retaliate, which does put us in a real sort of blackmail situation. So I am not sure I am giving you the kind of an answer you want, but I believe that unless they do this nuclear pre-emption that the forces that we have here that are protected as we are planning and proposing to protect them that they are going to be able to hold their own or at least be a credible force to where they are going to have to really come to this, to what you are guessing is a use of nuclear in order to really do us in. Maybe I missed your point, I...

Mr. Brewin: I just would like to—you are right on my point, but I would just like to follow it up with one further point. I can understand the full relevance of what you are saying for the use of the forces under your command for the purpose of support, some conventional support of some conventional defensive action in the case of some minor but not all out aggression. I can understand that, but what I cannot understand is how that is consistent with the use of a strike force which surely in itself is such a devastating blow on our side, devastating capacity on our side that it would be likely to provoke the nuclear counter-attack which you said to which there is apparently no effective defence.

General Holzapple: Well, I think that we are a lot better off if we are able to respond and respond effectively and credibly at any level whether it be a small excursion here or there, or a conventional engagement, clear up through the nuclear response, and we are prepared to do either, and I think they are too. I think the fact that we both know what the nuclear exchange really implies and the fact that it exists has been a large part of the political stability here for the last twenty years, and I think that we have got to be prepared to do it on the lower levels in addition and have it credible and I think that it will create the same attitude or atmosphere and stability that we have through the use of the nuclear forces in the past.

The Chairman: Thank you sir. Mr. Prud'homme?

Mr. Prud'homme: We are at the moment reviewing our NATO commitment. If Canada

was to decide to not stay in the *status quo* or not getting off immediately from NATO but to play a different role, how could this different role affect the effectiveness of your force at the moment if for instance part of our new role would be to withdraw our troops from the actual NATO commitment?

General Holzapple: Well, as to quote some of the figures that were given in the briefing, the Canadian contribution in aircraft is 12 per cent but I think that any reasonable assessment of its contribution to the 4 ATAF area is probably greater than 12 per cent. I do not know and I cannot say that if it were reduced by the numerical 12 per cent that this would mean the difference as to whether our overall air capability in 4 ATAF would be completely credible to the Warsaw Pact powers or not, but it certainly would degrade it, and all prudence would then indicate that if you did not provide them, then somebody else should, and whether this would be forthcoming or not I do not know. But, as with the principle of the North Atlantic Treaty Organization all the members in various forms and ways have all agreed to come together and collectively to provide a credible reasonable force here to create, what all military forces are for, to be the instrument of national or collective policy. I think it would be a very significant blow to our capability at 4 ATAF to have the Canadians withdrawn and I think that in order to keep a reasonable credible force here that if you did not then somebody would probably have to step in and do it for us.

Major General F. W. Ball (Chief of Staff): General, I might elaborate a bit on that role and answer your question too at the same time. There is a level of operations, when you exceed that you have exceeded NATO's capability convention. I have not heard any NATO Commander state categorically that he can take care of the hardened 50-60 divisions Russia can throw against us on the ground. Now we are talking air war. Our weapons are configured optimum for the kind of war we are talking about over here. So therefore as you go up this level of escalation at some point in time you probably will have to go nuclear if you are going to stop these people. That is accepted in 14.3 You can do this either in any one of the three phases, direct defence, a deliberate escalation, or general nuclear response. So now, let us assume that we have to have a level of nuclear capability standing by in the event that it is necessary to employ it, either atomic demolitions, missiles, the Pershing missile, the US Army and

the Germans have, or it could be air. And you have set aside a certain level of nuclear capability, now in the Canadian case that aeroplane was designed for the strike role, it is very good at it as an all weather capability and it will carry one hell of a bang. What we do since it is optimized for strike, we will give General Lane's outfit a higher level of nuclear commitment to free some of the US F4's so we can use some of those aeroplanes that are optimized for this tactical air. If we did not have the Canadian contribution we could not do that, and we could not free those aeroplanes for the conventional role. So we do, in lots of our exercises, request that SACEUR allow us to transfer these targets from the US forces to the Canadian Forces so we can free the US forces for the conventional role. So in effect it does have a tremendous rate of impact of 12 per cent, because remember this is an all weather delivery aircraft that you have here, the pilots are highly skilled at this, and it is designed for this purpose. It does have a secondary capability, but it does not approximate the F4 because of the carrying capacity.

General Holzapple: Well to summarize and to answer your question, there would be a very significant loss of capability here if the Canadian Forces were withdrawn. They have a great capability in both the conventional and the strike role.

Mr. Prud'homme: Could the fact that these planes would be located in Canada, would this reduce considerably the effectiveness of your actual plans?

General Holzapple: Well by being located in Canada, subject to being called up, well of course you know this concept is not new at all and has been used in varying degrees by various members of NATO. There is certainly a degradation because airplanes in Canada have to presume then the capability in getting them over here in a hurry, to have the facilities available when they come in to be ready to accommodate them, and as a commander I can be very honest with you I would much prefer and would feel that they would be much more effective if they were here, trained every day in the locale, knew exactly what the situation was every day and every minute, and then if they were called on they could be brought up into a state of readiness and usefulness much quicker and be better. Now that does not mean that there is not some capability, and we do the same thing in the United States force, there are

some earmarked for NATO—committed units that are in the States—we exercise them from time to time, but to say that those are just as good as in place I would, in all honesty, have to say that our NATO committed forces that are not here are not as good as the units that are right here on this base for instance.

The Chairman: Gentlemen, originally we were going to have lunch at 12.30. Now I understand there is a little bit of flexibility and that we can go on to 12.45. I get more questioners as we go on. Is it your wish then to go on to 12.45 so that we can accommodate some of these questioners? We will not be able to get them all in but perhaps during lunch we could get some answers on a personal basis. Mr. Howard?

Mr. Howard (Okanagan-Boundary): General, I can accept the fact that we have had 20 years of peace in Europe because of NATO, but I cannot conceive of a political situation in Europe at this time that would involve what you call the flexible response. I cannot see either side loosing a limited war in Europe. Their positions are much too rigid and the limited response could quickly become a nuclear response. I feel that we are now in the position of having a marginal line here where our weak flank is out in the Middle East or Africa, or the Far East, or any other part of the world where limited wars do go on. I cannot see the limited war that you are talking about. I feel that you are going to be in a nuclear role within a matter of hours and in this case, your units here in Europe are not that effective or that important because you are going into the ICBM situation almost immediately.

General Holzapple: Well, you may be right. I will not say that your assessment is not valid at all. However, if the NATO forces—conventional forces—were so weak and so vulnerable that they could be quickly knocked out as in the Middle East, or very quickly brushed off as being ineffectual, or neutralized very easily, I can conceive of a possible Berlin, to use an example, or maybe elements of West Germany here that could be a tempting prize if our only response were nuclear. Now, you may be right, any encouragement of that nature might well trigger the whole nuclear exchange, but I think as more and more awareness of the real consequences of nuclear exchange are understood or realized, that prudent, sober judgments would really be very reluctant to initiate the nuclear exchange. I think that we would put ourselves

in a very vulnerable spot if, through lack of conventional capability, we allow ourselves to be so weak that if something like that were done our only response could be nuclear, and I think that we would be vulnerable and could tempt them. I think if we have a credible conventional force here in order to make an incursion, that it could not be resisted, that we would have less options than what we deserve and what, in all prudence, we should have.

Mr. Howard (Okanagan-Boundary): There is a big difference though between the maximum and the minimum capability that might be suitable here in Europe. Is that what you suggest?

General Holzapple: Yes, there is no question about it. Those are matters of judgment and I cannot precisely say that up to a certain point that we do not have enough and that at a certain point we have just enough and that beyond that we have too much. I think there are too many variables and kinds of situations that might occur that for me to make that clear delineation would not be very smart on my part; I could not do it. As I say, those are judgment factors. But I do believe that we should have and must have a reasonable non-nuclear capability here because without it—beyond this point, and I am not going to define it, my judgment might be different than yours—you can see that if you get below a certain point then you are vulnerable to possible incursion to which you would only have then the nuclear response capability.

The Chairman: Mr. Winch?

Mr. Winch: Mr. Chairman, I would like to ask the General a question that has always intrigued me. Supposing there is the early strategy of an antagonist because he is on the aggression and knowing of the results, has the strategy of early escalation into nuclear, what is your position then on account of the position of the Council authorizing you? Is there a different strategy then that if it is used before you are completely wiped out, you can move, or what is your position in that interim period of time?

General Holzapple: Our rules of engagement—and I cannot fault it really—are that we do not even respond to nuclear attack until the NATO Council and the political elements decide that we should do it.

Mr. Winch: And what would happen to you just in the period of a couple of hours?

General Holzapple: We could all get killed. We could, but on the other hand anybody that starts using nuclear weapons—starts it—had better reckon very seriously with the ultimate possibilities of exchange they might receive.

Mr. Winch: You mean exchange outside this area?

General Holzapple: Absolutely.

Mr. Winch: Oh, you mean on a world involvement.

General Holzapple: Absolutely, and I do not think, unless you get a crackpot which is, I guess, possible and it has happened before...

Mr. Winch: That is exactly what we had in mind.

General Holzapple: ...that you could get something started that way. But we live in a world with certain elements of danger all the time; there is always a crackpot around some corner that might do us in individually or collectively—I do not know. On the other hand, that does not mean that just because there is potential of a crackpot and some irresponsible action that we should be less than prudent in our normal arrangement of our affairs.

Mr. Winch: Just a brief supplementary. Does your intelligence give you any understanding as to what is the policy on the other side on a holdup on retaliation like we have when we have to wait until we get the order?

General Holzapple: That is a very interesting question and perhaps there is some indication that their political mechanism may be able to work faster under certain circumstances because of making a shorter circuit diagram. On the other hand, I think that both sides are going to be very very reluctant to initiate a nuclear exchange.

The Chairman: Thank you. Mr. Allmand?

Mr. Allmand: General, for your mission here, what is your assessment for the future role of manned aircraft? Do you see a rapidly diminishing role for manned aircraft for both defensive and strike attack roles let us say within the next five years?

General Holzapple: No, I do not. I will be very candid with you. At one time when the

missiles were becoming very popular—and there is no question but what a nuclear missile has a great amount of utility, based on the assumption that you are going to use it—it is real easy to put a small hardened hole in the middle of Montana and have a very accurate inertial guidance system so that it goes with great accuracy to the middle of some place you want it to go to, but there is a great loss of flexibility with a missile. You have got to be real sure that when you press that button you really mean it and after a situation degrades to where there is a big exchange they are very useful. On the other hand, manned aircraft and we are coming more and more to that realization in the States, and right now we are in the process of getting started with a new manned strategic bomber because it does give a great deal of flexibility in the way it is utilized, not only for nuclear but for conventional use, we found with the B-52s in Southeast Asia, the fact that in very delicate situations they can be launched and recalled, targets shifted or changed enroute, and so I would say that despite some of the apparent advantages of missiles, and particularly nuclear missiles, that the role of manned aircraft because of their greater flexibility—the fact that you can exercise them every day, the fact that you can practice and you know exactly what you can do with them and so forth—that I personally feel that the role of man and equipment in the form of aircraft are going to prove through their utility a long long way down the loop. In fact I cannot foresee the time when man in the loop of machines—manned machine loop—is not going to be probably one of the most significant and major portions of our military force.

Mr. Allmand: I had particularly in mind your role here in NATO, in Europe and especially the defensive role. Do you visualize in ground to air and so forth that there will still be defensive manned aircraft?

General Holzapple: I do, and identification is just one good example. I mean the fact that man and his airplane can go up, certainly in the early parts particularly, and in very delicate situations. You see it is very difficult—when you press the button on your 9 key or your “hot” line you are finished with it. However, the manned aircraft can go up and identify and maybe take prudent action that would not be possible once you have pressed the button.

Mr. MacLean: I have a short supplementary. Is there any indication, to your knowledge sir, that the Russians are doing some re-thinking along the same lines—that they may be considering redeveloping new bombers and this sort of thing?

General Holzapple: This is a debatable question among our intelligence community as to what their future plans are for manned bombers. Certainly they have long range bombers now. They have considerable manpower and our intelligence indicates that they have the production facilities and so forth and are producing—not a great number, there is not a great expansion in their force—but on the other hand the estimated phase-down which the intelligence community has been calling for years has to be revised every year because they are not phasing them down as the intelligence estimates or projections have indicated you see. Now whether or not they are going to have a whole new replacement for their present fleet, I do not know. It is likely that it may be smaller than it was in the past before the era of the nuclear missile because they do certainly compliment each other and for any over-all total force,—a portion of each—there is every indication that they are continuing a mix just as we have and as most countries do.

The Chairman: Mr. Guay?

Mr. Guay (St. Boniface): General, my question has been asked and we have been advised on it, but I would like to ask the question in a slightly different manner.

The Chairman: Would you speak into the microphone please, Mr. Guay?

Mr. Guay (St. Boniface): Yes. I believe you were asked as to the effect of the withdrawal of Canada from NATO. I believe, General, that your comments were that “it would be a blow” and later on you said it would be a significant loss. Could I change the question slightly and say, how important is it to the United States and to Europe for us to remain in NATO? I would rather that you would not look at the loss but rather the importance of us remaining in both instances (a) and (b). Could you mention your thoughts on the matter.

General Holzapple: I am sorry if I used different words because they really were intended to denote much the same thing. If the Canadian Forces were withdrawn from 4 ATAF I would consider that, as Commander

of 4 ATAF, a significant loss of our capabilities and would degrade our capability to perform this non-nuclear role. As far as the importance of Canada contributing to NATO this is certainly something that the Canadian people and your government must decide. I personally think that all members of NATO have not only a practical self-interest to provide forces but also from a standpoint of if you are going to be part of the alliance then I think that really being part of it is kind of an important thing. This is just my personal opinion and admitting that there are many ways in which this can possibly be made and I am not attempting to even imply that whatever you in your collective judgment decide as the appropriate role is necessarily wrong. But certainly the contribution that you are making and to the forces here in this Command they are important. They are very important. And I would hope that you would see your way clear to maintain forces here because the experience that we have had with Canadian Forces because of their capability and esprit and their high professional performance and so forth, as a Commander I welcome the Canadian Forces. I think they are very important to my performing my mission here and being able to do what we are being provided here for and I would hope that it would continue. I hope that answers your question Mr. Chairman.

The Chairman: A supplementary from Mr. Marceau first and then Mr. Nowlan.

Mr. Marceau: Do you not think that Canada should play a more useful role to protect peace such as a mediator between the U.S.A. and the U.S.S.R. if we stay out of NATO?

General Holzapple: I would be presumptuous if I really tried to give you an answer on that. As a military man I would be much more interested in the forces here.

Mr. Nowlan: Mine is almost supplementary to Mr. Howard's. In this surveillance of the line here, here and in Warsaw Pact countries across the way has there been planned provocative incidents, I mean sort of keep the thing up some time and cool it down later for instance? In other words because it is a manned surveillance what are the possibilities of miscalculation in the surveillance?

General Holzapple: Maybe I had better preface my answer to this by saying that I have only been here for a very short time. But on the other hand having been in Wash-

ington for many years and then here previously I think I have kept pretty current with the border situation here in Germany and in general I think I would answer that by saying that there has been pretty good respect on both sides for the border situation, and I am not aware of other than certain harassments in the corridors under a very controlled condition. There have not really been any hostile things towards the border here on either side. It has been fairly steady and stable. Now that does not mean to say that since their redeployment as a result of the Czechoslovakians that they are not really in a little bit better tactical position as a result of their re-positioning than they were before. Now this does not imply in any way that this is an answer to your question. I do not believe.

The Chairman: Gentlemen I think we just have time for one more short question although I have a number of people on the list. Mr. Anderson.

Mr. Anderson: There is just one question now. Do you feel that this build-up in your conventional capability has created a situation whereby if you like you have created the conventional stalemate and now you are in a situation where if the other side attempted to do anything they would have to reckon on instant nuclear war. Do you feel that you have sufficiently made it clear that your conventional capability is such that they have no hope of any success in a conventional attack? I say this because you mentioned a number of times such things as forcing them to a higher level. This was in your short speech. You feel that then that if this was the case that probably thanks to your conventional build-up you reduce the chance of a conventional war enormously and put it entirely back into a nuclear situation?

General Holzapple: I believe that yes. I think that is really the philosophy behind the corps d'esprit but it also implies that we make the conventional force that we do have here credible and to leave them unprotected, all lined up in a row, where it just invites a very quick wipe out like the Israelis were able to do in the Middle East a year ago last summer or to have such a small force that it could be just brushed aside without much consideration. Then I do not think we are in that position. But I think that with what we have and if we take prudent action to put it under the revetments as we are programming right now to do and maintain the high state of readiness through the exercising of our con-

ventional weapon delivery, a reasonable stockpile of conventional weapons here, I think that we put ourselves in a credible position, that they know that they can have a real scrap on their hands even in a conventional way and it is going to create the kind of a political stability that the nuclear capability on each side has done in the past.

Mr. Anderson: I do not know whether I am allowed a supplementary but it means then that the various levels of escalation now mean nothing because you have created a situation where there is this conventional saw-off, this conventional stalemate.

General Holzapple: That is right and that is exactly what they have done. They have hardened their forces. So where we could go in with maybe two fighter bombers and shoot up practically a whole airfield full of airplanes, it would take half our force to really assure that you are going to knock off even one airfield with everyone of their airplanes under a hardened shelter. It works both ways.

The Chairman: Gentlemen, I know all of us are sorry that we have to bring this question period to an end because of luncheon arrangements which have been made. We have already gone over our time. Perhaps those who had questions and did not have an opportunity to ask them, Mr. Cafik, Mr. Buchanan, Mr. Ryan and Mr. Marceau might possibly get individual answers to their questions during the luncheon period. I know all of us are most grateful to those at the table here. General Holzapple, General Ball, General Myers, and also the officers who gave us the very helpful briefings for making themselves available this morning and for giving us this information. Thank you ever so much. General Ball has an announcement, gentlemen.

General Ball: I might just explain that we are having lunch gentlemen in what is called the Vesuvio Room and it is downstairs. If you would like to leave any of your things you may leave them here and pick them up on the way out.

Lahr, Federal Republic of Germany,
March 12, 1969

Major General R. J. Lane, Commander 1 Air Division: Mr. Chairman, Gentlemen, on behalf of the air division I wish to extend a sincere welcome to you. I am extremely

pleased that you have included the air division in your European tour and only regret that because of the limited time available you will be unable to visit one of the wings where you could get a very real feel for the complexities and the operational nature of our job. In an operational command such as this, effective security, physical and otherwise, is a constant necessity in meeting the external threat to security which we face daily. We have been reminded of this particularly since the events of August. I know that you will appreciate the sensitivity associated with discussing our operational posture in an open forum such as this. I regret any inconvenience this may cause but I assure you that in this briefing and the question period to follow I will be as frank and explicit as possible within the confines imposed by NATO security.

There are many active trouble spots in the world today which hold our attention, causing all of us varying degrees of concern and no doubt your present tour will assist you in assessing the relative significance of some of these areas. While many of the peripheral areas are presenting difficult problems in the search for peace and stability, in the final analysis, only those which affect the interface of the two major nuclear powers pose a direct threat to Canada's national security. As the Minister of National Defence said to this committee on December 3 and I quote "the forum where super power interests most closely impinge on each other is Europe, and hence Europe, in my view, is the geographical region where Canada's security is most in jeopardy" unquote. Our forces assigned to Europe contribute to Canada's national security in a clear and visible manner as part of the common deterrent.

While Europe has in many ways been a model of political stability in the last fifteen years, the military occupation of Czechoslovakia reminds us that on short notice this could change dramatically. There is no doubt now that the Soviets are prepared to use their military forces when they consider it expedient to achieve their ends.

I am sure there is no need for me to dwell upon the situation which pertained in the late 1940's when the Soviets threatened to engulf all of Western Europe, whether through political subversion or by a military steamroller thrust to the Atlantic. The threat was real and response from the West realistic. The military alliance was created to defer the

threat of Soviet aggression and has been extremely successful in this regard. But—the Soviet military capability has not disappeared. It exists today as it did then—re-equipped with the latest generation of military hardware which has increased both its mobility and fire power. Thus, until such time as mutually acceptable disarmament can be undertaken, a credible deterrence is the basic strategy of NATO to retain stability in Europe. It is within this basic strategy that I shall, in my brief this afternoon, outline the air division's posture touching on five main points:

- Operational roles
- Command and control
- Composition of the air division
- Capability and achievements
- Concept of operations in the air division as it is today.

I say "as it is today" because, as you know, the new NATO strategy of responding to aggression with flexibility has been accepted and we are now in the implementation period with certain operational problems still to be resolved. I will conclude by briefing with a few words on this year's relocation of the air division to two bases and briefly expand on the new NATO strategy.

Stated concisely the air division's role is: to provide the combat ready forces required to meet that element of Canada's NATO commitment which embraces the three distinctly different air operational roles of nuclear strike, reconnaissance and attack.

Specifically, as commander of 1 Air Division, I am responsible for conducting:

First: nuclear strike operations against tactical targets using our squadrons from 3 and 4 wings;

Second: Photo/visual reconnaissance using our squadrons from 1 wing; and

Third: Attack operations, involving the delivery of conventional or non-nuclear weapons against tactical targets using our dual capable CF104's from 3 and 4 wings.

Except for a small number of training and communication aircraft, all 1 Air Division forces are assigned to NATO. Therefore, once an emergency is declared, these forces come directly under NATO operational command.

As you heard this morning at 4ATAF, the operational chain of command is SACEUR—allied forces central Europe—fourth allied tactical

air force—air division. I am operationally responsible to the commander of 4ATAF and it is with his headquarters that my staff deals daily on operational matters. Administrative and logistic support are a Canadian responsibility. For example, we maintain a very close liaison with Canadian forces headquarters on the postings of personnel to the division to assure a proper experience level in our operational units. On the logistics side, with the exception of petrol and rations, support of the air division—including engine overhauls—is carried out directly from Canada using the airlift capability of our air transport command.

Before discussing the present composition of the air division, I would like to sketch very briefly some of the highlights of the air division since it formed in 1952.

From 1952 to 1956 Canada maintained 12 squadrons of F86 day fighter aircraft on four bases in Europe. This force totalled 300 aircraft which, at that time, were the most advanced aircraft in service in Europe. In addition a type 80 radar was operated as part of NATO's air defence warning system. As the need for an all weather fighter capability became apparent, four of the F86 squadrons were re-equipped with the Canadian built CF100 which had been performing effectively the all weather air defence task in Canada.

In the early 1960's, when priority was being placed on creating a tactical strike and reconnaissance capability under SACEUR's control, we re-equipped with CF104 aircraft. These were transported from the factory in Canada to our bases in Europe in a partially assembled state using our C130 aircraft of Air Transport Command. Eight squadrons of CF104's were assigned to Europe and committed to the strike or reconnaissance roles. It was during this switch of roles that the air division establishment reached its peak of just over 6200 military positions.

In 1967, coincident with the move out of France, our commitment to SACEUR was reduced from 8 to 6 squadrons. The present commitment is 4 squadrons, with the dual capability of nuclear strike or conventional attack, and two reconnaissance squadrons. These squadrons are—in terms of numbers, but particularly quality—a very important element of the tactical air forces available to SACEUR.

To support our commitment to SACEUR the air division is organized into:

- A command headquarters
- Three main operating bases; and
- Three auxiliary units.

The command headquarters is located here in the Canadian caserne with 1 Wing providing all administrative support. Several other buildings in the caserne have been converted into a collegiate and junior high school complex. This fall these schools will accommodate over 1,400 children from grades 5 to 13. Other buildings are being used for recreational and community activities.

The first of our three bases is 1 Wing—The home of our two reconnaissance squadrons. This base is also our terminal air head for air transport command trans-Atlantic flights in support of the air division and serves as the main European staging base for United Nations operations. Cyprus is an example. In addition, with the exception of the brigade group, 1 Wing provides administrative support for all other Canadian servicemen in Europe including the Canadian forces attachés.

Our second main base is 3 Wing located at Zweibrücken near Saarbrücken. It is established for two strike attack squadrons. Also at 3 Wing are the division's main hospital and several centralized technical facilities. Plans are now well advanced on the closure of this base.

The third, and last, main base is 4 Wing, located at Baden-Soellingen, some 30 miles north of Lahr. It, also, has two strike/attack squadrons. These six squadrons, located on our three operational bases, forms Canada's air commitment to SACEUR.

We have three auxiliary units. Located at our main air head here at Lahr is 5 air movements unit, under the control of air transport command to handle all our trans-Atlantic passenger and freight traffic. Also at 1 Wing is 109 communications flight, equipped with six Dakota aircraft. It provides special flights and scheduled feeder-line service between the air division bases and other units at which Canadians are stationed in Europe. This unit is supplemented by an air transport command C130E on continuous deployment from Canada.

The last of our auxiliary units is the air weapons unit at Decimomannu on the island

of Sardinia. This unit provides the training facilities for our CF104 pilots in bomb delivery techniques and sea survival. We share the use and operating costs of this airfield and the associated bombing range with our Italian and German NATO Allies. Without this facility at Deci we would be unable to maintain the high level of expertise in our squadrons as the few ranges in continental Europe are badly over committed.

In addition to these three auxiliary units, there is a T33 instrument flight at each wing where pilots are checked out on the continental instrument flight procedures, which differ considerably from Canada, and, thereafter, complete each six months a prescribed instrument training syllabus.

I mentioned earlier that a peak manning figure of some sixty two hundred servicemen was reached during the introduction of the CF104. Since that time, due partly to the reduction in our commitment and relocation, but more importantly to improved maintenance and logistic techniques, our manning requirements and associated manning costs have continued to decrease. As a result, our new posture this Summer, of six squadrons on two bases, will require approximately thirty-eight hundred military personnel. Since 1962 our commitment to SACEUR has decreased some fifteen per cent in aircraft but our reduction in personnel is close to forty per cent—an indication of our increased productivity and attribute to the increased efficiency in the technical support area and to the professionalism of our airmen.

Efficiency in the technical support area means basically the maintenance of the CF104. This aircraft is an extremely versatile machine. It was designed initially as a high altitude supersonic interceptor and was modified for use in the low level role. I want to emphasize here that the CF104 is now in its prime—as effective in its roles as any aircraft in squadron service today and is doing an excellent job. A programme of modifications and updating of the engine and components during factory overhaul in Canada has produced what might be termed a “new” aeroplane from that we received in 1962.

Now I would like to say a few words about our achievements of the last year. There is probably a greater degree of impartiality used in assessing the air division's operational effectiveness than is generally found throughout the Canadian Forces. For in addition to

the inhouse tests common to most commands, we have an external and probably more exacting assessment in the form of annual NATO tactical evaluations. These evaluations of our operational units are conducted by a multi-national NATO team to determine our ability to perform our wartime mission. A tactical evaluation team will arrive without warning at a wing and within two minutes the wing must assume a wartime alert posture.

The wing's capability is assessed in four main areas:

- Alert posture and reaction
- Mission effectiveness
- Survival
- Support functions generally

These four areas are examined in the minutest detail and their individual assessments, added together, make up the final rating. A top rating of one is therefore a measure of every facet of a wing's operation.

In 1968 all wings received a one rating across the board. This was the fourth consecutive year that 3 and 4 wings have achieved a top rating and, for the reconnaissance wing its first tactical evaluation since moving from France.

Operational effectiveness is also determined by the various competitions held within NATO. Our strike-attack wings compete in an annual AFCENT tactical weapons meet. Here, as part of the 4ATAF team, air division personnel compete against a team from 2ATAF. Last year the competition was held at a German Air Force base and the 4ATAF team, led by one of our Canadian squadron commanders, won the overall competition for the 5th time.

On the reconnaissance side, the air division pilots and supporting personnel have been working hard to become masters in their trade. In reconnaissance, as in the strike and attack roles, annual competitions have been held for many years to determine unit proficiency. In 1966, in their first appearance at a "Royal Flush" meet, the air division squadrons came in last. At the 1967 meet, with another 12 months experience behind them, the results were much improved and the Gruenther Trophy was recovered by 4ATAF. In 1968 the competition was so keen that the two ATAF's tied for the Gruenther Trophy. The two air division squadrons finished 1st and 2nd within 4ATAF.

We have achieved these high objectives partly because we have maintained an adequate number of flying hours per pilot per year. This is important and our present monthly flying rate is the minimum required to maintain proficiency in the type of low level mission our pilots are required to fly in the European environment.

An adequate annual flying rate per pilot is also important to our aircraft attrition rate; that is the number of accidents in which the aircraft is damaged beyond repair compared to the number of hours flown. Initially with the CF104, this rate was relatively high, a not uncommon occurrence when a new aircraft is introduced and particularly so with an aircraft as sophisticated as the CF104. Based on these initial accident rates the planners felt that the aircraft could not be supported in adequate numbers beyond perhaps 1969. As we came to know the aircraft, both from a flying and from a technical standpoint, the problem areas were overcome, the number of accidents dropped dramatically until in 1967 we had only three. As a result we now have sufficient aircraft on inventory to maintain our present strength of six squadrons until at least 1975, barring any catastrophic failure in the airframe or engine.

Accidents will continue to happen since, unfortunately, that is all part of flying but we are making every effort to keep the number as low as possible and our whole flight safety programme is geared to this end.

We monitor our aircraft very closely to ferret out problems before they have an opportunity to develop. We are inspecting our aircraft for metal fatigue and a number of selected airframes are being flown at a high rate under test conditions. Any problems which are detected in these test aircraft can be corrected before the remainder of the aircraft reach the same number of hours flown. We also use a programme called the spectrometric oil analysis programme for monitoring engine performance. In this programme oil samples are drawn from engines and analysed for metal content. Using this technique, suspect engines can be removed before failure in the air occurs. This type of testing programme is a major factor in the reduction of accidents.

There are many examples of progressive technical improvement to the CF104 which I could cite but one should suffice to illustrate what I mean when I say the aircraft is in its

prime. In 1964, overhaul of the J79 engine was required after every 400 hours. By 1967 this interval was increased to 600 hours and we have just now moved to an 800 hour cycle—an improvement of 100% in four years. This latest increase—from 600 to 800 hours—will result in an annual overhaul contract saving of \$600,000.

Now to say a few words on the concepts of operation beginning with strike then reconnaissance and finally the attack roles.

To ensure that his strike or nuclear forces are not caught on the ground, SACEUR has placed certain of these aircraft on a continuous 24 hour a day high state readiness. This force is prepared to launch within minutes at any time. Pilots and supporting personnel are located in a specially guarded area. Once nuclear weapons are released for use, and SACEUR orders the launch, this special force launches automatically and is followed immediately by the balance of the strike force as aircraft become available.

All strikes are planned, as far as it is possible to do so, to ensure safety for the pilot and aircraft both for the penetration and withdrawal phases of the flight. The objective of tactical nuclear weapons employment is the accomplishment of the military task with a minimum of unwarranted destruction. Therefore, the primary targetting is directed against the enemy's military offensive capability and not against centres of population. The range of the CF104, in all its roles, limits it to tactical and not strategic employment. In addition to the special force at instant readiness, under conditions of increased tension, the readiness of the remainder of our force would be increased by SACEUR as the international situation required.

Turning now to reconnaissance, the conduct of these operations will vary with the type of war being fought. For all commanders, air reconnaissance will provide the majority of his intelligence and it is therefore vitally important that all facets of the operation work well.

During a conventional war, reconnaissance activity would be intense. Missions would be flown to identify enemy military units posing the greatest threat to Allied Command Europe and, also, in support of the land battle.

In a tactical nuclear war, post strike reconnaissance would be essential.

Now for a few words on the concept of attack operations. Within NATO "attack" refers to the use of non nuclear weapons and it is this conventional weapons capability which will be given increased attention as the new NATO strategy is applied. Our strike/attack squadrons at 3 and 4 wings now possess a dual capability and are operationally tasked in the conventional role against a variety of military targets. And division pilots have practiced conventional weapon deliveries for over two years and have developed a very high expertise in delivery accuracy.

Turning now to this coming year—our immediate future was confirmed by the government's recently announced decision to retain through 1969, our presently committed air contribution to SACEUR. This has permitted us to get on with the work required to relocate our six squadrons on two bases: Lahr and Baden-Soellingen. The squadrons will be in situ by 1 July and the base at Zweibrücken will be handed over to the host nation by 1 September. This means a very tight work schedule for us but the programme is now well underway to ensure that we meet these deadlines.

Since both Lahr and Baden-Soellingen will each support an additional squadron there will be an increase of personnel at both bases. This increase will be mainly in the operational and not the administrative or support areas. In terms of total numbers, the strength of these two bases next summer will not be significantly higher than those of September 1967, since a 10 per cent decrease in personnel was achieved at Lahr and Baden-Soellingen during the summer of 1968. Many of the servicemen moving from Zweibrücken to Lahr and Baden-Soellingen will replace those who are returning to Canada after a three year tour of duty and the number of servicemen posted from Canada to Europe this year will be less than the normal annual turnover.

From the technical aspect, there are several engineering and repair projects required to permit Baden-Soellingen and Lahr to accept the additional squadrons. At Baden-Soellingen an infrastructure, or NATO funded programme to resurface the main runway began on March 1. While this work is underway the 4 wing squadrons will operate from 3 wing. At Lahr a minor rehabilitation programme is currently underway to improve certain support facilities and to accommodate 430 squadron which has already moved from 3 wing.

Now I would like to turn briefly to the new NATO strategy which is popularly known as "flexible response". This term is unfortunately ambiguous. It does not mean a lessening of a requirement for a tactical nuclear capability in Allied Command Europe nor does it predict the likely response to a given level of aggression. What the revised guidance actually calls for is a flexible and balanced range of appropriate responses conventional and nuclear, to all levels of aggression and threats of aggression—it means that under the new strategy, Saceur will have a greater flexibility in the type of military response than formerly. In the final analysis, it will be the commander's judgement which determines the most effective response.

At the North Atlantic assembly's annual session in November 1967, General Lemnitzer warned of NATO conventional deficiencies, particularly on the central front where he had considered the reserves to be only of marginal strength even before the French military withdrawal. He pointed out that reduced resources meant the possible earlier employment of selected nuclear weapons. He emphasized that the critical factor was the readiness and level of forces available to him and that these were the forces which determined the credibility of the NATO deterrent. 1 Air Division is, of course, the type of force—at full operational readiness—to which he referred.

On the air side, the implementation of this concept will mean that a viable conventional contribution is required but not at the expense of the nuclear capability. The present capability was created to deter the threat of military aggression and so far, has been successful. The steamroller threat to Western Europe remains, however, and the Soviet forces in Europe today have a greater mobility and striking power than in early 1960's. The only way to create a greater conventional capability, while retaining the nuclear deterrent now available, is to make use of dual capable aircraft—that is aircraft with the capability of carrying either nuclear or conventional armament as circumstances dictate.

The CF104 is a weapons system that is dual capable and adaptable to the new strategy.

The CF104's range, performance and all weather systems are vital to a realistic conventional capability in the European Theatre. Although emphasis will be placed on the conventional role, a nuclear strike capability will continue to be vital in maintaining a credible

deterrence. In Europe, warfare could involve their tactical use. Any meaningful deterrent depends upon a knowledge by the Warsaw Pact of a willingness and ability to employ them.

In the air division, the level of expertise is very high in the strike role and we are now directing more and more effort to improving our non nuclear capability in line with SACEUR's requirement for a greater dual nuclear/conventional capability in his forces on the Central Front.

I said earlier that in numbers, but particularly quality, the Canadian Military contribution—the air division and I must not forget our brigade group—is a significant part of SACEUR's force. The Canadian contribution, at the peak of operational effectiveness, and setting a high standard for other air forces to emulate, is part of the forces in being immediately available to SACEUR. He does not have to wait for either mobilization or transportation to get them here. With a limited manpower base but an advanced technology, Canada, has been able to provide forces capable of operating and defending themselves in all types of warfare. This takes on added significance with the military threat to the Atlantic community coming from the Soviet forces—an extremely versatile and sophisticated fighting force.

I would like to end on the note that in spite of the uncertainties as to the future of the air division, morale here remains high. Our servicemen have proven themselves as professionals in the strictest sense of the word. The air division is the most effective, efficient force that Canada has ever placed in the field and our personnel know it. They are very highly motivated and are fully aware of the part they are playing in the defence of NATO.

London, England, March 14, 1969

The Chairman: We have lost a few of our members in the heavy traffic but I think perhaps because we are running a little late, we will start and the others will no doubt join us.

We are very fortunate to have the opportunity of talking with officials of the Institute of Strategic Studies and I will introduce its Director and then he will take over from here. Mr. Alastair Buchan, Director of the Institute.

Mr. Alastair Buchan (Director of the Institute for Strategic Studies): Gentlemen, it gives me great pleasure to offer you a warm welcome.

When Peter Dobell and the Department raised the possibility of our talking with you they thought that perhaps the most useful thing that we could do since we are outside—we are an independent Institute—rather than get into questions of NATO policy and so on, would be to have some discussion with you on the sort of general context of east-west relations in which the kind of decisions with which Canada is faced will have to be taken. My colleagues are, on my right here is our Deputy Director, Brigadier Kenneth Hunt who has had long experience with NATO force planning. On his right is Mr. Malcolm MacIntosh who is one of the leading experts in the world on the Soviet armed forces and he served with the Soviet army during the war and has written two definitive books on the Soviets and on Soviet strategic policy in general. On the Chairman's left is Dr. Christoph Bertram, our Assistant Director, who is an international lawyer from Germany, and on his left is Mr. Philip Windsor from the London School of Economics who is an expert on eastern Europe and on central European questions. He and I wrote a book in 1962 together called, "Armed and Stability in Europe" and we have just published an extremely good paperback study by him on the Czechoslovak question.

First of all if I may, Mr. Chairman, just say a word about the ground rules as I understand them. This is an entirely informal discussion, that we are not in any sense giving evidence to your Committee. I think you found in your bundle of papers first of all an annual publication of ours which is called "The Military Balance" and I suggest that if we want to get into questions of figures it might be useful for you to turn to Table 2 at the end which is the one that has the various force strengths of east and west in Europe. We have roughed out an agenda of four questions. The first deals with the question of what is going on inside the Warsaw Pact.

What I propose, if you are agreeable, Mr. Chairman, and members of the Committee is that we should invite some discussion within the panel on the question and then after a very brief discussion we should submit ourselves to your questions. Is that agreeable?

The Chairman: That would be fine.

Mr. Buchan: The first thing I think perhaps we ought to talk about is the question of what is going on inside the eastern bloc. For many years we talked about the eastern European countries as the satellites of the Soviet Union. How do we look at this relationship today in view of the very contrary explosions of Romania and Czechoslovakia. Here is Romania for four years pursuing a very critical policy of the Soviet Union. It has expressed an opposition very analogous to that of France, to multilateral pacts and it got away with it. Czechoslovakia expressed her loyalty to the Warsaw Pact, but pursued an internal policy that moved not only towards economic liberation, but also appears to be moving towards political democracy.

What do we think about the next 10 years? Do we think there are going to be explosions similar to Czechoslovakia? That the Warsaw Pact contains within itself now the seeds of its own breakup. Is this a dangerous phenomenon? Is it a western interest to see the breakup of the Warsaw Pact or to see its maintenance and perhaps its gradual internal evolution and liberalization? Perhaps I could ask Malcolm MacIntosh if he would like to start on that.

Mr. Malcolm MacIntosh: I think the main fact about the Warsaw Pact is that it can go two ways in theory. When the Warsaw Pact was founded in 1955 the Soviet Union envisaged it as a command and control organization, both in the field of foreign policy and in the field of military affairs.

It envisaged the Warsaw Pact as a co-ordinating and administrating agency through which the Soviet line in foreign policy in any given way—in any given matter could be communicated to the east European countries and upon which the east European countries could act. On the military side the Warsaw Pact was set up not really as an operational military organization, but rather as what used to be called in this country the War Office. As a co-ordinating agency to administer the armed forces of the east European countries.

As the Warsaw Pact developed the main feature was that some of the east European countries, notably Romania, but also Czechoslovakia, came to believe that the Warsaw Pact could be developed into a genuine classical alliance system. As a forum for discussion among the east European countries with the Soviet Union and among themselves. The Soviet Union which had never intended this

development to take place found itself opposing it all along.

The reason why the Romanians were able to take advantage of this situation was because Romania is the one country of the east European allies of the Soviet Union that has an economic base. Namely, related to its resources and oil which enabled it to pursue a policy which was separate from that of the Soviet Union because the Soviet Union could not impose its will on Romania through economic methods.

At the same time Romania had no direct frontier with any NATO or neutral country and therefore was not in the front line in the military sense. What has happened in the Warsaw Pact is that Romania has pursued its policy of independence from the Soviet Union and the Soviet Union was completely unable to find a convincing and successful way of preventing the Romanians from seeking a genuine forum status for the Warsaw Pact. In other words turn the Warsaw Pact from a command and control organization to a classical alliance where each of the members had equal rights to discuss and propose things. Both in the field of military affairs and in the field of foreign policy.

What has happened within the last year is that a crisis grew up in eastern Europe which was not strictly-speaking relevant to the Warsaw Pact at all, because the one thing the Czechoslovaks never said they were going to do was leave the Warsaw Pact or in any way become disloyal to the Warsaw Pact. They always insisted that whatever they did internally, their alliance was with the Soviet Union, that militarily their armed forces were devoted to the Soviet Union and to the Warsaw Pact alliance. In a curious way the Czechoslovak crisis of 1968 was not closely related to the real crisis in eastern Europe. It was a divergence, it was a different kind of crisis and now that the Czechoslovak crisis is over temporarily and in the short term settled in the interests of the Soviet Union, in the sense that the Soviet Union now occupies Czechoslovakia militarily and has—is in a position to force her views on the Czechoslovak government, we are back in the old crisis—the pre-Czechoslovak crisis within the Warsaw Pact in which Romania and the Romanian ideas of independence are once again coming to the fore and I think that the Soviet Union's dilemma, as far as the Warsaw Pact and as far as eastern Europe is concerned is really—

can it find an answer to the continuous pressure from Romania and from several other countries in eastern Europe as the east European people become better educated with a higher standard of living with improved economic opportunities and this is going on all the time and exercises a great deal of pressure on the east European Communist Governments and on the Soviet Union itself. Can the Soviet Union find an answer to these pressures and can they develop their east European alliance system into something which is more lasting than the original idea which was the Command and Control system in the military and political field and I think to end very briefly on this point, I think that the Soviet Union in the short-term has taken the view that it must put the claw back, it must return in the lives of Czechoslovakia and Romania and so on, it must return to the solution returning the Warsaw Pact to a Command and Control organization. Whereas the longer term and more promising trend from the Soviet point of view and from the European point of view and hope would be if the Soviet Union would come to terms with the pressure from Eastern Europe and would genuinely turn the Warsaw Pact into a classical alliance with the quality of consultation and discussion and weight of decision-making in the alliance, and I believe that the Soviet decision turning the alliance back to try and review its function of the Command and Control organization is going to mean continued tension in eastern Europe, continued pressure to change from eastern Europe in spite of Czechoslovakia, and I think that the Soviet Union is going to be faced in the next five years with some extremely serious but not very easily identifiable pressures and crises coming from the east European allies.

Mr. Buchan: Thank you, Mr. Windsor would you like to comment on that?

Mr. Windsor: In east-west relations generally, the detente between the two central powers became more recognizable, more definable in certain terms so that as the importance of the Warsaw Pact in east Europe increased it became more necessary to the Soviet Union to extend the range of activities, and the degree of co-ordination inside the Warsaw Pact partly perhaps as a mechanism for political supervision of the activities of the east European allies, and I think the reason is a fairly simple one in that the very existence of detente gave countries like Romania but not only Romania, including

Hungary and Czechoslovakia, greater scope for diversifying their relations with the western European states. They raised the question of relations between the Federal Republic of Germany and other east European states at that time.

In order to maintain some kind of framework of definition on the range of policies in eastern Europe, the Soviet Union began to reactivate, as it were, the Warsaw Pact, proved that it might be given an increasing emphasis on this consultative committee which is essentially I think in political form and on its military integration as well and partly perhaps the military reason, partly certainly I think as a means of co-ordinating sectors of foreign policy. So that the importance of the Warsaw Pact grew with the detente and not in spite of detente and these two things in fact went together. The same question that I would like to mention is that the history of Czechoslovakia is one where firstly Czechoslovakia as Mr. MacIntosh suggested remained loyal to the Warsaw Pact. It advertised its loyalty on every possible occasion, was publicly deferential to the Soviet Union on questions of foreign policy particularly with regard to Germany. But at the same time although the Warsaw Pact itself was not relevant to this eastern European crisis which arose out of Czechoslovakia it was made relevant to Czechoslovakia. It is an extraordinary threat perhaps that if one compares it with Hungary the Soviet Union in 1956 felt perfectly able and felt it was convenient, to intervene alone in Hungary. By 1968 it went to tremendous pains to reassure Warsaw Pact members and to present this as a Warsaw Pact exercise and to present Czechoslovakians in some sense or other as traitors to the Warsaw Pact.

In fact it seems to me that one of the chief concerns in the period before the invasion of Czechoslovakia was to ensure the kind of Warsaw Pact framework which would enable it to continue to impose, as it were, the ground rules of interstate behaviour in eastern Europe. I do not think that this means by any means that the states in eastern Europe have reverted to being satellites or are even conceived of as satellites by the Russians. I think it does mean that the Russians have extended their own freedom of interpretation about the actions of the eastern European states. One interesting aspect in this is Romania itself. Romania is frequently compared with France, Romania playing the role in the Warsaw Pact that France does in

NATO and with some justification. But in fact the mechanics of these two countries' operations are entirely different. France leaves the NATO organization, France insists that its political differences with other NATO members make it difficult to co-operate with the NATO military planning and so on. Romania insists, on the other hand, that other Eastern European states ought to have a greater voice in the affairs of the Warsaw Pact. It also foreshadows I hasten to add the day on which the two alliances will disappear. But while the true alliance is lost, Romania appears to be pressing for greater integration if anything, in the Warsaw Pact with a greater eastern European voice, while France presses for a looser association of states within the framework of western alliances and a smaller degree of integration.

But it seems to me that what this is about is that Romania is precisely attempting to avoid, or has been attempting to avoid the use to which the Warsaw Pact has been put as a political frame of reference and it has failed. But the end result of this, the Romania and Czechoslovak experiences together have been that the Soviet Union has allocated to itself a certain freedom of action in determining what constitutes the threat, of the social system in eastern Europe, to the interests of the Soviet Union or any other social state itself, but it has enunciated this in the form of the version of doctrine of the socialist common world for limited sovereignty, or whatever one prefers to call it, and that it has now announced that it will feel free to intervene in the affairs of any other state in eastern Europe when it, the Russian Government, conceives the activities of that state are a threat either to socialism or to the interests of any other socialist state. And in this it has been not at all supported even by its most loyal allies, even by Poland, even by East Germany. In other words, the Soviet Union, I think has now drawn apart from the other members of the Warsaw Pact into a position of super-national authority, and this raises a number of other questions which are on the agenda in terms of the super power detente and the relations of the eastern European and western European powers themselves. But I think what is important to know in this particular point perhaps is, that the new position of the Soviet Union is that it does not insist that the other powers should revert to being satellites, but it does insist that the decision-making centre in Moscow is a kind of super-national authority or commission as it were,

for the whole of eastern Europe and this is a paradoxical situation in which the eastern European states are continuing to claim freedom of action, to promote their own room for manoeuvre and to be allowed to do so by the Russians, but the Russians at the same time have set themselves up as arbitrators in the position which nobody else can challenge.

The Chairman: Mr. Hunt, would you like to add anything particularly . . .

Brigadier Hunt: Well it seems to me that the issue of super-nationality is a very interesting one. You will recall this concept which was really first implemented in the European communities very much because the smaller nations wanted a super-national authority. The smaller nations in Europe such as the satellite countries believe that their voice was stronger in the super-national setup. And quite the reverse is happening in the Warsaw Pact as Mr. Windsor has just indicated and Mr. MacIntosh too. It seems to me the reason for this is that in fact super-nationality applies to a system where you have conceivable areas of majority and conceivable areas of disunity. But with a member state as strong and powerful as the Soviet Union—strong and powerful in the sense too that it can rally to its own views, smaller countries, majority voting or super-nationality in the international context does not work. And therefore I think this paradox which apparently the Rumanian position reflects, that wanting a greater east European voice but opposing super-nationality is dissolved, is precisely the fear that particularly the countries of the northern tier of the Warsaw Pact might form a sort of holy alliance with the Soviet Union in order to overrule what the southern tier or the Hungarians, Romanians and now the Czechoslovaks and Bulgarians want to do. And so you have a strange reversion of political structures and of motives for political structures in this sense.

Let me just add one other thing. It is quite interesting when you look at the development in the Warsaw Pact that your western fears in a way have not been totally justified. I mean the western fears that while the Soviet Union would be quite prepared to dismantle the Warsaw Pact for what seemed to be a European security system, they would still retain their control through bilateral arrangements within the Warsaw Pact and all the specialists for the last ten years have repeatedly pointed out that even if the Warsaw Pact were dismantled and still this network

of bilateral treaties, bilateral arrangements between the various Warsaw Pact countries and the Soviet Union would remain. Now it seems and this I think is an interesting change, that for the Soviet Union itself, the Warsaw Pact as a collective organization suddenly becomes more important and I doubt very much that nowadays the Soviet Union would be prepared to propose a dismantling of the Warsaw Pact in exchange for a very vague—still very vague concept of the European security concept.

Mr. Buchan: Thank you very much. I would like to invite your question, gentlemen. I would like to ask you to comment briefly on that.

Dr. Bertram: Mine is a very brief comment but the sense of the Warsaw Pact is in Russia. However one describes the Warsaw pact at the centre of this enormous country, whether one calls them satellites or not, and if Russia wishes to exert the command and control that Malcolm MacIntosh described, it can do it in one of two ways.

Either by the party or by putting soldiers on the spot and it had no difficulty at all in controlling eastern Germany because there were Russian divisions sitting there. It had no trouble with Hungary once it had put its soldiers there and similarly with Poland. When it found that in Czechoslovakia its control by the party was not enough, it put soldiers back. Therefore, in simple practical terms the problem of command and control in the short term is what does Russia need to do to exercise its control? One found in Czechoslovakia it needed by attendance standards to put troops back.

It is possible, it seems to me, for a country like Romania, distant in the southern tier to exercise a good deal of freedom, but it can only get to a certain point. It goes up to the point at which it risks itself having troops put in. For many many years Yugoslavia has permitted itself a good deal of freedom because geographically it was a long way away and that sort of freedom is not available to a country which is on the Russian borders.

One must accept the fact it seems that in the short term that Russia has made up its mind that it must control by one means or another. It either controls through the party where it feels confident it can do this and in Czechoslovakia it wavered and decided it could not and put in soldiers. It seems to me

one has to face this rather elemental truce in the middle, that you have an element of Russian imperialism inside what we are pleased to call the Warsaw Pact.

The Chairman: Thank you very much, gentlemen. We are open for questioning and I have a number of names on my list. Mr. Cafik.

Mr. Cafik: I cannot direct this to any specific person. I will put it to Mr. Buchan and he can pass it on from there. There is one thing that you have not talked about and I would be just interested in some comments in respect to what is happening in places such as the Ukraine, within what is commonly considered the sovereign area of Russia. Secondly, and I brought this up earlier today in my questioning. I am very much concerned with the possibility and I cannot see this ever happening where Russia can start to loosen up a little bit because of this liberalization tendency. It would seem to me that they would simply open the doors to their own destruction and...

Mr. Buchan: Could you clarify that? Do you mean inside the Soviet Union?

Mr. Cafik: Inside eastern Europe and would include the Soviet Union itself. I cannot conceive how we can ever reduce the tensions when this is such a strong possibility. They have such a strong fear in this regard. Perhaps you could comment on those points if you would.

Brigadier Hunt: Would it be as well... Malcolm, would you like to—I think I will only answer one question if I may on each point. I think this is one of the key questions of the next 10 or 20 years in eastern Europe and the Soviet Union. There are forces working and I will come to the Ukraine in a minute.

Mr. Cafik: Yes.

Brigadier Hunt: But the general question first. There are forces working for a loosening up and a liberalization in the Soviet Union and in eastern Europe and there are forces working against. I think the forces working for in the Soviet Union could be described as the rising standard of living. There is no doubt that the Soviet standard of living is rising and is going to go on rising in spite of the enormous sums that the Soviet Union is spending on defence.

A higher proportion every year of the Soviet population is getting better-educated

and is going to higher institutes of education, universities and so on. These people are reading more, are listening more and with quite small things such as the Soviet acceptance of west European cultural programs for their television and so on.

More and more people in the Soviet Union are discovering and learning more and more about what is going on in the rest of the world and this inevitably means acquiring more and more information and contact with the things that we describe as the basic freedoms of our type of society.

Forty years ago and for something like 85 per cent of the population of Russia—the Soviet Union lived a hand to mouth existence on the farm and did not move more than a few miles away from the homestead for their entire lives. Although quite a large proportion of the Soviet Union population still lives on the farm, more and more people—there is a drift to the towns and more and more people who are staying on the farms are getting more and more education, information and knowledge of things outside the boundaries of the Soviet Union. This is—just to take one sort of symbolic fact in favour of a general loosening up because when people know more they ask more questions. They become more inquisitive and eventually they demand more.

The main forces working against liberalization is the age-old Russian tradition of autocracy. Whether one likes it or not there has never been a democratic government in Russia. Russia has always been governed by a central authority which insists on dominating everything from religion to agriculture and from control of public order to education. In the 50 years or so the Soviet Union has if anything, intensified the age old Russian determination to run things from the top by a central authority. In present day it boils down to 11 men, members of the ruling politbureau of the Communist Party.

I should add to this idea of forces against loosening up, the enormous bureaucracy which this centralized authority needs to run a country of 230 million people stretching from the Baltic Sea to the Pacific Ocean.

There is a tremendous element of inertia in the way everything is done in the Soviet Union. Things are done by precedent, the machinery of government ticks over at a very slow pace by inertia. The pressures for change in the Soviet Union are relatively far away from the top—from the people who

make the decisions. It is very difficult for the pressures which are much nearer the surface, in eastern Europe, in a country like Czechoslovakia or Hungary with so many western traditions. The pressures for change are much nearer the decision-making process. In the Soviet Union they are enormously distant from the decision-making process.

To turn to—not to take up too much time, to turn to your specific question of the Ukraine. The Ukrainian case is an extremely interesting one because the Ukrainians are a more turbulent people by temperament than the Russians. They are more interested in change for change sake. They are more lively, they are more—in many ways they are quicker intellectually than the Russians—than the Great Russian people. They are therefore more restless.

In the case of the Ukraine which has never in its history had a separate national sovereign existence as a state, except for a month or two during the Russian civil war. In the case of the Ukraine this restlessness and intellectual quickness is allied to a certain linguistic difference with the Great Russians which is sometimes described as a totally separate language and other times it appears to be something more like an accent—a provincial accent.

If you get Ukrainians to discuss this they will probably tell you their language is as different from Russians as for example Bulgarian or Polish. In fact...

Mr. Buchan: The Canadians are probably very familiar with this. They have a large Ukrainian population.

Mr. Cafik: There is one in my riding.

Brigadier Hunt: So that in the case...

Mr. Cafik: You are talking to one too, by the way.

Brigadier Hunt: If I may just finish on the Ukraine, you have this very lively, highly intelligent, restless people.

Some hon. Members: Hear, hear.

Brigadier Hunt: I think I said this before, which feels not only that it is more lively and quicker than the Great Russians and they do feel a certain linguistic difference with the Russians and therefore there is a strong possibility that one of channels, slow though it may be, through which change may ultimately come in the Soviet Union could well

be through the Ukrainians. Not only the Ukrainians in the Ukraine, but the Ukrainians who have moved to Moscow and have come up in the Party. Such as Krushev, he was not strictly speaking a Ukrainian, but he had Ukrainian associations.

The Chairman: Thank you. Mr. Gibson.

Mr. Gibson: If I could ask, Mr. MacIntosh Sir, in your statement you said this I believe, that you believe the Soviet decision was advanced to the command control idea as to cause tension and the Soviets will be faced with serious, but not easily identifiable crises. Could you elaborate on what you mean by these crises and why they are not easily identifiable? What form of crises do you have in mind there?

Mr. MacIntosh: Yes, the form of crisis briefly can be summed up really in the word "nationalism". That is to say the force of nationalism is eastern Europe, Bulgarian nationalism, Polish, Czech and so on. The reason why it is not easily identifiable is that a great deal of east European nationalism is wrapped up in Communist ideological terms and therefore the Czechs for example put their problems last summer during the critical period, in terms which looked as though they were doing more for Communism than the reverse.

This is the reason why they are not easily identifiable because they can be wrapped up in ideological terms. I think perhaps that is the answer.

Mr. Buchan: Would anyone else care to comment?

Dr. Bertram: The difficulties about this whole question of liberalization in both the Soviet Union where it has been intermittently going on and Eastern Europe, is that liberalization where it equates with nationalism in Eastern Europe is *ipso facto* a threat to the Soviet Union and must be suppressed and naturally it does equate with nationalism in Eastern Europe almost everywhere. Though nationalism does not always equate with liberalization and as in Poland it equates with repressive tendencies in the regime rather than the reverse. The real difficulty is that while the Soviet Union is engaged on a very long term in a very difficult and tricky kind of political experiment, trying to marry social and political and economic criteria off, and to produce some kind of compromised program between these. Any tendency in Eastern

Europe which threatens to go faster, which makes the Russians themselves appear a kind of dependent variable in this, to use the term in political science jargon, in itself threatens the position of the Soviet Union as a state in Eastern Europe and predisposes a disposition towards crisis.

I think crisis will come in situations precisely where the Eastern European countries themselves are trying to do the same kind of experiment as the Russians. Where they too are trying to meet various conflicting requirements and where their sense of their own interest might lead to a conflict of interest with the Soviet Union. I think the state where this might perhaps be most likely at the moment is Hungary which has already had enough, heaven knows, but where it could easily happen again and where, I do not mean to say in the sense of bloodshed, but in the sense of a long drawn-out political crisis with the use of Soviet troops as a political instrument and where the Hungarian Prime Minister, alone I think, of the prime ministers in Eastern Europe, has insisted that the events of Czechoslovakia and the developments inside the whole bloc since that time have not made any difference whatsoever to the Hungarian policy of trying to seek a pragmatic day-to-day cautious, practical rapprochement with individual states in Western Europe. And this kind of thing, it seems to me, could if things went badly either in economic or political terms turn towards crisis very quickly. Which does not mean, of course, that it is inevitable.

Mr. Buchan: Mr. Chairman, I would just like to mention, are we going to cover number four topic this afternoon? The first is the one we are on now, relations within the Warsaw Pact, the second is Soviet strategy towards Europe, the third, change in Europe and four, the consequences of Soviet American negotiations.

The Chairman: I have three or four questioners on my list now. If you want to pursue this, if they all relate to this first point, this first phase, fine, we will take them now. Otherwise I wonder whether we should after hearing Mr. MacLean's question go on, and perhaps hear the discussion of the second point and I would hold the names of the questioners on my list. But if they relate specifically to this first phase then perhaps we could deal with them rather rapidly. What is your wish on that. Mr. Allmand, Mr. Howard, Mr. Marceau and Mr. Harkness, do your

questions relate specifically to this first aspect or are they more general and could they be picked up as we proceed.

Mr. Harkness: Mine relates really to all of them to some extent.

The Chairman: Well probably we could pick that up later. How about yours Mr. Allmand?

Mr. Allmand: Well mine relates to this and to the Warsaw Pact.

The Chairman: Mr. Howard and yours is more general. And Mr. Marceau, is yours more general?

Mr. Marceau: It is a matter of budget, the Russian Budget.

The Chairman: Well perhaps it does relate, if I could interrupt Mr. Marceau, it does relate to this specific item perhaps and yours Mr. MacLean does it relate to this first phase?

Mr. MacLean: My first is finished and then the second relates to subject two.

The Chairman: I see. Well then Mr. Allmand and then Mr. Marceau, and then we will go on to the second...

Well then could we deal with those two questions rather briefly perhaps and then have a five minute break... Mr. Allmand.

Mr. Allmand: I would like to have the panels' assessment of the following events on relations within the Warsaw Pact. The first of these is the recent border incidents between China and the Soviet Union and the growing power of China, and related to that the fact that as a result of Czechoslovakia, Albania, a satellite of China, which left the Warsaw Pact and its very personal proximity to the Warsaw Pact countries. The second event is that while there is liberalization within the Warsaw Pact countries, we have on the other side of the fence possibilities of strong socialist governments or things like communist governments coming to power in the NATO countries. Now I think of a possibility of a communist take-over in Greece as a result of the civil war or even communists sharing in the government of Italy and how, as these events, China on the one side, and growing socialization perhaps in the West, have an effect on the Warsaw Pact relations?

Mr. Buchan: I wonder if I could try myself to start the ball rolling on that. I think that there is a connection between stability in

Europe and China-Soviet relations but it is too early to tell exactly what it is. I think we are all simple-minded in saying that as the Soviet Union got more concerned with China-Soviet relations it would wish to calm things down in Europe. This is too facile. The Soviet Union has a very complex set of interests in Europe which are only moderately affected by her relations with China, and there has been some transference of nuclear resources to China but frankly this is something the Soviet Union could manage, without really debilitating its nuclear position in Europe. Albania, frankly you cannot accept as a joke, I think. It is a splendid, beautiful accommodating state, a little rugged mountain state and the fact that it has left the Warsaw Pact means it has really come to the end of a long, long, quarrel with the Soviet Union and the other East European countries. It was egged on by China but all ideas of Chinese missile bases in Albania, I think, are ludicrous. However, it is an aspect of something that does concern us very much, I think, which is that as the authority of the Soviet Union is more in question in the socialist system generally, and as the circumstances of the American authority in NATO is not as unchallenged as it was ten years ago, Southern Europe does in some respects become a more dangerous place again. There are a number of troubled relationships in the Balkans, Greece and Bulgaria and Bulgaria and Yugoslavia, Greece and Yugoslavia, Greece and Albania and so on, and this always rather unstable area has the possibility of local trouble which has been somewhat raised I think, perhaps because of the number of uncertainties over Soviet action in the Ukraines, partly by the fact of the build-up of a strong Soviet or a moderately strong Soviet fleet in the Mediterranean. So that I think we may be more concerned with trouble particularly in Southern Europe than in the past. I am afraid I personally am not particularly, have not given very much worry or lost sleep about the possibility of a communist government in Western Europe. You mentioned Italy. The Italian party is now on terms of daggers drawn with Moscow as a result of Czechoslovakia and perhaps also in Greece. A communist take-over in Greece is the same kind of thing that I was mentioning. The possibility, one of the things we have to watch for, is not only the old Greek-Turkish conflict but also of internal conflict in Greece and this is an aspect I think of this possibly growing

instability of Southern Europe. Would anybody else like to speak on this.

Brigadier Hunt: I would only like to add one point I think that the feeling that Russia automatically supports communist parties in other countries may have given way to the idea that Russia perhaps courts the existing regimes. She showed no signs at all of supporting, for example, the French communist party in all of the troubles in France last year. On the contrary she kept her links open with de Gaulle. She has shown no particular wish it seems to me to exercise power through communist parties in quite a number of countries.

Mr. Allmand: Is it competition with Chinese communist countries that is a factor? Is that a possibility?

Mr. Hunt: Yes. But not I think to the extent of prejudicing relations necessarily with the government of that country. I think at the moment her tactics may be to keeping contacts with the government of that country, than trying to influence the communist party inside that country to take over. I think we are going through a period now where she regards contacts with certain communist parties...

Mr. Allmand: I am thinking of Greece.

Mr. Hunt: Well in the case of Greece, it is a difficult one certainly but this is something where she might make a positive gain.

The Chairman: Mr. Marceau.

Mr. Marceau: What is the ratio of the Russian national budget with most of the other different peoples, for military purposes?

Mr. Buchan: I have not got the piece of paper in front of me but if you turn to about two tables back you will see it. It states it in that *Military Balance* in front of you. It is in the order of ten or 11 per cent. It is about ten or 11 per cent GNP. I think so. 9.6, the same order of magnitude as the United States. This figure is calculated by taking in defence expenditures and not the defence budget alone. It does not cover more than a fraction of defence expenditures. And there is a footnote explaining some of that, the problem of moveable conversion and things like that.

The Chairman: On our schedule we have a 15 minute break scheduled, set out for this period. Are we causing any problem by continuing with the panel discussion.

Mr. Buchan: Well shall we turn then to the question that is perhaps even more simple. Oh I am sorry, finish off that one.

Mr. Hunt: Just a brief remark on the position of communist parties in Western Europe in relation to the Soviet Union. I think there have been sporadic congress reports from the press in October, where it was quite clear that the communist regimes in Eastern Europe tried to plead with the communist parties in Western Europe that their problems were quite different, and trying to push off the criticism of the communist parties in Western Europe concerning events in Eastern Europe. And it seems to me too that if you look at the action of communist parties both in France and in Italy where they are strongest that what you see is something entirely different from what happened in the Warsaw Pact. Not only as far as the invasion of Czechoslovakia is concerned, but look at for instance the assessment of what the Common Market is. Where the Italian communist party for instance has been one of the moderators and exerting strong influence on Eastern Europe the Common Market was something to be accepted and to be dealt with and to be gotten in contact with by Eastern Europe and similarly the same applies, on a different level I agree, but nevertheless with the French communist party where you had in the instance last May in fact a tacit coalition between the Gaullists and the communists to get rid of the incidents and to restore law and order. It seems to me that this is rather significant of the way the communist parties see themselves in the system of Western democracies. They are much more domestic-minded than in fact they are, necessarily, as communist parties in Eastern Europe, particularly in the Soviet Union.

Mr. Buchan: Gentlemen I think perhaps we should turn to the question of Soviet strategy in Western Europe, toward the West as a whole. As you know from your own experience, the Soviet Union deploys very, very, very, powerful military forces in this part of the world. Last autumn there were 40, over 40 Soviet divisions west of the Soviet Union. The figure may have gone down one or two since the stationing of Soviet troops in Czechoslovakia. It is of that order of magnitude, plus the various bomb and tactical air forces. There are about one thousand medium range missiles targets on every major airfield, city, communication point, in western Europe, considering its role. What is it all for? It is very

costly. Is a large part of this military strength to keep eastern Europe under control, to maintain this military command control system—to control the pace and direction of change in eastern Europe? Is it as Khrushchev used to suggest, to hold western Europe as a hostage to American caution and good behaviour in a crisis? Or does the Soviet Union really fear attack of some kind from the west European base? Do they really believe their own propaganda about German reconnaissance? If they do—do they really want to see the NATO system break up? Do they want American troops out of Europe? They talk on both sides of their minds on the subject in public and in private—and this is the question I think—since it is very close to your own preoccupations—that perhaps we ought to turn to. Perhaps Kenneth Hunt would like to speak.

Brigadier Hunt: Very, very briefly. I think there is an element of all the reasons you made clear here. I think it would not be unreasonable to suppose that they do fear or did fear attack. If all there was a country which wanted to have a whole lot of aircraft carriers and strike aircraft hovering around within range of one's shores, if one had missile submarines and if one had some intelligent tactical missiles on one's soil, if one had long-range strike aircraft as NATO has with tactical missiles, one would be disposed to say now one must do something about defending against these things. These cannot be all defensive. You do not, so to speak, defend the west by having long-range strike aircraft. I am sure, therefore, both historically and tactically there is an element of sheer defensive fear in the Russian mind. It seems to me not unreasonable. We organize our own forces to defend in the opposite way against similar things. Clearly there is an element of keeping eastern Europe under control—this is really why there are divisions to the extent now allowed in certain of the eastern European countries. One can justify Russian divisions in eastern Europe in terms of defending against NATO but clearly one does not always justify all of them simply by some of these concerns. Just for example, those in Czechoslovakia which are now concerned with keeping control of that country. One might say that those in Poland are in order to make quite sure that the supply line between Russia and Germany is kept open. It has something perhaps also to do with making quite sure that the Polish regime is an acceptable one. Controlling the

pace of change in Europe it seems to me is evidently a Russian influence. The status quo for the most part, that is to say the political position as it now is, suits the Russians rather better than perhaps it suited the Germans—to put it simply—and they would like to see change, if change happens to their advantage rather than the other way. It was never then necessarily a Russian interest in keeping either the status quo or getting something better and Russian forces have a certain amount to do with that. I think holding Europe hostage to American caution is something which may have exercised their minds many years ago when the Americans were talking of rolling back and there was a black and white picture of all communist subversion. I doubt if it is quite as bad now as it was, when one sees that the Americans are concerned with a dialogue with the Russians. I suspect that they feel now that the Americans are in fact extremely cautious individuals. Why does one not suspect that the Russians are not cautious individuals? Undoubtedly, once upon a time there was this hostage element there but I come back to fear of attack. I do not believe they fear ground attack, talking in vivacious terms, in the sense that they fear the Germans have any power at all of themselves to attack. They may fear a conjunction of German ambitions with American power—they may even fear, if one accepts that nuclear war is unlikely, that some form of fighting below it is possible. They may fear that there is a certain element in German thinking, which England has a problem indeed solving, and would perhaps wish to see solved one fine day, and the Russians with vivid memories of what happened in the last war just as the Germans have memories of what the Russians did in the last war. Perhaps to see these things in black and white terms, if one talks to a Russian he sometimes talks of rape, and burning buildings and he is still thinking in those sorts of terms and it seems to me a number of Russians, older men, have got in the back of their minds this sort of thing. I believe there is this sort of element in their responsive speech which harks back—it is not rational—but lots of things in politics are not rational the Lord knows. One is preserved from hell by things which were politically viable and valid twenty years ago, not necessarily now, but domestic pressures exercise themselves.

The Chairman: Thank you. These views are not held, I suppose, by people who are younger than we are, remembering that probably half the Soviet population is much too young to have any memory of the Second World War.

Dr. Bertram: Well, I think that when one looks at this possibility or one looks at what affects the Soviet threat in central Europe today, one wonders if it still is or ever was concerned with overrunning and integrating western Germany into the communist system. This is the first point I would like to make. It seems that not only for the east Europeans but also for the Russians a reunified communist Germany would really be a nightmare—a nightmare for the east Europeans because they already resent the increasing economic and political power of the east Germans in the world today, and a nightmare for the Russians because they find it is already quite difficult to deal with the East Germans in the east—the communists in East Germany—and I doubt very much whether they would like to tackle this together with their difficulties with China—a unified communist Germany. It seems to me that therefore, the probability of an all-out attack on West Germany, in order to win over or to occupy and integrate West Germany in the Warsaw Pact system is one that cannot be totally discarded but one that seems not altogether likely. Now Kenneth Hunt has already mentioned this question of the fear of Germany and it seems to me that if one cannot interpret Soviet policy as being directed by the desire to have a unified communist Germany at least what one can see is the desire to isolate West Germany—isolate it from NATO—isolate it from the Common Market—isolate it from the Western Concert as such. And one of the reasons why, in fact, the West Germans always find themselves particular bogie men of Soviet propaganda I think is this. The fear that Germany as far as it can trigger off—that is what the Russians seem to believe—trigger off major war, not only concerning Germany but concerning the West against the East. This is something that they are worried about and it seems they are not at all worried about, or much less so, about an isolated Germany. They seem to be quite prepared to deal with that and to be quite confident that their power is sufficient to deal with an isolated West Germany. But of course, it is in their interest to get West Germany out of the collective structure much more than I think it is in their interest to dissolve the collective structure itself. It

seems to me that while NATO is something that they are worried about, not so much that they fear the attack of NATO, and if you look at the tables in the military balance you will find that as far as ground forces are concerned there is very little likelihood of NATO being able to conduct a successful campaign against eastern Europe—but they are worried about NATO because they seem to believe, and this is evident whatever they say about Germany, they seem to believe that Germany due to its economic power and its efficiency and whatever have you, will be able to influence the collective structures in Europe to an extent where all the other countries will very nearly have to go along with it. So it seems to me that the Russian interest in western Europe is much more one of isolating Germany. This is the prime interest. As far as the dissolution of NATO is concerned again there seems to be a major difference between what east Europeans think and what the Soviet Union thinks. For east Europeans I believe that NATO provides indeed something like a containment of German integrative structures in the west and is regarded or more and more regarded, as a means to control the Germans rather than give them additional power. And there is a last point which I would like to make. The fear the Russians have of Germany is quite genuine and of course the Germans have done all they could to make us feel they are strong enough. However, it seems to me that today the exploitation of this fear of Germany in eastern Europe is something that has less integrated power than it used to have. For the east Europeans, relations with West Germany are what might be called normal relationships. And indeed, Poland, if you look at Poland 1956, where the Poles were quite ready to have diplomatic relations with West Germany without West Germany recognizing what they had in mind. I think this does show you the extent of evolution in the Warsaw Pact away from the rather rigid Soviet solution.

I think rather, too, that the Soviet propaganda about the dangerous Germans is a very dangerous one for cohesion of the Soviets in the Warsaw Pact too. Because what you have seen since the Germans so radically changed their policy towards eastern Europe is that the desire for independence for more nationalistic structures and regimes in eastern Europe has made the relationship with Germany an issue of almost domestic policy—a symbol of independence and I think here

indeed there is a grave danger that the Soviet insistence on the German militarism and verlanism may backfire.

The Chairman: Thank you, sir.

An honourable Member: Sir, there are two points I would like to make. The first is that I definitely do not agree with you when you say the policy of the Soviet Union is to isolate Germany from western Europe—it seems to me that on the whole the Soviet Union has shown that it is opposed to accepting the major conglomerate of western Europe into a federal republic. But what is most interesting it is to prevent the Germans from ascertaining and defining their own role in east-west relations in Europe. The German question as far as the Russian is concerned is settled. That is to say, their progress towards greater security understanding, a gradual rapprochement about the division of Europe and so on. Without a preliminary acknowledgment of the division of Germany. Meanwhile the federal republic has in many ways appeared and certainly I think it has attempted to create a more flexible position with regard to East Germany and has made innovations toward East Germany, stored up for the future so to speak, and the Soviet Union is determined to prevent this from taking place. It is a constant endeavour to make the federal republic and its allies recognize that the only way forward is through some kind of recognition of East Germany. This I think is the first point and towards this a great deal of the penetrative Warsaw Pact is directed, the revival of the Warsaw Pact has taken place in the past few years which I mentioned earlier, and the Warsaw Pact and anti-German propaganda have both become more important as the détente proceeded. In this way, I think it is always hard to distinguish between Soviet military intention and political purposes to which they put their military preparations but in the particular case of Germany, I think the military preparations have a very strong and a very clear political motivation. But on the whole a reasonably successful one. But the second point I would like to make is certainly to agree wholeheartedly with Christoph Bertram that the greater the extent to which the Russians stress the German danger the more they force eastern European states on the whole to examine the realities of this German danger which for the moment consists of getting a great deal of very good hard currency and being able to expand one's economic and

therefore one's political base and to subordinate everything to a somewhat artificial question of security which is cast in the light of revulsion and the importance of the Warsaw Pact is in fact it seems to me to invite a kind of Subterranean revolt in eastern Europe. This is not only true in the countries where the states themselves have rebelled against Soviet indicatives in this matter as in the case of Rumania, to some extent Czechoslovakia, to some extent Hungary. This is also the case in a country like Poland where it is one of the issues which has split the Polish party wide open and where it has helped to bring to power a regime which is based on a kind of compromise between over anti-Germanism and covert anti-Soviet feelings and where this kind of compromise could still lead to a continuing internal crisis and work out either way. And here, I think is the Soviet exclusive emphasis on West Germany which is what it has become. The Russians have begun to treat West Germany very much like the Western powers treated East Germany for so long, as the only obstacle to a kind of ray of sweetness and light all over Europe which is beginning to backfire in almost exactly the same way. That is, until the question of how we trade with that country is settled, all kinds of internal difficulties within the Alliance and within the states of the Alliance are going to go on.

An hon. Member: Thank you very much.

Dr. Bertram: I would like to summarize the Soviet outlook in answer to this question in perhaps four very short priorities recognizing that Soviet policy tends to be rather simple and rather primitive in its main lines. First of all, as has already been mentioned, the defence of the U.S.S.R. in depth is the role of Soviet forces in Europe.

Second priority, the maintenance of something like the present political and military status quo in Europe, and this I think includes—and I would be prepared to argue this point later—the continued existence of NATO and the continued American presence in Europe.

The third priority: keeping as many Soviet political and military options open as possible because I do not think we should forget the Soviet option of using their influence in Western Europe to weaken and disrupt and subvert Western Europe as well as, of course, the obvious military options in the event of war or hostilities becoming imminent.

The fourth priority, I would say, is to keep Germany divided. I think the thought on Germany is extremely simple in the Soviet Union, that no Russian government—let alone Soviet government—would ever be prepared to subscribe again to the 18 million or so Germans—the bloc of 18 million Germans in the centre of Europe with all their intelligence, their hard work, their business capacity, capabilities and so on, of ever being run and administered by one central government again. This, I think, is Soviet policy towards Germany.

The Chairman: Mr. MacLean was your question directed towards this particular part of the discussion? Mr. Brewin, I think, has a question on this too. Mr. MacLean?

Mr. MacLean: I would like to have some more expert opinion as to what the Russian foreign policy is. What is their motivation? I think that is the subject we have been talking about. It would seem to me that there is a mix of perhaps two motivations: one, a kind of a nationalistic one dating back as far as the days of the czar and, secondly, the idealistic one like world communism and I would be very surprised if the military might which they maintain at the present time in Eastern Europe has anything to do with any concept of world conquest or even European conquest in the historical sense, but that its main purpose is to keep Eastern Europe in line. Secondly to maintain a threat to Western civilization in the hope that perhaps eventually the West will become tired of maintaining a constant defence posture and that their real ambitions would be in the line of the struggle for mens' minds. In a belief that their type of ideology is more viable than ours is and that ours can be weakened and will perhaps destroy itself anyway, but this process of destruction can be encouraged by subversion and the Russians are constantly fishing in troubled waters all over the world from time to time.

Mr. Buchan: I think, myself, that the ideological element in Russian policy began to die out some time ago, although as in all countries—we all have an ideological element in our policy—it will remain. The amount of effort and expertise that the Russians put into subversion is now very little indeed. It seems to me they behave more and more like a traditional great power. I think this is emphasized by the fact that she came to the conclusion in 1965 that the traditional display of the great powers is as strong as their best naval

force—the ability of a flotilla in Lagos or Bombay. My own feeling is that she is conceiving of her place as a super power, because that is what she is. But on the other hand Czechoslovakia throws some interesting light on this and I would like to ask Philip Windsor to comment on this because in a moment he has to go to catch a train.

Mr. Windsor: I think one can see this in several ways. In one sphere, the Soviet Union does behave like an ideologically motivated power. In Eastern Europe it has shown itself concerned to hammer out a kind of ideological line with which it can afford to confront the Chinese, with which it can be imposed on the Eastern European states as well and is at least part of the reason for the intervention in Czechoslovakia. More precisely, the Czechoslovak government seemed to be diluting the ideological agreements to a point where it was becoming almost impossible to define. On the other hand I think it is awfully good to say that since 1962 there have been some catastrophic defeats to the Russians sent to Cuba and they have been determined to act like a world power and gradually to become a world power. I think one of the paradoxes in the Soviet position, until recent years, has been that it has been a super power in terms of ability to intervene at a distance, to influence defence in other parts of the world; it has been much less of a world power, say, than Britain or France has been and it is now becoming a world power as it were to catch up on its super power status in a very classical sense. At the same time, the complications of a super power status is such that it is gradually being forced to recognize that it is in its own interest to recognize a series of tacit or open understandings with the United States about division in Europe, about the necessity of constant control and strategic regulation in the arms race, about where conflict is permissible and where conflict must be regulated and where conflict is forbidden. In all these ways the Soviet foreign policy seems to be operating at a number of different levels and there is a kind of analogy one can draw from it, perhaps some Freud, in the sense that there is an ideological European Id, which is good old basic drives and aggressions and there is a kind of world power ego where the Russians relate to other people in the world and there is a kind of super ego which is just trying to keep the other two in order and which, at the moment, seems to be taking the upperhand.

The Chairman: Mr. Buchan mentioned that Mr. Windsor has to leave to catch a train. On your behalf I would like to thank him most sincerely for making himself available. Mr. Howard and then Mr. Brewin.

Mr. Howard (Okanagan-Boundary): I just have a very brief question, Mr. Chairman. I would like to come down to the day to day events and ask how the Soviet strategy operates when they come to the simple matter of closing off the road to Berlin. Why do they do this kind of thing? What is there in it for them, and do they not by so doing merely stir the pot up and encourage our side to be more vigilant and spend more money on defence and all this sort of thing?

Mr. Buchan: Subject to correction by the experts, in the last instance it was not them who closed the road to Berlin, it was the East Germans and there was every sign of considerable Soviet reticence about this development because throughout the last Berlin sally caused by the German presidential election in Berlin, they would show everybody although they could lay hands on that they were not going to cause any trouble in Berlin.

I think one thing is clear. Berlin offers a unique chance for the Soviet Union to put pressure on the West, but I think they are not terribly afraid that showing too much force would revive the spirit of defence and cohesion within Western Europe. I mean, if you look at the Czechoslovak invasion, the result has not been totally discouraging for the Russians to that extent, but I would agree with what Mr. Windsor has just said. I think that the last Berlin crisis as indeed, the one last year and in June was much more an affair of the East Germans and the significance of this was the power that the East Germans could yield within the Warsaw Pact to make the Russians look on to what they were doing, to make it impossible for the Russians to stop this thing at all and one would have expected from the start that the Russians were less interested as to the question of the super power dialogue than of destroying the impact that Czechoslovakia had made on all the West. Still the interesting facet of this crisis war is that the East Germans forced the hand of the Russians and that the Russians felt obliged to do little in order to please the East Germans. Indeed, this may become the real significance of Berlin as a means of the East Germans to put pressure on the Russians rather than the Russians putting pressure on the West.

Mr. Howard (Okanagan-Boundary): Do you think it possible that the Soviets were not unhappy that the East Germans did at the same time play the game? That is the impression I got from it.

Mr. Buchan: My impression is that this is not the case. It seems to me that the Russians are quite aware of the resentment towards Eastern Germany in the Warsaw Pact. The Russians are quite aware of the fact that if they abide too much by what the East Germans want them to do this would make cohesion within the Warsaw Pact even more difficult than it is now. The resentment, for instance, in Poland or in places like Czechoslovakia or Hungary towards the East Germans is quite considerable and both fear of their economic power and their influence with the Russians is something that East European leaders are very much concerned with. It seems to me that from this point of view this was not a very welcome crisis to the Russians. Now this does not exclude that Berlin offers the possibility to the Russians to separate the men from the boys, to separate the Germans from the allies in Berlin. If you look at the crisis last year in June and, indeed, the crisis just now, you will see that the restrictive measures imposed by the East Germans did not hamper in any way the access of the allies to Berlin or the position of the allies in Berlin, but did hamper the access of the West Germans to Berlin and of Berliners to West Germany. It was really this that seemed to be in the focus of the matter.

Brigadier Hunt: I had wanted to wait to make this one point, which Mr. Buchan has just made, but I think Russian policy can always be looked at as: is it directed against the Germans or is it directed against the West? By and large the Russian policy is almost always directed towards Germany. It stopped short, it seems to me, of directing itself against the Americans. Clearly at the moment, in the last analysis it was ably agreed on the part of the Russians not to confront the Americans. They were waiting for the Americans to agree to arms control talks and so on. There is something, therefore, which stops short of wanting to confront them. They did not want to confront the Americans also in the Middle Eastern war when this took place, but the opportunity to single out the Germans so to speak and to hold them hostage is always I think an attractive one and occasionally of course they also have to pay some sort of lip service to the

East Germans too, and this can be seen I think in the same context.

Mr. Windsor: Yes, I very much agree with what you said. I think one of the factors is that the Berlin situation was inherited by successive Soviet governments from the post-war situation, and the Russians over the years have tried various experiments over Berlin in 1948-49 and tried to force us out by intimidation. In 1958 and in 1961 again they had other attempts to throw us out one way or another or to get us to leave.

I think that the Russian attitude to Berlin since 1962 has been made up very much with an attempt to cut off West Berlin from West Germany, to break the links between the West Berlin state and the Federal Republic and to try and do what they can by economic and other measures to reduce the economic viability of West Berlin as an economic entity by allowing or encouraging the East Germans to raise tolls on goods, and forbid different kinds of goods going from the Federal Republic to West Berlin and back again.

But with particular relation to the last crisis, I agree with Kenneth Hunt very much that one of the reasons why the Russians were so anxious to go around telling everybody that there was not going to be a real crisis about Berlin was simply because they are very anxious to get into bilateral talks with the United States. There are two other background factors I think about Soviet attitude to Berlin which are important.

One is that it does give them an opportunity to show their strength from time to time. To show the Western Powers what a strong position they have in Eastern Europe and in particular in East Germany. And secondly, they are very anxious I think for the West to retain its position in Berlin because the Russians have never given up since 1945, their residual interest in all German affairs. As long as there is a Western British, French and American presence in West Berlin there is a vestige of the old four-power control over Germany. This enables the Russians then to say so—and this may be important in the future. At any moment the Russians can say, because we recognize the four-power position in West Berlin and so our 1945 four power interest in the whole of Germany, in all German affairs still extends. This offers them an opportunity to interfere in the future in political and other ways in what is going on in West Germany.

If the Russians got us out of West Berlin and West Berlin was absorbed into East Germany, the last vestige of four-power control in Germany would disappear. The Russians would therefore find themselves, with no legal peg on which to hang an interest in all German affairs in the future of Germany as a complete—as an integrated two states. I think for this very important reason, the Russians will not press in the future, for the West, for the British, French and Americans to leave West Berlin.

The Chairman: Mr. Brewin was your question directed to this particular phase or do you want to hold it until we deal with the next part of the program?

Mr. Brewin: It relates to this phase all right.

The Chairman: Then why do you not proceed?

Mr. Brewin: I think this question should be directed to Brigadier Hunt. We just came back from a very brief and hurried trip in Europe where we met with a number of allied troops.

Yes, I will not argue with you about that, on the continental part of Europe, shall we put it that way. We were told when we were getting advice about what should be the military posture, or military division of the Western countries, that the Soviet possession of offensive weapons—weapons with great offensive potentiality—that the intention of this could not be reduced except from the capacity that was evident there, and therefore we have to build up an adequate force to meet it. I was wondering if amongst these reasons the Russians are building up their military strength would be essentially the same argument from their military men. I quarrel that in Europe we have on the West side a tremendous concentration of past nuclear weapons for example. Is it possibly just a sort of reaction to that sort of advice which is responsible for the Russians building up a threat, and perhaps an offensive threat in Europe. I think perhaps you dealt with that.

One final connected question is this. Is there anything in the Russians purposes that seems to be inconsistent with a gradual nuclear reduction of military concentration in there?

Mr. Buchan: On the last point there is no evidence I think that the Russian defence effort has gone down. On the contrary, from

time to time it has gone up and when mutual force reductions have been offered as indeed they were offered by NATO this past year and the year before in no sense were they taken up by the other side. So for the moment therefore the Russian intention here has been to maintain what it has or indeed modestly to increase. Their defence budget has gone up rather than down.

On the business of who is defending against whom is a difficult one. One has to go back in history, but certainly if you look at the postures on either side you can see a distinct asymmetry. You can see it and you can go way back to the 1940s. Massive Russian conventional forces which could simply well afford and have no particular defence against them except atomic weapons in the early 1950s. Then you can see the build-up in Europe of the NATO armies and they are required to use their weapons as a means of defending themselves against what were much stronger conventional forces. And as part and parcel of this the Russians in building up their conventional forces paid great attention on the one hand to close support aircraft to support their armies going forward. On the other hand, they paid great attention to interceptor defence aircraft to defend themselves against what NATO was given, which was deep strike aircraft.

Conversely, the Western side being confident that they so to speak could not defend themselves conventionally acquired these many nuclear weapons and of course also nuclear strike aircraft in order to take out the airfields from which this massive close support aircraft came. So you have an asymmetry building up. At the same time you have the Americans acquiring polaris and acquiring carrier-strike forces and so to speak menacing the Russian mainland and indeed acquiring ability to strike at it.

They strike at it from a distance incidentally which was rather greater than that of the close-support aircraft from the Russian mainland. So you have a Russian feeling that it was administered certainly in strategic terms from outside. Who maintains the defence against whom I do not know, but I can postulate one simple thing. The West most certainly could not attack Russia except with nuclear weapons. Napoleon conduct is that you cannot walk to Moscow so to speak, and if you look at the Western forces you would find they simply are not geared or numerically strong enough to advance more than a

relatively short distance. There is no conceivable question so to speak of their attacking Russia.

The Russian forces if they wish to attack only have to cross Germany, a distance which is a minimum of 80 miles and at the greatest point is only a matter of 100 or 200 before so to speak they can get to the Rhine on the one hand or get to the capitals of the various major countries on the other. So you do have a great asymmetry. But there can be no doubt that the Russians are concerned with the nuclear strength in strategic terms on the one hand and with the 7,000 missiles on the other. There is equally no doubt that Germany in particular and the continental countries are concerned with the MRBFs which is a target on Europe and the numerical strength of the Russian conventional force. How you break yourself of this fear in which each one is scared of the other I do not know.

What you would have to do is to look at the political motivation. Once upon a time there was a strong ideological motivation which one supposes the Russians had sweeping across Europe. There was an ideological motivation on the American side which was to roll back this sort of regime if the opportunity offered itself. This has long since really stabilized itself into an acceptance really of the *status quo*. What one feels on the Western side is that one has a level of force which is sufficient to prevent the Russians from doing what they want except by major attack. This major attack would bring in the problem of escalation and nuclear weapons. This is what they feel. I feel perfectly certain that the Russians feel that they have achieved a *status quo* too. That we cannot so to speak attack them and so we have this established picture.

This is rather a confused answer to your question but it is really to try and elaborate what each must have felt as they built up their positions. But the Russians do actually maintain their forces—they do not show any signs of running them down. We, I think, for budgetary reasons would like to run ours down, but on the whole the offer has not been taken up.

The Chairman: We have a problem. We have covered two of the four items. I have on my list of questioners Mr. Harkness who has been very patient and has been waiting a long time. Then Mr. Buchanan, Mr. Anderson and Mr. Prud'homme. Mr. Harkness is your question related specifically to this or could it be general?

Mr. Harkness: As I said it relates to all of the aspects really.

The Chairman: Mr. Harkness would you like to question now then?

Mr. Harkness: Some reasonably knowledgeable people in regard to these matters have expressed to me the view that the present Russian Government is a weak government. On the one hand this militates against the possibilities of arriving at arrangements of any kind with the Soviet government, and on the other hand, it presents the danger or the threat in the event of a crisis developing which might call the more warlike or hard line elements in the Soviet government to take over and use that crisis perhaps in an irresponsible way as far as actions are concerned. I wonder if you would comment on that theory if you want to call it that, or that point of view?

Mr. Buchan: If I may just say, sir, we had better end on the question—particularly the question of negotiating with the United States, I think that this is very relevant.

The Chairman: I wonder if we could not complete that now Mr. Buchan. If it would be possible to summarize the views of your panel on those remaining two items and then perhaps give ten minutes or twelve minutes to each one.

Mr. Buchan: There is another question on this question of what the Soviet force is for in Europe, or what the function of this force in Europe is and it goes far beyond that.

I may say that a number of intelligent American defence officials have pointed this out to them on many occasions when the Russian forces are being restructured. It has been so far a singularly unprofitable exercise.

Mr. Anderson: Yes, but what you have not indicated today is whether it is an excellent historical reason or not. You have not indicated what might be their present thinking and why have these Americans have not influenced them although they are obviously people like themselves.

The Chairman: Before we deal with Mr. Anderson's question how have we left Mr. Harkness' question. I am a little confused now.

Mr. Buchan: Mr. Harkness' question has been irrelevant to this question of simplified

negotiations in this sort of context of simplified détente of an agreement. It has been irrelevant, do you not agree, Mr. Harkness?

Mr. Harkness: Yes, as I said I think the question was applied to all four of these questions that we are dealing with, to some extent.

Mr. Buchan: Let us take this question now. First of all is the Soviet Government at the moment a weak government of the kind that will find it hard to reach constructive agreement with the West. And, second why do the—why is the Russian top level in Central Europe so much higher than we think is necessary for them?

Brigadier Hunt: Yes the answer to the first question is that the present Soviet government is a polygon with all the disadvantages and some advantages of a polygon. It is a—you could hardly call—not really it a collective government as they call it themselves because it is very much subject to government by a committee. It is committee government. Exactly, now it so happens that most of the members of the Committee which is in existence now are,—it is difficult to find the right word, not exactly conservative but are open to inertia in the way they look at, and the way they should run things. They are slow moving, they are extremely suspicious of what is going on in the outside world and what is going on inside the Soviet Union. They are extremely suspicious for example of the intellectual inside the Soviet Union and I believe that it is not entirely accurate to envisage the Russian, the Soviet government, in terms of hawks and doves with the hard line down the middle dividing everybody on the left into a hard line and everybody on the right into a soft line. I think the evolution of the committee comes rather slowly and with a great deal of inertia involved, to decisions which tend to be cautious and tend to be unimaginative and tend to be not very decisive, not in the sense that Stalin took dramatic decisions and in the sense that Khrushchev took dramatic decisions. And, therefore, you have to think of the Soviet government as wrangling among themselves over practically every issue large and small, internal and external, political, defence, economic, agriculture, everything that comes to it, and sometimes a harder line consensus emerges as it emerged over its implications in the Czechoslovakian crisis. I do not believe for example, that the hard line has won over and suppressed the soft line as when they went into

Czechoslovakia. I think the consensus of the 11 men gradually became convinced that Czechoslovakia was endangering communism or the events in Czechoslovakia were endangering communism. So that I think that you have a group, a committee of slow moving, rather backward looking, rather very suspicious people whom it is rather difficult to get through to with new ideas, and even when you can get through to them, it is very difficult to get them to realize. And, therefore, I think, I would not say they were a weak government and I would not say that they are a more difficult group—just more likely to be overtaken by a hard line policy, and I think this is it—this really has to be judged on its own merits; you just cannot draw a picture of the present Soviet leadership which fits all situations.

And, this leads me to answer the second question, and that is, the question of over stationing of troops in Europe and why do they not listen to reason and that sort of thing. First of all, it is a very old Russian tradition and it goes way back to time of the czars—that you over insure in everything you do. Soviet operational groups in the Second World War would take on one German Division when they had ten of their own. And this is a feeling which is part of their suspiciousness and their general pessimism which is very difficult to eradicate because it goes into the deepest roots of the Russian character. And, therefore, I think you would be almost impossible on intellectual or practical or financial grounds to point out to the Russians that they have too many troops there for the political military jobs they want to do with any hope of getting them to accept. The second reason, is that the way they are structured and financed they have no budgetary restraint and they do not feel a pinch by the stationing of ground, air and naval forces in European theatres such as we do. They do feel a pinch, of course, when they go into the field of very advanced technology like anti-ballistic missiles systems and so on. But the stationing of 10, 20 or 30 divisions in a place like Europe does not cause financial or manpower or administrative hardships to the Soviet Union. They do not feel a pinch here, so the combination of these two factors will make them go on forever insuring themselves, over insuring their position, remembering always that they want to keep as many options open as possible. They want to be able, in other words, to try thinking in pure military terms, to fight defensively, to fight at

the conventional level, to fight at the tactical nuclear level or to fight at the all-out nuclear level. They want to keep all those options open and they over insure by nature which is part of their temperament.

Mr. Harkness: Mind you you are putting that dramatically, am I not correct that the force is very well placed for the next 6 or 7 years? The 17 to 21 age group in the Soviet Union is doubling I think I might say between 1967 and 1975.

Mr. Buchan: They can take between 800 and 900 thousand men into the forces each year, if they wanted to. They have the manpower available, without hurting the economy and without quick notice. One has to consider the danger of a Russian offensive not just a war with words, but the function of their military forces of course is also concerned with the internal structure of the Warsaw Pact and with the ability to keep a certain amount of control there and to secure regimes in the various countries. There is an inertia in the question of what they are defending against, and there is also inertia in the way they look at the structure of the Warsaw Pact, and I think this should be seen as an additional incentive to keep the troops that they have there at the moment.

The Chairman: I think perhaps we had better get on with these other items, if we could, Mr. Howard?

Mr. B. Howard: I think there is one last important item which we would very much like to discuss with you which is this question of security. For nearly a quarter of a century these two great international systems have confronted each other in the middle of Europe. Until Czechoslovakia it was possible to construct a respectable political hypothesis I think, but if you could keep it fixed and low both between super powers and between the European states east and west, that the word security forces as it were, involving pride, culture and political matters which were making for a more pluralistic European society and that you could certainly construct on paper the ground work of something that you could call a European security system, in which the two alliances look more like systems of crisis management rather than military-integrated military machines that conceivably will build a bridge between them and thus illicit the term super-power guarantees of territorial services in Europe.

Mr. Buchan: Well now, Czechoslovakia has really changed this whole concept of peaceful engagements for the moment. But, of course there is another aspect to the program. As you all know as well as we, this question of Soviet-American dialogue on the strength particularly of ballistic missiles defence systems has now become a matter of real urgency and it will be probably a matter of weeks before President Nixon visits Moscow, and this has been announced perhaps for the summer. We—probably today sometime, Nixon will be announcing—even making his decision on the anti-ballistic system in the United States and my hunches is that he will defer the current controversy.

Now I think one of the things that concerns us in Europe very much, is what is going to be the effect of the liaison getting into a negotiation of this kind. Is it going to be purely about American and Soviet relations, about strategic weapons, or is it to be about one of the implicit crises and possible urgent matters like the Middle East and perhaps the American expectations in Vietnam. Or is it also going to lead to some kind of arrangement, and I use the very broad word, between the two super powers; that recognize they each have a separate sphere of influence which would, of course, have a damaging effect upon German reunification. Is there a danger that super-power agreement which we in this country I think have always encouraged, may have the effect of easing suspicions between say the United States and her European allies. I think this is the question that we ought to very briefly discuss and Christoph Bertram I wonder if you would like to tell us how it looks to you?

Dr. Bertram: Is is a very difficult question and I am not at all happy with being asked to answer it and I do not for a second suppose that I can. It seems to me that there are two considerations. The first is that, everybody wants disarmament and all the countries in Europe and elsewhere who have in a way, even those that have been voicing some opposition to the non proliferation treaty for instance, have at the same time urged the two great powers to do something in the field of disarmament. Disarmament is something that seems the only long-term answer to get out of this deadlock which we find ourselves today, in Europe particularly, that it is quite understandable why everybody has said this would be something that would be useful to the situation.

For these smaller countries, some sort of super-power arrangement that was going beyond the limitations of arms but reached into areas such as the Middle East and possibly into areas like Europe would mean that one was more or less attached to a system without the possibility of getting out of it. And, it seems to me indeed, that even before the two big powers there are two sides to the coin. One is their desire to avoid conflict and to get some sort of arrangement to make it possible to find common ground in problems like Vietnam, like the Middle East. And, at the same time there is the question, how far can they impose solutions, how far can they control their sphere of influence, and whether or not the notion of spheres of influence is not a very old fashioned one, that no longer applies.

While you have the two super powers being indeed, super powers in the strategic and military sense and the economic sense too, you witness at the same time due to their fear of getting in conflict with one another, their inability to control countries who think to the extent that they would like to do it, and, therefore, the fear of the smaller countries is that a super power arrangement over their heads would likely be to reduce their own freedom of manoeuvre it seems to me is exaggerated, and it seems to me that if one finds the ground for some sort of superpower agreement this could only be beneficial and I do not fear for a second that this would lead to a permanent division of Europe. But, of course, what you will have at the same time is that the interests of the superpowers will be directed in another direction than those of the smaller powers and I am thinking again of smaller European powers. For all West European powers and East Europeans to that extent it is desirable to find some sort of grey area where agreement does not mean division for the superpowers and agreement in Europe must necessarily be a division of Europe. I see there a certain danger of the smaller countries in Europe floating away from what the superpowers and the assistant superpowers try to set off and floating away and making it more difficult at least for the countries that have the choice, as those of western Europe have, to stick to their alliance to the same extent as they did before.

Brigadier Hunt: I think there is just one point I would like to put and this really refers to the Soviet outlook, what the Soviets hope to get out of the talks or the relationships with the other superpower, the United States,

and that is that the Soviet Union is now basically a status quo power and interested in good order and discipline throughout the world, good order and discipline in the sense that it could create a situation in which their ideological activity although it has been said much reduced but still nevertheless is a part of Soviet policy overseas in which their good order and discipline serves Soviet security and Soviet policy aiming at increasing Soviet influence wherever it is appropriate in the world. Therefore, the Soviet Union is basically interested in talking to the United States as potentially the other power which can induce good order and discipline in, if you like, the non-Soviet world. The Soviet Union has always been interested in talking to the other real power in the world and always been interested in finding in that power a willingness to get its will, the joint will of the two superpowers imposed on the other smaller countries of the world. And, therefore, what the Soviet Union would really like the United States to do would be to come together in circumstances in which the Soviet Union says we guarantee stability in that part of the world which acknowledges in one way or another our authority or our influence. If you will guarantee the same in that part of the world which looks to you politically, economically, sociologically and so on, so that the Soviet Union basically is going into discussions with the United States not only for reasons of controlling crises or of preventing enormous expenditures on weapons systems such as the antiballistic missile system which the Soviet Union does not want to, not only from the point of view of gaining the prestige of a superpower and talking to the other superpowers at the same level but also because it hopes that the other superpower, the United States, will induce the same kind of good order and discipline in its area of the world which the Soviet Union is prepared to try to offer for its part of the world and I think this is a very important aspect of the Soviet motive in wanting to talk.

In other words, in one word, the Russians are interested in a superpower deal I think: Very briefly, I think the interest of the superpowers is concerned with their own security and their own interest, perhaps the smaller power too.

Dr. Bertram: I have two points to make, first, of all, the interests of the smaller powers are not exactly the same. Germany obviously has a much greater interest in the future of Germany than does, for example,

certain other countries but the interest of the smaller powers in security in Europe is very much bound up with the American commitment to Europe and therefore whatever emerges from the Russian-American talks the European nations would not wish in any way to weaken the American commitment to Europe and this seems to be an essential point to take and in terms of the interest, is that Germany subsequently and I think a number of other countries too, would not want an agreement between the two super-powers to be an agreement to maintain the status quo. They want in fact somehow political change in Europe to follow from it and in a sense if possible to be tied to it.

The Chairman: I have two members who have questions, Mr. Buchanan who has been very patient and Mr. Lewis, and I think on that note we would have to end because I believe the members of the panel have to leave at 5.30 p.m.

Mr. Buchanan: This question basically Mr. Chairman, was prompted by the remarks Mr. Windsor made when he indicated as I gathered it was a foregone conclusion that the disappearance of both the alliances in the relatively near future or perhaps that was the interpretation I put on it, was almost a certainty. I was going to ask Mr. Buchan to comment on that.

Mr. Buchan: I do not think it is quite bad enough to say that.

Mr. Buchanan: When the two alliances disappear you stated somewhere along—

Mr. Buchan: I think this is a reference to a theoretical proposition that you find in the positions of some eastern European countries particularly Roumania.

Dr. Beriram: I would say it is not a theory that is totally beyond the political discussions but I would say at the present time there is very little likelihood of the two alliances disappearing. Now, they may change and their actions may change and their outlook may change and the structure they have given may change but I think there is very little likelihood that any of the western Europeans would like NATO to disappear and would feel more secure in a different arrangement nor indeed the east Europeans would as has been said at the beginning, there is this tendency in eastern Europe to try to exert more influence through the Warsaw Pact.

Indeed I think there are very few illusions in eastern Europe that they have a political choice of opting out of the Warsaw Pact as is shown quite clearly I think by the way the Czech government during the crisis conducted its own policy but it seems that there is interest behind the structures and even if there was not the structures have the ability to stay on for a long time even if the interest has vanished.

The Chairman: Mr. Lewis, do you want to wind it up.

Mr. Lewis: It is up to you, sir.

Earlier this afternoon, Mr. MacIntosh made a comment which seemed to me very interesting. He promised to argue it later in the afternoon but he has not yet done so, whether he did not have the opportunity. If I remember correctly, and I think I do, he suggested that the Soviet Union and indeed the Soviet combination was interested in maintaining the western alliance rather than otherwise. That was one of the priorities of the Soviet policy and as I say, he said he would be prepared to argue it later. I would like to take this opportunity—

Mr. MacIntosh: No, that was an important point to clarify.

Mr. Lewis: To elaborate your point.

Mr. MacIntosh: I think it was a view we all held.

I think that the Soviet Union realizes that a great deal of potential uncertainty in the European theatre has been avoided since 1949 at the end of the Berlin blockade in 1948-49 and the creation of NATO by the existence of a well-established and firmly-based alliance system in which the United States, the world's strongest power, economically and militarily, is firmly committed to certain principles, the establishment of certain principles in Europe and there are certain American and other NATO guarantees too, which are effective, which would come into effect if certain things happen in Europe, for example if the Berlin crisis exploded into military action. I think the Soviet Union while it takes the ideological view that the United States has no business in Europe and would like to see American power withdrawn from Europe completely and this would in their view allow healthy forces to take control of western Europe. In practice, this is, in effect, an ideological Communist viewpoint. In practice the Russians who are realists see the value which

the western alliance structure has brought to this situation in Europe and therefore, I think they look at the alternatives. The alternative is the disbandment of NATO or the serious weakening of NATO, for example, the loss of certain members of NATO and I think that they would conclude and I admit I am oversimplifying the argument for reasons of time and space, they would conclude that the alternative is worth it, that if you had no NATO structure, no American presence in Europe, no American guarantees to Europe you would have a very much more unstable situation. You could have, for example, renewed dangerous tension between France and Germany, between Britain and Germany and between Britain and France. You could have Communist parties coming to power in Europe which would be not subject to Soviet influence which would be Titoist, for example. A French Communist party in power might well be more Titoist, more Titoist than Yugoslavia. The same with the Italian communist party and the range of uncertainty in a word of the alternative system without NATO, without American presence in Europe is something that would worry the Russians very considerably. And in their caution and to some extent arising out of their inertia, they would prefer the present situation to exist, to go on, always allowing, of course, that they are permitted to where appropriate, where possible, to subvert individual areas and countries in western Europe and by propaganda and other means to try to undermine the structure but basically I think they would like the alliance to continue.

The Chairman: Gentlemen, before asking Mr. Buchan to adjourn the meeting there are one or two administrative announcements. I wish to pass them on to those members who are not here at the moment. For instance, all members will be called at 7.15 a.m. The bags must be down in the lobby no later than 8.00 a.m. We are leaving the hotel at 8.30 a.m. so if you want to have breakfast you make your arrangements accordingly. To repeat that, the call is at 7.15 a.m., the bags must be down no later than 8.00 a.m. and we leave the hotel at 8.30 a.m.

The High Commissioner has very kindly mentioned that there will be refreshments in his office for those who wish them after the meeting has adjourned.

On your behalf I would like to extend our sincere thanks to Mr. Buchan and Mr. MacIntosh and to Brigadier Hunt and to Dr. Bertram

for being here this afternoon. We have been dealing with pretty basic matters and I can assure the panel that we realize how complex the situation over here is. I am sure that the information we have received will be most valuable to us.

Mr. Buchan: Thank you very much indeed. We are extremely pleased to have been able to participate in this discussion with you. I am afraid our discussion has been very general. I do not know if it brings us any nearer to being able to make up your minds on Canadian points of defence policy.

**Geneva, Switzerland,
Saturday, March 15, 1969.**

The Chairman: Just a word of explanation about the simultaneous translation, two for English, deux pour Anglais, and trois pour Français and if you wish to speak put up your hand, press the button in front of you and wait until the light on the microphone comes on. You press the black button on the base of the microphone and wait until the light above the black button goes on.

Gentlemen, there are one or two administrative announcements before I introduce His Excellency, Mr. Ignatieff. First of all I have had a very important communication from Canada on the occasion of the opening of a new tracking station to send very important greetings to all of us on the Standing Committee. Apparently the line was poor but the person who took the message thought he said that Mr. Kierans asked that his best wishes be conveyed to the visiting MP's on the occasion of their deliberations with regard to NATO and defence policies. I know you will want to thank Bob McCleave when you get back to Toronto. Incidentally, after that very good lunch that His Excellency provided for us, I would advise none of you to look at that Church which is up on the ceiling because if you do you will think perhaps you have had one drink too many because no matter which way you look at it, it seems to be on a slant, and depending which way you look at it, it slants differently.

Gentlemen, I am sure that we all wish to thank the officials of the United Nations who have made this Council Chambre of the Palais des Nations available to us with the excellent facilities. I also know that you would want me to thank our Ambassador for the wonderful reception he has given us, and

Mr. Ignatieff will be making an initial statement; I believe he intends to speak of the United Nations to which he was the Ambassador, as you all know, and particularly perhaps the prospects for peacekeeping; we have a particular interest in that, in our Committee, and I believe he may also say a few words about disarmament which is his new interest of course. But knowing Mr. Ignatieff I know you will realize that he will be quite happy to accept questions on almost any subject which may occur to you so do not feel limited or restricted in any way and if he feels that he should not reply—I know he does not need any protection from me, he is quite able to look after himself and that he will always answer diplomatically. So Mr. Ignatieff.

Mr. George Ignatieff: Mr. Chairman, I should like to welcome you here. Through the courtesy of the administration of the *Palais des Nations*—Are we on channel 2? The room we are in is one of the most historic in the world. It is here that the Council of the League of Nations once deliberated, between the two world wars. Now that the United Nations Organization has succeeded the League, this room is used not only by the United Nations but also for such highly important conferences as the Korean armistice talks, the 1954 talks on Indochina, and the 1961-1962 talks on Laos. The Four Power Conference on Berlin was also held here.

It is here that the Disarmament Commission conducts its important work, begun in 1962. On these walls, you will see the murals by the famous Spanish painter, José Maria, which, if I am not mistaken, represent man's titanic efforts, over the centuries, to eliminate war—efforts which, since we must be honest, have been more or less frustrated so far.

With your permission, I shall now speak in English in presenting an analysis of the disarmament situation, the current Canadian attitude, and the prospects for the maintenance of peace through the United Nations; as your chairman has been good enough to point out, I shall be at your disposal to answer a few questions you may wish to put to me.

[English]

I should now like to say how happy I am to appear before this Committee. I recognize from the standpoint of first-hand experience and security in disarmament matters over a period of some 28 years, I realize only too well how complex, difficult are the matters which are under your review, in fact appearing before you as a Civil Servant reminds me

of Samuel Johnson said about women preachers; like a dog trying to walk on hind legs, while it is remarkable, it is not that it is well done or done badly but that it is done at all. And also speaking as a Civil Servant to legislators I am reminded of something which I keep always close to my heart and that is the rule of the whale that you are most vulnerable to the harpoon when you are on the surface bounty. I have however, an understanding that my introductory remarks, if the gentlemen of the press so desire can be attributable but I must ask the leave of the Chairman and members of the Committee that if they put questions to me which require me as a Civil Servant to express opinions, which have to be off the record, I shall ask that my answers be so regarded. And I will then indicate in each case.

I assume that we all agree that the starting point to disarmament and defence policy are essentially two sides, the same coin, part of the total currency used in the conduct of Canada's foreign relations. In other words, I take it the starting point of foreign policy is inseparable from defence policy and disarmament from both.

Just as a lasting peace is the ultimate objective, this obviously cannot be assured by arms alone anymore than it can be achieved by disarmament alone, particularly in a heavily armed international environment with nuclear weapons as we have them today. Therefore, the first point I wish to make in my introductory remarks is that Canadian disarmament policy has of necessity to be consistent with our defence policy and both have to serve the general foreign policy of Canada.

The most important aspect for the background against which our disarmament policy has to be formulated is the current nuclear stalemate between the United States and the Soviet Union. I say that the security situation is based on stalemate rather than on stability because the hard fact is that the arms race is still going on. And each of the nuclear powers is trying to obtain an advantage in armament and armed forces. Robert McNamara, nine years Secretary of Defence in the United States, in his remarkable book "The Essence of Security" explains his attitude on this question of the arms race and its relation to disarmament in the following striking language: I quote Mr. McNamara.

We do not want a nuclear arms race with the Soviet Union primarily because of the

reaction phenomenon which makes it foolish and futile. What we would much prefer to do is to come to a realistic and reasonable riskless agreement with the Soviet Union which would effectively prevent such an arms race. We both have strategic nuclear arsenals greatly in excess of a credible ashore destruction capability. These arsenals have reached that point of excess in each case for precisely the same reason. We have each reacted to the other's build-up with very conservative calculations.

This excess of capacity has been described by the specialists in the subject as "mutual ashore destruction" or mad for short.

Now, located geographically as Canada is, between the two nuclear powers and on the shortest distance between the nuclear powers as intercontinental missiles are apt to fly, Canadians of necessity cannot afford to regard the arms race, or the disarmament negotiations which are now going on in this Chambre or will be next week, in the rather detached way we did when the disarmament talks were going on right here in this Chambre in the 1930's.

In those days Canada was protected by the oceans which were regarded by the navies friendly powers, and there were no intercontinental missiles. If through some frightful miscalculation war were to break out in present circumstances, involving the nuclear powers, and the use of intercontinental missiles and nuclear warheads, Canada would not help but be effected immediately. It is above all the risks of what would happen to Canada in the event of a general war in a nuclear environment that makes our participation and disarmament negotiations so important. The stalemate I spoke of arises from the fact that at present the avoidance of nuclear war ultimately depends on the capacity of the two super powers to inflict unacceptable damage on each other because both have what is called second strike or retaliatory capabilities. They do not possess first strike capabilities, that is that neither the United States or the Soviet Union has the power to knock out the other with a sudden strike. But they do have the power to inflict unacceptable damage in retaliation.

A series of confrontations, including Berlin, Canada the Middle East as well as Vietnam have lead to a realization on both sides of the tremendous risks of the two nuclear powers becoming involved in hostilities. Moreover in

a world with increasingly swift communications, there is a growing realization by other governments that such confrontations involve unacceptable risks not only for the nuclear powers concerned but for themselves, and this realization in turn generates pressures which makes negotiations on arms control irresistible. I am therefore basing the trend towards arms control negotiations not on benevolence, the great powers or any other powers concerned but on their necessity. These negotiations however have to be within certain limits, reasonable limits, that is that if the powers directly concerned wish to avoid a disturbance of the existing equilibrium, the military power between the two sides which might precipitate a crisis, this is one of the essential assumptions on which all arms control discussions are based, that they must not only be a preservation of balance but an assurance about verification of that balance at any given time. Against this background Canadian policy is to endeavour to contribute in every way possible to the reduction and eventual removal of the high risks inherent in the present dangerous nuclear stalemate and to help end the arms race through negotiation. The ultimate objective of Canadian policy is general and complete disarmament. Unfortunately the objective is distant in the present state of distrust and tension in the world. Meanwhile Canadian arms control and disarmament policies have to be designed to accommodate Canadian political defence as well as commercial interests. That is to preserve not only our contribution to international negotiations on disarmament, Canadian independence, but also to maintain the necessary collaboration with the United States in defence and commercial matters, as well as promoting Canadian export of nuclear fuels and technology in view of the Canadian important potential in fuels as well as nuclear reactors and technology. Now, Mr. Chairman, you asked me to say something of the prospects of disarmament as I see it. I will be frank to admit that some of the momentum of progress obtained last July at the signature of the non-proliferation treaty has been lost in the intervening months. This has been mainly due to the presidential elections in the United States and the ensuing change in the United States' administration. The arms control and disarmament agency in Washington has been seriously dislocated and affected as well as the State Department, the Defence Department. All three having changed their executive heads and their immediate colleagues.

The immediate objective therefore in the disarmament negotiations is to try to recapture that momentum. The present and principal impediments to arms control are twofold. First, political. That is distrust and suspicion between the nuclear powers and between the allies. Secondly, technical disagreements over inspection and verification techniques and procedures. Nevertheless confrontations having been tried by the nuclear powers in the circumstances that I have mentioned, and I speak with personal experience because I was in NATO when the confrontation over Berlin, over Cyprus, over Cuba, and recently in the U.N. over the Middle East. As I say, confrontation having been tried by the nuclear powers and having been found such a risky proposition in a series of crises, negotiation on reasonable terms not only becomes feasible but necessary. The new President of the United States has said the area of confrontation must be replaced by an era of negotiation. The question now is to what extent these discussions between the super powers will involve the interests of others and how the others will be effectively represented in these discussions. It is because such discussions will obviously involve the interests of others in an important way that President Nixon came to Europe to give assurance to his allies that they would be consulted, as well as being kept informed of such negotiations. Now the main channel for representing Canadian interests in these matters is not only of course the 18 nation disarmament conference here in Geneva. There is also the North Atlantic Council in Brussels, as well as the bilateral channels which are used through our mission in Washington and the U.S. mission in Ottawa. The political objective must be to work towards a genuine détente and its political objective. Technically the objective must be to develop dependable verification techniques in support of disarmament agreements. Canada will do everything within its power to make such progress possible and I hope that we will be in a position to exercise some leadership in both directions, but particularly in the matter of technical verification procedures.

Now, in present circumstances, because of the preponderance of military power as well as military circumstances the vital key to immediate progress in armaments control and the reduction of armed forces and armaments is in the strategic arms limitation talks which take place between the United States and the Soviet Union. Conciliatory and accommodat-

ing attitudes on the part of these two super powers would denote better than anything else their determination to end the arms race. This is the top priority in disarmament today. In the Canadian view these two super powers having incurred an obligation in this direction arising out of the recently negotiated non-proliferation treaty. Obviously, non-proliferation is important as an end in itself, but it is not up to the treaty to disarm the unarmed as a French authority has said. Article 6 of the non-proliferation treaty which was before the House of Commons called upon the nuclear powers to pursue in good faith negotiations to curb the nuclear arms race. At the last general assembly the Canadian delegation stressed the importance which Canada attaches to Article 6 being implemented in good faith. The Canadian government will continue to place emphasis on this expectation when the conference on disarmament opens next Tuesday. The development and deployment of ever more sophisticated and automated nuclear weapons delivery systems and launching facilities would make limitation or make verification of limitation ever more difficult as well as contributing to international tension without a compensating increase in international security. This is why the beginning of talks between the United States and the Soviet Union is of such vital concern, especially to Canada. Now the greatest achievement in arms control to date has been the non-proliferation treaty and the limited test ban. The word now on the non-proliferation treaty. The effectiveness of the non-proliferation treaty will largely depend upon the accession to it of the majority of near nuclear nations. These are India, the Federal Republic of Germany, Brazil, Australia, and Israel. It was partly in the hope that these other near nuclears, that is with countries with nuclear potential as Canada has, would follow our example and put the easing of world tension through arms control ahead of their nuclear option. Canada acted quickly to be among the first to sign and ratify this first postwar arms control agreement containing an effective verification system under the International Atomic Energy system of safeguards. We also acted from the belief that the coming into force of a non-proliferation treaty would act as a gateway to further measures of disarmament, particularly, nuclear disarmament. Non-nuclear powers signatures of the non-proliferation treaty, having given up the nuclear option themselves, are in a strong position of demand as a

quid pro quo that the nuclear powers live up to their promises of disarmament under Article 6 of this treaty. We had hoped the process of bringing the treaty into force by the ratifications of the United Kingdom, the Soviet Union, the United States, and 40 non-nuclear states which is the requirement under the treaty would have proceeded more rapidly, but it was unfortunately slowed up by the invasion of Czechoslovakia. We are however encouraged by the fact that 87 countries have signed the treaty. Nine nations beside Canada have now ratified it. The United Kingdom, the United States, Ireland, Nigeria, Camerouns, Denmark, Norway, Finland, and Mexico. Perhaps, of course, most important of all the United States Senate approved the treaty unamended just two days ago by a vote of 83 to 15. And we can reasonably expect that the Soviet Union will now follow the Americans in short order. These actions by the super powers should give a significant momentum to the coming into force process, which now requires ratification by the Soviet Union plus 32 non-nuclear countries.

A word about the comprehensive test ban. The comprehensive test ban which would prohibit underground nuclear tests is unlikely to be concluded until the two super powers agree to limit strategic weapons for which nuclear warheads, so they say, need to be tested underground. Therefore progress on the comprehensive test ban depends on strategic arms limitation talks. As soon as a strategic arms limitation, SALT as it is called, agreement is in sight the CTB or the comprehensive test ban will be vitally important as one of the only means of verifying that the nuclear powers have indeed actually stopped warhead research development programs. Consequently Canada supports the conclusion of a comprehensive test ban at the earliest possible date. The comprehensive test ban would have the effect of putting an end qualitatively to the nuclear arms race since the armed forces of the nuclear powers would be unlikely to rely upon new designs of weapons which have never been tested. A related measure which would follow more strategic arms limitation talks and the comprehensive test ban would be the cessation of the production of fissionable materials for weapons purposes, known as the cutoff. We expect a number of delegations of the coming session on disarmament to show an active interest in promoting the cutoff and Canada will continue to press for the negotiation and an appropriate agreement. Now these three

measures, the limitation on the deployment of nuclear missiles arising out of SALT, the Comprehensive Test Ban and the cutoff would be the milestones marking the end of the nuclear arms race and setting the stage for actual reduction in arms and armed forces. We are also concerned with stopping the proliferation of weapons in new environments, particularly the seabed and outer space. Canada expressed its support at the United Nations for collective measures to ensure that the seabeds and the deep ocean floor are preserved exclusively for peaceful purposes. This is to be a priority item in the 18 Nation Disarmament Commission meeting on Tuesday because of the desirability of prescribing this environment before its potential military purpose is exploited along with developing interests in exploiting the economic resources of the seabed. The position that we are taking is that the area to be reserved for peaceful purposes need not be co-extensive with the area to be inter-nationalized for economic purposes but could be larger. While purely defensive and especially surveillance devices of the sonar type should not be ruled out defensive installations for launching nuclear missiles should be prohibited.

A word now on conventional armaments and in the NATO context. If, as we hope, progress is made in the strategic arms talks this summer between the United States and the Soviet Union, and the Non-Proliferation Treaty is followed up, disarmament talks will move increasingly from nuclear weapons and their means of delivery to more conventional weapons. Now the most important prospect in this field is the NATO project for balance force reduction. Canadian participation in NATO gives Canada a chance to have a voice in this regional arms control project which essentially involves reciprocal reductions of NATO and Warsaw Pact forces in Europe. It should be remembered that membership of the 18 National Disarmament Committee, when it was set up in 1952, from five members each from the Warsaw Pact and five from NATO, constituted a balance in membership with eight non-aligned representing the interests of the non-aligned members of the world community. Canada is therefore expected in the 18 nation disarmament committee to consult with its NATO partners, especially on regional arms control matters, such as the reciprocal balanced reduction of forces, while working for Canadian objectives such as stopping the arms race and reducing

the risks of war through global disarmament measures. There has been a temporary setback to discussion of reciprocal withdrawals as a result of the Soviet invasion of Czechoslovakia.

However, the studies and preparation for it are continuing in NATO. There have been discussions on possible verification procedures in Brussels only a few days ago. And Canada will support this project of balance force reduction which largely depends on the prospects of a détente in Europe, as well as contributing to the techniques of verification.

A word now on chemical and bacteriological warfare which poses another form of mass destruction weaponry. A United Nations study of this form on warfare was commissioned at the last session of the UN General Assembly and a Canadian expert is now participating in the study of this project. Canada was a signatory of the Geneva Protocol of 1925 which prohibits the use of these weapons. We, of course, do not favour any action which might weaken in any way the Geneva Protocol, but we will support any steps to strengthen it and ensure that it covers satisfactorily the developments in this kind of warfare 45 years after the negotiation of the Geneva Protocol.

As I said, general complete disarmament remains the ultimate objective of Canadian policy. At present the 18 Nation Disarmament Committee has as its more immediate objective the problem of slowing down and trying to end the nuclear arms race, i.e. the arms race by those who are most heavily armed, the super powers. This is the priority objective. If there is success in partial arms control, as we hope there will be through the Strategic Arms Limitation talks, a more appropriate atmosphere for disarmament discussions may open the door for more fruitful negotiation on general and complete disarmament. I should now like to say something in response to your Chairman's request on peacekeeping.

The factor which has a direct bearing on Canada's impact on disarmament negotiation is the leading part which Canada has played in UN peacekeeping operations. For progress in disarmament beyond a certain point is obviously dependent upon the availability of effective means that collective security through the United Nations replacing reliance for security on alliances as well as national armaments now in forces.

What are the prospects? Of course as long as the UN exists it is bound to have a role to a greater or lesser extent in the maintenance of international peace and security. The extent to which the UN are allowed to have an effective role. An effective role in any case will depend on the decision of governments either in the Security Council its most powerful members, the permanent members, or in the Assembly of the majority. Thus member states from time to time are bound to use the UN as an intermediary in disputes which cannot be worked out bilaterally or through the intervention of other powers.

We must be frank to admit that we are a long way from being able to depend primarily on the UN for the maintenance of international peace and security as envisaged by the charter. While controversy within the UN over peacekeeping has led to confrontations in the past and has seriously divided the membership, I can at least say this in the light of experience, particularly in the last six months at the United Nations. There now seems to be a tacit acceptance by the permanent members as well as by the smaller members that present peacekeeping operations notably the operation in Cyprus, UNFICYP, and the Middle East, UNTSO and the operation in Kashmir, UNIGYP, may be continued for some time and that new peacekeeping activities may be required in the future, particularly as part of a settlement in the Middle East.

The effective exclusion of the permanent members of the Security Council from participation in such peacekeeping operations, although not from observer groups I should stress, is likely to continue because of the concern of small states at the possibility of having forces of the larger members, the major powers, on their territories even under UN auspices with its connotation of dangerous intervention in domestic affairs.

The burden, therefore, of providing forces or observers as they may be required is likely to continue to fall on smaller countries, particularly those with past UN peacekeeping experience. In the light particularly of the traumatic experience which these potential contributors to UN peacekeeping went through as a result of the financial crisis in the abortive assembly. Some of you may remember in 1964-65 the traumatic experience of the withdrawal of UNIF on the eve of the June war in 1967 in the Middle East. There is likely to be a reluctance to accept

new commitments for UN peacekeeping on the part of these members, including Canada, which may be asked to make contributions unless there are new assurances about the sharing of the burden and the effectiveness of the peacekeeping operation.

Indeed, taking these traumatic experiences into account as well as the fact that the UN has rather divided for peace, instead of uniting for it as provided by the UN General Assembly resolution, during the past 23 years. It seems likely that future peacekeeping will now proceed on the basis of a generally acceptable principle that all permanent members of the Security Council as well as the other members of the Council will want to ensure that the requisite financial and other support is available before member governments are asked to commit themselves to any new peacekeeping operation.

If that assumption is correct it must surely imply, given the well-known Soviet and French position that the exercise in the future of more control rather than less over peacekeeping will be by the Security Council, rather than the Assembly. It also implies that the spelling out of the exact terms under which any peacekeeping operation is to be carried out will be by a Security Council resolution in the first place and those exact terms would spell out the exact period for which the peacekeeping operation is authorized by the country accepting the peacekeeping force.

Last year at the United Nations Canada took part—a leading part in the working group of a committee of 33—in trying to work out an agreement on a model which might serve as a basis for such a Security Council resolution when the need arises in the future.

In the first place a model has been worked out to cover observer groups. But subsequently models for peacekeeping forces of another kind is expected to be negotiated. The fact of big power corporations within the framework of the Committee of 33 suggests that arrangements for peacekeeping in the future may be based on an understanding between the United States and the Soviet Union as well as of France and Britain to co-operate. This co-operation may not extend to providing forces for UN peacekeeping except for observers which may continue to fall on countries acceptable to a host government in a particular case, but the important thing is that this

great power of co-operation would at least ensure that any peace co-operation in the future had the support of the permanent members of the Council including their financial support.

In these circumstances the Canadian aim has been and continues to be to take an active part in working out the guidelines or models for peacekeeping operations through the Committee of 33 which is meeting at present in New York. Meanwhile the standby arrangements which have been developed over the years by Canada in support of UN peacekeeping with particular emphasis on training for observer missions is being continued.

You may well ask what does all this gobble de gook add up to. In trying to summarize I will say this. Peacekeeping operations on a voluntary basis like those undertaken in Cyprus or in the Middle East, or in Kashmir which are essentially peacekeeping operations as an adjunct to diplomacy to permit a mediator or mediators to try and bring the parties of an international dispute to an understanding. That kind of peacekeeping which may take the form of an observer group or the group as in UNFICYP, that kind of situation, that kind of peacekeeping is likely to improve the prospects of peacekeeping, is likely to improve if as I hope the models which I have referred to are worked out, that is that the Council will have at its disposal the basis of agreement of how to mount an operation of this kind, how to finance it, how to organize it.

I do not suggest that type of peacekeeping which may extend to enforcement action to resist aggression. The kind of operation that took place in Korea. The prospects of that kind of operation is not at all good. For the very same reasons that the membership of the UN remain divided on this point as before. The limitation of the powers of the permanent members to undertake that kind of exercise is particularly evident.

A few conclusions if I may be permitted to put them to you, Mr. Chairman, before I answer questions. Expenditures for military purposes as well as the risks of military confrontation with nuclear weapons and missiles is making the need for progress in disarmament ever more urgent. The most recent estimate of military expenditures produced in a report by the United States Arms Control and Disarmament Agency in December 1968

which is the latest available, it seems that global military expenditures continue to rise. This report states and I quote:

From \$132 billion in 1964 they rose to \$138 billion in 1965 to \$159 billion in 1966 and estimated \$182 billion in 1967 and preliminary data suggests a continued rise in 1968.

The same United States publication also says and of course this is available and I quote:

The dominant influence of the NATO and Warsaw Pact powers on the world's arms race became more pronounced. The two major military alliances accounted for nearly nine-tenths of this rise in expenditure in 1966 and 1967 the increased outlays of the two leading powers in these two alliances; the United States and the Soviet Union, made up \$35 billion of the \$44 billion increase from 1965 to 1967 in world military spending.

For an explanation of this phenomenon I suggest to those of you who have not looked at it to see the explanation offered by Mr. Macnamara to what he calls the intrinsic dynamics of the nuclear arms race and the essence of the nuclear arms race and the essence of the nuclear arms race. Pages 57 and 58.

This trend towards increased military expenditure shows I think that the efforts to stem the arms race are still inadequate and that effective international co-operation to achieve a balanced reduction of armaments and armed forces is not something that is likely to thrive and prevail against the encroaching pressures of the arms race without a more determined and concerted effort cultivating what is obviously a rather undernourished and feeble plan.

In other words, if we really want to slow down and stop the arms race there has to be a more determined effort to work at it and in the nuclear age I suggest more effort has to be invested in what I call war prevention by every means. It being recognized that in the nuclear missile environment defence policy cannot be concerned with winning a war. The need to make progress is clear enough. It is of course to reduce the risks of nuclear war arising out of military confrontation between the nuclear powers and because of our geographic location between the two chief nuclear powers we have a vital stake in stopping the arms race. There is of course the added and important benefit of reducing our own and other countries defence budgets in order to release resources for other more

useful expenditures, but making progress in disarmament has proven to be an exceedingly difficult and slow process.

At one extreme it has to be recognized that an unbalanced and unilateral disarmament could upset the uneasy equilibrium of military power in a strategically important area such as Europe or the Atlantic in a way which might endanger world peace. On the other hand the other extreme, the accumulation of further weapons of mass destruction, the use of which as a means of settling political disputes is ruled out for the simple reason that they threaten annihilation on both sides if used—obviously threatens peace.

Inherently progress has to derive from a multinational effort with the heaviest responsibility falling on those nations which are most heavily armed, particularly the nuclear powers and also on those who have the greatest potential to develop acceptable solutions to the many complex problems of disarmament, both political and technical.

Although not among the heavily-armed nations, comparatively speaking, Canada stands high on the order of potential for contributing to disarmament for the following reasons. First, Canada's major nuclear potential has existed ever since the last war and it placed Canada on all disarmament negotiating bodies. Second, Canada's geographic location between the two most powerfully-armed nations on earth, including intercontinental missiles and all that goes with them makes disarmament of vital interest to Canada.

Third, Canada's favourable international political position, including its favourable relations with the United States, the United Kingdom, as well as the developing countries. Fourth, Canada's technological experience and know-how gained from Canadian participation in military alliances such as NATO and NORAD. It is the resources of scientific skill in the assessment and analysis of armaments and armed forces contained in several departments in Ottawa. Lastly, easy access to the larger store of technology and technical information in the field of disarmament, especially available through the United States Arms Control Disarmament Agency. In the light of these factors I would like to suggest that it is the Canadian potential that contributed to the progress of disarmament which stands in need of development to be exploited to the full. The opportunity to use this potential will present itself increasingly

if progress is made in the strategic arms limitation talks and in the implementation of the non-proliferation treaty which are the highest two items on the agenda of disarmament today.

Canada already has an important expertise and developed technology in the seismic field and in applying seismology to detection of nuclear explosions, not only detection but identification.

We may have less expertise in relation to anti-ballistic missile defence in which the United States and the Soviet Union have principal responsibility. The disarmament discussions as I have indicated will tend to move from the nuclear field to the comprehensive test ban as well as to the control and reduction of the more conventional forms of armament. In these areas Canada should be able to participate in a more independent role as a leading authority with a capacity for initiative. It will, however, take time and effort to organize and focus the necessary expertise to enable Canada to realize this full potential. For this purpose it may be desirable to consider setting up a special panel or continuing task force composed of representatives of all the departments and interests concerned, including National Defence, External Affairs, Mines Energy & Resources, Defence Research Board, National Research Council. It is essential in order to reconcile competing and conflicting considerations to have a collective continuing inter-departmental effort of this kind so that the decision-making process should take into account the parallel political, defence, legal, scientific, commercial and other economic and political Canadian interests concerned. So it goes without saying the Canadian policies and arms control disarmament should be decided on the basis of a balanced assessment of all Canadian vital interests, and by bringing together the necessary specialists on a continuing basis, political, military, scientific, economic and legal, to develop fully Canada's potential in the disarmament field to help in consultation with other governments, to back-up disarmament negotiations.

I think we should get this kind of balanced contribution at the staff level, to decision making, because it is badly needed. The main objective of this continuing task force should be addressed both to reducing the risks of war as well as to a balanced reduction of the economic burdens of defence. In this context

the task force could for instance turn immediately to a consideration of the problems which arise directly from the non-proliferation treaty. For example, the implementation of the safeguards article will require the negotiation of a network of safeguard systems within the international atomic energy agency. Machinery must be set up to implement the undertaking of the nuclear parties in the field of peaceful nuclear explosions as provided for in article 5. The expansion of nuclear systems has to be studied, and perhaps most importantly of all, how the operation of security assurances to meet the legitimate concerns of non-nuclear nations arising from assurances given by the nuclear powers should be assured. The aim of this panel in short would be to provide the decision making process with a full range of well considered and studied options. The only sure security any nation like Canada can hope to enjoy in the long run has to include negotiation between the principal military powers of the world on agreements for the limitation and control of armaments and armed forces rather than the unlimited pursuit of superiority which is now going on in an unending arms race. The present arms race has led only to a stalemate, does not arrive at a stable balance, as I have indicated in the figures I cited, and a mounting military expenditures. To attain a balanced reduction of armament and armed forces it is necessary and urgent to use the present state of strategic stalemate between the NATO and Warsaw powers to bring about through negotiation the permanent improvement in West-East-West relations as well as global and regional balanced reduction of armaments and armed forces.

Mr. McNamara, who as I say served for nine years as Secretary of Defense, and who should know what he says and whereof he speaks, says in his *Essence of Security*: "In the end the root of man's security does not lie in weaponry, it lies in his mind, and what the world requires in its third decade of the atomic age is not further arms but a race towards reasonableness." I would be happy to try to answer your questions.

The Chairman: Thank you very much, your Excellency. Mr. Ignatieff has indicated that he will be prepared to answer questions, if necessary continue until about six. That might be a little bit of an imposition, but we should plan on perhaps finishing by 5.30 or 5.45. May I remind members that when they wish to ask a question to raise their hand so

that the sound technician behind them can see them, if they press the black button, wait for the light to come on and would they also please announce their name when they start to speak because even though I call their name the sound technician may not hear me. Mr. Prud'homme, did you have a point of order?

[Translation]

Mr. Prud'homme: I would like to know—Your Excellency, would it be possible for you to give us copies of the report you have just made? I will not ask for them today, but at some future date. Would it be technically possible for us to have such copies, or is it confidential material? I think it would be very useful to us if we could have copies.

Mr. Ignatieff: I have no copies, but I can give the original to Mr. Dobell. He could have copies made. I can give the gentleman all the notes, including a few replies, I hope.

[English]

The Chairman: Mr. Marceau, the first question.

[Translation]

Mr. Marceau: Mr. Ignatieff, I believe that Canada is playing a role not only within NATO, but also by having a peacekeeping force that is playing a particularly vital role in Cyprus. If you had to choose between a position favouring participation in NATO, and one favouring the establishment of a mobile force like the one we have in Cyprus, which position would you choose, always assuming that both are useful?

Mr. Ignatieff: If you will allow me to reply in English—Yes?

[English]

This is a reply which I would ask be off the record because I am giving a personal opinion in response to a request by a Member of Parliament using my experience in NATO and in UN peacekeeping.

[Translation]

Mr. Marceau: Mr. Chairman, could I have a ruling from the Chair as to whether we are entitled to several questions or to one?

[English]

Are we allowed to question only one time, or...

The Chairman: We have quite a number of questions, Mr. Marceau. Could I put your name down at the bottom of the list and we will come back to you? Mr. Allmand?

Mr. Allmand: Mr. Ignatieff, how can we expect any real progress towards general

disarmament between the two great powers vis-a-vis each other when both of them might have some fear of a growing powerful China which is not participating in the disarmament discussions? In other words, although they may not fear each other or they may agree to disarm themselves, it would appear to me that they would not do it because there are others who are not disarming who are really a greater threat in the future.

Mr. Ignatieff: The participation of both China and France is essential to any global disarmament scheme, and we would hope to see that and work towards that end. I think that the point at the present moment is that in a way the move towards disarmament on the part of the two super powers may indirectly be encouraged rather than discouraged by the state of relations with China. The situation which is getting some grounds for hope in the immediate future, in nuclear disarmament, is the fact that, which is very fully revealed by Mr. McNamara in his treatment, that you have a situation where the nuclear powers of the Soviet Union and the United States have reached a sufficiency to ensure the destruction one of the other through retaliation. Now sufficiency is always questioned and I do not mean that I am the authority on sufficiency because there has just been a decision for instance to increase certain protective qualities of the second strike capability by going into this sentinel armament scheme. But by and large the situation is that you have both countries which can do each other vital damage in retaliation. You have a very important economic consideration vis-a-vis the two because the Soviet Union rightly have half the gross national product of the United States, but is spending—and it is difficult of course to run down the exact nature of the expenditures under various categories but is spending roughly the same order of magnitude as the United States minus the expenditure of the United States on Vietnam. And this is putting a very great strain on the Soviet Union. It is notable that with more strain between the Soviet Union and China, it is the Soviet Union which has asked for, and is pressing for strategic arms limitation talks. *Isvestia* published I think it was three days ago a public request that these talks take place soon. We know that the nature of the approach to the United States and the United States has not turned these down. They have said that they are on the agenda. To what I said about the Soviet Union I would only add that as far as China is

concerned, its prospective power to do disastrous damage to the United States, according to the kind of authority which a qualified speaker such as Mr. McNamara has said are things for five or ten years hence. In other words, it is important of course to bring China in. It is even more important that the two super powers, the United States and the Soviet Union, should start ending the arms race now. China and France have taken rather similar positions in regard to taking part in such talks. China has never totally refused to take part. What they say is that they are not going to take part in what seems to be philosophical exercises if the nuclear powers decide to reduce. If they stop the arms race and decide to reduce they are there to take part. And so far from the figures I have cited the United States and the Soviet Union have not agreed to reduce, they are still continuing the arms race. So in answer to your question I would say that the first priority is that the United States and the Soviet Union taking into account the factor of the danger that you mention from China in the future, if they do not do this, also the economic consideration, the political one of the desirability of trying for a détente in Europe if the United States and the Soviet Union set the example to start strategic arms limitation talks to end the arms race, then there is a perfectly reasonable chance to associate in the end with both China and France, once they stop the arms race, to move into the field of mutual reduction.

The Chairman: Mr. Thompson?

Mr. Thompson (Red Deer): Mr. Chairman, Mr. Ignatieff if I might be permitted to make a non-related remark. May I just say it is of great significance to me personally to be here. For 15 years I served directly under the little man who sat in your place and made that historic statement, in 1936 that God and history would not forget, that I think has so much relationship to us today even though it came from the Emperor of Ethiopia at a time when disarmament and all that we are concerned with in our Committee did not mean quite so much to us. I would also say, Mr. Chairman, I think it is a great honour for us, at least I speak for myself, to have with us today the statesman that, Ambassador Ignatieff is—his great experience in NATO in disarmament and in the UN peacekeeping gives us a great privilege.

I was impressed by the statement you made, Mr. Ignatieff that defence and disarma-

ment policies are one and the same, that defence and foreign policies are inseparable, that disarmament is part of both. And I think this is a very important statement to us as we are considering Canadian policy. But as you have said as well that Canada has an important part to play in any disarmament arrangement because of her great nuclear potential, do you think that as long as we are directly participating in NATO equipped with tactical nuclear weapons, as we are, that that role in disarmament is seriously effected by this fact and is there any other position which you could see us in NATO where we might enhance or strengthen that role which you referred to so effectively?

Ambassador Ignatieff: Thank you Mr. Thompson for those kind remarks. I am particularly happy you mentioned the fact that the Chambres included history, the Emperor of Ethiopia making this plea for collective security just at the time when that country was invaded. This also is the hall where Mr. Riddell of Canadian fame came. I would say in reply, or trying to reply to Mr. Thompson's very pertinent question, I would say there would be no contradiction between Canadian membership in NATO and our participation in ENDC so long as NATO is committed as I understand it to be and pursues the policy of negotiation with the Soviet Union and the Warsaw Pact for a détente, for regional disarmament, arms control policies. It is important to bear in mind that if Canada was not in NATO, Canada would have no other international body through which Canadians could project their views, and influence in a region whose security has proved vital to Canada in two world wars.

It was Canada's original policy in NATO when we joined in 1949, that its members should under Article II seek to harmonize their political and economic aims as well as to provide for their collective defence. Now the aim of harmonizing the policies of the alliance and seeking a peaceful settlement in Europe, I believe is more important today than ever before. Because military confrontation has shown through a series of crises which I lived through in NATO Berlin and Cuba, how risky and futile such crises are. In the end the principal confronters had to back down. The objective therefore of seeking the détente through negotiation rather than through confrontation is I believe, fully compatible with seeking global agreements on the reduction—balanced reduction limitations on

armed forces through the 18 Nation Disarmament Committee, and indeed an essential concomitant of it.

The Chairman: Mr. Laniel then Mr. Nesbitt. Mr. Laniel?

[Translation]

Mr. Laniel: Mr. Ambassador, you mention non-proliferation and disarmament, and I am wondering whether, in speaking of non-proliferation, we are really getting to the heart of the problem, in view of the fact that the great powers are retaining their arsenals and their capacity to destroy the world? Unless they agree to sign some kind of disarmament treaty, I do not think very much progress will be made, especially in view of the philosophy currently existing between NATO and the Bloc, mainly on the NATO side, concerning the use of nuclear weapons; you were telling us just now that the Disarmament Commission is presently leaning towards the reduction of conventional weapons—well, the feeling in NATO seems to be that non-conventional weapons do, after all, provide protection against world destruction. I should like to have your comments on that?

To sum up, must we really think, first and foremost, of preventing the spread of nuclear weapons? Or again, must we try to achieve the elimination of nuclear weapons? In speaking of wishing to do it first of all in the field of conventional weapons, are we not running a risk, the risk of losing the buffer that would make negotiation possible, should a conflict ever develop in Europe?

The Ambassador: Mr. Laniel, I believe I share your point of view entirely; that is, the non-proliferation treaty is meaningless if it does not involve obligations under article 6, and if the major nuclear powers, meaning the Soviet Union and America, do not take their obligations seriously and make a start, this summer, on the planned negotiations on strategic arms limitation.

Having said that, I fully agree that progress towards disarmament is an absolute priority. As I have said, however, the disarmament must be balanced; in other words, no action must be taken that would seriously threaten the balance. In Europe, there is one great military power. There are a few secondary powers from a military point of view. The Soviet Union, which was attacked by Germany during the second world war, was not interested in being a great military power in Europe, but once attacked, she ended the war as a victor in Europe. She stood at the centre

of Europe, with completely overwhelming power. The essential point about NATO is that the Europeans, finding themselves confronted by a conquering power, of a size they had not seen since the time of Napoleon, asked America to restore the balance. A strategic balance of a kind was arrived at, with America on one side and the Soviet Union on the other, and both sides supported by a few other participating countries with conventional and tactical nuclear weapons.

But the balance involves strategic weapons, together with what is included in the term "second strike capability", and it is these that form the subject of the major discussions between Washington and Moscow. If there is an agreement—and as I have said, there is, for the first time, a willingness to achieve some practical results in the reduction of tension—if not, I agree that there is no point in disarmament in the field of conventional weapons. Here, we come up against a big question mark. As a result of circumstances, and economic pressures in Russia, there is a desire for an opportunity to secure a relaxation of tension in Europe based on the status quo. The danger of a confrontation between Russia and China means that there is now a possibility of significant talks between Moscow and Washington. But those are the priorities.

[English]

Mr. Nesbitt: First, I have one question Mr. Ignatieff. It is in two parts. But the first part I think you have answered already to Mr. Thompson, but I would perhaps pose it again just to be sure. If Canada were to withdraw from NATO

(a) Would she likely be able to remain on the United Nations Disarmament Commission, and if I am not mistaken you have already indicated in the negative. And

(b) Assuming that Canada were to withdraw from NATO, and were to rely on the United States of America for our protection as some suggest, so that we could divert our energies to United Nations peacekeeping and foreign aid, do you think our forces would then be acceptable by the United Nations, since we might well be regarded by others in the U.N. as a quasi province of the United States?

Mr. Ignatieff: If I may reply, my reply to this question would be off the record, if I may ask that it should be so.

Mr. Nesbitt: If Canada were to withdraw from NATO and were to rely on the armed forces of the United States of America for her protection as some have suggested, so that we could direct our energies to peacekeeping operations for the U.N. and increases in foreign aid, I said, "Do you think our forces then, our peacekeeping forces, would be acceptable to the United Nations, since we might well be regarded by many U.N. members as a quasi province of the United States?"

Mr. Ignatieff: Well that is a rather loaded question. But I would say this, sir, that, trying to answer it, is that the acceptability or otherwise of participants in the U.N. peacekeeping field is becoming increasingly tied to the view which members of the United Nations, particularly those who may be involved in the area where there is an international dispute, the extent to which that country is regarded is more or less independent. That is that if it was thought under the kind of circumstances that you had hypothesized Canada was in any way acting as a stooge or representative of the United States then we would be regarded as such and would not be accepted. There is, as I said, in my previous remarks, a question, yes it would be a question that...there has been some discussion as to what countries are or not acceptable and what countries, whether in a region for instance, the regional members are likely to exclude Canada or not. I think that in any given region there is a tendency not to include people from the region because they are too interested. That is one point. This turns up in the Middle East, not only in the political but in the economic. I was once asked to take part in a meeting for Middle East assistance and I said "Well, Canada is not directly in the Middle East." They said, "Well, it is no use having a dairy without a cow." But they want disinterestedness. They do not want people from the region who might sharpen their knives on the situation and exploit it that way. They do not want the Great Powers, because when they go in there they might exploit the situation and intervene. And so this is a very important consideration in our likelihood of being asked to take part in peacekeeping operations, that we are at the present moment regarded as relatively able to stand on our feet even though we may lean one way or another like that tower up there.

The Chairman: Mr. Groos and then Mr. Forest. Mr. Groos.

Mr. Groos: Mr. Chairman, I wonder if you would permit me also to say how fortunate I think we are in having Mr. Ignatieff today. A very happy combination of diplomatic and military experience. Diplomacy I take it is inherently a cautious art and in this exercise that we have been conducting we politicians are finding that we are entering into the political-diplomatic field. You gave us the examples of a quotation from Samuel Johnson, Mr. Ignatieff, and you spoke also about the whale, so perhaps I will be permitted by the Chairman to say that in my day I used to read some Damon Runyan and he had I think an example of extreme caution which he used and if I recall it it went roughly like this:

Son, there is no such animal as the sure thing. Some day, somewhere a guy comes up to you and shows you a brand new deck of cards on which the seal ain't never been broken, and he is willing to bet you then and there that the Jack of Spades will jump right out of that pack and squirt cider in your ear, and he is willing to bet you a thousand clams. Do not bet him, because as sure as you do you will get an earful of cider.

Now that is an example I think of extreme caution which perhaps as diplomatists we should not follow. We also have the example of the other extreme of the turtle who never gets anywhere without sticking his neck out. I think that as Canadians we have succeeded, have been successful over the past twenty years in producing safety in our alliances and our dilemma as I see it today is that our contribution is for us a major one when weighed in the balance of the total requirements of a still developing country with the added complications of our geographic position next to the United States, the most wealthy and the strongest military nation on earth, who is also the keystone of western security. On the other hand our present contribution is not however vital to our allies, if I can use that word "vital" in its ultimate sense. What we see here, I think, is not necessarily a unilateral sweeping change of policy which would alienate us from our friends and our allies, but perhaps a single initiative—a single step perhaps—in a new direction; a new direction which, hopefully, might be the beginning, or just the beginning, of a long journey towards the goal of universal security. During that journey we might possibly be joined by other like-minded nations if the journey continues to show promise. We all

agree, I think, on the need for new steps but we seem to suffer from a combination of both paucity of initiatives and of the almost overwhelming pressures of the status quo. Now, Mr. Ambassador, you have been briefed far better than we could ever be for your present job and your experiences are lengthy and varied, perhaps you could tell us what ideas have echoed around these halls in the last 40 years? Surely there are some that we should be able to consider sticking our necks out over. Would you care to give us some of these ideas either on or off the record?

Ambassador George Ignatieff: Mr. Chairman, I am very flattered by the invitation. I agree with Mr. Groos that he has stated the state of our frustration as well as I have heard it stated: that here is Canada, in my view, in one way in the most tangible position namely that we live in the fork or on the fringe of the most powerful nation on earth from which we derive certain fringe benefits of assured defence, security, which has been so since the United States began to abandon isolation under Franklin Roosevelt; the first important step being the Ogdensburg statement and the agreement which assured Canada that the United States would not stand idly by and so on. This has been built on. The Hyde Park agreement, our Secretary of the Post Hostilities Planning Committee—if it is of any interest to anybody—in 1944-45 had to work on the various post war plans including the one of continued co-operation, building on the Ogdensburg agreement. The question of what regional alliances, what dependence on universal global system security should be, were all examined. We opted, as you know, for a universal system only to have it dashed by the confrontation between the United States and the Soviet Union primarily and East and West, and the Security Council failed to provide that security; we had out of necessity to turn to this alliance.

Now, you mention the question of paucity of initiative and what do we do from here. I have, over a period of some years, found attempts at initiatives not lacking. I can assure you, some have been tried in this chamber. I have been present when they have been tried. I would like to tell about it someday. But I suggest the following factors: first, that Canada is in the most dangerous position in respect of the arms race of any country in the world as to its consequences. This is my considered view. That is, that if the arms race were to get out of hand by a miscalculation

the consequences to Canada would be catastrophic. The pressures of the arms race in terms of its economic consequences are very far reaching on our economy as it is on the American economy. The dangers of failing to alleviate minor conflicts which arise, which has been my responsibility at the United Nations is likewise extremely serious. I am aware of the fact that in the Middle East there is potential confrontation between nuclear powers involved in the continuing hostilities. I also am aware of the fact that the geographic situation that we are in makes it inevitable that if there are such confrontations, that Canada in some way or another will be involved. Therefore, I say as regards the overwhelming pressure of the status quo, and I very much liked the way Mr. Groos pointed this thing straight at me so I could not avoid it, there is an overwhelming pressure of the status quo in every thought, in every department, as there is in every establishment. My suggestion, and it is one which I have thought over considerably, is that I think we must—I quite agree with you—get the best brains that Canada has, addressing itself to two main problems: how to reduce the risks of the nuclear arms race which is going on right over our heads. I advise those of you who have not studied the current issue of *Time* magazine, which has just come out which examines the current phenomenon which the President of the United States announced, those who see it will see that to deal with a Sentinel system requires antiballistic missiles, to deal with intercontinental missiles coming in over the shortest route and this shortest route according to *Time* magazine has a nice circle starting from the left to the right: the U.S.S.R., Alaska, Canada and then it reaches something called PAR and then the ABM site SPARTAN, missile site radar SPRINT. This is something which needs studying; the implications of this needs extremely the best brains which can be brought to bear on this. It cannot be done by unilateral disarmament, I have had some experience on this, that you cannot get powers who fear the consequences of being less than the super power to release or reduce their power except under the terms that Mr. MacNamara suggested, that is called riskless verification or assurance. Whether we can ever get riskless is something, but I would suggest that arms control studies could help in depth producing studies on detectability on verification procedures and also know more about what the implications are of the arms

race which is going on. You can read a great deal about what the sentinel system is in Mr. MacNamara's reading in the congressional report in *Time* magazine, but the implications for Canada are very considerable. Therefore, I would say that as far as overcoming the overwhelming pressure of the status quo and moving in the direction of initiatives and overcoming the positive initiatives, I believe that there should be an interdepartmental continuing task force to study the reduction risks of the nuclear arms race and of also considering the whole economic implications which are very considerable. That is the only way I can see it; I see no short cut to this.

The Chairman: Mr. Forrestall?

Mr. Forrestall: Mr. Ambassador, my question is relatively brief in content because it is a secondary question; others that I have had in the back of my mind as you have gone on have all been answered. I must say you have done extremely well in cutting down our side of the job. Could I ask you, Mr. Ambassador, if you could briefly describe for us what the repercussions would be, if indeed any, of serious consequence, if Canada in acting unilaterally did withdraw from NATO physically its presence in Europe for example?

Ambassador Ignatieff: I think that I would ask to go off the record on this, because if I am to answer that honestly I have to.

The Chairman: It is now 6 o'clock, we still have four questioners, can we go on for a few minutes Mr. Ambassador? Whose names can come off, Mr. Asselin, Mr. Prud'homme and the last questioner is,—what about your question Mr. Lewis, do you want—Mr. Ryan has the final question then.

Mr. Ryan: The vice-chairman cannot go on in the face of those remarks.

The Chairman: Gentlemen, just before thanking Mr. Ignatieff, just a brief announcement. A number of members have suggested that possibly it would be desirable to have a general Committee meeting tomorrow at 11 a.m. We have certain points to discuss, and also, perhaps to discuss the form of our proposed report, this would be for those who are interested I think, and many of you would be interested from what I have heard. If that is satisfactory, we will make arrangements to get a small sitting room at the hotel, and if you inquire at the desk, you could perhaps be informed as to what that room is at 11 a.m....

Mr. Lewis: I will not attend the meeting, personally, I just intend to walk around and get some air,

The Chairman: I beg your pardon, Mr. Lewis?

Mr. Lewis: The hour you suggested does not affect me, because my personal plans are merely to walk around and get some air. But why—some people will be going to church, why do you come into the middle of the morning like that. If we have to leave at 3 o'clock, whatever the hour is, why do you not make it half an hour or an hour...

The Chairman: Gentlemen, let me know what is the convenient time, and we will arrange it at that time?

Mr. Lewis: I do not mind myself...

The Chairman: Shall we make it 1 o'clock then?

Gentlemen, I am advised that we have to leave for the airport. We have to leave the hotel for the airport at 1.50 p.m., which is one of the reasons why I suggested that we do it before lunch, to give us more time, but if you want to make it say, at 12.30, this will be satisfactory.

Mr. Allmand: Have you planned any meeting of the steering or drafting committee before that?

The Chairman: Yes, I was going to fix the time of this meeting of the Committee and then work back from that to a meeting of the steering committee—Can we settle now a time which will be reasonably convenient to—

Well it is 1 o'clock then, that will give us time. Gentlemen, I am advised that will be satisfactory as long as you check out before we start our meeting. You must be checked out of your rooms before 1 o'clock.

Mr. Allmand: If we have the sub-committee meeting at 12, would an hour not give us sufficient time to get something done?

The Chairman: Well, I was going to suggest that the—I think the sub-committee meeting I hoped, would be very short—could be reasonably brief and I was wondering whether we could have a sub-committee meeting say between 8.30 and 9.00 tonight, so as to give us time to make arrangements for the main Committee meeting tomorrow morning.

It would be—I hoped it would be a brief meeting, is that reasonably satisfactory, at 8.30 tonight? And, perhaps that meeting could be held in my room at the hotel, the steering sub-committee meeting. Let us say 8.30 tonight and we will keep it brief, I hope, and the general Committee meeting then 1 p.m. tomorrow and if you will inquire at the desk, you will obtain information as to the room.

I would like to thank, on your behalf Mr. Ignatieff for his information and his assistance and also, of course, for his hospitality. He went to a lot of trouble, I know, in obtaining guests for the luncheon today, and conversations with those guests, I know they were most helpful. I would also like to thank an old friend, His Excellency John Louis Delisle, whom I have known for many years, for being there at the airport to meet us. Thank you very much Mr. Ignatieff.

The meeting adjourned.

**Stockholm, Sweden,
Monday, March 17, 1969.**

The Chairman: The purpose now is to receive some instruction from our local representatives, headed by our ambassador, His Excellency Arthur Andrew and assisted by Counsellor, Robert Edmonds and Canadian Forces Attaché James Arnott.

His Excellency has been in our External Affairs Department since 1947. He was a First Secretary in Bonn, Chargé d'Affaires at Prague and Vienna, Ambassador, or maybe High Commissioner at Cyprus and Ambassador at Israel, and for three and one half years Ambassador at Stockholm.

We are interested particularly this morning, your Excellency, in your experiences in Sweden with particular reference to the neutrality of Sweden. And I would ask you therefore to let us have your presentation, if you would, at this time.

His Excellency Arthur Andrew (Canadian Ambassador to Stockholm, Sweden): Thank you very much, gentlemen. First, I should like to welcome you to Sweden and to say that your Embassy is entirely at your disposal. We hope that the people you will meet here will be able to provide you with the information you require and in addition to those that will come to speak to you here and the Parliamentary Committee which you will have lunch with. We are having a dinner this evening, a

selection of people, some of whom you will have met, either here or at the Riksdag, and you will have a chance to speak to them more intimately and talk to them at greater leisure. Of particular interest this evening we will have Madame Myrdal who is the Minister without Portfolio, responsible for disarmament questions. Also will be present a Mr. Petrie who has just returned from China, Peking, where he was the Swedish Ambassador and he has also been quite closely involved in the process of Sweden's recognition of North Vietnam. Those of you who meet him this evening, I think will find him to be a very interesting person.

We have prepared some documents. I hope they give a little bit of the background of the sort of vital statistics in the areas in which you are interested. I hope they will be of some use to you.

[Translation]

On behalf of your Embassy in Stockholm, allow me to welcome you to Sweden. You will find that almost all your contacts speak English and, less often, French. If you experience any great difficulty, please let me know, and we shall give you all possible assistance. I hope the documentation that has been prepared will be useful.

[English]

In accordance with what I understand to be your wishes, I will confine myself to suggesting some areas in which you might find it useful to probe and to indicate some points of similarity and difference between the two countries, Canada and Sweden, which you might think worth exploring. I will then shut up and my colleagues Colonel Arnott and Mr. Edmonds and I will constitute ourselves a panel for the purpose of answering your questions.

The following are the topics on which the Committee have expressed an interest and in which Sweden might have something of interest to offer. The first is United Nations peacekeeping and collective security arrangements. The second is the possibilities in the field of civil defence. The third is neutrality and the non-alignment option. And the fourth is the prospects for disarmament.

On U.N. peacekeeping operations Swedish experience has been virtually identical to our own and your questions in this area will be readily understood as will their responses.

On civil defence you will find that the Swedes have developed their thinking and their preparations well beyond what applies

at present in Canada. I should like only to enter one word of caution. Swedish civil defence should be looked at in its context. That is as a part of the concept of total defence. It is not intended to be a passive thing, but an active contribution to their total defence effort. I think the people that you will be meeting will always be careful to put it in this context, and I think it would be a mistake to try to remove it from this fact which implies that it is not merely a question of survival but of preservation of the ability and the will to resist and fight back.

On neutrality and non-alignment, I shall try to be careful not to try and promote my own views, if any. At the same time I think I would be failing in my duty as your friend at court here if I did not bring to your attention a few of the points which you might like to bear in mind and on which you might like to obtain the views of the Swedish experts who will be coming before you.

The first point relates to the underlying assumption of Swedish neutrality. How do the Swedes see the world around them? How do they imagine that their neighbors see them? Is Sweden a threat to anyone in any respect? Are any neighbors a threat to Sweden? Above all, is Swedish territory, or any part of it, of significant importance to any world power, as a strategic area?

When you have had these questions answered and have compared the answers to those that you would get if you put the same questions to yourself in respect to Canada, I think you would be in a fair position to judge the relevance of the Swedish example to the Canadian situation.

The next question that I would advise asking relates to Sweden's defence strategy. Is declared neutrality by itself a sufficient guarantee against aggression? Or even more likely, is it a guarantee against bullying or blackmail? If not, what additional means, presumably military, are needed to support a neutrality in war policy. And that is what the Swedish policy is. It is not an abstract neutrality. I do not think they even particularly like to be regarded as non-aligned. Their policy is a pragmatic one that they will be neutral in any war, and they declare it in advance.

You will of course wish to apply these answers as well to the Canadian situation to determine to what extent they may be appli-

cable. There is another aspect of interest, but one in which it would be difficult to obtain a Swedish opinion. And that relates to the psychological requirement and the psychological effects of being neutral. Swedes are different. Not only from Canadians but also from their own neighbors. Their genius is a special, a very special one, and it is widely and justly admired. They have by their intelligence and diligence created a very clear conception of themselves, particularly abroad. And undoubtedly they have been themselves affected by this conception. There has been feedback. And there is a relationship, an interlocking relationship between the external Swede and the internal, the psychological, Swede. Above all, Sweden is a homogeneous country. More than any other country I can think of it is homogeneous. The policy of neutrality is not debated seriously by any intelligent Swede, although not all are equally certain of its ultimate wisdom.

The last question, but one we can only ask ourselves is whether Canadians are prepared psychologically for the Swedish model.

If it is the Swedish model we are thinking of we will find that it is more than a policy or a strategy. It both demands and reflects a certain state of mind. On the matter of disarmament, the last item that you mentioned as being of interest, well we come very close to the Swedish position. We co-operate with them almost daily, certainly weekly, on this question. We are members with them of the 18 nations disarmament committee in Geneva. And there are surprisingly few differences in our points of view considering that we are NATO members and they are neutral. The differences that do exist are more of emphasis and style than of substance.

That is all that I had in mind to say at this moment. And I should be glad with my colleagues to attempt to answer questions that may be put by the Committee. Thank you.

The Vice-Chairman (Mr. Perry Ryan): Thank you, sir. I have four, now five questioners. Messrs. Wahn, Howard, Laniel, Groos, and Allmand in that order. Mr. Wahn.

Mr. Wahn: Thank you, Mr. Chairman. Your Excellency, you have indicated the similarities in some respects between Canadian and Swedes, they are peaceful people interested in peacekeeping and activities of the U.N., with an interest in disarmament and so on. The Swedes as I understand it believe they are

performing a very useful, making a very useful contribution to peace by acting as a buffer between Russia and other countries in western Europe. In view of Canada's geographical location between the United States and Russia, is it not possible that Canada could perform a rather similar function as a buffer between the two armed super powers?

His Excellency Arthur Andrew: You tempt me greatly, sir, but I would like to try to confine myself to the Swedish situation and let you draw the conclusions from it. I do not think... I think the Swedes do not see themselves as a buffer. I think we see them as a buffer. I think the Russians may or may not see them as a buffer and this is a good thing to know. But the Swede would say that his function is simply to preserve Sweden from the evils of war. The best way of doing this is I think to declare that they will not fight in a war in advance and hope that their country is not sufficiently important to anybody else for them to come in on it. Whether this analogy can be applied to Canada I do not know. Whether Canada is sufficiently unimportant strategically I think is out of my area of expertise, but I think the Swedish analogy—to apply the Swedish analogy to Canada you have to know that Sweden bases its position on two things.

The first is that their territory is not strategically important and the second that to the extent that it may be important they will defend it and they are able to defend it. In other words, they augment their natural unimportance by being an extremely prickly object to try to handle. The extent to which this works, the ultimate answer can only probably be found in the Kremlin on the assumption that NATO does not intend to invade, but they have to be credible. The important thing to Swedish neutrality is that it must be believed in by both parties, by both the power blocs. The Swedes have to be able to tell the Russians: if you try to invade us you will be in an extremely undigestible piece of territory.

At the same time they also have to tell the Russians: we will not allow our territory to be used by NATO against you, and that has to be credible too, but whether it is credible, whether this in fact is believed and does work nobody, I do not think anyone, can give you a positive answer or positive assurance. The answer will depend on circumstances

that may not be possible to envisage and it is locked in the bosom of the Kremlin.

I have not answered your question, sir, I realize that.

Mr. Wahn: That is very helpful, thank you very much.

The Vice-Chairman: Is that all, Mr. Wahn? I have six more questioners and we have 25 minutes, so it may be advisable to limit each questioner to one good question and I may take one or two more. I have not any members of the Conservative Party who have indicated—I have one now. Thank you, Mr. Forrestall. The next questioner, Mr. Howard.

Mr. Howard (Okanagan-Boundary): How can you anticipate that any nation would come to its assistance if it were attacked by any other nation or group of nations?

Mr. Andrew: It would be no, in practice I think. If you put this question you may get a little nuance in your answer that will suggest that they do regard themselves as being under the NATO umbrella. I speak quite freely out of ignorance, but I would think that the NATO strategists in Brussels would consider that Sweden was a part of their trip-wire area and that a Soviet invasion of Sweden would be taken as tantamount to an invasion of any NATO territory, but obviously the only reason they are coming, that they would invade Sweden would be because they were on their way to Norway. It would put the whole NATO apparatus into gear and to this extent I think the Swedes—of course they would yell for help and you would then get a NATO reaction. To this extent I think the Swedes do feel they are under the edge of the NATO umbrella.

Mr. Howard (Okanagan-Boundary): Are they paying their price for being in the club when they do not belong to NATO.

Mr. Andrew: They are not paying the political price, but they are paying more of a—paying a higher military bill than they probably would have if they were in NATO. I think the per capita on defence in Sweden as compared to Norway is much greater. This is so I am told.

The Chairman: Mr. Laniel.

[Translation]

Mr. Laniel: Your Excellency, may I ask some questions in French?

Mr. Andrew: A little, yes.

Mr. Laniel: Just now, in your presentation on neutrality and non-alignment, you asked the question: how does Sweden regard the world, and how does the world regard Sweden? I am wondering, myself, how Sweden regards Canada, particularly in the light of her geographical position and of the fact that she is, after all, a minor power belonging to an alliance like NATO in which her participation is, perhaps, more or less symbolic.

Yesterday evening, I was chatting with a young political science student in a discothèque; it was not the most suitable place, perhaps, but anyway the young man was saying that he was a conservative while engaged in his studies, but what with the Vietnam question and other world problems, and the attitude of the United States, he had become a socialist; finally, he ended up by saying that he identified Canada with the United States, seeing Canada as an American satellite that was subject to outside influence in all its policies. But since we have worked with Sweden to preserve peace and are a member of NATO, but have nevertheless tried to retain the image of a peaceful country all along, how does Sweden stand—what is Sweden's opinion of Canada's position in the world?

[English]

Mr. Andrew: This is a very large question and a very interesting one. We are not identified with the United States. In the foreign ministry when they are kidding me and they do sometimes, they refer to us as the extra neutral. The Swedes officially at least do intend to give us the benefit of the best of both worlds, of being within NATO when it is convenient and not in NATO when it is inconvenient.

The Swedish attitude towards us in general?—politically I think we have no problems—but hockey? Psychologically there is a certain envy. This is highly subjective, but from an impression I have that the Swedes do not generally envy anyone, but to the extent that they do envy anyone they envy us. We sell shrimps cheaper than they can produce their own. We could if we wanted to, drive them out of the forest products field, practically. We can undersell them in most work markets on pulp and paper products. They do not like this naturally, but they are interested and intrigued by it and sometimes the criticism that we get I feel is in a way back-handed flattery. In the international field our co-operation could not be any more complete. I

will do a little special pleading while I have you here.

Our small embassy cannot deal with the number of requests for help that we get from every department of government in Canada and it works both ways. The Swedes are asking us too—we have regular flows and it is more than we can deal with.

I do not know if I have dealt with the question, but it is a very large one.

Mr. Laniel: On the military side of it, are they concerned about our attitude, our evolution, such as our present study. Does that concern them?

Mr. Andrew: No, I do not think so, but I would be interested if you would ask them. I think—I would like to hear what they would say on this, but my feeling is I do not think they are concerned, but they are very concerned about NATO. They would be extremely unhappy if anything happened to NATO. Whether we were in or out they would undoubtedly say politely that it is our business and they have no opinion, but I think if you pressed them a little beyond that it would be interesting.

The Chairman: Mr. Groos.

Mr. Groos: Mr. Chairman, my first question is really to you. I wonder if it would be possible for us to have a map of Canada with an overlay somewhere on it of Sweden to give us some idea of the disparity in size between the two countries.

Mr. Andrew: I will try to arrange this. You are now at the same latitude as Port Churchill.

Mr. Groos: It felt like it this morning.

Mr. Andrew: Half way up the coast if you will look at the map, a place called Omioz, there is a bulge in Sweden and that is Frobisher Bay. Then when you get up to the extreme north at the largest centre you are beyond Aklavik. You are well up into the high Arctic, but they have the Gulf Stream so the climate is not comparable in any way, although we tend to think it is. We send experts here to study their Arctic conditions, but I do not think they have any permafrost in Sweden.

Mr. Groos: Another question to the Vice-Chairman. I wanted to ask if the military attaché could give us a very brief run down

on the Swedish armament industry which I understand is self-contained and if he would specifically answer the question of an estimate of the cost of the country and the comparison between the armament industry of Sweden and the armament industry in Canada.

Colonel Arnott: They do have a self-contained armament industry to the extent that 85 to 90 per cent of the Swedish military purchases are made here in Sweden and perhaps 15 per cent is an off the shelf purchase from outside. I am sorry I cannot say how this actually compares to the Canadian industry. I know we are more specialist in Canada and sell or build the various parts in bits and pieces of the military industry. For example parts of aircraft and so forth.

Mr. Groos: Could you give me some estimate of the cost to the country.

Colonel Arnott: The military—the cost per year to the military for their purchases here in Sweden?

Mr. Gross: What are the costs keep the armament industry going?

Colonel Arnott: I would say...

Mr. Andrew: I think this is a very difficult question for anyone to answer because there is a lot of feed back on it. You might try that with someone from the Ministry of Defence this afternoon, but I doubt if you would get a really precise answer because a lot of it is really not a direct and complete outlay. They get it back in other forms. From sales abroad and so on.

The Vice-Chairman: Gentlemen, we will have to speed up a little bit. I now have a total of 11 questioners all together. Mr. Allmand.

Mr. Allmand: Mr. Andrews, you said that the policy of neutrality was seriously followed here now, but if I remember after the last war there was quite a bit of criticism against Sweden because it was felt they did not come to the assistance of the democratic countries when they were threatened by Nazism. How do the Swedes feel when they see the possibility of their kin in Denmark and Norway being overrun as they were in the last war by an invader. These people are very closely related to them. Do they not feel that they have a sort of moral duty to protect and help people that are very close to them culturally and historically.

Mr. Andrew: The answer is no. They do not feel in any way obliged and in the last war they allowed the Germans to transport reinforcements across the east territory to help them out with their job in Norway. Norwegians have not forgotten it. The Swedes are quite regretful but nothing interferes with their policy of neutrality, that is firm and they have served notice on everybody look after yourself, we will look after us.

Mr. Allmand: Was it not after the last war because of some of the criticism from Norway and so forth, the question was raised again in Sweden as to whether it was a good policy?

Ambassador Andrew: Yes, but it worked, they profited by it and it never really—I will let Robert speak on the subject. I do not think we have ever—it was ever seriously a question, it was debated but I do not think it has been seriously debated.

Mr. R. B. Edmonds (Counsellor): I think the answer there is that Scandinavia has traditionally been a neutral area. Norway and Denmark were neutral during the first world war; they were obliged by circumstances to get involved in the second world war, and there was a feeling in all the free countries that they should get back to the tradition of a specific northern area, and there was a very serious thinking triggered largely by Mr. Lange, the foreign minister of Norway, about the possibility of a Scandinavian defence pact. This led to some very serious negotiations in 1948 prior to NATO. Sweden was interested, but only on the condition that it was an alliance free pact. That is to say it would be a Scandinavian alliance not linked with NATO. Scandinavia would be an area of neutrality bound by common ties. But the idea was eventually overruled in Norway and Denmark when they joined NATO. But as you say there was a very serious consideration given in the two or three years after the war to restoring a Scandinavian neutral area, armed and ready to defend itself.

Mr. Lewis: The question I intended to ask follows naturally from what Mr. Andrew has said. I have been unable—Mr. Edmonds I am sorry—to understand efficiently why the difference between Norway and Sweden. And Denmark as well. But Norway in particular, what is there, either historically or in the national character, if there is such a thing, that makes that difference?

Ambassador Andrew: I can only tell you that they are different and they both agree. The story goes of a Norwegian—someone spoke to him, an American asked him if he was Swedish, he said, no I am Norwegian but I have been sick. This is the sort of relationship here.

Mr. Lewis: There must surely be something in the historical development producing this reaction.

Ambassador Andrew: This is history, they are totally independent of each other. They had a union pressed on them by paradox at the beginning of the last century, and they dissolved it at the beginning of this century. And their language is very similar but they have developed quite differently. In fact the Swedes have looked east and the Norwegians have looked West. I think to sum it up and I do not know—it is a long story, I might be able to tell you but I think it would take me a little while. I am limiting it of course in my mind to the international relationship. If one is eastward looking the Swedes were a Baltic power and a continental power, the Norwegians were a maritime power, they are a maritime westward outward-looking people.

Mr. Winch: Could I raise a point of order, Mr. Chairman?

The Chairman: A point of order, Mr. Winch.

Mr. Winch: I just mentioned the point of order because I think it is rather important, I note the reference "Swede" now is it discourteous to say "Swede" instead of "Swedish", it may be important in our questions afterwards.

Ambassador Andrew: They call themselves "Swedes".

Mr. Winch: That is fine, I just wanted to get that clear.

The Chairman: Are you finished then Mr. Lewis?

Mr. Lewis: If the Ambassador is, I am.

Mr. Edmonds: I could go on, but I do not think I should.

The Chairman: It will likely come out anyway in further questions. Go ahead Mr. Edmonds.

Mr. Edmonds: Well, I think that the one very short answer to that question is the

experience of war. The Norwegians realized that they had been invaded and they realized the virtues of defence. And they saw it in wartime. We had Norwegian flyers in Canada and so on, and I heard Dutchmen say exactly the same thing about their own country, they were neutral in the first world war, they took time to grow after the war as refugees because they were neutral countries, but the experience of the invasion of Holland convinced them that they needed collective security.

Mr. Brewin: You mentioned the psychological attitudes of Sweden which you said, I think both grew from the fact of neutrality and also supported and buttressed the idea of neutrality and you put the question whether the Canadian attitudes I think you the question, or suggested it to us, could be similar. I would think one of the difficulties, at least one of the differences might be the fact, or is it a fact that the Canadians have the very closest relationship with one of the super powers, namely the Americans. We intermarry, there is a tremendous flow of pioneers, a tremendous flow of personnel across the borders for vacations and business and one thing and another. Is there any similar close connection between Sweden and Russia, or any other super power. Is that one of the psychological differences?

Ambassador Andrew: Yes, I think it is. I think the Swedes are, I said they were homogeneous and they are, not only homogeneous but they are based in Sweden, they travel, they have interests all over the world. It is one of the contradictions in the make-up of the Swede that he is an inward-looking person, and an outward-looking person. Their relations with Russia have been historically that of enemies. The Vikings were the first people to go down the Volga, they went right down to the Black Sea. The Swedes know the Russians, but not on terms of intermarriage unless you use that term extremely loosely. They visited them several times and the Baltic was a Swedish lake until Peter the Great got out at then, St. Petersburg, Leningrad. The Swedes have not even—I do not think that you would say that there is very much intermarriage, considering the similarity between all the Scandinavians. I do not think there is very much—there is a lot of official contact but the personal contact is small. I have this impression, I do not know if my colleagues would agree with me, on that, but I have this impression.

Mr. Brewin: It is more economic.

Ambassador Andrew: It is growing. There is a conversation going on at the moment for a thing called Noric to develop economic relations, a sort of free trade area in the north.

Mr. Brewin: With Russia now?

Ambassador Andrew: No, no, not with Russia.

The Chairman: We can move on now to Mr. Forrestall.

Mr. Forrestall: Mr. Ambassador I wonder if I might ask you, it might not be fair to ask you to comment on this. Would an open declaration of alliance with the east, drive them further away from us?

Ambassador Andrew: No, I do not think so. I think that the possibility of war, you mean, whether this would drive them away, no I think the Swedes would try very much to maintain foot in both camps.

The Chairman: Mr. Prud'homme?

[Translation]

Mr. Prud'homme: Has there been any talk—have conversations taken place between the Canadian authorities here and the people responsible for foreign policy, regarding a possible Canadian withdrawal from NATO? What do the Swedish authorities think of a possible Canadian withdrawal from NATO? Do they seem favourable, indifferent or opposed?

[English]

Ambassador Andrew: Well someone asked me a question similar to that a minute ago and I...

[Translation]

Mr. Prud'homme: I would like you to elaborate.

[English]

Ambassador Andrew: I would like to hear the Swedish views. If you ask this to one of the foreign military people, I would be very interested in hearing what they say.

Mr. Prud'homme: Exactly for this reason, sir, I would like you to elaborate a little bit in order for us to be able to ask them more precise questions, for information.

Ambassador Andrew: To me they give the polite answer which is that this is for you to decide. It is a question for Canada to decide. We Swedes are not effected by this, you decide. But anything that hurts NATO they would not like, this is my impression because they regard NATO—they are in a position of

a keystone in an arch, I would say. If one—if the pressure comes off on one side they fall, and if they thought that Canada was vital to the strength of NATO, they would be very interested in us staying in it. Because I do not think they would want NATO to be weakened if it would affect their position. But I think it would be interesting to know whether they think that our departure would weaken NATO; I do not know what the answer to that one is.

The Chairman: Mr. Asselin?

Mr. Asselin: Mr. Ambassador, yesterday I was reading the documentation you provided, and I found that this country, Sweden, pays very dearly indeed for its neutrality. In the list, I saw that some six per cent of the gross national product is allocated to defence. I have always thought that a country could become and remain neutral by signing non-aggression pacts with its neighbours. In the case of Sweden, do you not think that, if Sweden belonged to a club like NATO, she could reduce her military expenditures considerably? From another angle, I believe that if Russia were to invade Sweden, on one pretext or another, this country does not now have the necessary military strength to repel aggression on the part of Russia. Do you not think that it would cost Sweden less to belong to NATO, and have NATO protection, instead of maintaining a military force that is, in my opinion, meaningless in view of her proximity to Russia?

Mr. Andrew: Well in terms of strict economy, in terms of money it would no doubt be cheaper for them to be a part of the NATO system. They would get more bang per buck that way. But in a way they are also prisoners of their past decisions. At this moment in time it would be more difficult for the Swedes to enter NATO, politically it would be more difficult for them to enter NATO than it would be for Canada to get out of NATO. The Russians would react extremely strongly if not against Sweden then against Finland and there is something I should have said earlier, that the answer to many Swedish situations is Finland. Because Finland is a necessary buffer between Russia and Sweden and the Swedes are very solicitous about the Finnish situation and they would not want to embarrass the Finns because if they do the Russians would move just that much nearer to Sweden. So many Swedish decisions can be seen in this context as not really directly affecting Sweden itself but as affecting Finland. Now

one of these things would be if they went into, if they came into NATO. It would produce if not a reaction against Sweden itself, it would produce quite a serious reaction against Finland. I do not know if I have adequately covered your point but it is a very interlocking thing.

AFTERNOON SITTING

Monday, March 17, 1969

The Chairman: Gentlemen, could we get started. It would be best if you would take the second and third rows, where the microphones are available.

This afternoon we have the pleasure of a discussion with officials from the Swedish defence department, and our Ambassador has arranged to have as our invited guests or witnesses, Mr. K. S. Olhede Under Secretary of State of defence who will deal mostly with Swedish security policies; Mr. B. Dahlberg, Chief of the Swedish Planning Secretariat of the defence department and Major General P. Ljung, Chief of the Army Materiel Department, who will be able to answer any questions with respect to army procurement. In addition, we have some supporting witnesses that may be called upon by any of these three. We have the first of the three that I have mentioned, he will be making his presentation and I suggest that we do not—that we hold our questions to all three, until they have completed their presentations. Then, it would be simply a case of indicating which man you wish to put your question to.

So without further ado, I would call upon Mr. Olhede to make his presentation.

Mr. Olhede: Well, I am very pleased to sit across from so many Canadians and have not done so before since I have been in Montreal where I have been frequently in my life. I know that you are very pressed for time indeed and, therefore, I have made some pictures or something to show what is the Swedish security policy. First of all, we have in writing to explain what is the aim of the Swedish security policy, and this has been accepted by the Government to secure national freedom of action in all situations and under such forms that we choose ourselves, in order to obtain and develop within our own borders, our social life, our society in political, economic, social, cultural and terms and every other respect in accordance with our own desires and in that connection to work for peace on the international scene, easing international tension and promoting peaceful development.

It is however not only—it is one thing to say what is your security policy but it must be based on, first of all, the power situation in the world and Sweden's strategic position. And, we must furthermore go through that what is the development of the military strategic doctrine. First, when we have gone through that, we can decide upon our foreign policy line of action, and secondly, on the defence policy line of action.

To start with the power policy situation and the Swedish strategic position. First of all, you must face this as we did on the following facts. The international political scene is essentially formed by the great powers. Sweden can, as a small country, only make a limited contribution to influence that scene. We have to adapt ourselves to what is considered to be the requirement of the scene, that is to say, that although we will do the utmost to change the international milieu, the scene, we must accept that we nevertheless, are a small country and must adapt, adapt ourselves to what is really the scene which is defined so to say by the actions of the great powers. Another fact in Europe at least, that there are two power blocks in Europe with at least partly-contrary political influence, and we also consider as a fact that on the whole, a balance of power exists between the two blocks and a considerable degree of parallelism exists between the military resources. The forces of the two blocks of power are vis-à-vis each other. Only limited resources can be adapted for an attack against us. There is nothing, of course, in our defence to say that we have our arms to defend ourselves against one of the two blocks. We consider that there are bound towards each other in a balance and only limited forces can be allocated in an attack towards us. And, we have the following assumptions and it is of an absolute necessity that any assumptions made must be reasonable. It must be a reasonable assumption. When the great power blocks endeavour to assert their interests several disputes can arise between them and military forces may be employed. While we have seen that in Vietnam, we have seen that in other parts of the world and we think this is a correct assumption. None of the great power blocks wants Sweden. I have simplified this expression although we can see that we have a potentiality, economic potentiality on that point of view, but we want to state, that an attack against us must be seen in the light of the strategy of the great powers. There is no other circumstances where we consider we

can come to a compromise, and from that point of view there is also a reasonable assumption to believe that the value of the advantages one of the great power blocks would achieve by occupying the whole block of Sweden. This is first and foremost determined by the disadvantages such an occupation would cause the other great power block, namely the main opponent. If we also state a logic on this, if a conflict should break out in our proximity, the strategically most important area of the Baltic Strait and Northern Scandinavia, the importance of government supposed to be neutral.

This is then, thus a power situation and from there we also have to consider the development of the military strategic doctrine. A lot of people mainly said that why on earth should Sweden have a defence? The first day there will be an inter-continental atomic war and, consequently, Sweden will immediately be dragged into such a war and, consequently, there is no reason for us to put any emphasis on conventional weapons. However, when you consider the development in the world in this connection you will find the following facts.

The military strategic doctrine of the United States on massive retaliation which was varied until the beginning of the 1960s has been replaced by a doctrine with greater possibilities of choice in conflict situations. The doctrine of flexible response or the so called escalation doctrine.

The great blocs aim at creating and maintaining a balance of power which would act as a deterrent on attack at every war level. In the event of a conflict, endeavours should be made to induce the great powers to agree to negotiations before escalations of the next level is made. The possibility of negotiations must always be left opened, and there is a consequence of this. I think, it is an important fact to state that the conventional forces have hereby gained increased importance. The nuclear weapons have become more a political instrument than a military instrument of force, and also on the next page you will find also a very important feature in the whole strategic doctrine development.

Measures have been taken to guarantee that decisions on employing nuclear weapons will be taken on the highest political level and not be made by military commands, and consequently, we can from these facts which

undoubtedly offer—we can draw the following assumptions.

The balance between the strategic forces of the United States and Soviet Union. The realization of what a nuclear war means as well as steps taken make it less probable now than earlier that an inter-continental nuclear war will be started suddenly and deliberately. And for Sweden's point of view the following conclusions. If however a nuclear war should break out, the first attack with nuclear weapons against Sweden is not very likely. There is hardly any reason for one or the other of the powers to use nuclear weapons against Sweden for the purpose of forcing the main improvement to come to the negotiating table. I would add, that this can be a wrong assumption. It can be that we will have a nuclear war from the first stage, and also, it is a possibility that we will be dragged into such a war but in that case it will not be a defence in our opinion, it will be more a matter to survive. And I am also convinced that how much we spend on defence we cannot defend ourselves from everything. Not even the great powers can do that!

From this glance we have formed our political foreign policy line of action. And, I am aware of Mr. Ryding has spoken about foreign policy today but I think I will go rapidly through this just to get it in the proper connection with the defence policy.

First of all, we state that even if Sweden is a small country it cannot by an appreciable degree improve its national scene. We aim at diminishing the distrust between the great powers; preventing a proliferation of nuclear weapons to still further nations; reaching an agreement when a comprehensive nuclear test band and an effective control system are reached; reaching an agreement on balanced disarmament. That is to say, to bring down armament to a lower level while maintaining the balance of power between the great power blocs.

I should say, we tried to do this in Geneva, of course, together with other nations but we think it is the main thing to do everything possible to minimize the mistrust between the great powers and also you may be aware, we have just had under construction here in Sweden, where the money comes from the defence department on a cross which will, in our opinion, be an instrument able to really differentiate if there is a test of nuclear

weapons on the ground or if there is an earthquake in any respect. Just to make sure that this mistrust is no longer valid so we can go ahead on this policy. And in this situation we have formed our policies in the sense we free them from alliances. I do not know whether this is a correct English translation. It is a non-alliance policy in peace in order to preserve neutrality in war. I prefer myself to always state that Sweden is not neutral in peace because neutrality is, in my opinion, very difficult to define in peacetime. You have the Austrian situation where Austria has defined neutrality in the treaty with Russia, with England, France and the United States and Canada as well and you have the Finnish neutrality which is defined in an agreement with the Soviet Union. You have Swiss neutrality where the Swiss do not even participate in the work of the United Nations but Sweden still does. Her policy is to take these standpoints in the United Nations and consequently we can take standpoints and therefore we are not neutral. But what we have said we have alliance-free policy in order to preserve neutrality in war. Because neutrality of war is defined in The Hague convention of 1902 and there is no doubt about that with this combination you have a clear combination of the two situations. Well this is not the goal for the Swedish foreign policy or security policy. It is just a phrase which specifies our absence in two situations, during peace and during war. And, of course, it is most important for us to make this policy good working. Will you change to the next slide. Our main task as a non-allied state is not to do anything in our proximity that can destruct the balance of power between the great power blocs. The great power blocs must be convinced that we shall fulfill the obligations of neutrality in the event of war in our proximity. That is to say that where the will, the power and ability to meet an attack by diligence by violating Swedish territory. The great powers must be convinced that Sweden, that in Sweden there is a definite majority among the people for this foreign policy line and that the climate for this situation is so stable that the foundation on which the security policy rests is firm. While in that respect you know we have almost all the time had the same government for 37 years so I think it is quite firm, a firm situation at least.

The next, of course, in this connection is the defence policy line Act, which has built

up as a consequence of what I have said up to now. The national defence shall be so framed as to support our foreign policy. It should aim at the maintenance of peace, that is to say, it should be stabilizing and a war-preventing factor in different political situations. It will express the will of the people to maintain our independence. The national defence shall enjoy the support of the Swedish people and it shall be the concern of the people, that is to say, it has been based upon the principle of compulsory military service. This is, in my opinion, a fundamental democratic idea. The national defence shall be so organized and made up that parts of it can take part in the peace-keeping operations of the United Nations at short notice. I want to stress this point and it corresponds to the last sentence in our security policy, the aim of our security policy. The next point is freedom from alliances and neutrality that non-alliance policy and neutrality require that it should be possible to defend the whole country. We cannot say consequently that we leave this part out, that the defence can concentrate its power on different parts of the country and in different directions as the situation changes. Special attention should, however, be paid to the strategically important regions in the north and south of Sweden. This is a consequence of what we in Sweden consider most important, being the most important strategic area in this between the great powers. The national defence must have such a composition and strength that it cannot happen that the great power blocs by findings deficiencies in the Swedish national defence are misled to distrust the declared foreign policy of the country and our ability to ward off violations of this neutrality if war should break out in Europe. For example, if we did not have an air force, if I can take that as an example, then of course the Eastern block or the Western block may think of us, they do not have an air force, consequently there must be an agreement between Sweden and one of the others saying that all right there must be some help or I take this example of an air force, there can also be other parts and consequently to make our policy true work it is so important that we have a balanced defence. So no one can say that you have a lack in your defence system there and consequently you must have an agreement with somebody who will fill that gap if it comes to a war. The structure of the national defence must be such that it cannot be regarded as a threat against any country.

Our national defence shall be a conventional defence and therefor not equipped with nuclear weapons. There are two important sentences in this point, and furthermore we must have a structure that it cannot be considered as a threat. Let us take for an example our aircraft. We could make them longer but the flying characteristics of that aircraft will not change. In fact it will improve a little bit. But by making it longer we will have considerably longer endurance and we say this is not necessary. For defence purposes in Sweden we have enough endurance of that aircraft and by making better endurance it could be considered that it would be a weapon carrier of some sort outside the border of Sweden and consequently we take this line of action and that is if you go through the whole of our defence you will find that there is nothing which can be considered as to be used more or less in an attack on another country.

And then the national defence can be too strong. That the value of the advantages, one or the other great blocs wishes to steal by concentrating marginal resources against us, would not be compatible with the resource losses which would be the result of such an attack against Sweden. The two power blocs can thereby restrain from attacking the country and we have this requirement that there is no doubt that we have such a strong defence so it will not, if I may use another term which probably is not proper in this connection, but does express it, it will not pay off to attack us. It will cost them too much for the advantages they will gain to do it and we consider that we have such a defence. Up to now you have, I hope, realized that I have rational reasons and tried to be as helpful in a logical and rational way. Because we have considered that even in a war there is anyhow some sort, something of a rational state. But this last point, on a rational thinking should, of course, by the potential enemies lead to a conclusion that they knew worthwhile attacking Sweden. But this last point even takes the irrational into consideration one could say. The national defence shall be so built up in such a way as to make a tough and persistent resistance possible if in spite of our will for peace and declared neutrality we are nevertheless attacked and consequently we both have a defence at the borders, shall we say, and a deep defence. We cannot have one or the other. We need both types. Well I thought that it might be good to

go through the entire position of the three security policies which lead to our foreign policy, foreign policy line of action and to our defence policy line of action. And, of course, after if there is any questions I will be very pleased to answer them. And I leave now the work to Mr. Dahlberg who is head of the Planning Section, Planning Bureau in the Defence Department.

Mr. Dahlberg: Gentlemen my object is to speak a little about Sweden's defence budget. Sweden is one of the two countries which did not disarm after the Second World War. In the main we kept up our organizations built up during the war. No great modifications were made prior to 1958. All the defence positions prior to 1958 fixed the expenditure only one year in advance of the time. The size of the defence budget remained about the same from year to year. As the general level of prices was steadily rising this meant that the fixed organization was being steadily undermined. The Defence Act passed by the Swedish parliament of 1958 demonstrates the fundamental change of policy as compared to its predecessors. It was the first multi-year defence act. The government deemed it necessary to introduce spending for several years in advance. This was in order to consolidate defence planning and bring the strength of our military defence up to date. This Defence Act of 1958 was based upon an agreement within the parliamentary committee on defence, between the foreign office and the parliament. This covered three years extending up to 1961. The Act defined the current budget for the fiscal years 1958-59. All the expenses were totalled to give a certain big sum. Two important modifications were introduced. It was decided to increase this big sum by two and a half per cent each year during the time of the Defence Act in order to compensate for the steady increase in expenditures due to technical developments. Moreover the real value of this basic allocation was to be kept constant by compensation for changes in prices and wages. The 1961 Act, Defence Act, was based on the recommendations of the 1960 Committee on Defence which was also a parliamentary committee. This Act covered two fiscal years up to and including 1963. This Defence Act confirms the principle which had been accepted by the 1958 parliament and also extended them. Not only the current budget but also the capital budget was now included.

In other words the 1961 Defence Act gave the Ministry of defence a joint financial plan

for the current and capital budget. The 1963 Defence Act was based on the recommendations of the 1962 Committee on Defence. The financial allocation for defence was extended to cover four years up to and including the fiscal year 1966-67, and again confirmed the principles which have been accepted by the 1968 Parliament, i.e., a yearly increase by $2\frac{1}{2}$ per cent due to technical development and compensation for changes in prices and budgets. The 1968 Defence Act covers also four years. It gave us however the three main aspects from the previous three Defence Acts, firstly there is no four-party political agreement behind the Act. It was impossible to get political unanimity on the defence expenditure within the 1965 Committee of Defence appointed to prepare the Defence Act following the 1963 Defence Act. The three opposition parties did not agree upon the suggestions worked out by the representatives of the majority and the government party the Social Democrats. The Act is consequently based on the government proposals only.

The second difference is that there is no compulsory increment by a certain percentage due to technical development as it was before by the $2\frac{1}{2}$ per cent yearly increase.

The third, and I would say main difference is the way in which the expenditures for a four year period were worked out. The committee first calculated the amount of money needed to meet already-made engagements and other commitments, e.g., normal yearly basic and refresher training of general conscripts, service for about 50,000 persons serving in the forces of this non-commissioned officers and civilian personnel. Further maintenance of war materials in stock and in use and payments for already ordered but not delivered war materials. Expenditure on these objects were, as I said, calculated and called basic military defence expenditures.

This picture shows the calculated need of sums for these basic expenditures. As you can see from the picture the amounts needed are decreasing through the four year period which is quite natural because payments for already ordered material will decrease at the end of this year.

The next step—This is Swedish million kroner, 70,742 million kroner which means, divided by about 5 to get American dollars—by 4 it is?

The next step we are defining the total expenditure on military defence was to estimate the needed complements to acquire a satisfactory balance within the armed forces and to create a freedom of action in the long run, either to increase or decrease the organization in various ways. The complementary defence expenditures for military purposes are estimated as shown on this picture. These figures are also in million kroner. The first object is something for the development of aircraft, 47 million, a reconnaissance version. The second object—development of our defence systems, either surface for our missiles or our aircraft fighter interceptions.

The third object—the development of aircraft, 47, a reconnaissance version and further aircraft, 47, a strike attack version and also for the development of a missile.

The fourth object—Completion air defence command systems, base systems, communications, etcetera. Then ammunition for the army, and then new standup vehicles, motorcycles, and for the army units, completion equipment for armoured brigades, completion equipment for infantry brigades, completion equipment for artillery and communication units which is also for the army, and then modernizing anti-aircraft artillery, and then general resource and development, and then miscellaneous.

The total military defence expenditure during the four year period will be as follows on this picture. This means the total figures will be 19,090,512 million kroner during the four year period.

Mr. Wahn: Excuse the interruption, Mr. Dahlberg but it is still an average of $3\frac{1}{2}$ per cent.

Mr. Dahlberg: No one per cent. All these figures are calculated at price level May 1967, and the Defence Act also includes this time compensation for changes in prices and rates.

Can I have the next picture please?

This figure shows the rising trend of defence expenditure in current prices since 1958. You can see different Defence Acts, what they have meant. This is in current prices, the magnitude of this increase may seem alarming, expenditure has risen more than 90 per cent during the eleven years since 1958-59.

This picture relates military defence expenditures to the annual total budgetary expenditure and gross national product. You can

see the decrease in the proportion of the total budget allocated to military defence. It was 1.84 per cent for 58-59 but has fallen to estimated about 12.1 for 1969-70. However, this decrease is not, of course, really related to the strength of our defence. My just stating that a certain percentage of the national budget is devoted to defence expenditures is, of course, misleading. It does not convey an accurate picture of how strong our defence is or to what extent we need a defence. The expenditure on the basic pension scheme and on the whole educational system has also greatly increased, but this does not automatically imply that we need a stronger defence, i.e., keeping the same percentage of the total budget. I think you get a more realistic idea of defence expenditure when regarding its relation to the gross national product. Expenditure has risen very steeply as I mentioned before, more than 90 per cent, but so has the gross national product too. In 1958 our gross national product was 57,000 millions kroner, the figures for 1968 were 141,000 millions kroner. This represents an increase of 150 per cent. The result is that the percentage of the gross national product going to defence expenditure has decreased. It had fallen from 4.9 per cent 1958-59 to an estimated 3.8 per cent in 1969-70. For comparison I want to tell how defence expenditure has developed in other countries. The first row is the figure for defence expenditure in actual currency in the country's own currency. The second row for each country means defence expenditure as represented by gross national product, and then thirdly, the third row means defence expenditure per inhabitant in United States dollars. This is for Sweden, this is for the Balkans. 1967 is the last year which we have got figures for. This is from the OECD definition of gross national product which slightly differs from our own definition. This is the reason why the figures for the part of the gross national product differ slightly from the figure I showed just previously.

This figure shows and gives, I think, a more realistic idea of the trend of the defence expenditure in Sweden. The table shows the actual value in fixed prices for the annual expenditures from 1966-69 up to 1971-72. The last Defence Act, the 1968 Defence Agreement or Defence Act, covers these four years as you can see there is a small rise of 1 per cent. There is an increase of 1 per cent for the coming four years, in comparison to the 2½ per cent increase previously.

Between 35 and 40 per cent of total military defence expenditures is normally devoted to the purchase of new equipment. This table shows the defence expenditures through wages, purchases of equipment and miscellaneous. In comparison with foreign countries this procurement of equipment is fairly high and it is mainly due to Sweden having no standing forces. There is a decrease as you can see from the figures in the Tables. In 1958-59 we had 46.5 per cent for procurement of equipment. It has fallen now to 43.8 per cent. Of course we have noticed this and we are working to bring a proportion between consumption and investments; and the next figure we will show you in another way. If we split our budget into consumption and commitment. We have split the defence budget into two parts—first, consumption current consuming expenditures and under consumption we have training of already existing units, maintenance of equipment, fortifications and buildings. This takes 44 per cent of our budget. Then investments—besides investments in new equipment we invest in fortifications buildings, interceptors, and also research and development. For research and development from this figure you can see 10 per cent which is quite high. Totally we have 56 per cent for this investment in comparison with 44 per cent for consumption.

Major General Ljung will later talk more about the breakdown of the equipment. I would only like to show the next picture which shows that we have a very strong air force. These figures for combat aircraft in certain countries are coming from the *Military Balance* for 1969.

The United States Third Tactical Air Command has, of course, quite a few more combat aircraft. Thirdly, there is the figure given of \$12,500,000 and, then, of course there is the Soviet Union \$3,700 CVO, that means defence.

The two latest defence acts had also covered expenditure for civil defence purposes for a four year period. Grants will amount to about 600 million kroners. The civil defence forces comprise about 230,000 persons mainly women aged 16 to 67, and men 16 to 18 and 47 to 67. Purchases of equipment was \$200 million for these forces, which has been authorized during the recent four-year period.

The program for the construction of nuclear shelter centres is also financed under this heading. You will get more about this tomorrow I think on your program.

In 1969-70 civil defence expenditure will amount to the same volume as 1968-69 in real terms, that means about \$145 million dollars.

Economic defence is a term used to denote methods for maintaining economic activity in wartime. It includes the stocking of food and strategic material. From this picture you can see military defence for the next fiscal year, 5.370 million; civil defence 145 million kroners; economic defence 125 million kroners; miscellaneous 75 million kroners. That means that our various groups of items of a defence nature, e.g. psychological defence, the equipment of emergency hospitals for civilian use, and the development of certain communications. As you can see from this picture some 90 per cent of defence expenditure is devoted to military defence.

Finally I will table our central government's expenditures in the coming fiscal year. This is the block budget and the different objects are grouped according to its purpose. You will also see the changed figures in relation to the budget for the present year.

The Chairman: Major General Ljung.

Major General P. Ljung: Gentlemen, I am pleased to give you a sketch of the Swedish organization and the principles and comments on our military equipment.

My statement will follow the divisions shown by this picture. After my statement, representatives of the army, navy and air materiel department are prepared to answer your questions and if your time permits it, they are also prepared to show you some slides about some modern materiels produced in Sweden. A copy of my sketch also will be handed over to you.

This is the organization of the materiel procurement which has the materiel administration of the Swedish armed forces, the FMV in this organization.

Which is the organization of the material procurement and which position has the Materiel Administration of the Swedish Armed Forces (FMV)

The Materiel Administration of the Swedish Armed Forces is subordinated to the Swedish Government and carries out technical and economic activities necessary to provide the Armed Forces with ordnance and quartermaster materiel. The mission of the FMV is based on a Royal Instruction. In fulfilment of its mission the FMV shall follow the directives given by the Supreme Commander

of the Swedish Armed Forces and the Commanders-in-Chief of the Services concerning the respective activities.

As to development and long-range policy the FMV shall follow the directives for long-range planning given by the Supreme Commander and the Commanders-in-Chief of the Services.

In connection with procurement and maintenance etc. of ordnance and quartermaster materiel the FMV collaborates with other defence establishments: The Medical Board, the Royal Fortification Administration and the Civil Administration. The distribution of similar functions between the establishments is arranged in a way to take advantage of the total resources and competence in the best way.

As far as concerns studies and evaluation of new materiel and human engineering the FMV cooperates with the Research Institute of National Defence and the Institute of Military Psychology.

In the procurement and maintenance activities etc. the FMV also collaborates with interested domestic and foreign industries, which are to a great extent involved in the projecting and development activities and the manufacture.

Furthermore the FMV is responsible for the central management of all ordnance and quartermaster service as far as subordinated authorities are concerned.

Organization of the FMV

The FMV has a Management Board, with a Director General, as chairman of the Board, and at least six other members, specially appointed by the Government. The Director General, for the present S. Wahlin, is chief of the FMV. The FMV includes five main departments, the Army Materiel Department, the Naval Materiel Department, the Air Materiel Department, the Quartermaster Materiel Department and the Administrative Department.

The Director General and the chiefs of the main departments form the Management Council, dealing with and informing on questions concerning more than one main department.

Functions of the FMV

See fig.

Long-range planning

The King in Council stipulates the objective of the Defence and establishes the limits of the economic and personnel resources.

On the basis of the economic and personnel resources the Supreme Commander of the Armed Forces has strategic and technical makes up forecastings of the development of our own and that of the adversary for the planning period and carries out studies and evaluations of different alternatives for the organization of the armed Forces.

The studies and evaluations result in principles for defensive methods at the end of the planning period. These results are concentrated into directives to the Commanders-in-Chief for the continued development of the Defence. The directives result in a preparation by the Commanders-in-Chief in their respective fields of responsibility of long-range plans for the wartime organization, and consequently long-range plans for peacetime organization, materiel, investment and personnel.

The long-range requirements plans of the Commanders-in-Chief are used as a basis for detailed materiel plans which are prepared at the FMV.

The Procurement Course

Procurement of materiel for the Armed Forces does not cover the purchase only but has a broader meaning. The different phases of the procurement course are seen on the picture.

Prior to projecting and ordering a series production of some extent the FMV must obtain the permission of the Government.

A very important basis of the cooperation between staff and administration are the tactical-technical-economic requirements, gradually drawn up in the course of the procurement, which define the more and more fixed requirements on the materiel to be procured.

Value of materiel procured during a 7-year period

The value of materiel procured during a 7-year period is seen on this picture. Actually the principal part of the procurement is applied to aircraft materiel.

Annual costs of materiel and maintenance and value of available materiel

The annual costs of materiel procurement and maintenance is seen on the upper part of this picture.

The value of the available materiel is accounted for at the bottom.

Where is the materiel procured

The FMV has no industries of its own but procures the materiel at domestic or foreign industries. The approximate percentage distribution of the materiel procurement is seen on this picture. About 15% of our materiel is procured either directly or indirectly through Swedish sub-contractors.

Which are the basic principles for materiel procurement?

The procurement of materiel covers not only purchase but also research, development, design and questions connected therewith, e.g. the rights of ownership and use of designs and licence agreements.

The 1952 Government purchasing proclamation applies to all government purchases. It says among other things that the offer totally seen most favourable to the Government has to be accepted. In this respect no preference is given to Swedish products rather than to foreign ones.

As to procurement of standard materiel competition is as a rule prevailing, in most cases facilitating a good result, technically as well as economically. In order to take advantage of the competition possibilities market researches are carried out.

For procurement in case there is no competition the Royal Ministry of Defence has in 1968 issued directives for procurement of defence materiel. According to these directives cost contracts with variable profit have to be drawn up in absence of competition. The fundamental idea is to obtain the best product on conditions most favourable to the Government through suitable forms of agreement e.g. by giving the contractor higher percentage profit at lower costs of the order.

Development of our own or purchase from abroad?

Estimation of the fields within which we should not carry out a development of our own but depend purchase from abroad or manufacture under licence has to be made in each specific case.

The decisive factors not to pursue development of our own seem to be the following:

When we are aware that development abroad is going on to such an extent that a safe procurement situation results without our activity in the field, and when we are

expected to have safe possibilities to buy the materiel to be developed.

When the development costs required for a development in Sweden seem to be disproportionately large in relation to the series costs, or when the development costs seem to be so large, that they cannot at all be included in our budget.

When our resources within the country of research scientists, technicians and manpower do not cover the requirements in order to develop a project within the time required and with necessary safety.

When procurement from abroad can be made without repercussion on the confidence in our policy of non-alignment.

The materiel of which we *should* carry out development of our own and manufacture within the country seems above all to be the following:

Materiel, that cannot be purchased from abroad for purposes of security (e.g. jamming, jamming protection, crypto and electronic intelligence equipment).

Materiel that has to be particularly designed considering our geographical and climatological conditions and our military service system.

Materiel of which war production is necessary and where a development of our own is a condition for the production.

Materiel influencing the tables of organization

(a) of such importance, that we dare not await a possible foreign development with the risk of being without materiel at a point of time when need arises according to our war organization plans,

(b) concerning which we cannot—considering possible aggravation of the world situation susceptible of rendering impossible planned import of war materiel, or considering our policy of non-alignment—make ourselves all too dependent of procurement from abroad.

Certain development resources may also need to be assigned in order to create such a volume of knowledge that materiel purchased from abroad can be received and maintained in a rational manner, and that we can appear as competent buyers.

Within the country resources for long-range planning, studies and research and for development and manufacture of war materiel are

required. We must be able to develop and maintain a defence of such a technical standard, extent and preparedness that the non-alignment policy and the system of military service defence, demobilized in times of peace, achieve their war-abstaining function. Functions of the Materiel Administration of the Armed Forces

The Functions of the Materiel Administration of the Armed Forces are given in a Royal Ordinance.

The materiel administration shall within its responsibility:

- Procure materiel and other supplies
- See that the supplies are suitable and serviceable and stored in a proper way
- Follow the technical development, analyse materiel collected and provide information in this respect

The materiel administration of the armed forces shall follow:

The directives of the supreme commander of the armed forces

- In order that the functions of the administration shall satisfy
- The operational activity
- Concerning long range planning
- Concerning budget proposals

The directions of the Commander-in-Chief

- In order that the functions of the administration shall satisfy the activity connected with mobilization, training, tactics, organization, equipment and personnel, directed by the commander-in-chief
- Concerning budget proposals

Basic Principles for Materiel Procurement

The 1952 Government purchasing proclamation states

- that the most favourable offer to the Government totally seen shall be accepted
- that no preference shall be given to Swedish products rather than foreign ones

Creation of competition situations through among other things market researches

The 1968 directives for procurement of defence materiel in absence of competition,

- cost contracts with variable profit, that is to say higher percentage profit at lower costs of the order.

The Vice Chairman: Mr. Brewin.

Mr. Brewin: Mr. Chairman. In the original presentation to us, a matter came up that I would like to enquire into. The NATO doctrine seems, unless it was recently modified, seems to have been that the strength of the USSR in conventional weapons is so overwhelming that any all-out attack, or any major attack, might have to be met very early by use of tactical nuclear weapons or at least deferred by the possession of tactical nuclear weapons by the NATO forces. I understand that Sweden has deliberately opted against the acquisition of tactical nuclear weapons. I would like to enquire as to why and wonder whether it is because you reject the soundness of the NATO doctrine or because you feel that either the political or military situation in Sweden makes that NATO doctrine inapplicable?

Mr. Dahlberg: I should not, of course, discuss the applicability of the NATO doctrine. But in our opinion for the Swedish defence system, we feel that even the use of tactical atomic weapons will not hit Sweden in the beginning of the stages and we also feel that we have such defence that we are prepared, we can resist even such limited numbers of tactical weapons, but we feel that we do not need to have such weapons for our defence purposes. And we have felt that the contribution we could make politically in this respect is to say that we will not arm our forces with nuclear weapons and so we have done.

The Vice Chairman: Mr. Wahn.

Mr. Wahn: It is apparent that the Swedish air force is a very large defensive air force. I wondered if you could tell us just how you would anticipate it would be used. In Canada we have been told that the Russian bomber threat is a decreasing threat and I am interested in knowing just how this very large and presumably very efficient Swedish air force will be used in the event of war.

Mr. Ohlede: Well, the main force—our air force—is, of course, mainly air defence, but a part of it is attack aircraft. We feel that up to now we have had a very very great part for air defence, but just now we are reconsidering a little bit. We have a special committee working on the air defence problem and also what is indicated here by Mr. Dahlberg in our budget that we will consider the mix between air defence aircraft and missiles and see what will come out of that. I cannot say now if we will change very drastically the

amount of air defence aircraft. I will certainly wait for that committee to come up with its considerations before any decision on this subject is taken. One reason for having this committee just now is the following; that I do not know if you know, that the main body of air defence aircraft has dropped just now—the Swedish Dragon as it was just named recently. And we have now gone into making this big aircraft—the Thunderbolt—and this is a platform aircraft for three purposes. It is a platform for a tank aircraft, for reconnaissance and for air defence purposes. The decision to continue—and we have decided now to go on with the test version and the reconnaissance version and a decision is to be taken on the air defence version, must be taken, early in March 1971. There, the government, based on what the Committee finds and also, of course, other considerations, has to say if there will be a beginning of this version and if so how many. I cannot state here how many aircraft we will go into in the future, but today we have this many.

The Chairman: Mr. Harkness?

Mr. Harkness: I was particularly struck by the low percentage of your total military cost devoted to personnel. It is the exact reverse of our situation in Canada. That leads me to ask what percentage of your military personnel are permanent force or regular soldiers, sailors and airmen, and what is the general rate of payment for your conscriptive personnel?

Mr. Dahlberg: As I mentioned before, we have around 50,000 persons in the service who are commissioned officers, non-commissioned officers and civilian personnel. They are paid at the same level as civilians. The conscriptive personnel are paid around \$1 a day during their first training period which is about nine months. Then, of course, it differs between the services. In the air force most of the people are commissioned people—pilots: Also in the navy there is a large proportion of serving people, but in the army, in the field of artillery, I think there is about 85 per cent which is conscript.

Mr. Harkness: What is the total size of your forces?

Mr. Dahlberg: The wartime forces?

Mr. Harkness: I mean in relation to this budget.

Mr. Dahlberg: The budget as such for personnel is 50,000 people in the armed forces. They are employed by the regular forces—50,000.

Mr. Harkness: In the regular force.

Mr. Dahlberg: That is just the regular force. And every year we educate 50,000 boys so that is the combined forces, 100,000 I should say in peacetime. During war, the forces are considerably greater, but I consider that we would have a greater budget in a war.

The Chairman: Are you finished, Mr. Harkness?

Mr. Harkness: I have another question but perhaps I will wait till the second round.

The Chairman: All right. Mr. Groos?

Mr. Groos: Mr. Chairman, I wonder if our host would be kind enough, I was very interested in that projection he had on the screen of the OECD figures for various countries, and I wondered if perhaps we could see that again.

In the meantime perhaps while they are looking that up, I could ask a short question. I would be interested in hearing something about the Institute of Military Psychology. It is a new type of institute to me; certainly the name is new. I wonder if someone could tell me what goes on there?

Major General Ljung: One of their missions is to help us. And for the right education of them we must have a correct place for them in our educational system. We make tests and those tests are constructed by individuals for psychology.

Mr. Groos: Thank you very much. I think that explains it. I had not run across the expression before and I see now what the purpose is. Thank you.

The Chairman: Are we ready with the map now?

Mr. Dahlberg: For the reason, that we are only 8 million people, we are rather high compared with some others.

Mr. Groos: What confused me was when I saw the U.S. dollars and the Swedish budget of almost five times. I see, thank you very much, Mr. Chairman.

The Chairman: Mr. Nesbitt? Then Mr. Guay.

Mr. Nesbitt: Most of my questions have been answered by our very excellent host, but I still have two very brief ones that I would like to ask if I might. In your military costs do you include for accounting purposes, the cost of, say, roads, airfields and even perhaps some merchant shipping that you would not ordinarily construct but that would perhaps serve both a military and civilian purpose?

Mr. Dahlberg: I should say the following in reply to this question: as you have probably heard, we use our big roads to a certain extent as airstrips and runways during the war. This is planned and preplanned and made an arrangement around these routes and in some part they may be strengthened due to this fact but very limited, but there are arrangements where such things are paid but not the roads themselves. Of course, of the merchant ships we had very few merchant ships with billets for military purposes, but there are some ferry ships which go between the islands where we can have them prepared by putting rails on them rapidly for the navy. And, of course, if there is any additional cost in this respect we pay them and also prepare for these rails to have them ready.

Mr. Nesbitt: But all these costs are included in your military budget and not included elsewhere?

Mr. Dahlberg: That is included in the military budget.

Mr. Nesbitt: My only other question is perhaps not too important but I believe it was the information that the General gave us a little while ago that 11 per cent of war materials was secured from abroad while 65 per cent was secured directly from Swedish manufacturing firms. Do you have any idea of what percentage of materials that these manufacturing firms use would come from abroad?

Mr. Dahlberg: Well, this is very difficult to speak generally about, because if you go for instance to an aircraft you will find, for instance, some very important parts may be made in foreign countries or even licences obtained. The Legion aircraft, for instance, we have a Pratt and Whitney engine, Pratt and Whitney basically but it is built on licence in Sweden and also modified for our purposes. It may differ, I should say, from zero or up to about—could you give some figure?

Major General Ljung: We did a case study based on the 1958 budget and I think, if I remember rightly, that 35 per cent was made in Sweden and 65 per cent came from abroad.

Mr. Stewart (Cochrane): Mr. Deputy Minister, in Canada we do not have compulsory military training and some people have advocated it over the years, others are against it. You stated in your presentation that a principle of compulsory military service was a fundamental democratic principle. Could you explain that statement a little, please?

Mr. Ohlede: Yes, I added though, "in my opinion" because there can be many opinions about it. For me, as I stated, defence must be the case for the people—for the people themselves. In my opinion, if we build a democratic country where the people shall have a right to say how this country shall look and take an active part in it, they must then get the feeling that this country will accept themselves as being able to build—is worthwhile defending and with that background feeling that it is worthwhile defending this country they shall in my opinion also take an active part in the defence of the country and as a consequence of this I feel from the logic that it must be logical that they really have compulsory military service. Surely they have a real interest to defend this country.

Mr. Stewart (Cochrane): You do not feel that this would be done as well by a voluntary service?

Mr. Ohlede: No, from the democratic point of view, from my democratic feeling and opinion I feel not.

Mr. Stewart (Cochrane): I have one other question if I may, Mr. Chairman. In Canada we have gone through the unification and integration of our armed services. Have you thought of that here? Are you planning anything such as this, or have you looked at our set up?

Mr. Ohlede: In some ways we were ahead of Canada in this respect although we did not go so far. We can say we have a Supreme Commander which really, first of all we have, all the plans for the war situation are under him and he has six military districts or what you want to call them where we appoint one as the military chief and he commands all three forces in that area and the Supreme Commander commands the entire three forces which we call the chief of the navy, the chief of the army and the chief of the air force;

they are in fact only chiefs during peace time. They are what you could call in Canada chiefs of operations revue. They are just educating the people in peacetime and in wartime they are not acting as chief of the army, chief of the navy and chief of the air force.

May I say in this respect we have been earlier than Canada although we still have to name a chief of the army, a chief of the air force and navy. Therefore, it is just in peacetime and we prepare for war in another way. On the materiel command side, the materiel command department, we did just one year ago combine the three army materiel commands, navy materiel command and air force materiel command and navy department into one single unit—although you have them in a single unit with Maj. Gen. Ljung. We have gone there as well as you have in my opinion.

Mr. Stewart (Cochrane): Thank you very much.

Mr. Ohlede: But we have not the same uniform. I think the navy uniform is nice.

The Vice-Chairman: Mr. Allmand.

Mr. Allmand: If you have not been in a war for over 150 years and you belong to no military alliances how do you keep in touch with modern military techniques and tactics? Do you have exchanges or observers with other countries who have been involved and are involved to a greater extent?

Mr. Ohlede: Yes, we have had peace for 150 years and of course that is a basis anyhow for our thinking, but we chose what we have chosen. I do not think military tactics are secrets. We have exchanged with our officers visiting foreign countries—there are exchanges of views and the military schools—I have visited military schools in all the different countries and I do not think anything can be kept secret in military strategy or military tactics, but perhaps Gen. Ljung can give some idea in more detail than I.

Maj. Gen. Ljung: I do not think so, but I just want to add that we have to pay a lot more for a system, studying the problems, and material problems in nations who have wartime experience.

Mr. Allmand: The same would be true as to technology I suppose.

Maj. Gen. Ljung: Yes, you exchange information and technology.

Mr. Ohlede: Then I will add that we have had Swedish boys out in the United Nations forces and seen how they acted there and we have heard that they behave and act just as good as any other nation. There is no problem in that connection.

The Vice-Chairman: Mr. Lewis.

Mr. Lewis: I would like to ask some questions of the General, or anyone else really and if it is a little uncomfortable I do not intend it to be. I was interested General when you were giving us your outline that at one point you said something like the following: You said:

We evaluate and forecast our own situation and the situation of the adversary.

I am pretty sure those are your words and in view of your policy when NATO members make that kind of evaluation the adversary is very well known. It is the Warsaw Pact and I was seriously interested in knowing what you meant when you said that you were evaluating the situation of the adversary. Who in your estimation is the adversary?

Mr. Ohlede: It is necessary for me to say that you know the adversary. We have to stand against both forces, but we are limited and we have to begin with one of them and it is up to you to decide which one.

The Vice-Chairman: Mr. Winch.

Mr. Winch: As a matter of fact General mine is almost a supplementary now. I have two questions I hope you can give me the answers to. One, as I say is almost supplementary, although you recognize that the military policy and strategy is governed by your domestic and your foreign policy. First to have a strong military as a justification for maintaining your neutrality. You have also said for a defence. Defence means aggression from outside. Do you actually in the back of your mind from a military point of view on defence operate on the basis that in that eventuality you are under the rim of the NATO umbrella and being a democratic country—a Western power country if I can put it that way—I would anticipate that they would immediately come to your aid. From a military point of view.

Mr. Ohlede: My reply is the following: we do not build up and I thought I stressed that very strongly, build up our defence, meaning that we shall get aid from west or east. We do not say that we are under the NATO umbrella. We can say we are within the

nuclear umbrella of both parties. We calculate on the balance of power. I mean, I will supplement that and here we have to consider an attack from one or the other side. We can construct an attack from the south. Who is in the south, we do not know. It can be just south on the map or there can be others in the south that are just sitting there now. They can be from the east in a certain situation, from the west, those who have the real power in the south. You know what it was during the last war when Germany was sitting on the west of us.

There can be all combinations of possibilities and there is nothing which I thought I expressed very clearly that we do not consider morally involved in this security thought. It goes—I can see where some fights for his life when it is east or west. We can be under pressure both from the East and the West. In the north and the south it is obvious we can be. It is only and our purpose is to build up the defence so the west believes definitely that the Swedish defence is so strong that the Russians will not attack Sweden and consequently we have no fear that the Russians will manage to come over the Baltic Straits or attack over the north and vice versa.

The Russians must feel that we are so strong and to our willingness we will defend ourselves so they feel sure that the opposite will not occur. Even in a war situation both powers are fighting for their life or death and must be in a situation where there really is a balance of power so they will not put any forces into an area where it is not absolutely needed for their self defence. That is on the assumption which we build our defence on.

Mr. Winch: Mr. Chairman, just a brief question for purposes of clarification. You mentioned and I think you called it a platform which is capable of reconnaissance, attack and defence. I am not quite certain what that is. Would you mind giving me the details.

Mr. Ohlede: Yes, I talked about the present aircraft which we now have started production on. The Swedish name of this aircraft is Veegan, translated into English it means approximately Thunderbolt. This aircraft is an aircraft, is a platform of the basic structure of the aircraft itself. So we can make this aircraft in three versions. One version which we have already decided upon is the attack version—the strike version and the second version which we have also decided upon is the reconnaissance version of this aircraft.

We have the engines, the body, it is only to change the equipment in the aircraft and made slight modification for such a version. The third version of this aircraft will probably be—as I say the decision has to be taken in 1971 on this. It will probably be an air defence aircraft—the interceptor.

Mr. Winch: Its basic composition is adaptable to all three and I presume it must be...

Mr. Ohlede: And it is the third generation of JET aircraft which we have succeeded. To give you a figure of the development costs of this aircraft, if you want to hear that figure. It is a very high cost when we talk of a little country like Sweden, but internationally it is a very very low cost. So when Englishmen were over here and I gave them the cost, they hardly believed me. And, also the Americans have a very difficult time to believe the cost. But it is definitely true what I said to you now, definitely true. That it costs us \$1,700 million Swedish kroner to develop this aircraft and the production is now started and is, I should say, the first really modern aircraft in this area which is flying in the western world today.

The Chairman: Well that is the end of the first round of questioners, we have two more on the second round but I would like to advise the Committee that we have possibly 10 minutes of fine slides that we can look forward to and I ask that on the second round of questions that you be brief if possible. Mr. Harkness?

Mr. Harkness: There are 2 questions I would like to ask, one which is really a follow-up one. We have found in Canada that our research and development costs for the more sophisticated modern weapons is getting beyond us and my question really is, how do you manage to keep your costs down for research and development for something such as this jet aircraft that you have been talking about.

Mr. Ohlede: Well, to this aircraft, first of all I must say the following: First of all we had good technicians, of course, the second is, which I think is very proper and correct to state that we were helped from the beginning with our limitations, if you understand what I mean. Limitations and capabilities and limitations in money and consequently we did not that is to say dream for the moon, that is, what we consider will be the possibilities of Sweden to develop. And if by some other

project abroad, in my opinion has possibly tried to reach the moon, well now they have reached the moon, but this is little—and they are not defeated and I think a realistic view means one thing and I also say that traditions, a very good tradition in Swedish technology in the field where we have built aircrafts a long time ago and done more or less of a continuous program with highly skilled workers and scientific people, has lead to this and then I must add we have had a share of, very, very good luck as well and that, touch on wood, that is probably the one thing which has helped. I mean the conception of a vision is the construction, it was unique in one way and also the biggest is a double wing. Well I must say that the future is a little bit cumbersome, we have to really look into this, if we can continue with these high costs. But I would dare to say here that we can or that we cannot, put that is my answer. It is cumbersome in this field and there is one thing more which I want to add. When you talk about the basis of production, it has always been the trouble in our general industries, of course today. Sweden is a small country and it cannot produce cheap because it cannot have the long series of production. But if you see the number of aircrafts down here, you can see that we do not have the short series of production. We are, in fact, almost in the group being the third in the world in production of aircraft and so we have had a long series of production and we have—this is a typical example, where we say try to make a platform for three purposes not to split this so we have kept up with that.

Mr. Harkness: My other question was, what are you doing, if anything in regards to chemical, and bacteriological warfare?

Mr. Ohlede: Well it is a very difficult question in many ways. But I would say the following that there has been much talk about chemical and bacteriological warfare but a fact, if you go back in history, a lot of these chemical things although there has been bacteriological things has been worse now than ever before but it was not really used as you say in the second as in the first world war. It was not used in the second world war and it is not, in my opinion, considered really to be used if, God forbid, there should be a third war. Because the risk for the other side, a realistic risk, and therefore I think they would hesitate indeed to start such a war and, in the escalation principles I do not find where this escalation would come in and cer-

tainly not in connection with Sweden because if there should be an attack on Sweden this very territory or for strategic reasons and no one as I said and we feel will have Sweden, want Sweden, it is just in the strategic sense they want to acquire and I think that it would be a very, very unrealistic war, if they do this, all right, but we have, I would like to add, we are working hard between what is the name, protection act in our scientific laboratories.

An hon. Member: In other words, sir, whatever I say, you will carry on and this is why you are building in a defensive nature.

Mr. Ohlede: Definitely defensive.

An hon. Member: Mr. Chairman, we spoke earlier on in the day about peace keeping duties and we have been associated with Swedish forces in peacekeeping duties many, many times and, the point has often occurred to me that when we go in, I would just like to put this question to our host. That when we send, when the United Nations send peacekeeping forces to separate regions really you—solve only one half of the equation, the second half is how do you get out of there, and I would think that the time has come when people who have, such as our two countries, have the experience in taking part in peacekeeping operations, should sit down and consider this problem whether there is some economic way out that we should commence as soon as we get into such an operation, or perhaps something else and I throw this out just as an idea because it is a long way when we walk in there. We do not know how long it is going to take and we really do not seem to have any plan of getting out.

Mr. Ohlede: Well, I can answer this question a little more sophisticated. Of course, someone is talking of war and when we do not know how to come out of it that has been the trouble in many cases. If we can go on preventing a war and we feel that all right, it will be difficult to come out of it. This is in my opinion a less concern. We can remain for 1, 2, 3, 4, 5 years and you know the situation in the United Nations that even if it is basically healthy that policy that all other nations not participating should pay for this. You know as well as I that they have not got paid. They have got some paid but not to the fuller extent. But I think that—I do not think first of all quite honestly that we can sit down and write under which circumstances we can jump out of it. We can sit down and write

down rules when we can jump in that possibly is all right, but we cannot write rules when to strike back with our forces, and this is a difficult problem but I think it must be handled in the United Nations together with the United Nations and not by a separate country. Of course, I must say both Canada and Sweden and all the others have of course the right to take home their forces whenever they like, that is always one of the requisites before we enter because, the political situation may change so rapidly that we do not feel that it is in the interest of peace, or in the political situation of the world that will remain there with our forces as you might well understand. But, all right, I do not think we can write rules when to take them out.

An hon. Member: I think, Mr. Chairman, I would not like my question to be misinterpreted as there is no one more in favour of the United Nations peacekeeping forces than myself. What I had intended to suggest was that perhaps with the experience we have now had, it might be a useful exercise to sit down and see if there were not some constructive measures that we could take as we go into a country to try and create and help create conditions which would make it over a long time easier for us to withdraw.

Mr. Ohlede: Well, it may be an idea. I think that it may be an idea and I think it can be taken up by Sweden or by you or we can discuss it. There is you know possibilities of a Committee of the United Nations which can take this up. I can guarantee you that if Canada put it into constructive means it would be considered by Sweden and we will take part in the construction itself.

The Chairman: Thank you. We can go on then now with the next subject. Major General Ljung will present the slides that he has.

Major General Ljung: Yes, we have the slides, to show if you are interested about our modern Swedish forces. Here you have the anti-tank missile. It is in service with our armed brigade. It has a range 400 to about 2,500. It can be carried by one man and it penetrates about 20 inches. It is sold to Switzerland. Here you have our most modern anti-tank weapon. It is the light anti-tank weapon, and is entering service as a squad of anti-tank weapons in our brigades. It weighs 6 lbs., its firing range is about 200 yards against moving targets. The minimum is the short weapon with a high explosive hand grenade.

Our modern main tank is the S tank. It is developed and manufactured in Sweden.

It is entering service with our armoured brigade. Its weight is about 86,000 pounds. Its armament is the 105 millimeter high velocity automatic gun and the machine guns, and its crew is only three men.

An hon. Member: Who are the three men?

Major General Ljung: One of them is the chief of corps, one is the driver and one is the operator of the guns but that is the best concept of this modern tank. Everyone of them can operate all three duties from his place. The same person can drive the tank and can fire the gun. It is an automatic gun therefore you need no loader for it.

Mr. Harkness: You have 360 degrees of traverse with this gun? It is a fixed gun?

Major Gen. Ljung: It is a fixed gun. Forgetting the low silhouette and forgetting the highest possibility to protect against shot, you have to have a very very low silhouette and you have very flat armour in it, and for special work you have to have a fixed gun and you have a system directing the gun which is done by levering or lowering the whole (car).

Mr. Harkness: How do you hit your target if the car is moving? As an old gunner I look on this with suspicion.

Maj. Gen. Ljung: You can see you have a Centurion tank and you have an "S" tank and I suppose if you are a gunner—and if you are an old gunner and you are a thousand yards in that direction which target will you hit first—the Centurion or the "S" tank?

An hon. Member: There is no question about that!

Maj. Gen. Ljung: The thing is that the whole vehicle can move around as quickly as you move the towers and you can adjust the gun and you also have a longer gun which will give you a longer shot and you can move exactly as you move a Centurion tank—you move the tower—the whole gun and the tank can be driven as far backwards as forwards. It does not matter. There is just one limitation you cannot shoot with the gun while you are driving. With a Centurion tank you can shoot when you are driving. You can do that with the "S" tank but the velocity of the direction is the same as the tower tank.

Mr. Harkness: How fast is the tower tank?

Maj. Gen. Ljung: It is 30 miles per hour and the velocity afloat is 4 miles per hour.

Here you have our modern armoured personnel carrier. It is developed and manufactured by Egmont. Its weight is about 30,000 pounds, its armament is shown on the slide.

Maj. Gen. Ljung: Here you can see our modern self-propelled 155 guns, manufactured by the force which are in service. Its weight is 110,000 pounds. The gun has a calibre of 155 mms, is automatic with 14 round magazines. Its firing range is about 15 miles and its firing rate is rather high.

Here you have our other carrier. It is in service with our brigades in the northern part of Sweden where it is an extremely good cross-country vehicle and its mobility is most valuable. Its weight is about 9,000 lbs. Its carrying capacity is 1,800 lbs or eight soldiers. It has a towing capacity of a mortar and an anti-tank gun or about 15 skiing soldiers. Its velocity on the road is 25 miles an hour and up north its velocity is 1 mile per hour.

It floats without special preparations. It has been sold to Norway and to the United Kingdom. This shows our transceiver radio set, a lightweight radio used in our brigades and our reconnaissance units. Its weight is only 15 pounds. Its range is about 8 miles and it operates with nearly 1000 channels.

Commodore Lindquist: We have during the last years ordered the building of submarines, torpedo boats and minesweepers. We have also bought helicopters and we have under construction a mine-layer which is a submarine shape. There are submarines which are under delivery, we are building five of them, three are delivered, two will be delivered this year. The submarine has a submerged displacement of about 1,100 tons. It is armed with torpedo tubes of 21 inch size and it has conventional diesel electric machinery, that is in every respect very modern. This is the latest torpedo boat.

It has displacement of about 200 pounds. It is armed with six torpedo tubes, 21 inches, and has an aircraft gun of 57 millimeters. The boat is driven by three gas turbines with three propellers and has a speed of about 40 knots.

We are designing a new type to this but with a more modern gun. Now there is another picture of the same boat. These torpedo boats have very good maneuverability and very good sea thickness.

We have built 12 minesweepers of this model with a displacement of about 315 pounds and a length of 145 feet. They have been in wood with laminated parts glued together in order to have a light hull. All equipment is made of anti-magnetic material to a large extent. The main machinery is not 100 per cent anti-magnetic but they are of a good design.

The Swedish board of shipping and navigation is building an ice-breaker of this size. She will be delivered this autumn from a shipyard in Firth in England. She has four propellers together with 12,000 horsepower. Some of our destroyers are armed with ship to ship missiles 508 and this map shows the installation on board. It is a homing missile constructed by France and manufactured here in Sweden. It is a long range missile and we are now interested in missiles with a range of about 50,000 metres intended for smaller ships.

Though I have no slides of it I may mention that for the new series of the torpedo boats we are now constructing a 57 millimeter gun with a firing rate of 200 rounds per minute. Our torpedo boats and also our destroyers and submarines are armed with two types of modern torpedos. Mark 61 which is a guided torpedo and Mark 41 which is a homing torpedo. Type 41 is also intended to be used from helicopters.

I now pass to artillery where we have evidence of various capital labours in fortifications and also in mobile installations. Our light coast artillery is now modernized. We have 7.5 millimeter guns in fortifications, specially constructed to resist the effects of nuclear weapons. The 508 is used in the coast artillery as well as on board the destroyers and here we see the missile and its launching ramp. The coast artillery also uses small guided missiles of the types SS11 and SS12 from France.

And I will pass to Major General Oeliden, Air Materiel Department.

Major General Oeliden: This aircraft has a very high speed at low levels. It weighs about 12 to 15 tons and the thrust of the engine is about 6,700 and with an afterburner of about 12 points. It is a single seater and it has got rather sophisticated equipment to help the pilot with his navigation and for his shooting with guns, rockets and missiles. We have the cunard wing to get very good aerodynamic effectiveness and to get low speed and good

handling during landing and even during the sonic region. We operate from a short radius and will be stressing the short take-off and landing. We even have a rather unique system for stopping even when the runways are slippery. As you see we have used the same double configuration. Then we have armament and I will show you some of it later. This is a missile, of low altitude and mostly for ships. This is a missile from aircraft to ground targets and it is steered by the pilot. This is the brain in the aircraft. It is a digital-computer and it is the pilot for all things, calculating the course, the fuel consumption and so on.

There is some more representation. It is the radio equipment and navigational equipment. This is the rocket part.

For this fighter aircraft, we started development in 1955 and ceased production in 1960 and then we have developed the weapons system from rather simple fighter equipment until the last version which is equipped with missiles and good radar and site equipment. This is the main fighter in the Swedish Air Force. This is an integrated display U35.

And now we have a trainer version, it is a 105. It is a twin engine aircraft and its main purpose is for training the pilots. They will only fly about 25 hours in the prop aircraft, after that they go on to the jet aircraft for the training. We can have some with missiles, even guns, and then we have the reconnaissance version with cameras. Then to complete the system we have a rather good I think air defence system with radar and all that and from centres to lead all the aircraft systems and the missile systems too. If it will interest you, we have some pamphlets we can give you afterwards to know more about this aircraft.

The Chairman: Well, that will conclude this afternoon's proceedings. I would just like before we close to thank you Mr. Ohlede and Mr. Dahlberg and Major General Ljung, and your assisting officers, very very much indeed for this very fine presentation that you have given us. It certainly added to our education and you have left us, I think, rather gasping with the amount that a small nation such as Sweden can do in the realm of independent defence. Your manufacturing techniques must be magnificent to produce all these weapon carriers that we have seen produced on your slides. Thank you very very much.

Mr. Ohlede: Thank you. I will only add that it has been a real pleasure for us to be here

with you and I regret very deeply that your stay here in Sweden will be so short. It should have been a very great pleasure for us to show you part of our defence plant and also the manufacturing processes, and to see how our interests are met there, but I imagine your time is unfortunately so short that you cannot do this. However, before you leave we have some pamphlets here which you can get. First of all we have the Swedish produce, the total Swedish produce in all branches in English, and you can read there especially about defence but also about other parts of Swedish produce. We have here also a pamphlet "The Total Defence of Sweden". You will also find some pictures with our equipment for the Navy and also an explanation of how we can go as you know into the rocks with our Navy. And we have also other papers written in the French language which can be delivered. I hope you will read it and I think you can get some new information about us which we did not have time to give you here.

The Chairman: With respect to the Swedish budget, we have only 12 copies of it so I would suggest that we give them to our clerk and any party that wants a copy ask him for it. Is that agreed? Well if there is no further business let us adjourn.

Roserberg, Sweden,

Tuesday, March 18, 1969.

Mr. L. Sundelin (Director General, Civil Defence Department): To Swedish people Canada is a country of resources, all the abundant richness of the land with a people full of daring. I imagine that Sweden as a country to most Canadians is a country of a long-forgotten phase of Vikings, of a history which is not much past the 17th century and people who are unhappy to the limit of suicide, until they settle down in Manitoba or Alberta. It is a pity that you do not give us an opportunity to show you a little more of Sweden. Could it be that such a short stay as this one which is in Sweden should be called a French visit. Anyhow, we are happy to see you here and we are very anxious to make this short hour worthwhile and Mrs. Lindstrom will start with a briefing on the outlines of our organization and system. You have one hour for questions and we have a meal which I certainly hope you will not compare to what the Ambassador gave you yesterday.

20553—7

Mrs. I. Lindblom, First Secretary: Civil defence in Sweden has as in all countries short traditional background. We can look back on only 30 years of activities, but unlike other countries, with first-hand experience Sweden has continued since 1937 with its uninterrupted civil defence work. Civil defence is led from the civil defence administration. The Board is responsible to the King in Council and specifically to the Minister of Defence. The administration underlines in its declaration of policies that its organization is civilian and humanitarian. That its main thought is to protect and save human lives and property, no matter if the country is attacked by conventional or nuclear weapons. We believe that if civil defence measures fail, even the strongest military defence will be without meaning. Our goal is to construct a civil defence system that would make an attack upon our country more expensive than profitable, that it would maximize the cost of an enemy. Swedish civil defence is basically built on three components. Shelters, evacuation and rescue, in other words in the widest sense.

Shelters and evacuation are aimed at reducing the impact of enemy action through passive prevention. Rescue implies subsequent active intervention.

In Sweden we are lucky to have both granite and distance. We are at liberty to form our protective policy with the knowledge that both of these closely interrelated components, shelters and evacuation can be given full consideration.

The name of the shelter program is Standard Shelters. These shelters are built in all new apartment houses of more than two stories and the obligation applies to all cities and towns of more than 5,000 people. Besides these shelters the law obliges sector units, schools, hospitals and municipalities to build shelters according to specifications.

For the last ten years Sweden has had and still has an additional shelter program in operation. I am referring to rock shelters for the central parts of our 14 largest cities. These rock shelters were originally planned as a substitute for standard shelters in central parts of large cities where the buildings were so old-fashioned and easily wrecked that standard shelters were deemed dangerous. But now the situation has changed. All city planners are re-building the central areas so quickly and giving them such resistance that standard shelters will from an economical point of view be the option. Also in order to

keep the decision for a wider choice between extensive evacuation and shelter occupancy, the establishment of the obligation to build standard shelters in the centre part of the 14 biggest cities seems to be a necessity.

Should the administration deem it to be necessary, they will approach the government to re-establish the requirement of including standard shelters to be built when new houses are constructed in the central parts of the cities.

The evacuation planning is drawn up in detail. Evacuation towns are divided into suitable sectors. Housing areas have been investigated and evacuation centres have been planned and the training of personnel is going on continuously. The public is informed in our telephone books and pamphlets and through voluntary courses in self protection. This picture shows the evacuation plan for one sector and it is found in the telephone book for the people living in that region. Most evacuees will be accommodated within 10 to 30 miles from their home town. Only evacuees from our three largest cities will have to travel up to 250 miles.

Here we can see where the people living in Stockholm will go in case of evacuation.

Permanent quarters will be provided mainly in private houses. Fundamental prerequisites for successful evacuation are the will and capacity of the individual citizen to do things for himself. To take initiative and independent action and to be ready to help others. He will if possible arrange for himself, his upkeep, transport and billeting. He will use his own car. Families are to keep together as far as possible. School children evacuate with their relatives. The evacuation planning affects 3.8 million people, almost half of our population.

Let us now come to the question of evacuation policy. Our policy is intimately interwoven with our shelter policy. The government's position of assignment of funds for shelter building is to a large extent influenced by its appraisal of the accessibility or existing plans for evacuation. And on the other hand, freedom of action, perhaps the most valuable asset in time of war is greatly enhanced if the government is in a situation that they can differentiate their decision in accordance with the shelter situation. In both the living and the receiving end of the evacuation line. Here we touch the mainspring of our evacuation policy. Complete flexibility in all possible respects. The plans themselves call for com-

prehensiveness. They must be complete to be able to offer the implementer the benefit of choice, but in no way do the plans expect the responsible authority to give any automatic or immediate concurrence with the formed plan. This must be emphasized as misconceptions have crept in here and there. The evacuation plan does not mean that half of our population automatically must leave their homes in case of war. The plan means instead that freedom of choice is given, from a lesser order to move certain categories from the centre parts of the town to an orderly execution of this evacuation. It may concern only one province or spread over the whole country. It may in one place be the question of a fluctuation because of fall-out. In another recommendation it may be to begin voluntary evacuation.

Shelter space is more than sufficient for a population after preliminary evacuation, but only 60 per cent can be sheltered at present before such an evacuation. As shelters based in urban areas increases stress on evacuation they may decrease. Another important factor in our policy of maximum freedom of choice in evacuation in rural areas. As yet no obligation lies on the population outside towns of 5,000 people to build such shelters. Nevertheless civil defence now provides the government with the authority to decide which preparatory arrangements should be put into effect.

The third main component of our civil defence is rescue. Time does not permit that I present these particulars. On the whole it corresponds to similar organizations in other countries. Personnel necessary to man the organization is recruited by compulsory enlistment in peacetime. This comprises all citizens, men and women between 16 and 65 years of age, health and physical strength permitting. This may sound as though recruiting was an easy matter, but it must be borne in mind that the other branches of our total defence, that is military, economic and psychological take their big toll, especially of male ingredients. A large group in civil defence are men who have passed the upper age limit for military service, 47 years. Smaller groups are those exempted from military service or granted respite as well as conscientious objectors. About 20 per cent are women. Exempted are women taking care of children below 16 years. In practice we enlist women between 26 and 38 years. A special group are those enlisted in the regular mobile columns.

They will use only transferred military personnel, conscripts, about 35 years, with basic military training and certain categories of officers with voluntary enrolment.

The administration faction gives binding directions to the provincial government. In war time a new authority would exist, 24 provinces are grouped into six co-ordination areas with one of the governors acting as regional civil co-ordinator. He co-operates on the same level as his military counterpart. On the local level our country is divided into a hundred civil defence areas, five to six to each province. Each area is led by a controller responsible for all activity in the area. Both the co-ordinator and the controller are designated in peacetime and given proper training. The controller has at his disposal six services, command, rescue, fire-fighting, ambulance, constabulary and guard. These are local services. On the regional level there are three types of units, the mobile columns, the volunteers and those specialized in rescue work. They are located for action near certain cities in case of calls for outside help. Groups from the voluntary air force will be used for reconnoitering, supervision of traffic, fire-watching, indicational radio activity, transport and communication service. There are 28 such groups. Twenty-one sanitary platoons will mainly be used for supervising sanitary conditions among refugees. I said before that this organization is a civilian and humanitarian organization. We have in our services only one group of men who are armed and that is the constabulary service. They will be taken over by the State Police Force soon.

This picture shows how many people we have in each service.

As I said before, the Civil Defence in Sweden is a young branch of our total defence system, only 30 years old. To begin with, emphasis was mainly on gas protection, latterly the concept spread through the nation that civil defence was not merely an egotistical question of personal self-help but a necessary organization covering many aspects of our community. During the war we grew to a rather over-burdened organization with 800,000 people put through training of some sort. After the war there followed a long period of continuous activity. The aims of the civil defence organization however were not clearly defined and as a consequence it had mushroomed outwards and perhaps should have been let under the responsibility of other authorities. A parliamentary investigation

was initiated in 1953 and put forth its plan in 1958, and it was adopted by our Riksdag the year after. The aims were now more clearly defined as the eventual tendency was to cut down the organization and make it more effective. A measure of this concept of quality instead of quantity can be seen in the fact that personnel was cut down to half but the appropriated funds were doubled and are now four times bigger. All these new activities were begun in 1961 with a ten year plan for its completion in view. Funds have not been outcoming to a full extent, but have been quite acceptable and we now stand more than half-way with 4 or 5 years left before the plans can be fully realized.

It is self-evident that the responsible authorities do not sit back complacently awaiting the completion of a ten year program according to plan, on the contrary, constant analysis is being carried out at the various levels of different kinds of things that can affect the structure of civil defence. The future policy includes changes in the rescue and relief units, strengthening of the emergency alarm system, and of that proportion. Evacuation has just been revised, shelters will probably have to be built according to stricter criteria especially concerning the nuclear protection.

Re-introduction of the obligation to build standard shelters in central parts of the major cities is, as I said before, being weighed. Individual protection in the light of new chemical warfare must be substantially increased and supplemented by an effective detection and warning system. Gas masks should be accumulated for the whole population.

One method in the works to achieve this is the new way of application of grants that will be used for the fiscal year of 1971-72. The King in Council has enjoined that civil defence as well as other total defence authorities create the basis for a better balance within the total defence. This new basis should also give the government a bigger freedom of action and a better instrument for the long term development of total defence. The budget system now in force is to be considered more or less as an expense and cost budget. The new system is a budget aimed at civil defence as it progresses, that is a performance budget. This implies that today's 15 traditional grants will be replaced by five programmed elements. These elements are command in war, evacuation, protection for the population, rescue and administration.

The picture here shows reservations between plans in a system of performance budget. For the five program elements the administration shall draw up program plans for the following five years. These program plans are to be considered as a long-term budget which one by one will be transformed into performance budget applications. In addition to the program plans, the administration shall work out a prospective plan for year 6 to year 15. The plan shall be an outline of ideas for the alternative shaping which the defence program can display beside the different levels of the source supply. The prospective plans are to be revised at four to five year intervals, and will be the beacon for program planning. In order to get a foundation for the prospective plan, extensive studies and research will be necessary. In one field this work has already begun. The commission is working on protection for the population. The purpose of this investigation is to study external conditions in the form of conflict aggression and attack from different aggressors which ought to be implemented and to be considered by civil defence. That civil defence is an integrated and necessary complete part of our total defence system is nowadays left without dispute. But it is quite another question to find a valid method of estimating the relative role of civil defence to other components of our total defence. These studies should bring us nearer a definition of what we might expect in a given case of aggression, and the sort of integration of our defence system that would give the optimal effect.

Mr. Sundelin: Now is it time for questions. May I introduce Mr. Orterstrom and Mr. Bergelin, and we will all four of us try to answer your questions.

The Vice Chairman (Mr. Perry Ryan): Well members of the committee we have Mr. Art Sundelin, the Director General; Mr. Bergelin, the Head of Research Department; Mr. Orterstrom, Chief Information Officer; and of course we have Mrs. Inga Lindblom who has just addressed us, and all four are ready and willing to answer our questions. I have Mr. Wahn, Mr. MacLean. Mr. Wahn?

Mr. Wahn: What would be the total cost to all governments in Sweden, that is federal or provincial or municipal governments of civil defence per year, approximately?

Mr. Sundelin: The total expense for civil defence this year is 125 million Swedish

Crowns, that is from the State and then the communities help to pay part of the shelter buildings for headquarters and so on and that will be around 10 million Crowns. Then we have the shelters built in the private houses and that will be about 60 million Crowns. And then the factories have to pay for their industrial civil defence organization, and that will be about I think it is around 6 million Crowns. It is around 200 million Swedish Crowns for civil defence every year.

Mr. MacLean: According to a little pamphlet here there are roughly 2 million urban inhabitants, in 1967 $4\frac{1}{2}$ million. Is there any planning or attempt to direct growth of urban centres to spread them out or have the growth in smaller urban centres or is it like Canada where the bigger the city the faster it grows?

Mr. Sundelin: There are no plans in Sweden in civil defence to direct the people, not at all.

Mr. MacLean: Not in any branch of the government?

Mr. Sundelin: I think it is in some branches of the government, but that is to try to get the industries localized, dispersed. Yes, sometimes, but not for defence purposes.

Mr. Nowlan: I have a question I wanted to ask, but this is a supplementary. Is there an estimate of what the program has cost you in the thirty years which you have been in operation? You got 200 million Crowns this year, I wonder if there is an estimate of what was actually spent on the program while it has been in force, presumably for thirty years?

Mr. Sundelin: I do not have the figures but I think it is about 1,500 million Swedish Crowns.

Mr. Guay (St. Boniface): Members are interested in the financial point as I am, while your government is spending a lot of money and I believe that you are, your shelters are par excellence. I am wondering how effective is the organization and the reaction of the people themselves. That is, I am presuming that your organization is mostly volunteers.

A Witness: Compulsory.

Mr. Guay (St. Boniface): All right. Then what is the reaction in the case of your people in these various areas—How effective is it to their reaction in case of an emergency. Do you, are you satisfied that they are well

aware of it and that they will follow the organization methods that you have?

Mr. Sundelin: I think I can say they will follow our organization and our plans, but perhaps Mr. Osterstrom can say something more...

Mr. Osterstrom: I think that they are pretty satisfied. We are trying to measure opinions continuously and we figure that the population will follow, as you put it.

Mr. Guay (St. Boniface): Do you have any exercises to make an assessment of it.

Mr. Osterstrom: We have had exercises as well, yes. Mainly to try the plan, to control the plan but the population involved has been very loyal I must say and we have had no objections. As a matter of fact you might say that Swedes are as loyal now as when they started by voting themselves into civil defence so long ago and are accepting the program as a whole.

Mr. Ryan: I think he means, have you had any test runs? Have you evacuated any populations Mr. Osterstrom? Have you done it in a small way at all?

Mr. Osterstrom: We have. Of course you cannot—You will never be able, not in Sweden at least, raise money enough to pay a test evacuation of a whole town or a city or something of that kind. But we have tested evacuation planning in Stockholm, in Sweden, in one of the bigger towns as well. And in a couple of other smaller towns and it has all turned out well. We know now that the planning is all right and that the population will stay loyal if needed.

Mr. Ryan: And follow instructions.

Mr. Osterstrom: And follow instructions, yes.

The Vice Chairman: Mr. Allmand.

Mr. Allmand: I was not quite sure if I heard correctly in respect to evacuation. Were we told that in an evacuation, people are encouraged to use their private automobiles and what I also wanted to know, as a status quo do you have some kind of co-ordinated plan to use buses, trains and airlines? And how do you make sure that people who do not have automobiles get proper transportation.

Mr. Osterstrom: People who do not have transportation are instructed to gather to

what we call evacuation stations, which they will. And from there we will transport them by buses directly to the area where they are billeted or to a train and other transport means.

Mr. Allmand: The supplementary question was that if the emergency occurs during the daytime when children are at school and mothers are at home and fathers are at work. What kind of instructions do you give to try and get the family together or do you try and not have the family brought together before evacuating? Do you try and evacuate the children from the schools, housewives from their own districts and the fathers from their working districts? Because I presume in a big city like Stockholm they could be spread out over the whole city.

Mr. Osterstrom: We are planning to bring the families together and we are not believing in an emergency of that kind. The planning is based upon the thought that we get what we call strategical warning in time so that we will gradually carry through the evacuation plans.

Mr. Allmand: You feel you have enough time to bring the families together before evacuating.

Mr. Howard (Okanagan Boundary): Are the shelters hard shelters? Are they capable of withstanding bacteriological warfare? Or are they just for radio-active fall-out?

Mr. Osterstrom: The standard shelters, you mean?

Mr. Howard (Okanagan Boundary): The shelters that we saw this morning and other shelters that you have. What are they prepared to withstand?

Mr. Osterstrom: The standard shelters are built to resist conventional weapons of bombs up to 1,000 lbs. And then we have in the modern standard shelters, we shelter for a little, not the high level, shock from atomic weapons, 14 p.s.i. for the modern standard shelters.

Mr. Howard (Okanagan Boundary): And radio-active protection?

Mr. Osterstrom: It is a balance in the different shelters, working from these atomic weapons.

Mr. Sundelin: I think it something like 1,000 times the reduction of the radio-activity if around 1,000, I think.

And the shelters are gas proof and equipped with air purifiers.

Mr. Howard (Okanagan Boundary): And hat about bacteriological?

Mr. Sundelin: It is just what the shelters give, but I do not think they can take all types of bacteriological weapons.

Mr. Laniel: Yesterday I got the impression that when you spoke of civil defence it was mentioned that it was not passive defence as the way it was interpreted in Canada. Could you tell us really what you mean. This morning you spoke of shelter protection for the population, but that is not the complete portion of your civil defence. Is there not a portion of the civil defence where your non-conscripted people will also defend the land and where they come in as to the authority of the control and all that.

Mr. Osterstrom: No. As a matter of fact the organization and the whole system is as Mrs. Lindblom said humanitarian and all personnel will not take part in fighting whatsoever. May I add that, as Mrs. Lindblom also said, but to make it clear, the only part of the organization which is armed is the so-called civil defence police forces. What would you call it, the constabulary and guard service. But we have been fighting for years and years to get rid of that task but still we are hoping and we have a basis for that, hoping that we will get rid of that part of the organization and thus be peacified, or what is the word, altogether.

Mr. Buchanan: Mr. Chairman, I think in Mrs. Lindblom's chart she mentioned within towns of over 5,000 apartment buildings and factories with 25 employees or more must have shelters constructed in them. Now, are the costs of constructing those shelters a cost which must be borne by the owner of the apartment building or the owner of the factories or do you have some program whereby someone else assists in the construction costs?

Mr. Sundelin: The household owner has to pay for the shelters.

Mr. Buchanan: No subsidy at all from the government?

Mr. Sundelin: No. But they take it into account when they are renting out the flats.

Mr. Buchanan: What about private homes?

Mr. Sundelin: We have not been doing this in one-family houses. It has to be an apartment house with more than two floors.

Mr. Buchanan: And now I gather from the chart roughly half of your population is in shelters, is that correct?

A Witness: That is correct.

Mr. Buchanan: So that your hope is that over the next ten to twelve years, a quarter of a million a year should accommodate them all.

Mr. Osterstrom: As Mrs. Lindblom said, we are building shelters in all cities with more than 5,000 inhabitants and in some smaller cities. But we are not building shelters out in the countryside. As we today have about 3.5 million seats in shelters that is in cities with more than 5,000 inhabitants and that means that they have shelter space for more than half of the population in the cities.

Mr. Buchanan: What about people in the country? Do they...Is any provision...

Mr. Sundelin: We have some plans for constructing in time of preparedness, to construct fall-out shelters in the countryside, yes.

Mr. Nowlan: You do not have a program on the type of structure that should be built or is someone instructed to go around and inspect it.

Mr. Sundelin: Yes.

Mr. Harkness: My question is sort of a supplementary to this one. Do you have any form of protection for livestock and food supplies stored in the country? Apparently you have no shelter program for the farm population. Is there any program to protect livestock and food?

Mr. Sundelin: That is not in the civil defence program in Sweden. We have a special administration for what we call economical defence and they are responsible for food and for material for the industries too. They have some stocks of food, a lot of stocks with different kinds of material for the industries. Some of the stocks they store are in the country too.

Mr. Harkness: I was thinking of your milk cows and things like this, you see. To protect your milk supply. You have nothing?

Mr. Sundelin: No. No shelters.

Mr. Legault: My original question has been answered but one thing that was brought to our attention this morning was the fact the public shelters are used as garages at the moment, and there is a charge. Now, financially speaking, is there any relation in the rents or the moneys received as to the payments of the expenditures of those shelters?

Mr. Sundelin: Oh yes, yes. No shelters are built by the community, you see, it is built by the City of Stockholm and they have got money from the State for this construction, 2/3 of the cost are paid by the state, but it is not 2/3 of the total cost, it is 2/3 of the cost for the shelter building after we have reduced this cost with the peacetime equivalent of the shelter as a garage, and that means that the City of Stockholm can rent it out to a firm and take the money they get for this shelter and use it for themselves, it is not for the government.

Mr. Legault: They pay 2/3 of the deficit, in other words?

Mr. Sundelin: Yes. For the peacetime use it amounts to 5 million, so we pay 10 million and the community 5 million.

Mr. Laprise: I am going to ask my question in French, I believe.

With regard to the training you give the personnel, is this training of use in the case of other disasters, such as fire, and would it be useful for giving first aid in cases of accidents and things like that?

Mrs. Lindblöm: Yes, we have two other kinds of training: we have some people who are trained in civil defence work, and others who are trained on a voluntary basis. All those who have had life-long training can be employed in time of peace. However, we do not call on these people in cases of fire or...

An hon. Member: Disaster.

Mrs. Lindblöm: ...disaster, no, they are not involved in such cases.

Mr. Laprise: Are they trained to give first aid to the wounded?

Mrs. Lindblöm: Yes, some of them are trained for that.

Mr. Brewin: Mr. Chairman, I was interested in the answer given to the question of one of my colleagues, that the evacuation plans

would take some time and it was anticipated there would be advance I think the word used was "strategic" warning. Now I was wondering how long that warning would be, and I was wondering if it was anticipated how long the process of evacuation would take and whether it was realistic to anticipate that any adversary would presumably be fairly close to this country, not a great distance, would give any strategic warning knowing of your plans. If they would not take advantage to launch a surprise strike if they were contemplating an aggression on Sweden.

Mr. Sundelin: We are not planning for an isolated attack against Sweden, and we do not believe in such an isolated attack. We presume that if there is a war that Sweden might be involved. It will be on a much much bigger scale and so we are aware of certain evacuation planning. This is just for instance say in Germany they are going to bomb, you might ask the Germans what they are planning for taking people over to Holland for instance, which is one of the very interesting details in the German plan. The Russians have got plans of the same kind, and so have other countries. If it is going to be a war, other countries which are more interested in that war than we are have got we presume to secure their population first and that will be probably months before anything really starts. That is one of the basic factors in our planning that we should be observing international affairs and what is going on in other countries be able to judge the situation to come. We can say to ourselves, all right this is the moment, now we have got to start, if not more but to start just to show that we are able to carry through what we have been planning for so many years, and to show that we are taking this training seriously. That is a thought which in the United States also has been planned whereby the United States might evacuate part of cities or part of areas just to show that this is possible and that what they want, what they are talking about on the international theatre should be taken seriously.

But our plans for mobilizing the civil defence organization say that our organization, civil defence organization can be mobilized in six hours most of it from now and the whole organization can be mobilized in 24 hours. There could be mobilization of the giving of alarm on the radio and on the usual radio net, and the part of the organization that has to work with the emigration, this part can be mobilized within six hours and

the emigration can start in six hours if it is necessary to start it so fast, we do not think it is but our preparedness means that this is possible. Our shelters are used in peacetime as garages or for other purposes but the standard shelters they shall have the preparedness to be used as a shelter within 24 hours. What is in the shelter in peacetime shall be taken out and it is necessary to have food and water and beds and other things in it and that must be done within 24 hours. That is our plan. The big public shelters that you saw today shall be prepared as a shelter within 48 hours, equipped with what is necessary as a shelter. It is very fast to take the cars out but you have to take in the beds and some walls you have to set up and so on.

Mr. Forrestall: Yesterday, Mr. Chairman, we heard that there had been not an awful lot of interest in this program on the part of the people of Sweden up until about two years ago when there was, if I remember the word, an intensification of interest. What caused that, what happened two years ago that all of a sudden brought about a realistic interest or this tremendous interest in civil defence in your country?

Mr. Sundelin: I do not know what it was two years ago but the Defence Committee presented what they had worked out to the government two years ago and at that time it was just a big discussion in the papers and TV and so on, but not only civil defence even the military defence.

Mr. Harkness: But there was no one specific thing that happened.

Mr. Sundelin: No.

The Chairman: Mr. Harkness, did you have another question?

Mr. Harkness: Another question I had in mind was in regard to the special firefighting equipment that you have for civil defence, does that consist of fire engines and regular firefighting equipment which you keep solely for this purpose and which is not used under ordinary circumstances?

Mr. Sundelin: In time of preparedness civil defence take over the responsibility for all firefighting even what we call peacetime fires, and the peacetime fire forces are involved in the civil defence organization, both personnel and material. But added to that we are stockpiling material for firefighting, pumps and hoses and a lot of those things, and our fire-

fighting forces in wartime will be about I think eight times as big as in peacetime, something like that.

Mr. Harkness: You must have stockpiled then quite a lot of extra equipment.

Mr. Sundelin: Yes.

Mr. Nesbitt: My question is very similar to Mr. Brewin's. I would like to follow a little further if I may, the speed at which these arrangements can take place and the fact they can be made in six hours to get us from the original warning time. Has any adjustment been contemplated, or have any arrangements been thought of in the event that Sweden might well be attacked very speedily, as for instance the invasion of Norway in World War II which came very quickly indeed or as seen more recently when Czechoslovakia was occupied, although I realize that is not quite as likely because of the water barriers between any potential adversaries, but is consideration given to this factor that any potential adversary might very likely make a very sudden move on Sweden in order to take hold, or are arrangements made to allow for this possibility.

Mr. Sundelin: I am not quite sure I got the question right, but we really do not think that Sweden will be attacked as the first country in the world, if there is not a war going on somewhere else in Europe or other places. As soon as something happens in Europe, I do think we would mobilize our civil defence and our armed forces too and we would be prepared at that time for an attack against Sweden, but we do not think it will start with Sweden.

Mr. Chairman: Mr. Guay, a supplementary.

Mr. Guay (St. Boniface): I feel that your country are the experts in this particular field. It may very well be that your encirclement formation is the same as what prompts your national defence. But my question therefore is this. We have several witnesses and experts who have come in front of our Committee where they have warned us that the 20 minutes, particularly in the NORAD program, that 20 minutes warning would be cut down to less and even possibly no warning at all of an attack. My question is to supplement what they said and that being the case, surely you must be aware of it that these things can happen and if you are planning so well, surely you must have taken that into consideration as a possibility even though you are a

nuclear nation. And if with all the preparations that you are making and then you do, let us just suppose that there could be such an attack in such a limited time, then surely you must have a measure to cope with the situation and could you explain that particular aspect of it to us.

Mr. Sundelin: I think Mr. Bergelin can tell you just little bit of what we are planning today.

Mr. Bergelin: It is not possible for Swedish defence to be optimum in every case of attack. We have to study the values, kinds of attacks that are possible to Sweden and now in front of a new system of planning we have started up a group for analysis and investigation about their internal and external conditions that may influence Swedish defence policy and planning. The government has directed us to study four cases first hand, but the investigation may take up other questions.

The first conditions we shall study is attack. We shall describe the effect on the inhabitants following the combating of military targets in Sweden in an invasion where the attacker only uses conventional weapons.

The second attack case shall describe the effect on the inhabitants following a combination of military targets in Sweden in an invasion when the attackers may use atomic or nuclear weapons to such an extent they find it necessary for their purpose.

A further attack case shall describe attacks when the attacker tries to obtain political advantages by political means, combined with threats and demonstrations of strength.

And the fourth case shall describe the effect in Sweden from a nuclear weapon in Europe between great powers.

We have a possibility to take up other cases and we think that we shall have some fuse attack cases that may govern the planning and policies for defence and we may have a lot of cases that may make it possible to analyze the situation. Besides these attack cases we expect certain planning elements fixed in ways. That means that we are now studying these problems. We are certain of investigations into these questions, and we will make a plan that makes it possible for Swedish defence to be the best in every possible attack case against Sweden. We cannot forget those blitz attacks. We may have a level that makes us optimal in every possible case against Sweden.

Mr. Winch: Mr. Chairman, I would like to, would not like to, but I am going to ask a very morbid question. In the shelter that we were in this morning I understood that in an emergency it can accommodate 15,000 persons. Now in that emergency you are going to have a great many who suffer from claustrophobia, from hysteria, from shock. I would like to ask, what is the provision for medical assistance supplies and the disposal of the beds? May I just say that I am interested in this because some three years ago I was one of a number of House of Commons members to spend a couple of days in the Command fall-out shelter about 50 miles from Ottawa and there, we all noticed that even then there was a certain amount of hysteria and shock and in an emergency I discovered that they had the accommodation to take care of one person who died. Now that is the reason for my question, because I think it is important for claustrophobia, hysteria, shock, the heart attacks.

Mr. Sundelin: It is a very, very important thing to plan for how to manage such a situation and we have plans for it. The shelter has to be divided into a lot of smaller rooms. You cannot have such a big hole for 15,000 people. That is not possible. It will be divided into smaller rooms. There must be special rooms for sick people. There must be special rooms for the dead people and it is necessary to have a special staff to run the shelters, with a commander, and with people on special posts and in each room in the shelter responsible for just this part of the shelter.

Mr. Winch: How are you going to dispose of your dead, because in 15,000 in an emergency like that you are going to have them, because you need your ice for the purification of the air. Is there any other provision?

Mr. Sundelin: We have to bring them out.

Mr. Winch: Bring them out.

Mr. Sundelin: Yes.

Mr. Winch: If it is nuclear fall-out then—your whole shelter has gone then, has it not?

Mr. Sundelin: No, no. You can go out for a short time, even when you have a nuclear fall-out. It depends on how strong it is, but you can go out for some minutes, some hours, perhaps a day to take it. You do not have to go out very long. You have to bring such things as dead people and other things out from shelters, out, but still underground.

Mr. Anderson: Is it true that NATO forces in these areas stockpile food for over a year.

Mr. Sundelin: No. It is not stockpiled food for a year inside the cities.

Mr. Lewis: There is an economic defence hike and we say yesterday I think \$125 million kroner for one year. I assumed that that was for some kind of arrangement for stockpiling food and distributing food in the case of war. Do you have 125 kroner every year for a number of years or a lesser amount of a higher amount? That is a very large budget for that kind of work.

Mr. Osterstrom: But, that is not only for food, that is for some special things you need in the industry too. And gasoline, and fuel too.

Mr. Lewis: Fuel and industrial materials and everything.

Mr. Thompson (Red Deer): What provision have you made in your overall civil defence program for emergency hospitals, field hospitals, out into where your evacuation has taken your population? Have you provision for that? Do you have emergency hospitals and stockpiles?

Mr. Sundelin: Yes. But in the civil defence organization we are responsible for taking care of the victims on the spot and bringing them to the hospitals. For that reason we need what we call first-aid stations for shock treatment and fixing of broken legs and so on, to bring them after that to the hospitals and the medical board in Sweden is responsible for planning for hospitals in wartime and they have plans and equipment for hospitals, especially arranged in wartime out in the countryside.

Mr. Guay (St. Boniface): Supplementary. Are they in the shelter? The hospitals.

Mr. Sundelin: They are out in the countryside and not in the shelters. We have some rock shelters in some of the hospitals inside the cities. But most of them in wartime will be out of the cities, out in the countryside and they do not have shelters.

The Vice Chairman: Well that is the first round. We have Mr. MacLean on the second round and then Mr. Wahn and Mr. Nowlan.

Mr. MacLean: Is there provision for these people who operate from highly protected underground headquarters—I am thinking of

the government itself, some local governments—and if there is special permission along this line...

Mr. Sundelin: Yes there are arrangements for the government, for the governors of the provinces or the civil defence leaders in the civil defence districts.

Mr. Wahn: What training courses do you have for adults and in the schools in connection with civil defence?

Mr. Osterstrom: In the schools we are giving three different courses, not in civil defence actually, but in what they call self defence, fire fighting, simple fire fighting, at home first aid and what we call individual protection involving evacuation, some knowledge of evacuation, planning, how to behave in shelters and protection against ABC warfare. The population as a whole got the opportunity voluntarily for such self-defence courses as well. We started that in 1961, I believe, and up till now something like 1.1 million people have taken those courses. Of those about 700,000 have taken this course in individual protection.

Mr. Smith (Northumberland-Miramichi): What does the compulsory part of the training consist of? It has been mentioned that some of the training is compulsory.

Mr. Osterstrom: That depends on the training we have been giving the individuals. Now, as Mrs. Lindblom said, we are aiming at an organization of 220,000 people supplemented by 10,000 military conscripts being transferred to civil defence and also by what we might call advance protection, industrial protection, or something like 60,000 persons all together. As a whole this organization will involve 300,000 persons. We take them according to the civil defence law if we need them. We take the individuals we need and we pick them out basically so that we get people with some professional knowledge of the course he or she will be given by us. And they get the training needed to make them fit to carry through their duties.

Mr. Smith (Northumberland-Miramichi): Another supplementary, Mr. Chairman.

The Chairman: Mr. Smith.

Mr. Smith (Northumberland-Miramichi): Do they receive any pay while they are taking the training?

Mr. Osterstrom: They are being paid, yes.

The Chairman: Mr. Nowlan.

Mr. Nowlan: Mr. Chairman, I do not know if this is considered a fair question but I wonder if in the planning and discussion of the civil defence program that the reason there is so much emphasis in this country because of your non-allied status, in other words, if you were allied and thus going to be involved very quickly in any hostilities, would you still be placing as much emphasis on civil defence? Or would you think of it as practical as you do, or do you hope to escape an exchange between two leading powers?

Mr. Sundelin: I am not quite sure what we should do in such a situation in an alliance but I do think that we would pay and do the same in the defence. I do think so and have a look at Norway, it is about the same, I think, as Sweden.

Mr. Nowlan: The only reason I ask the question is that one of your defence officials yesterday did point out that with your geographical position, let alone your status, you hoped to avoid the exchange between two blocks.

The Chairman: Mr. Thompson.

Mr. Thompson (Red Deer): We have not had explained the exact function of the centre as we are in here now this morning. Would you explain that to us and have you other similar centres in different parts of the country?

Mr. Sundelin: Oh, yes. We have five centre schools for civil defence and this school here is one of them. This place just here in this palace is what we call a staff college in civil defence.

Mr. Thompson (Red Deer): Senior staff.

Mr. Sundelin: Yes. And here at one time we take 60 students at this school. We are building a new building here and will take 90 at the same time. It will run the whole year. Then we have another school here in Roserberg too for conscripts for our mobile columns which would take at the same time about 200. Then they have out in the country one school taking 120 students at one time, another for 90 students and one for 60 students. That is the essential schools. Then we have a school also in the provinces too.

The Chairman: Are there any further questions? Well then I would just like to ask a question or two if I might, Mr. Sundelin.

Mr. Sundelin: Yes.

The Chairman: In the 48-hour period that you supply your shelter like we say this morning, what do you put in there? Do you put in food for a certain length of time? Do you put in standard beds? Do you put in air mattresses or sleeping bags or stuff—what is the order of your provisioning?

Mr. Sundelin: We put in food and standard beds and necessary equipment for first aid or for sick people.

The Chairman: From how long a period?

Mr. Sundelin: I think it is for four days.

The Chairman: And out in the country, when you evacuate your populace, do you put them up in temporary sheds that are erected or what would be the nature of their dwelling when they arrive there?

Mr. Sundelin: They will be taken care of in the ordinary homes by the people living out there.

The Chairman: Well that seems to be it then. I guess we can adjourn for lunch ahead of time. Thank you very much.

The Chairman: We are running a little late. We have this morning with us, our Ambassador His Excellency Mr. R. P. Bower and I think he has a few remarks that he would like to make to us outlining background information and other facts and then if time permits we will be able to ask questions.

Mr. R. P. Bower: Thank you Mr. Wahn. First of all I welcome you all to Bonn. I do not know how many or for how many of you this is your first visit to Germany but this is a quiet ex-university city with not a great deal of night life but it is an interesting historical place and I hope you will enjoy your brief stay here. Unfortunately, for you and for us, there is to be a debate in the Bundestag today on foreign affairs and defence. Many of our star witnesses are going to have to be present at the debate. We did not hear about this, we did not hear about the withdrawal of some of these chaps until four o'clock last night so our program has had to be altered rather drastically. It is a great pity because some of the best people, of course, are the ones that are going to be speaking in the Bundestag and therefore cannot be with us today. It is going to impair I am afraid the effectiveness of this meeting. Now we also

thought that it might be useful if instead of giving a rundown on the people who will be speaking to us, after they get here that we should do it now and that when they come, they will simply be asked to stand up when their names are called, so you will know which is which, but there will not be any rundown of their background. We will do that now so that you will know who it is that will be talking to you. If you want to have this information for direction later on obviously you can have it. Now I have to go through this list to make sure of the ones that are not coming.

Dr. Walter Kiep, he is a member of the Christian Democratic Party which is the leading party as you know in the coalition. He is a parliamentarian who has been able to combine an active career in business with one in politics. He has been in the insurance business since 1949 and in parliament since 1965. He has extensive contacts in the United States and he was one of the names mentioned recently as a possible German Ambassador to Washington. He is on the Defence Committee of the Bundestag. He has also visited Canada and he was in Ottawa early in 1968 for talks on defence and foreign policy matters with Canadian officials.

Nor Mr. Peter Petersen also a member of the CDU. He is a trans-Atlantic traveller. A market researcher by profession. He has been in the Bundestag since 1965. He is also a member of the Defence Committee and was in Canada early this year when he had talks with Canadian officials on defence and foreign policy matters.

Now in the SDP Party, Social Democratic Party, Helmut Schmidt maybe. We are very much hoping that he will be here. He is the leader of the SDP caucus in the Bundestag. He is an economist by profession. He was first elected to the Bundestag in 1953. From 1961-65 he was Minister for Internal Affairs in the State Government of Hamburg. He returned to the Bundestag in 1965. He has been a member of the executive of the SDP since 1965 and he is a member of both the Foreign Affairs and the Defence Committees.

Now Dr. Karl Mummer, is he coming?

Yes. He is coming.

Mr. Bower: Dr. Mummer who occupies the position in the SDP caucus which might best be described in English as the Whip. He has been involved in politics in one way or another for a long time. In 1933 he was sentenced to 21 months in prison for subversive activi-

ties against the Nazi regime. He then went into exile. After his return to Germany in 1946 he was active first in the government of the American occupation zone and later in the economic council of the combined British and American zones. He is one of the few parliamentarians who has been in the Bundestag continually since it was founded in 1949. Dr. Mummer is a member of the Foreign Affairs Committee of the Bundestag.

Is Schultz coming? Schwartz?

Yes Professor Schwartz is coming.

Mr. Bower: Professor Schwartz is one of the academics coming. He is Professor of Sociology at the University of Cologne. He has studied in both Germany and the United States. He is a frequent visitor to North America. Last autumn he was in Toronto where he gave a lecture at York University. He has written several sociological works, the most recent of which is an analysis of student unrest in Germany. Besides his interest in sociology he is a keen student of foreign affairs. Wagner is coming is he?

Mr. Bower: Dr. Wolfgang Wagner is one of Germany's leading authorities on foreign policy. He is a Director of the Research Institute of the German Society on Foreign Affairs. He is also editor of the Society's publication *European Archives*. The Society is the German equivalent of the Canadian Institute of International Affairs. Dr. Wagner is also an author. His most recent book being "*Europe Between Awakening and Re-Action*" which appeared last year. In addition he writes articles on foreign policy for various newspapers and periodicals and is a frequent commentator on radio and television.

Now we come to the journalists. We have two here. Dr. Gunther Mugenberg. He is familiar to most Germans since he has been the Chief Correspondent of the West German television for the past four years. Previously he was the Bonn correspondent of the West *Deutsch Alacamanaziten*. In this position he also covered international conferences. He is also familiar with both sides of the Atlantic having studied in the United States. See if Sommers is coming?

Mr. Bower: Well that is the lot. Again I must say how sorry I am that we are not going to have the turn out that had originally been planned. Nevertheless you must not construe this as lack of interest either in your visit or in foreign policy as a topic in Germany. In fact I would say that the average

German is much more interested in foreign affairs than is the average Canadian. He is much better informed. No German citizen is really much more than one hour away from a foreign country. I suppose the most central part of this country is no more than one hour's drive on the autobahn from some foreign country. The Germans next to the Canadians are the world's greatest travellers. Canadians are by far the world's greatest travellers. I think they travel 50 per cent more than the next country which is the Germans. A great deal of our travelling, of course, is done to the United States. But here the travelling is done through France, Czechoslovakia, Spain and even to North America. Our tourist bureau located in Frankfurt organizing package tours to Europe has sold out for the whole of 1969 already. Now this is not cheap. And maybe there should be more package tours. But the fact remains that the package tours that have been organized for Germans in Canada this year are already sold out. They have the largest tourist agency in the world as a German concern. So these people are accustomed, their history is one of relations with foreign neighbouring countries. Not always happy relations but they are much more conscious of the fact that there are other people in the world besides themselves than they are in Canada. In the case of industry, while our exports per capita are greater than the Germans exports per capita, our exports are handled by a handful of internationally-minded concerns, the aluminium companies, the nickel companies, the flour millers, the lumber people. Whereas the average man in the street in Canada is not directly involved in international affairs, at least he is not apparently directly involved in international affairs, as the average German so obviously is. The consequence of this is that foreign affairs problems are of much greater interest to the average German and your presence here is of interest to the people who unfortunately will not be with us today. I do not want you to believe, to think that because they are not present that it is any lack of interest on their part, it is definitely not.

Well, of course, German foreign policy like our own foreign policy is designed to achieve basic national objectives and the basic national objective of Germany at the present time of course is security. They are more concerned about their security than about anything else. Historically they have got good reason to be concerned about this. Secondly, I would say their main preoccupation is the

reunification of their country and they will view their relations with any other country in the light of how these relations will further these two basic objectives. The third basic objective is, of course, the Western European economic community, enlargement of the economic community. At the end of the war the primary German objective was to keep alive. To make a living out of the mess that was left at the end of the war. This problem they have solved. It no longer has the top priority. Their economic problem has been solved. The top priority to the Germans today remains their security, reunification and the unification of Europe. And they will view their relations, as I say, with other nations from the point of view of how these relations will further their basic foreign policy objectives. There is fair unanimity in Germany about what has to be done to achieve these objectives. There are different views on the method of approach but there is not much difference of opinion about the basic objectives themselves. Now perhaps if you have any questions you would like to ask before our visitors come we should start off with those now.

The Chairman: We have until 10.30 a.m. First I would like to mention that we are all delighted that Mr. Bower could be here this morning. He has not been well during the last little while and that was the reason why he was not able to meet us when we came in yesterday. So we are delighted Mr. Bower that at least you are feeling sufficiently recovered to be with us this morning. I think that it may be an effort although you are looking extremely well sir. Mr. Nowlan.

Mr. Nowlan: Mr. Chairman I would just like to ask about what he thought of Germany's aim and that has to do with reunification. Is this still as much of a central theme of their policy as it was say ten years ago? For when you come driving into the city of Bonn and, you know, you see fairly substantial and solid looking structures, I just wonder are these temporary buildings or are they getting a firmer foundation and perhaps getting reconciled to the fact that reunification may still be a long way away?

Mr. Bower: I think no German expects reunification especially after what happened last August to come very soon. It has always been my belief that this is a disappearing problem but the Germans assure me that I am wrong about this. They say would it be a disappearing problem in your own country if

an outside power were to move in and dominate one part of it, take one part of it away, would you ever accept this, would your children ever accept this? Historically they will not accept it and we would not accept it. I suppose that is a natural re-action. If I were a Canadian and this happened to my country I would re-act that way. On the other hand, Germany is a difficult country to define. One of its main problems is that it has never been possible to define what Germany is. Do you define it linguistically? Obviously not, otherwise you would take in Austria, you would take in Switzerland, you take in the low countries. You would even take in parts of the Crimea. It has no natural boundaries such as Italy has a natural boundary of the Alps to the north. It has been one of the major historical problems of Germany. Now there was a time when it was considered inconceivable that the Germans would accept the separation of Austria. This is now accepted. So it is conceivable, I think, that when the current generation of people who knew life in Eastern Germany, who were born there, brought up there or whose parents were brought up there disappear, that they will lose interest in regaining it. At least they are not prepared to go to any great lengths. Furthermore there is an undercurrent of resistance to changing the status quo but nobody feels it is patriotic to say so. For example, if there were unification today, it is almost certain that the C.V.U. would be a minority party because the inclusion of East Germany would bring the Socialists into the picture. It is also certain that the religious balance between catholic and protestants would be upset. This does not mean so much in our country. It still means a very great deal in Germany. A third thing would be that if there were re-unification tomorrow, the burden of restoring East Germany, because it would be a depressed zone, would fall upon the West Germans. There is an undercurrent of people who are quite happy to let things stay the way they are but it is not patriotic to say this and occasionally even politicians come out and suggest that this might be the trial balloon, if you will, to test public opinion.

Mr. Nowlan: Would this be stronger with the younger generation?

Mr. Bower: No, I think it is getting weaker.

Mr. Nowlan: I beg your pardon?

Mr. Bower: I would say it is getting weaker.

Mr. Nowlan: I mean would the feeling of status quo and permanent division be stronger with the younger people.

Mr. Bower: I have discussed this with quite a few Germans and one or two have said, "Well, I will not say it to anybody but you but I think so". They will qualify this with another statement that the extent to which European unity advances will affect their attitude towards it, if they find Germany is an aggressive, progressive, vital, energetic country. It has always had difficulties containing itself within its own boundaries. Right now the problem of Germany is to export to find markets for the stuff it is producing. If you have an enlarged European trading zone, free trade area or economic community, the opportunities for Germany will be greater. If this does not work German energies are likely to demand movement towards the East.

The Chairman: I have now Mr. Forrestall and Mr. Buchanan. Is there somebody else now in that list whose name I did not get? Mr. Forrestall.

Mr. Forrestall: Further, Mr. Ambassador, to the question Mr. Nowlan has opened up. It was suggested to us in Ottawa by one of our distinguished witnesses from Germany that there was a growing feeling that re-unification of Germany would not fully come about or be realized or be a practical thing to pursue with hope until some of the other European problems are cleared up. Would this be a valid impression? Particularly with the Eastern European countries.

Mr. Bower: I beg your pardon?

Mr. Forrestall: Particularly with the Eastern European countries until some of the political problems there...

Mr. Bower: You have talked about the Oder-Niesser line. I do not think any German, Kiesinger himself, has said they ever expect that they will get back the land on the other side of the Oder-Neisser Line. This they accept. What they are saying is that it is not up to West Germany to accept at this time, until there is reunification, any new borders but when that day does come they make it quite clear that they do not expect to move into that part. What I do think they expect now would be to take over what is today East Germany, certainly not the lands which Poland is now occupying on the other side of the Oder-Neisser Line. Is this what you are after?

Mr. Forrestall: More or less except, Mr. Ambassador, without pursuing it because it gets complicated more or less. It was whether or not you had to resolve the German problem before you could resolve some of these other problems lying outside the country or whether the other problems had to be resolved first. It is simply the order of resolution.

Mr. Bower: I think that you could say that the prospects of re-unification with East Germany are nil unless the countries of Eastern Europe are agreeable to it and one of these of course would be a settlement with Czechoslovakia on the Munich Agreement, another would be the settlement of Poland on the question of the Oder-Niesser Line, so that it can only come when relations between Germany and the Eastern countries and particularly, of course, Russia when—the future really lies with Moscow—things have reached a better point than they are today. Under today's conditions it is impossible but it is correct to say it will not happen immediately so Germany has been working on the policy of détente with these Eastern European countries with some success prior to Czechoslovakia. Perhaps it was too successful. They managed to achieve a pact with Yugoslavia and with Roumania but they were moving perhaps a bit too fast and perhaps gloating a bit over Czechoslovakia and this was a setback. Does that answer your question?

The Chairman: Mr. Buchanan.

Mr. Buchanan: Thank you, Mr. Chairman. Mr. Ambassador, one of the reasons which has been advanced to us as being one of the strongest reasons for Canada remaining in NATO is the concern that if Canada withdraws there might be similar movements in other countries, possibly Norway, Sweden and, say, reduction in the American commitment and that one of the results flowing from this action would be that the downgrading in the capability of the NATO forces would so concern the West Germans that there would be a very strong push or drive to secure their own nuclear deterrent. In other words, they would be so concerned about their number one item, as you point out, their security, that there would be virtually irresistible pressure and, of course, the other concomitant to that is that this would so alarm the Russians that we might well be into a real crisis situation. I would be interested in your comment on that line of reasoning?

Mr. Bower: If you think that Germany would be pressed by a Canadian withdrawal from NATO to demand a nuclear force, I would say that is wrong. We do not think that is in the cards at all. It will undoubtedly heighten their concern about their security and they would seek other assurances. I do not think we need to be too concerned about the German desire to go nuclear. What the Germans really feel, I think, about this is that perseverance is what is required. Perseverance and patience. What has become of polio? Whatever became of polio? It was the result of perseverance, nothing else, and their attitude is that we must not let our guard down at this particular moment. We must persevere and they hope that we will be with them in this perseverance. If we are not with them in this perseverance, it will automatically colour their attitude toward the usefulness of Canada to them in all matters because they are committed to solving this problem in conjunction with their allies. Not alone. They do not want to be alone. They do not want to choose between France and—they do not want to choose between France and the United States. They do not want to choose between France and the United States. They want to tackle this problem. This is the main objective, gentlemen, and I think as long as this can be preserved the pressure to go nuclear will not be followed.

Mr. Laniel: In 1964 I was here with the NATO Delegation. We were invited to Berlin and then, I do not know, I really got the impression that the German prime concern was to emphasize the division of Germany, they were put really to shame by the wall that divided Berlin and all that and it seems to me, anyway, to be overdone in the sense that they were more or less asking the world and asking us to look at this problem and be scandalized by it. Do they still give that kind of priority to that problem. You did partly answer it. What are their views concerning the Berlin problem and how far are they willing to go like they did the last time before the elections?

Mr. Bower: Berlin is symbolic to the Germans, to German unity really, I think, and they realize that this also keeps the occupying powers with them. You have British, French, and American troops there, not enough to repel an invasion, certainly, but enough to commit those countries if there should be an incident and they value Berlin as a token of the unification that is so important to them.

Then also, as I say, the commitment of allied forces which is involved there. I think it is rather a pity that the Committee is not being given an opportunity to see the wall and wire. You know, here you are in a civilized country where everything is much like it would be in western Ontario or any part of Canada but you only have to see the frontier at Kassel or anywhere along here or in Berlin, of course, to realize just what an evil, absolutely evil thing this whole separation is. I have done it, made the trip a number of times. I think the most depressing time was when I went to Kassel. I will give you an illustration of what is involved here. At Kassel or nearby Kassel there is more land taken out of cultivation through this long strip that runs around Germany than there is in the whole of Luxembourg. That is the amount of land that is withdrawn from cultivation to maintain this strip. All right, in this particular place this river running through and on either side of this river there is a village that straddled the river... Most of the people on the western side had been baptised in the church that is now on the other side of the river and when I was there an old lady on the western side died and she asked to be buried in the churchyard along with her husband on the other side of the river. Now, they had to go 400 miles to get to that church. You could see the church over there but they had to go 400 miles beyond to the check point, 200 miles down the check point, cross over and come back again. Standing along this road were soldiers with bayonets and anybody who comes within a certain distance—the houses on this side are pockmarked with bullet holes where people have been fired at because they got too close to the front line. You can understand that this sort of environment is not forgotten by anybody who has seen it or anybody who is experiencing it or any person who has relatives on the far side or has this sort of a problem so that it means emotionally a great deal more to the Germans than it can mean to us. This may seem difficult to grasp but if you presume it happened in Canada, how would you react? They regard this as the capital of their country. It is historically the capital of Germany and fortunately it is western, at least part of it is western and they want to keep it there in the hope that from this will grow the unity. I would like to make a suggestion that if any of my colleagues here in the office wish to comment further on this that they should do so. Have you any comment to make on this Jack?

Mr. Wolfgang Wagner: No. I would simply agree with everything that you have said, Mr. Bower. I think that it will take a very long time before the Germans would accept division under present circumstances whereas it might be possible to accept division if East Germany had the independence of, say, Austria and if it were within some wider European federation.

The Chairman: Mr. Laprise.

Mr. Laprise: Your Excellency, I should like to ask you a question that is quite closely related to NATO. In the white paper we were given yesterday, page 14 reads, and I quote:

...a major problem facing the Alliance is that of counterbalancing the difference in political and military importance between the United States of America and the other members.

In your relations, do you believe that West Germany feels a need, or is trying, to increase its military manpower in order to expand its participation in the NATO Alliance?

Mr. Bower: No. It is not my view that they want to increase the Bundeswehr in order to increase their contributions to NATO. They might feel that they had to increase their troops if other countries withdrew to fill the gap. Today the ratio of the Warsaw Pact to NATO forces is about six to one, that is along the frontier, and they would feel that that is bad enough and if there is any weakening here that they should make some effort to fill the gap.

Mr. Peter Petersen: This is related to the question that Mr. Buchanan asked earlier. I agree entirely with the Ambassador. The Germans do not want to increase their military forces if it is avoidable and this is an important element as far as they are concerned in the presence of troops from other NATO countries in Germany. The balance is already in their eyes bad. If there are fewer troops here from other countries then they will have to make up the difference.

Mr. Lewis: I just wanted to know this Mr. Ambassador. You said earlier that if there were unification East Germany would be a depressed area and that West Germany would have to take care of it. It is my impression from reading that the situation in East Germany economically has been much improved in East European terms. I am not thinking in

terms of consumption, of the way in which people live. It is normal Communist practice not to worry too much about that, but it has been my understanding that their economy as an economy is a very strong one now. Was I wrong?

Mr. Bower: You are absolutely right, Mr. Lewis.

Mr. Lewis: In what sense then would it be a depressed area?

Mr. Bower: It has the highest standard of any country including Russia behind the Iron Curtain but this is still appreciably below the German level. It is still the highest behind the Iron Curtain. It has been rising very well but it is still considerably below the West German level so that if it became part of the West German level in terms of the unified group it would be a depressed area but it is still the highest on the other side of the Iron Curtain.

Mr. Lewis: If the economy there is strong and is higher than in other European countries...

Mr. Bower: Other East European countries.

Mr. Lewis: Yes, other East European countries and the economy is stronger and has a capacity for wider consumption if the regime wanted to permit it, if it were less interested in defence expenditures as it is and in what they call capital formation as it is, then why would that be an issue in West Germany, reducing the desire for unification or did I misunderstand you.

Mr. Bower: Well it is a question of the West Germans not wanting to share or to take up this extra burden. It might result in increased taxation or a general lowering of standards in this part in order to bring that up. That is all. It is a selfish motive if you will, but it is a factor which is obviously present. If not expressed it is there.

Mr. MacLean: Mr. Ambassador if you were to take the hypothetical case of NATO being dismembered completely and the Treaty being terminated. This would cause I would think, greater consternation in West Germany than perhaps anywhere else. Would you agree with that point of view?

Mr. Bower: Yes. The danger has to be seen I think a little closer at hand, to be appreciated. The risks of an incident on the periphery I think are frequently underestimated. By the

periphery I mean the Dardanelles or the Baltic. One of Russia's main problems is access to the sea and in both areas in Turkey and in the Baltic these sections are controlled by somebody else. In the Baltic the Russian, East German and Polish forces consist largely of landing craft, marines and rocket-firing ships. There are only 40 miles of German coast on the Baltic. It is impossible to get out of the Baltic by submarine because the Skagerrak and the Kattegat are too shallow. They have to come to the surface. So that here is a vital place in case of trouble. Russia wants to control the Baltic and be able to get out on the sea. To Germany to see that she is out-numbered out there 40 to 1, not 60 to 1, but 40 to 1 in this area, with the Russian East European capability obviously designed to cut across the Peninsula, she wants more than her own forces to help her or protect her against this. Denmark probably is also concerned about this particular aspect with Germany but you can understand that they are in the front line. We are a long piece away but they are in the front line and they feel that if the NATO forces, if NATO were disbanded, the risk that the Russians might move in some small area and try to negotiate from that position, negotiate from the occupation of the Dardanelles, or negotiate from the occupation of the Peninsula and present the West with an ultimatum. Certainly nobody is going to press the button in the United States and send the rockets over if this happened and there they would be in the position of strength. The German argument would be that it is better to have conventional forces to prevent this happening. It is the greatest safeguard against somebody having to press the button.

Mr. Cafik: Mr. Ambassador, numerous witnesses that we have heard have talked about one of the purposes of NATO which is to confine German, perhaps military ambitions that it may or may not have. I wonder how sensitive the German people are to this argument and whether it is the kind of argument that is brought out in the open or only talked about quietly when the German authorities are not around?

Mr. Bower: Oh very much so. It is mentioned by the Germans themselves. They discuss it quite freely. It is mentioned in the papers and it is the subject of constant discussion. In view of their past I do not think they trust themselves completely. Their intentions are very good but they like to have this

additional safeguard. Oh yes, this is not a touchy subject at all.

Mr. Cafik: They are not the least bit insulted by NATO allies talking about the question and treating it as a real thing.

Mr. Bower: Oh yes.

Mr. Cafik: Thank you.

Mr. Bower: There is no shyness there at all.

Mr. Allmand: Mr. Ambassador, yesterday I read an editorial in one of the British papers which implied that because of the election of the new Social Democratic President there would be a consolidation on the right in Germany and probably a re-emergence of the right parties. How strong is the right in Germany?

Mr. Bower: If we are talking about the extreme right, not very strong, nor do I think the election of a Socialist President will have any effect on that group at all. It may mean that your CDU which is the right of centre will close ranks, and tighten up their organization, because they may see this as a threat to them. But if you believe that this is likely to be a stimulus to another Nazi type movement in Germany it would not be that at all. I would not be too influenced by that. One of my colleagues came here and he used to say one of the greatest problems of Germany was the editorial. More people wrote about more things that they did not know about and I would never say that the recent election was a gift to the extreme right wing.

Mr. Nesbitt: Mr. Ambassador, would you care to comment—there is a certain analogy between peacekeeping operations in other parts of the world in which Canada always participates and NATO itself inasmuch as without the NATO forces I suppose there are a number of countries certainly which have so far been able to act as a restraining hand on perhaps the Russian penetration into various parts of Western Europe or indeed perhaps have a certain restraining hand on the revival of militarism in Germany which the Germans might very well be obliged to do for their own protection if there were no other allied forces here.

Mr. Bower: I want to make sure I understand this question, Mr. Nesbitt. You are asking how I think...

Mr. Nesbitt: If you could care to comment on whether you would see any analogy

between United Nations peacekeeping operations elsewhere in the world in which we have always participated and the NATO forces located in West Germany inasmuch as they have actually kept the peace in Western Europe by acting as a restraint on Russian penetration which might well have taken place, and probably would have otherwise, and also at the same time acting as a preventative from the Germans themselves to a very large extent for their own protection and with perhaps consequent problems.

Mr. Bower: I would regard our participation in NATO as a peacekeeping operation and it is rather difficult to distinguish between the effectiveness of one arm with the other. I think they are both effective. If I had to make my choice and this is without the knowledge of all the facts I would think that our contribution to peace in NATO is probably—I mean we can make a greater contribution to peace by being in NATO than we can by being in the Middle East with the Gaza Strip. For one thing I think there are others who will fill the role in the Gaza Strip and there are not so many options open to membership in NATO.

Mr. Nesbitt: Is there not, sir, also a vital distinction between the peacekeeping operation in what NATO does in Europe as far as Canadians are concerned?

Mr. Petersen: In peacekeeping operations we have been concerned with the security of other small areas of the world. In Europe we are concerned with Canada's security as well directly.

Mr. Anderson: Sir, we have heard a great deal about how well-integrated the German officer corps is with the NATO command structure and I think perhaps they have heard far too much about this. How long would it take them to withdraw their forces from NATO, re-organize and become an effective national military force? My personal view is it would take a question of hours perhaps but perhaps you could comment on this.

Colonel Weeks: It would be very difficult to make an accurate assessment of how long this would take because it would depend very much upon the circumstances under which it took place. If it occurred in the circumstances of no outside direct military pressure it would happen extremely quickly because the Germans are very capable of re-organizing them-

selves under difficult situations. We have seen this time and time again. Their present forces—12 divisions worth—are at the moment entirely integrated into the NATO structure so far as their role is concerned, but they are not entirely integrated into the NATO structure in so far as their sources of supply are concerned so from a supply point of view it would not be difficult to achieve but the length of time that they would be then capable of supporting themselves would be questionable without outside assistance. Recently they have achieved or they have started a re-organization of their forces. Previously the territorial defence command which was purely national troops which they had designed to maintain the security of rear areas for NATO operations. This organization which is about 220,000 strong and consists of cadres which are present of regular force people, stores of equipment in central depots would be filled, I would say, within a period of 7 days with reservists to form new units. And, this would instantly increase the strength of the army—of the armed forces from the present approximately 450,000 to somewhere close to 700,000, and this would happen very quickly, I would say in 7 days this could be accomplished.

Now, recently this territorial defence command which was formerly a separate command has been put under the control of the army which they now call Land Forces, so it is no longer a separate component. It is now an integral component of the land forces and this has had the effect of blurring the formerly sharp division between what there was in terms of National forces and what there was previously in terms of what they call the assigned forces. Forces assigned to NATO. The headquarters, for example, around the country have been combined so that the NATO corps commander is also the commander of the territorial troops. He wears two hats. He takes his corps off to fight in case this is required and his deputy retains command of the rear area. Formerly, this was a clear split. This re-organization started on the first of February and is to take place over a period of three years and, not a great deal has happened with respect to it yet except that the territorial defence command has come under the army. This would facilitate achieving what you have asked, that is to say, the rapid establishment of the forces under a separate command. I would say, however, to revert once again to the question of supply that this would be the central problem, that

they could unquestionably supply themselves for a while, that they would very rapidly run out without the support of the NATO main supply depot.

Mr. Wahn: Col. Weeks, could you tell me how secure, in your opinion, are the nuclear weapons maintained under American control on German soil.

Col. Weeks: I would say that they are just as secure in NATO as the nuclear weapons which are held in the United States of America, because they are under American control.

The Chairman: Are there any further questions. Mr. Buchanan?

Mr. Buchanan: I notice in this white paper of the Germans that it is suggested that, the personnel strength for Warsaw Pact division, is generally only two thirds of that of the NATO division. There is no such appreciable difference between the two as regards their combat effectiveness. Now, in other words, is the suggestion that they are able to man the division with two thirds the number of people, would it be just as effective as we are with half again as many people?

Col. Weeks: Well by and large they tend to have greater fire power within a Warsaw Pact division. They have more weapons and fewer men whereas, we plan to have more men and fewer weapons. But, it is totally unfair, however, to make the analysis in terms of any one division because it is what is behind the division that counts in terms of artillery, and in terms of tanks and in terms of the types of divisions that are involved. I do not know what the quantitative strength is, I would have to look at the type of organization to know exactly what there was on each side. But I would think that what is implied and from what you have read is that the fire power of a Warsaw Pact division tends to be greater than the fire power available to a Western division. If you take it on a division, to division basis then it just balances the change in numbers to proportionately—a greater proportion. Yes.

The Chairman: Gentlemen, I am sorry to have to interrupt here, I believe some of the German officials have arrived and since it is now just past 10.30, perhaps we can bring this portion of our proceedings to a close and proceed with the next item after their arrival. We have time for a stretch.

Colonel Weeks: Thank you very much.

The Chairman: Gentlemen, we are delighted to have German officials and parliamentarians with us this morning and I will ask our Ambassador, Mr. Bower, to introduce them to you.

Mr. Bower: Gentlemen, I should say, first of all that we are not going to give a biographical sketch of each one of you because we have already done it. Before you came here we told all the good things and bad things about every one of you, in order to save time, and fortunately, there were no bad things. I am going to suggest that when I mention your name that you just stand up for a moment so that the members of the Committee can see who you are.

First of all, Mr. Walter Kiep, a member of the CTU. Unfortunately Herr Schmidt is not here but we are hoping he will show up later. Dr. Karl Mummer, Mr. Peter Petersen, Dr. Wolfgang Wagner and Herr Muggenberg. I think that is everyone.

The Chairman: You forgot Professor Scheels.

Mr. Bower: Oh, yes Professor, I am sorry. Very sorry, well your name is here, I see it but it has been written over by Dr. Muggenberg, I am sorry.

The Chairman: I wonder then, if I could call on Mr. Kiep to make a short introductory statement, Mr. Kiep.

Mr. Kiep: Gentlemen, it is a privilege and an honour to be here and I must admit though, that I was not advised to prepare a statement but I will try to give you a very brief introductory note which perhaps could lead us into a debate. We have recently had a very interesting and encouraging discussion about the future of NATO and I know that in Canada the question of Canadians participation in NATO, is a matter of great concern and has been the subject of a great deal of discussion in your country.

We have reviewed our policy of the past and we, this is the CTU parliamentary authority, has come to the conclusion that the security of Western Europe and the Federal Republic of Germany can only in future years be safeguarded by a closer cooperation with NATO, and that any weakening of NATO, any withdrawal of forces that are now integrated into NATO would be detrimental to the security not only of the Federal Republic but of Western Europe. We have studied the

policy, or we have tried to assess the policy of the Soviet government at this time, about 10 months after the Czech invasion, and we have come to the conclusion that our assumption would be moved towards more freedom in Eastern Europe and in the Soviet Union would continue gradually, peacefully, without violence and that at the end of this general trend there would be a chance for talks for co-existence in the true sense of the word. We have come to the conclusion that this development will take place in a different form and in a far more dangerous way than we had hoped and anticipated. We feel that the present Soviet administration will definitely tend to suppress any movement of more freedom within the Soviet Union and within their sphere of influence by either police or military methods. That, therefore, assuming that the trend, and that the desire for more freedom will continue, that this would take place underground, so to speak, with the possibility of violent eruptions of military actions, possibly even of limited war and we, therefore, feel that the coming years, are particularly dangerous ones and that it will be necessary to make absolutely sure that the West stands as united in its preparedness to defend itself against any sort of aggression as we have in the past. Then, I also fear, and we fear that under the new doctrine of the Soviet government an invasion of certain territories is still within the realm of possibility namely, USSR, Yugoslavia, Roumania and Albania. And, it is for this reason that we fear that at this point, there is absolutely no sign that we have actually entered an area of co-existence but that we are in the middle of a new consultation out of which we hope to proceed towards a time and a point in our relations with the East where co-existence becomes possibly meaningful, talks about disarmament, which we all desire should become possible. As far as our relations with Eastern Europe are concerned, you realize that we have been advised by the Soviet Union, at this particular time, any such move towards an improvement of relations will be considered a hostile act, by the Soviet Union. We, therefore, can only show our readiness to talk with anybody who is willing to talk and we can, on the other hand try to improve our relations with the Soviet Union. Indications at this moment are that no immediate agreement and no immediate success are in sight.

To sum up I will try to say in this brief introductory that we fear the security of Germany and Western Europe can only be safe-

guarded and guaranteed by NATO, by integration of our armed forces into NATO and, if possible, by the strengthening of NATO. Any withdrawal, any weakening of NATO at this point might prove to be disastrous and certainly, might endanger the peace in Europe and world peace. Let me close in adding that we have found some understanding with the new administration in the United States on this particular point, although we fully realize that in the long run, the United States will want to reduce their commitments to Europe. But I think there is understanding and agreement with this particular point. There is no way to retrace any American withdrawal from NATO and that the Americans for the time being are ready to continue to contribute their present share to the defence of the continent. Thank you.

The Chairman: Now, Mr. Kiep, you may not have been prepared to make an introductory statement, but you were certainly most eloquent and I can only apologize for having called upon you without notice.

Mr. Kiep: I can also too apologize.

The Chairman: I do not know whether any of the other men at the head table wish to make an introductory statement or whether you would prefer just to have questions asked.

Mr. Lewis: Is Dr. Mummer in general agreement or is there any difference in attitudes.

The Chairman: In regards to what has been said?

Mr. Lewis: Yes.

The Chairman: Would any of you gentlemen care either to make an introductory statement of your own or to comment upon what Mr. Kiep has said? I should have mentioned earlier that we do have simultaneous translation in both English and in French together with the earphones and the microphones, and if you wish to use the French translation, you turn the little button over to the left and for English to the right.

Were there any further questions, did anyone at the table wish to comment upon what has been said or make an introductory statement?

Mr. Lewis: I asked what Dr. Mummer would say representing the Social democrats.

The Chairman: Mr. Mummer?

Dr. Mummer: Gentlemen, we have a government coalition here in Bonn. As Christian Democrats and Social Democrats form this government and, I think that coalition would not be possible if the parties of the coalition had a different defence policy different one from the other on important points and, I am happy to say that, in that field of defence, we have the same attitudes that we have made during these last 2½ years and earlier. This same policy that is the security and maintenance of peace in Europe is based on the existence, the continuance and certain fortifications of the strengthening of NATO. During the time before the 21st of August last year, the date of the invasion of Czechoslovakia by the Warsaw Pact forces, there was a tendency not only in this country but everywhere to think that the threat of the other side had so much lessened that the—well we have to begin to be less intensive in our armament and in our defence measures but just this event of last year was an earthquake for our political conscience yet on the continent especially in this country so nearby to what happens there and, I must say, that again after those events it was apparent to all of us that this big military power of the Soviet Union is able to invade and—if they think that it profits them is willing to use military force—to use military forces not only against friends as the Czechs were, but would be prepared if it were possible to use military force against us for instance. Against France also who offered them the usual declarations and arrangements. We could say that and base ourselves that way, but that they had the right given by some old article of the United Nations charter to intervene in Germany if they could show up nationalistic or militaristic tendencies. This interpretation of theirs showed us also that it would be a mistake on our side to lessen or reduce our forces.

Everyone here understands French in this room, I think it is easier for me to speak in French.

It was someone from Quebec, a colleague from the Province of Quebec! It would be easier... So, we have seen, from these very events in Czechoslovakia, that it is not possible to combine defence efforts. But they must be maintained at such a level that the other side can never get the idea that an attack on the West could be profitable. Aggression must not pay; that is the essential point.

On that, I have a remark to address to our Canadian visitors, which seems to me the most important thing in everything we are

doing in NATO. Defence policy, and all the tremendous effort that has to go into defence, have no real meaning if, once a war has started, this military strength is to be used to win it. The goal of contemporary defence policy here in Europe, where great powers, with their atomic weapons, would be involved—there is only one real purpose in this defence effort, and that is to prevent war from breaking out, to preserve peace. That is the true purpose of our defence effort. This is only possible, gentlemen, if there is such an array of forces on our side, both from the technical and the national point of view, that there could never be any mistake on the other side like the mistakes Hitler made in 1939, when he thought that an attack could be over quickly, and that the Americans and Canadians, for example, would never have the time to intervene.

What is so valuable to us in having Canadians on our soil is that a potential aggressor must always be telling himself that an attack on our borders would trigger not only the defence forces of the country directly attacked, but also the massive defensive machinery of all the nations in NATO. And I believe that, although this means a great sacrifice for you, and I am sure that it is a great sacrifice, now that the war has been over for twenty-four years, to spend these enormous sums and to have your young people here, so far from home, it must nevertheless be borne in mind that, when you make this sacrifice, it is probably so much better, so much less costly, and involves so much less sacrifice, than would be the case if these efforts were not made, and we risked Moscow's making a mistake and attacking. You would then be in a worse position, far worse than during the first or the second world war.

In conclusion, therefore, I am fully in agreement with my colleague in the other school of political thought, and I would stress even more the importance I ascribe, in my view of the situation here in Europe, to the presence of the NATO allies, including the Canadians.

[English]

The Chairman: Before calling for questions I believe Dr. Wagner has a few remarks.

Dr. Wolfgang Wagner: Mr. Chairman, I will be very brief, but I should like to make two points. First on the importance of NATO to Western Europe and to Germany in particular.

The importance of NATO for Western Europe and for Germany in the field of security has been stressed by both speakers here, but I should like to ask that NATO and the presence of United States troops in Europe dependent upon NATO has some other importance also.

The American troops in Europe I feel are part of the provisional settlement of European affairs, provisional in this sense that European problems—some European problems are still unresolved. If United States troops should be withdrawn from Europe, for example, the German troops in the Bundeswehr would no longer be integrated in a common defence community and this very fact I think would change a lot of things in Europe, however unjustified fears for Germany might be, but I feel that some European nations not only in the East, but also in the Western part of Europe will be somewhat excited about Germany. The presence of United States troops and the existence of NATO does contribute to a situation of stability, also of political stability. I think this is a point you should know when you go back to Canada and have some deliberations on NATO.

My second point is the importance of Canada being a member of NATO. I think you are quite familiar with feelings that were recited of American domination. I think you have this in Canada and we have it probably in Europe. As you know we are close friends with the United States, but there is a certain feeling that a very strong American domination in Europe might not be so very favourable and also for this reason we would like to say that NATO should be maintained as it is. Being an alliance, not only between the United States and some European states, but an alliance between some non-American States—the United States and Canada and some European states. We prefer this situation.

Certainly there will be changes in NATO, but we would not like to see the number of NATO members being reduced and Canada for example dropping out. In order to impress this I should mention the idea of a European caucus. This idea was suggested by the British government in Bonn. I think most people feel that this is not quite so good an idea because it might be leading to a feeling of frustration in Canada and in some other countries such as Greece and Turkey. If a smaller European group within NATO should

be formed, Canada and other countries might be persuaded. This is one of the major reasons why we do not like the idea of a European caucus.

The Chairman: Gentlemen, I mentioned earlier that we had a number of German parliamentarians with us and I should have mentioned that we have someone from the University as well and also someone from television as well—the media. I believe Professor Schuring has a statement he would like to make or a few remarks he would like to make.

Professor Schuring: Only two points. One with regard to internal developments with the Soviet Union and one with regard to developments here in Europe. There has been a certain tendency in the developments with the Soviet Union to liberalization and thus leading to a better international understanding. A point Mr. Kiesinger has made.

There are a number of reasons to say that the more strange these unions are the greater degree of autonomy in the field of economics and bureaucracy and daily this develops. The more difficult the situation gets for the Communist Party itself. As a matter of fact you might somewhat overemphasize this when you say that the Communist Party quite rightly feels it becomes superfluous and this is a very dangerous self-diagnosis for international relations.

To stress the point again the Communist Party is a form of aggression in terms of its influence. In judging what we can do and what we cannot do we have to be more aware of the interest position within the Communist world and the developments in Czechoslovakia have pointed out one factor clearly, that though you may continue to pay lip service to Communism and Socialism much as Christians pay lip service to the church, the influence of this institution on daily life and the degree of authority it really does have in ordering change is extremely limited.

It is like for one example, public opinion polls in Czechoslovakia at the end of June and the beginning of July in 1968 which asked whether it should continue relations with the Soviet Union or establish preferential relations with the west. The results were 98 per cent for the west and this is of course an intolerable situation for the Soviet Union. Secondly, I wish one could spell out the implication of this still further. It means one has to depart from some notions of foreign

policy and move toward liberalization leading to less tension.

In the west, we had been thrown back on a nation state's type of existence due to the fact that certain mechanisms of supernational integration more or less came to a standstill and this exposed a structural weakness in which Germany finds itself. The relative weakness of the social structure primarily of Italy and secondarily of France makes Germany relatively too stable or too strong. To some degree this applies also to Great Britain. From our point of national interest one might say our situation becomes entirely justified, if the nation state existence continues the other states remain relatively weaker in terms of expansion than we are. It is politically impossible for Germany to be the most stable and the most expansionist country and thereby relatively increase its position vis-à-vis its neighbours. From this point of view it is a question I think in the long term of our own existence to put ourselves into a greater framework that makes it possible for us to keep expanding and this will also help to overcome whatever structural weaknesses there are in Italy, in France to some degree and in England to the least degree, I think personally. Those structural weaknesses do not add up internationally and stimulate each other. On that point of opinion and that perspective it becomes essential that some form of international integration, whatever form of mechanism may have been developed will avoid Germany being thrust again in the position of being an unbearable neighbour for east and west.

The Chairman: If none of the gentlemen at the head table wish to make any further statement at this point perhaps we could commence calling questioners. First, Mr. Asselin and then Mr. Allmand. Mr. Asselin.

Mr. Asselin: I will ask my question in French if you do not mind.

In the event of a partial or complete dislocation of NATO forces, could West Germany arm herself quickly enough to confront Russia with a valid deterrent?

Mr. Schucht: I could give a reply. I am remembering what Professor Schultz said, that there is not only the problem of defence against an aggressor, there is also the question of this country's position among the other countries of Europe. For this country to have an armed force capable of defending it against the armed might of Russia is unthinkable. In such a case, Europe would break up,

there would be nothing left of the Common Market, nor of the co-operation that exists between our peoples, nor of the reconciliation that has taken place since 1945.

From the political point of view alone, it would be unthinkable to assemble a force strong enough to oppose the great nuclear capability that Russia has. In addition, I believe it would be impossible from the point of view of men, money and technology. After all, we are now one part of a divided nation. We have a population of perhaps 59 million, and I believe that in an arms race with the Soviet Union, which has about 230 million inhabitants, the race would be lost right from the start; we are in a weak position, and we would never be able to catch up with the Soviet Union.

However, I would stress the political aspect of the matter, and I was very grateful to the Professor. He introduced the point of view into our debate that, for us, NATO is also the framework within which we can contribute our share to the collective defence of the West. Any thought of national defence is politically disastrous and financially and economically impossible.

The Vice-Chairman: Thank you Doctor, Mr. Allmand.

Mr. Allmand: I would like to put this question to Professor Schucht—I do not know if I am pronouncing the name properly—While the German government might be a strong supporter of NATO, and want all countries to maintain their support, what is the attitude of the man in the street, the people, and especially the younger people because I understand you have a certain contact with younger people, to the stationing of so many foreign troops on German soil, also the placement of atomic weapons on German soil? Is there a sort of an attitude against this among the people, and especially the younger people?

Professor Schucht: The stationing of foreign troops has never been an issue and is not an issue. They are not considered as occupational troops.

The importance of the alliance in the minds of the population is a direct function of the actual threat. The occupation of Czechoslovakia by Soviet troops led to a considerable increase in apprehension and a considerable increase in the responses that emphasize the need for Germany to have close co-operation specifically with the United States which after all provides the essential military

guarantees but with the west in general. To some degree of course public opinion is always reacting to decisions their politicians make so I would not be too nervous about reading polls going up or down 20 per cent on one score or the other. The underlying attitude is this, that Germany cannot stand alone. Amongst the youth a distinction has to be made between the majority of the youth and those on the university campuses. They are drifting further apart. The majority of the youth more or less reflect the types of feeling I described before. For the university students the question of communism, liberal communism has become a functional equivalent for Christianity to some degree, to put it pointedly. It is a moral issue. The east somehow does not exist and although it pretends to be an international movement to some degree it is fantastically provincial by looking at its own ills only, quite irrespective of the relative merits or demerits of your society. I think this is basically irrelevant to pay attention to this. What is relevant here in this context is the degree of lack of self-confidence in the leadership in Germany and what is termed the establishment here, although we probably have less of this than some other countries, the establishment here displayed vis-à-vis a moral challenge. This I would pay attention to, to which degree the leadership will keep on leading and defending themselves. University student unrest is current phenomenon.

Mr. Buchanan: Both Mr. Kiep and Dr. Schucht referred to the potential loosening of what we call the Russian hold on the peoples of eastern Europe. They suggested that it was a long way off and cited as evidence the actions against the Czechs, but I was wondering if there might be another feeling evolving now. The situation has changed appreciably even within the last half a year. Last August the Romanians for instance were trembling in their boots for fear that they were going to be next on the Russian's list. Now, they are of course pursuing a very independent course and going off to Belgrade and so on and do you feel that the fact that the Russians are most anxious for this detente, that they are concerned about the—particularly about the Chinese menace on the eastern flank, might well speed up and expedite the loosening process on the east, purely because they are reluctant to antagonize the west by actions comparable to Czechoslovakia again?

Mr. Kiep: This is a very difficult problem I think you have raised. The present situation in Romania of course is very difficult for us

to assess. We really have no way of knowing exactly what has happened in the talks between Tito and Ceausescu, nor do we know exactly what the Russians have in mind. The only thing is that the pressure is still on and obviously at this particular point the Soviet Union not having completely digested the Czech problem is not too anxious to get involved in another problem and therefore I think one must not mistake the present lull in Soviet-Romanian relations or the resistance of Romania and the apparent reluctance of Russia to press its point as a sign that Russia is letting up. We have had indications to the contrary. We have had indications that the Breschnev doctrine which is at the bottom of all this, was restated and restated and restressed. At the same time we have indications that history once more is being changed retroactively in the Soviet Union behind a re-emerging Stalin who is suddenly being made into what he used to be, being put back where he was until the 21st Party Congress and one must not misinterpret or misassess the problem of the present Soviet leadership in living up to certain commitments and statements that they have made because if they do not, in the long run they will have trouble within their own camp and they will therefore I fear have to maintain pressure. I think it is most unlikely that anything will come until after the Czech matter has been settled in the Soviet sense. It is that the question of the confrontation with China enters into this as well and one might even speculate as to the possibility that Ceausescu is becoming stronger as the confrontation in the east gets more important. But these are all speculations and I think what remains for us is the fact that the invasion of Czechoslovakia seen in the long run and seen in the context of developments for the next 10 or 15 years is a sign of Soviet weakness. One might argue, of course, that one more sign of weakness and the Russians will be in Paris, but I think it is still a sign of weakness. A weakness which of course poses a great danger to us and there I would just like to repeat what Dr. Mummer said a minute ago, and that is, the danger in the state of mind of the Soviet leadership at this moment is that the possible reaction of the West could be misinterpreted, could be misunderstood, and, therefore, I think for a time to come unity and a clear deterrent force and deterrent strength of the alliances are of the greatest importance for the maintenance of peace. And this, I think, also if I may add one sentence to a question the gen-

tleman put before you the question of the psychological situation in our country, and I think Professor Schucht answered this perfectly. There is only one point I wanted to add and that is the alliance among younger people, and I am not speaking of the campus people, I am not speaking of the radical left, I am speaking of the general youth of this country which has lost a lot of its glamour. It has become a rather gloomy affair because it is being associated with withdrawals; with people—desires—leaving the integration with problems of atomic weapons; with accusations of American dominance, and all these things. And, therefore, I think it is our job as politicians to make everything clear to our younger generation that we have a duty to support this instrument of peace because it is the only thing we can do to maintain peace in the coming five or 10 years. And then I think we should also stress that NATO is not an end in itself and that we will be the first ones to talk about changing the military structure; about abandoning the alliance; about reducing forces; about scrapping arms when the time has come. But between this day and today lies a very dangerous period of consultation. Those who want to preserve peace must support the deterrent force of the alliance.

The Vice-Chairman: Thank you. Mr. Brewin.

Mr. Brewin: Mr. Chairman, since the events of Czechoslovakia in August last, there has very naturally been an emphasis on unified defensive action within NATO. Before that it was considered that NATO could be used as an instrument for the negotiating—the mutual reduction—of the concentration of armed forces in Central Europe and for measures of arms control. Since August that has been pretty well in the background I suppose in Germany as well as elsewhere. There has been a repeated statement that one is still interested in that but I would like to know whether the German government—Germany—would support a renewed effort within NATO to bring about this arms control or to offer at any rate—to speak for one side—to offer measures towards reduction of this, it seems to me, a tremendous concentration—a dangerous concentration—of firepower in Central Europe.

The Vice-Chairman: Perhaps Mr. Petersen would like to answer that.

Mr. Petersen: To this point I would make one thing quite clear, we are all politicians, and in our case in Germany we are standing for re-election this year. It is always much more difficult to stand up before the taxpayer—and I do not have to explain this to colleagues—and tell them we need airplanes and tanks and guns instead of building this road or that hospital. And we Germans, all of us, would much rather spend these 20 billion marks, which is about \$5 billion American dollars per year, on hospitals and roads and universities and other things than on tanks and guns and planes. As my friend, Kiepe, has just pointed out, we would be the first ones to try to find a way to reduce the immense burden on our people which this participation in the framework of NATO in financial terms requests. But you need, I believe, not to forget two points.

One is before August 21 last year, there was a lot of very wishful thinking abroad, also in this country. Nobody could conceive that anybody ever would use tanks again in Europe in order to achieve political or economic ends. And when we pointed to the Czechs that in conventional terms, apart from the nuclear field, the Warsaw Pact countries are superior to the NATO forces in Europe, the ratio is about three to 1, we were always reminded by many people inside Germany and outside that after all the intentions of the other side are peaceful and therefore we could relax and we could use our alliance—the military pact—in order to start, what you, sir, pointed out to come to some kind of an agreement to get these birds off our fence.

This phase in a certain extent has been shattered. But I would say that today it is a very difficult, if not impossible job to try to assess the motivation of the men in the Kremlin, it is almost like astrology. Because in the old days when Stalin or Khrushchev was in power you had to deal with one man and you could try to assess his probable reaction to A, B, or C. Today you have a Central Committee within which you have “hawks” and “doves” and you have obviously changing majorities within the Central Committee, the average age of which is 60. It is a group of old men who have reached their power on the road under Stalin and have been taught by that mentality. And of course as Dr. Mummer has pointed out quite rightly, it is far more secure to deal with a partner who is safe, confident, sure of himself, knows exactly what he wants, than to deal with a partner who is insecure and who might react this or

that way. Therefore, I believe we have to endure the cold, hard facts counting noses, guns, tanks, planes here and in the Warsaw Pact. We have to keep the risk of any limited or larger scale war for anybody who might play with the idea and the temptation to use these means to achieve political ends, to keep the risk for anybody who would consider that they were entitled to them and that we can only do in the framework of an alliance where the other side knows. May this intrusion be small or large he will not be involved only with a German regiment or an Italian division, he will immediately be confronted with the whole free world. And there, if I may be permitted to add one last word on the specific role of the Canadian forces, you have 11,000 troops here in my country and we are grateful that they are there. I may add that their personal relations—I know it from Southern Germany, my own constituency, they are first rate ambassadors in this country. But apart from that point it is not the 11,000 troops as such but the Starfighters, the Lockheed 104 and the Division you have in the North. But it is the effect of the tremendous moral authority of Canada and the world. Nobody can blame you of being imperialistic or colonialist or any such thing. You have the image in the world of a country which is primarily concerned with peace. You have established this image in actions like Cyprus and in other parts. And if the Canadians were to decide that their contribution is not all that important for maintaining peace, and if they were to decide to withdraw, many people in the world—Scandinavia or Mr. Mansfield and his friends in Washington—but especially here in Europe, they might think, and they probably would think, now the Canadian main concern according to your image is peace. If Canadians think for the maintenance of peace NATO is not all that important why should then we not try to find a different road. Gentlemen, we have to face the facts in this world in which we live that peace and freedom are not to be maintained cheap; there is no cheaper way unfortunately. The questions that we politicians of course have to answer before history is what we do with the time the armed forces are able to buy for us but that of course is a different field.

The Vice-Chairman: Mr. Legault?

The Chairman: Mr. Legault.

Mr. Legault: Thank you, Mr. Chairman. My question could be for Professor Schucht, if

that is the correct pronunciation, and it relates to some extent to what Mr. Kiep and Mr. Petersen have just said. It concerns what is now taking place in Geneva. At the moment, discussion centres on the intentions and doubts that exist. My question is this: would West Germany be prepared to make certain concessions, should the talks indicate an intention to reduce Warsaw Pact and NATO forces?

[English]

Mr. Irwin Schucht: I do not know if I am the right person to address this question to, I doubt it. From what I know from my American friends of course we should have to make a clear distinction between the arrangement that is reached with the Soviet Union on the limitation of certain futuristic weapons, and this is one thing that does not affect at all the question of the conventional forces, since we are out of the running, for the time being at least, about these futuristic kind of tools, the question can only be properly related to conventional weapons or rather armament for conventional war.

What kind of conclusion politicians will draw you have to ask them themselves. One variable which is in the game which is hard to assess is how great an annoyance value Yugoslavia will be; Romania, I think, is fairly irrelevant. Again not so much as a country that defines a central headquarters on international politic terms rather a country which is upset internally because of certain social experiments which add to the dissent within the Soviet Union. Should the annoyance value of Yugoslavia increase drastically I think all deals are off, and I think that has to be kept in mind, and if I were to act I would buy time, I would not do anything right now.

An hon. Member: Would you clarify that, please?

Mr. Irwin Schucht: Yes I think one, we should state that we would welcome an agreement in Geneva. We think that a new acceleration of the arms race would be detrimental not only to the Soviet Union and the United States but also to peace because in this new arms race, apart from the wasted money that is involved, there is the danger of a sudden change and switch in the now existing balance of nuclear power and if one power, for instance were to assume temporarily the ability to protect its own territory from nuclear attack this would automatically, of course, shift and unsettle the

presently existing balance of power. And, therefore, we would like to see these talks succeed.

Two, we would like to see these talks succeed because we feel that the United States of America, who after all are our most important ally in the North Atlantic organization need all their strength and all their money to overcome certain problems which they face at home. This is another consideration.

Thirdly, as far as we are concerned we, of course, are ready to discuss conventional arms limitations at any given moment, provided that these discussions were met on a basis of full reciprocity and safeguarding also the right of inspection by some means which would have to be devised. In other words, we do not believe in unilateral concessions of the west in weakening NATO, but we would be ready to talk about actual limitation of conventional arms and troop levels in Europe at any moment if reciprocity is guaranteed. And how the Soviet Union reacted in the past to unilateral concessions is best demonstrated on the subject of Norway. Norway joined the NATO alliance under two conditions: number 1 was no atomic weapons on Norwegian territory and number 2, no foreign troops to be stationed. This was the condition of Norway joining NATO back in 1949 and this is still the condition today. No warheads and no foreign troops.

It is interesting to see how the Soviet Union reacted to this rather unique unilateral concession of the Norwegians. One would expect that the Soviet Union, which has a direct frontier with Norway so that satellite problems are not involved, would respond by reducing their opposing forces on the other side, but if you look at the facts and figures in northern Norway, the absolute contrary has happened. In fact this today is one of the very weak points of NATO and steps are being taken to remedy this situation.

Lastly on the question of the nuisance value of Yugoslavia. The problem I think that the Soviet leadership is facing today is translated into medieval terms, the problem of being pope and emperor at the same time and they find the two roles rather difficult to maintain at this particular phase. At this moment they are still trying to do both at the same time. I think in the long run they will find that in performing the one job it will be difficult enough.

Mr. Petersen: May I add one sentence?

The Vice-Chairman: Proceed, Mr. Petersen.

Mr. Petersen: I just wanted to add one point to this very important question. You see in May, 1967, the NATO Council decided, even though it did not say so in so many words, that we would unilaterally weaken NATO in the hope that the other side would follow suit. Between May, 1967 and August, 1968, 80,000 allied troops were withdrawn from this country. I need only to remind you of rotation like this scheme of the reduction of the British Rhine army, the Belgians and others. What actually happened was that in that same period the budget for armament in the Soviet Union was increased by 18 per cent. So this obviously did not seem to work so well. Then, of course, the NATO decisions after August, 1968, have stopped this trend. There was a lot of hope. I was at this conference and there was a lot of hope in our Council that if we would start substantially reducing that the others—we said after all the Russians have other important things to do also and they need to increase their standard of living and so on, they do not like this burden just as we do not and the fact was that the opposite was the case, obviously they were encouraged. They were thinking and they might have thought that there is a situation developing here which, of course, is the most dangerous thing if you want to maintain this.

The Vice-Chairman: Thank you, Mr. Petersen. Dr. Wagner would also like to speak to the question.

Mr. Wolfgang Wagner: Very briefly, I should like to come back to a point raised here and that is the point of the concentration of weapons in Europe. While this seems to be dangerous, I feel up to now it has not proved to be that dangerous. The immediate danger we had in the past—and I am particularly referring to 1968—the danger was more in the grey areas of Europe; that means Yugoslavia, Finland and perhaps Austria, particularly after the occupation of Czechoslovakia. There was no immediate danger in all the areas where Soviet troops and American troops were immediately confronted with each other. But nevertheless we here in the Federal Republic do favour arms limitations. We do not only favour the negotiations at Geneva, but also the forthcoming bilateral negotiations between the United States and the Soviet Union on strategic arms limitations. There will be no impediment, I feel, from the German side toward these bilateral negotiations between the United States and

the Soviet Union. It all depends on the problem of reciprocity. There should be no troop reductions unilaterally from the western side, but it should be made mutual east and west.

Mr. Cafik: Mr. Chairman I would like to direct my first question to Mr. Kiep.

In your opening statement you mentioned that there was some kind of an understanding reached with the United States that it would not, at this moment, reduce its commitment to NATO in Europe. I wonder if this was brought about during the recent trip of the President to Europe and what sort of reductions do you anticipate and when do you think it might reduce its commitment here?

Mr. Kiep: Number one, there have been several statements made by the new administration to indicate that they are not considering withdrawing at this point or reducing their commitment at this point. They are depending, of course, upon the settlement of certain outstanding problems like the offset problem, which is a major obstacle in the internal discussion in the United States in connection with the maintaining of troops here. If there is a solution—I hope a long term solution is in sight. As far as their plans for the more distant future are concerned, I think the Americans would like to reduce their commitments substantially. I think the United States are aware of the fact that they will not be able to continue at the present level forever, offset or no offset. It is for that reason, I think, and this is just my assessment not based on any facts or figures or documents, that President Nixon was very interested to stimulate a new spirit of European co-operation, hoping that by closer European co-operation both in the political and the military field, the United States might find it easier, at some future time, to reduce their commitments, because something would have developed by then that would replace any withdrawal of U.S. troops. But I do not think the United States would consider such a move under the present political circumstances in Europe and with the present attitude of the Soviet Union prevailing. When and if that changes is hard to say at this moment. I think a significant breakthrough in arms talks with the Soviet Union might be a moment where the United States would take a new look at this. You know of course that the present administration which does not have the majority in both Houses in Washington is under constant pressure. Senator Mansfield has taken up the question of troop reductions

again after a six month period of silence after the Czech invasion. This will keep coming up; the pressure will be on, but unless there is a significant change in Soviet attitude, I do not think that the administration would consider undertaking a reduction of forces here.

On the question of rotation and dual base system. We of course have certain doubts as to the value or let me put it this way. We have certain doubts as to the ability to maintain the necessary deterrent strength under such an arrangement, because we have seen what happened in Czechoslovakia; we have seen that the warning times that we have built up and based our planning on have proved to be rather fictitious and I therefore think that there are certain limits to what you can do, big lift rotation-wise and I think the Americans are more realistic about this than they were some time ago.

The Vice-Chairman: I now have Messrs. MacLean, Nowlan, Lewis, Stewart, Anderson and Laniel in that order, remaining in the first round.

Mr. MacLean: I have a brief question for any person who wishes to answer it. I should preface my remarks by saying that I agree 100 per cent with the point of view expressed that the maintenance of NATO at the present time, especially is the only thing the west can do, but countries like Canada and the United States and Britain have not only the direct cost of maintaining troops here, but they also have the rather politically-damaging factor of drain on their balance of payments as a result of the contribution they make. What progress is being made, or might be made towards relieving this aspect of the contribution of troops to Germany—which are stationed in Germany under the NATO plan by Canada for example?

Mr. Petersen: This has been for a number of years a very thorny problem in particular to the United States, because in 1968 the Americans had a negative balance of payments of \$4 billion and we Germans, little Germany, had a positive balance of payments of exactly the same amount of \$4 billion. Our export has been so successful that even last year we had a positive balance of payments of \$16.3 billion marks which is again a little over \$4 billion. The Americans figure that they spend about \$900 million per year here in this country which goes into the German Federal reserve bank in terms of dollars and so much of it adds to our foreign exchange

balance that that in itself is not a very comfortable position to be in, currency-wise, in terms of an inflationary pressure which of course comes from this.

Now we are spending about \$100 million a year in training German soldiers in the United States; \$100 million for schools for pilots, for rocket specialists and others, therefore you have a difference of about \$800 million and that is the basis on which we talk. There are two aspects in which we have tried to solve this problem. One is buying equipment in the United States for modernizing our weapon systems and so on. We have made a number of decisions since last summer which involved a great deal of money, like buying 88 Phantom bombers rather—a reconnaissance version of the Phantom and like buying 132 medium-sized helicopters and modernizing the Pershing system and others, this has brought amounts up to the amount that I have mentioned—this would add up to the amount that I mentioned. The other aspect that we are talking about and that we have not had an agreement on yet is the fact that the Americans are spending \$125 million per year in wages for Germans employed by the American 7th Army, workers and white collar workers and all sorts of different areas, and for the first time the United States Government has come up with the idea whether we would not support the budget of the 7th Army by meeting the payroll, the budget being 3.6 million dollars per year. This is the budget of the 7th Army stationed in this country, you see the size and the scope of the problem.

Now I know that with your government, sir, we have had a number of talks about the question whether you could sell us products which we could use in our armed forces. We had very much hoped that you would participate in developing the new aeroplane which is going to be a tremendous object which we call the NKF, an aeroplane which will in the mid-70's replace the Star Fighter which you of course operate also. We have then to put it quite bluntly. We have been very disappointed for a number of reasons that your government has decided to pull out from this project. Whether there will be developments, I know that government officials from Bonn have been in Canada recently. I have not had a report yet as to what has come out of these talks. But on principle we would be delighted to cooperate as much as possible with your industry, especially in the field of advanced technology. Because we, as you know, are at

one point in an identical position. We always have to decide and you gentlemen being in the same committee as we are know that we have to buy equipment so to speak off the shelf in the United States, tried and tested in the price we pay, that the thing will fly or operate, or whatever it has to do, or spend a lot of money in research and development in our own industries, and I wish we could come down to specific projects which we could develop together on a bilateral basis, Canadian and German industry. Of course there is one problem which you gentlemen have to figure out which I do not know the answer to. That is that if you look closely at Canadian terms related with this kind of hardware production very often the majority of the capital is in the hands of the United States and therefore big United States corporations. Therefore whether this hope of mine is practical, I think has to be decided on specific negotiations and specific questions. But in this field of development the balance of power is not held as it is in the United States. I think we could find a way together which would bolster our near balance of payments problems as contributed by the 11,000 troops in the country as well as developing together in an amity which in time would compare our industry to the United States which would benefit both.

The Vice-Chairman: Thank you Mr. Petersen. Mr. Bower would also like to comment on this question.

Mr. Bower (Canadian Ambassador): I would like to make one comment on this. We are talking here about offset payments. The question of Canada, Mr. MacLean, the question of Canada also making an offset arrangement with Germany has come up. It has invariably been resisted by our office and the decision has been taken not to proceed with the negotiating of an offset agreement. My reason for this, one is that these offset agreements are in question between Germany and United States, between Germany and Britain whenever they negotiate. It is an annual festering sore and we have avoided it. Secondly our balance of payments with Germany has been favourable, but nevertheless I think there is something to be said for continuing a watchful eye on this tradition. We do not want the existence of offset agreements with others to prevent us from getting business which we would have a legitimate right to claim. For example, if we are competitive in certain material and we have found cases where we are not getting the business. If we are com-

petitive we do not want to lose that business because we do not have an offset agreement and somebody else has then they are using this material to sop up some of the fat. Now this . . . We have a number of cases where this happens. All we can ask is we do not want you to buy from us if our prices are high. We do not want you to buy it from us if our quality is poor, but we do ask that where we are competitive that we should not be prevented from selling because of the existence of an offset agreement with somebody else. There have been I think in the past occasions when we have not had our fair share of these things, but we made our point of view known. They have taken a look at it. Now you have mentioned here this new multi-role aircraft.

I am prepared to make a bet with anybody here that it does not get off the ground. I think this thing is just about one month from folding up. Now it is true that in its original conception we had a chance to participate, maybe it is folding up because we are not in it.

Mr. Petersen: Mr. Ambassador, if you did not have a higher salary than I have, I would take you up on it.

Mr. Bower: You do not know what my salary is. The fact remains that this multi-role aircraft did offer an opportunity for us to co-operate but my bet is now that this multi-role aircraft, NFG (NKF) will never get off the ground.

Mr. Nowlan: Mr. Chairman, I would like to ask a question to the panel and see if there is any difference of view between the elected members of the panel and the intellectual panel, and it has—which sometimes happens in Canada too, by the way, and it has to do with the very real political question of the re-unification of Germany, and on the premise that in Canada political parties from time to time get boxed into positions that frankly are behind public opinion, I would like to ask the panel as divided, if in fact in the political parties there is any difference on this view and I gather there is not, but if in the new generation which has never experienced a united Germany if there is not a bubble of discontent about the present policy of the parties and outside of the parties if there is any—if the public opinion are really vitally concerned about re-unification where Western Germany has been so productive and so progressive in the last few years?

Mr. Schuch: This is a more serious question than the balance of payments problem, re-unification is rather more intellectual. The structural problem could apply to a more reconstructive measure which we invent. There is a move on, by the way on the drawing board by Germany through scientific research with United States which will also ease the balance of payments problem. But the structural problem is that as long as the race of inflation in the various countries continues to differ to the degree that they do, this will be a festering sore, re-evaluation or not. And the only long-term solution is economic and military, a rather close kind of operation economically between various countries. The main structural problem that I see here is that the Latin countries are determined to continue with a degree of easy-money policy that other countries find unacceptable. But unfortunately the whole problem has not become enough yet to be fully tackled so the question is premature for the next few years and we have got to invent little things, like buying this or that.

Now to the second question on re-unification. What little we get from public opinion in East Germany, they are conducting their own research now, people have accommodated themselves to the regime without loving it. It is not so terrible that you would like to incur great danger to do very much about it. I hope I make it precise enough. I do not like it, but it is relative to the other countries, fairly acceptable. They are, well the figures are compiled with the Central Committee unofficially, anyway I heard is you put the standard of living in East Germany at 100, you put Czechoslovakia somewhere about 90, and Poland is about 60, and that provides enough of a contrast to feel relatively happy even though you would put officially West Germany at 140. From our side, certain intellectuals of different ages, physical that is, rather than mental, make the question of the recognition of the DDR into a moral issue. And the lack of moral courage to send a document favourably recognizing it as a legal entity. From what I hear from the population, the politicians are fairly free to do this or not do this as the situation will warrant. There is not great pressure to come to any form of dramatic action, in the government. And the main concern is that of family relations and of personal contacts with East Germany. The estimate is that about one-third of the population here has fairly close personal ties with a person on the other side. One would like to have this less interrupted that it is.

Have I then got this question off the ideological hook? Thank you.

The Vice Chairman: Is there anyone else on the panel who would like to speak to this question?

An hon. Member: Of course. We are defeated.

Mr. Petersen: I would take issue with the difference you make between intellectuals and politicians.

On this point, you are quite right, a whole generation has grown up that does not know from their own experience the living conditions in East Germany. On the other hand you must understand that sometimes we get the feeling that our friends do not quite appreciate how deeply this tragedy sits in our heart, so to speak. I personally went to school on the other side. I was not aware how much I felt but the fact is, it is far more easy for me to go to Canada, Ottawa, than to Leipzig which is part of my country. There is a lot of frustration in Germany, I believe in all age groups, more pronounced though probably in the youths, frustration that politicians have taught at every occasion about re-unification as being our great national aspiration, without being able to do anything about it. And if you talk about this for 25 years people get cynical, fed up. We have one day in the year, the 17th of June, commemorating the day when there was an uprising in East Germany against the Communist regime and that was folded up under Russian tanks. I had occasion for a number of years to make a speech every 17th of June at a big rally and every year I get more uneasy as to what I tell those people. And the other thing is we have jointed the Atlantic Alliance, the alliance of the free world, and our allies have promised us on paper and they repeat this promise every once in a while that they would help us to somehow solve the German problem. And the suspicion is rising, the conviction is rising, that there are very few people in the East or in the West who would pull out their legs, as we say in German in order to re-form a country in which 75 million Germans would live as a national entity which of course would immediately be the most powerful—quite apart from the military aspect—economic country in Europe, which nobody in Belgium, Holland, Denmark, France or anywhere else is so terribly keen about. We understand that. Therefore for a great number of years we have said the only road

towards the solution of the German question is a road via a politically united Europe, because on the day when Belgium, Holland, Italy and West Germany become provinces of the politically-united Europe then East Germany and Hungary and Czechoslovakia and so on will be other provinces and there will not be one overpowering national state. I do not think you will find anybody in Germany who thinks that we will have again a national *Reich*, a national state of the whole of Germany. The tragedy is, and that, I think, has led to real spiritual crises, especially again among the younger people, that the cry for a politically united Europe which was taking up this tremendous enthusiasm after the war has bogged down and the united Europe today is a question for many people of the price of cheese and of technical agreements between the various partners. Men like Dr. Mummer, who has been one of the pioneers of a politically-united Europe, came into a position—now you have to speak for yourself, sir, but—came into a position where it is almost impossible to show a concrete road towards a united Europe and the nationalism—to be again quite blunt—which has led the policy of France over the last years in intoxicating directions across this river which goes right by this hotel. There we are politically, in a very difficult position right now, trying to maintain the drive towards uniting Europe. We sacrificed a great deal in order to achieve a politically united Europe and yet this goal seems to be very far away. In this respect you might point out that we have not been very wise sometimes; we have given rise to the suspicion that we wanted to become Europeans in order to forget our dirty past, forget that we are Germans and by being Europeans we will all be loving one another and that does not quite work that way, and we come to the point that we realize that we have to become better Germans in order to become Europeans. But those questions, the solution of the German question, re-unification, and the unification of Europe and the power of the communist ideology and the power, the military power in Eastern Europe today, all those questions are inter-related and it is dangerous as it is done sometimes in political circles of this country to just look at one of them and then of course blame the stupid politicians because they have not been able to achieve anything.

Mr. Prud'homme: What are the conditions in East Germany?

Mr. Petersen: Reports we have indicate that, as Professor Schucht has pointed out that the people in East Germany have accommodated themselves to their regime. They are proud of things that they have achieved and built up, in which they have been very successful compared to their neighbours in the East, but it is quite obvious that what Hitler succeeded in doing with me personally and with my generation in getting our enthusiastic support in the Hitler Youth, Ulbricht has not been able to achieve with the communist youth movement in East Germany, in fact he has a great many headaches with his university campuses, with his communist youth organization, as many report to me.

The Chairman: Thank you, Mr. Petersen. Dr. Mummer would like to have a word on this.

Mr. Mummer: Gentlemen, the difficulty is this: in dictatorships, there are no free elections or Gallup polls and it is therefore impossible to know what people are thinking. However, there are certain indications that enable us to form a judgment.

In Berlin, for example, there is a demarcation-line consisting of a wall, is there not, a wall that cuts across city streets? And in Berlin, on the western side, there are free elections. On the other side of the street, they have communist-style elections. On this side of the street, there are fewer than two per cent of the people who are communists, even in the former communist areas of the Republic of Germany; there are less than two per cent in perfectly-free elections, with a legal communist organization, and all the support they get from the other side—money, of course, as well as through communist radio and television; they still get only two per cent of the votes.

On the other side of the street, they also have voting for their Parliament, the *Volkskammer*, which is always unanimous, with the communists getting 99.998 per cent of the votes. Well, what I mean to say is that, among democrats, it is difficult to speak very meaningfully about the state of mind in a dictatorship. For myself, and speaking with some experience of dictatorships—we have now had several in this country—I will say: give us three months of freedom, and allow our democratic parties into that territory to compete with the communist party, and they will get perhaps even fewer votes, after those three months, than the communists receive

here on our side; they get two per cent of the votes in the various organizations they have here which are, in fact, communist.

Well, so much for the question of public opinion over there, where there is a dictatorship, and one cannot speak of free public opinion, because it is not allowed to form, to organize, or to express itself. A comment on German reunification: I personally believe that this feeling of belonging to a single people still exists, and will continue to exist. Mr. Schucht pointed out that there are some thirty per cent or more of the population here who have relatives on the other side, and this is a very important fact. Secondly, it must not be forgotten, after all, that everyone on the other side is aware of the fact that the régime they have there is not a régime established by the Germans themselves, but one established by the Russian divisions, and backed by them. There are twenty divisions there, and they are even more essential to keep the régime in power than are the Russian divisions in Czechoslovakia to keep that country within the Warsaw Pact orbit. That régime, imposed upon the population, is fairly oppressive; its restrictive, narrow and bureaucratic nature impinges constantly on the people's awareness. Nor is it necessary to have democratic education in the schools and in every aspect of public life for people to realize that they are oppressed, that they are not free, and that they cannot do as they wish. Mr. Petersen was saying that it is easier to go to Toronto than to Leipzig. That is true, but for the people of Leipzig, it is far more difficult still to come, say, here to the banks of the Rhine or to go abroad; after all, they are completely deprived of freedom. Imagine, in Berlin it is impossible for a mother living on one side to go and visit her daughter living on the other, and for the daughter to go and visit her mother. It is impossible for West Berliners to go and see relatives in another city in the DDR. All this depresses the people; the standard of living is rising there too, and people are going on vacation and travelling more and more. They can visit other countries within the communist bloc, though not Czechoslovakia any more—that is dangerous; one's loyalty to the communist party is endangered by spending two weeks vacationing in Czechoslovakia. And do you think that all this can continue for years and years, without this reaction developing all the time?

Of course, the day of freedom will come, I am convinced of that; nothing is really settled

that is settled by force. When will it come? We do not know; we have no illusions. We know that we do not have the means to bring about freedom here next year, or in ten years, or even in twenty years; we have no way of knowing. All we can do, as Mr. Petersen so rightly said, is to prepare ourselves politically, with regard not only to the East but also to the West, to make German reunification acceptable. We realize that today, the Federal Republic is already becoming a problem for its neighbours, because of its economic power. For our friends in Paris, they are becoming too strong, and our strength is a source of irritation. It is possible, is it not, to imagine what would result from a reunified Germany with 75 million inhabitants? It is because of this, as well as for reasons of national interest, that we are for Europe, that we are confirmed Europeans, and I do not mean the little Europe of the Six. The little Europe is too small, we are too big and too wealthy for it. We are strong advocates of a big Europe, of British entry into the Common Market, and of a Europe of abundance protected by a system of collective defence in which German armed forces will be not national, but European forces, thus giving no cause for alarm either in the East or in the West. That is why we can be relied on to support European integration.

In short, we are not giving up; we know we cannot name the date, but the future will bring freedom.

[English]

Mr. Nowlan: May I ask, especially in the generation where they have never experienced a united Germany, if the fact of re-unification would upset the economic balance, the present political balance of opposition parties and upset, as I understand it, perhaps the religious balance within the country? With this imbalance and the unification and the help that the West Germans would have to give to the East Germans to bring them up, that there was not a mood developing within a group of people, or perhaps within a newer generation within the parties to explore removing a lot of these festering sores that you so eloquently talked about, sir, and irritations and problems in transportation to see relatives, rather than trying to resolve the fundamental problem itself. In other words, to explore accommodation as a political reality, as a substitute for perhaps the irresolvable problem of political unions. That was my point.

Mr. Ryan: I wonder if we could have a view from Mr. Muggenberg?

Mr. Muggenberg: I might start by saying that I find myself in a strange position—agreeing with our politicians—part way anyway. It was mentioned the feeling of belonging together in both parts of Germany is still very strong despite the fact that the political outlook is rather bad. I must say that German politicians in the last couple of years—there was another time about 10 years ago—or the last three or four years at least, are very realistic. That means they do not try to sell any prizes on saying that unification is just around the corner if you just let them. I think they are very fair to the public and to the electorate.

Coming back to what was said about the feeling of belonging together. I think this is partly due to the fact that a stream of information is going from East to West and West to East, though we have the Iron Curtain and the Wall, and this is mainly due to the fact that radio-television goes over the wall and over the Iron Curtain. As you know, the East German government does not allow selling of Western newspapers, but they cannot stop the radio waves. So we reach four national radio programs, 100 per cent of the East German public, and 75 per cent of East Germany, in technical terms, can be reached by German television—by West German television, and we know that at least 40 per cent of those people in East Germany listen every night to German radio or German television, and I think it is very important that both parts of Germany know more or less exactly what is going on in the other part. This will, I think, keep up this feeling of belonging and strengthen it despite the fact that unification may come about in 10 or 20 years or even later.

The Chairman: Mr. Lewis.

Mr. Lewis: Mr. Chairman and gentlemen, I want to raise a question which has worried me throughout my trip and particularly here today. I heard a number of you refer to Czechoslovakia as being a sign of something sufficient to frighten everyone about Soviet intentions, more than one was frightened before August. In fact one of you gentlemen even said that you had reached the stage where you did not think this would ever happen, at the same time that you describe very fully what the Communist dictatorship always is. And when you cannot help but

remember that you had a similar situation in East Germany in 1953, if my memory serves me right, and in Hungary in 1956 and in Poland in 1956, I find it awfully difficult to understand how mature and obviously very intelligent and knowledgeable people could have been so surprised at what happened in Czechoslovakia and present that as a reason for a new kind of policy. It seems to me that what happened in Czechoslovakia is something that could have been foretold and that can still be foretold and that it may represent merely Soviet determination within its sphere of influence and not represent anything that is an additional threat to the West. I say, an additional threat, because I realize the others. I would like to understand better why it is that so many people in Europe, perhaps it is because I live in Canada far away that I was less touched by it, you have a border with Czechoslovakia—why this event has had, apparently, this kind of result in your minds and in your hearts. Finally, may I apologize for this lengthy introduction but I think it is an important question, I wonder whether all of us may not be using the Czechoslovakian invasion as a means of further propaganda to strengthen certain other policies that we want to strengthen, and whether in speaking of Czechoslovakia we are not really talking about East Germany with a more direct concern that the Russian divisions in East Germany might be increased. I just do not accept the proposition that Czechoslovakia was such a traumatic experience.

Mr. Kiep: Sir, I think the question is a very difficult one and it should come up in a discussion like this. Perhaps we make the mistake of just mentioning Czechoslovakia without explaining fully what we mean when we say sudden change or sudden conditions. Let me deal with the psychological problem first.

Many people politically interested in Europe and in Germany and perhaps in other parts of the world, certainly also in Eastern Europe, were watching the Czech experiment with great hope. They were hoping that out of this might emerge what one might call co-existence. The possibility of a Communist system, a socialist state, with freedom. This is why this is so fascinating and this is why everybody was watching this development which started in January of last year and finally, temporarily ended in August of 1968. This was not only the intellectual pleasure of seeing a process out of which might emerge a combined system which would allow freedom and Communism to co-exist, but also for

many, particularly Germans of course, the hope that out of this might emerge a model for a solution of the German problem. A solution of the German problem by way of a certain measure of self-determination, under a Communist system with a socialist economy, with state-owned enterprises and so on, but with freedom. And when these hopes were shattered with the Soviet invasion on August 21, of course, this caused and brought about quite a reaction; this is the psychological part.

Now, the political part—and this is the one that I tried to explain and bring out in my opening statement is of course that up to August 21 many people had believed in the West that the move toward more freedom in Eastern Europe and the Soviet Union would occur gradually, peacefully, without eruption, without violence and that therefore our policy ought to be directed towards promoting these efforts, supporting these efforts by conducting a similar policy ourselves—by liberalizing trade with Eastern Europe, by exchanging delegations of Parliament, by extending traffic in every form and shape. August 21, and this I think is the political meaning of it—the political impact of it, showed that the Soviet Union was not willing to let this occur, that they would move in by force, stop such a process. And this move was then made and legalized and formalized by the document which declare all countries within the socialist sphere of influence have a limited autonomy and cannot by their own free will or decision, leave the camp or even change certain structures like allowing free press, allowing opposition, allowing free exchange of visitors and so on. I think it is that reason, that fact, that has made August 21 important. Of course all we talk about are the military aspects, about divisions being in places where they were not before. Let us leave this to the military people to decide. But politically speaking, I think, this is the importance of the Czech event. This shows that the government and the Soviet Union is reactionary in the sense that it has decided and determined to maintain its present status quo internally in the Soviet Union and in the socialist camp with police state methods and use military force where and if necessary.

Mr. Lewis: Does that surprise you?

Mr. Walter Kiep: Yes, this has surprised some of us and I do not want to go into details describing the German political scene prior to the 21st of August, but Mr. Petersen

already mentioned that there were people with certain illusions and they were not bad people; they were people who really believed that this was the road toward co-existence and progress and that we were already there. There were others who said that we were not there yet and whether we would get there would depend on our permanent decision to maintain a strong and united West. Now this is not a subject to discuss at this point, but I assure you that the political impact of the 21st of August is the fact that there is no hope at this point in the present Soviet administration of achieving full co-existence with Eastern Europe or the Soviet Union and that we are back, politically-speaking, realistically-speaking, to where we were in the early 50s where the only person you could talk to was in the Kremlin in Moscow. You could not talk to the man at Prague or Warsaw or Budapest; you could only talk to the man in the Kremlin. We are back at precisely that point. This, I think, is the impact of the 21st of August and the invasion of Czechoslovakia.

The impact was very very severe on the people in East Germany. I am still able to go to East Germany occasionally and I hope I will continue to be able to do so. I was there in September, shortly after the Czech invasion and these people were really in great distress because the Czech invasion, which was carried out with the help of East German troops, to them was the most incredible thing that could have happened. They were watching this Czech experiment with great anxiety and with great hope and, of course, with illusions because they saw more freedom for themselves. And if I may answer your question, sir, that you put, I think to young people in West Germany and in East Germany, the problem has assumed proportions of a human problem more than a political or a national problem and these people saw in Czechoslovakia something emerging which would help them. Then all these hopes were dashed by this invasion and when they saw their own troops participating, this was really something of a shock from which I do not think they have recovered yet and many many young people in East Germany who were ready to accept the Ulbricht regime have not yet forgiven Ulbricht for participating in this attack on the neighbouring country.

To sum up, I think Czechoslovakia has had a very sobering effect and many illusions have disappeared and I hope that out of this

will come a more realistic policy towards the East, but I think we should not lose sight of the fact that the move towards more freedom is going to continue. It will continue and we have many indications of that, even indications from the Soviet Union. I only remind you of the event which we saw in the spring of this year. All this will continue. The present Soviet government is trying to stop this by force. This makes the future dangerous and full of risks throughout, but I think in the end we will come to a change of mind on the other side. I am afraid you are right in saying we are a long way off.

The Chairman: Members of the panel and the Committee, there is no intention whatsoever to curtail this discussion and your lunch has been arranged to allow it to continue. We have some who wish to make a reply to Mr. Lewis' question. Perhaps in view of the fact that we have four more questioners as well; Messrs. Stewart, Anderson, Laniel and Thompson remaining in the first round in that order, perhaps now would be a good time to adjourn, have an aperitif and then continue when we sit down to lunch. Would this be agreed? We will adjourn then to the dining room.

Paris, France, March 20, 1969

[Translation]

The Chairman: We are very happy to be here this morning. I shall now ask our colleague, Mr. Laniel, to be acting chairman for this morning's meeting Mr. Laniel?

The Acting Chairman (Mr. Laniel): First of all, gentlemen, I am pleased to welcome the Minister Plenipotentiary, Mr. Black, who will be addressing us and will make some comments regarding the various meetings we shall be having during the day. I wish to introduce to you and welcome to us, Mr. Black, he is the Minister of the Embassy who will address us and also give us some comments concerning the different meetings we will have during the day. Maybe this is the worst that I should be called to do this job. I will do my best with your kind co-operation. Thank you. Mr. Black.

With Mr. Chairman's permission, I think we could start at once by asking Mr. Black to make his short presentation.

Thank you for your kind remarks, Your Excellency, and thank you particularly for having agreed to be with us today. I know your health has caused you some problems in recent weeks, and I hope these few hours

with us will help you to regain your strength. As His Excellency has just said, Mr. Black, if you would be good enough to proceed, the members of the Committee will be able, afterwards, to ask some questions about our meetings today.

Mr. Black: Thank you, Mr. Chairman.

[English]

The Acting Chairman: I would appreciate it very much if you would accept to say a few words to the members of this Committee.

[Translation]

Mr. Black (Minister Plenipotentiary): First of all, the Ambassador has just arrived.

The Acting Chairman: Mr. Ambassador, we were about to begin our meeting, and I was going to invite Mr. Black to address us, but I believe it would be appropriate to ask you to say a few words to the Canadian delegation, and perhaps set the pace for us on what will be an important day in our meetings and discussions.

The Ambassador, Mr. Paul Beaulieu: Mr. Chairman, members of the National Defence and External Affairs Committee:

Needless to say, you are welcome visitors to the Embassy. As you know, France is playing a very important role—one that is sometimes a little enigmatic for Canadians—in NATO and in the fields of disarmament and security. Personally—for we are mainly expressing personal opinions—I believe that this attitude and this direction in French policy are largely due to a European concept or philosophy that is different from the one we hold in Canada, perhaps, and is not shared by all European countries.

But as you know, this vision of Europe is the work of a head of state who has played a significant role in Europe, and whose reputation wins him very wide acceptance in France, as demonstrated in the last election after the disturbances in May; however, this does not mean that France is not seeking a formula for European and Atlantic co-operation. It is a different formula, but as you know, the recent visits of the United States President and the West German Chancellor seem to have opened up some new approaches. At this stage, it is difficult to determine exactly how far these new approaches can be defined, and at what point, for instance, the United Kingdom could be integrated into Europe.

I am giving you these few pointers simply to show you that, in a sense, French policy is

more difficult to define than those of other European countries you have visited, or are going to visit. We thought the best way to proceed, if the members of the Committee agree, would be to start with a short presentation given by the Minister from the Embassy, Mr. Black, who has been dealing with these matters for a number of years and will, I believe, be able to give you more precise guidance.

Later, of course, my colleagues and I will be happy to try to answer your questions insofar as we are able, since we know we are dealing with experts, and experts sometimes do better than diplomats.

[English]

Mr. Black: Gentlemen, first before beginning my presentation perhaps I could just introduce you to three of my colleagues who will help me in answering any of your questions afterwards. First of all our service Attaché, Col. H. P. Lagacé, next our political counsellor Mr. W. M. Wood and Mr. J. Dupuis, our Counsellor in charge of NATO and European matters.

We are particularly glad to see you here, gentlemen, because our feeling that in a trip such as yours which is primarily one of information—to give you a balanced idea of the various currents of policy on defence and political questions it is essential to visit France which in a sense is the opposition. Opposition in the sense that its views on defence and on many of the European political questions of today are at variance with those of their immediate neighbours. I do not need to press this point, you are as aware of this as I am.

What I would like to do this morning in my briefing is to set out for you what we consider to be the main elements of de Gaulle's foreign and defence policy. In order to enable you, with your questions that you will ask afterwards, to be better able to understand the French officials and ministers who you will be hearing later in the day and also better able to pose the various questions which no doubt you will wish to pose.

I am not entering into any criticism of French policy. I think you are perfectly able to do that yourselves and in any case I am sure you have heard a considerable amount of it in your trip so far and you certainly will again when you go to Brussels. My briefing will take about 12 to 14 minutes and it will be in French which is the working language of this embassy.

[Translation]

Mr. Black: As far as we can judge from the writings and words of General de Gaulle whose personality has dominated French political life over the past ten years, it would seem that a certain idea of France has constituted the primary inspiration of his political thought and the principal motive of his action. De Gaulle places the ideas of state, country and national sovereignty above all else. For him, the organization of international life makes sense only if it proceeds from the free will of free nations. With regard to France, it is understood that in the Gaullist concept her place and role must correspond to the prestige, experience and human and cultural resources she has accumulated over more than a thousand-year history. For the President of France, the position France occupies in the world has always been an essential reference point and for ten years his policy has tended towards one major objective: to give France the means for a new role and new mission in the world and particularly in Europe.

French foreign policy has first of all a universal dimension due to the fact that France has interests which extend beyond her borders and those of Europe, that she continues to occupy an important position in the world economy both through her trade and the extent of her foreign aid and that, taking into account her possibilities, the spread and influence of the French language and culture remains an important reality. And I insist on this point. The other traditional dimension of French foreign policy is European, or better, continental; it is this second dimension which interests us more today. The Gaullist concept of a national and free foreign policy was to meet with much opposition in a struggling, postwar Europe. At the time of his accession to power, General de Gaulle assumed control of a country which for ten years had lived politically in the Atlantic world and whose military forces were integrated with those of NATO. Accordingly, from the Gaullist point of view, France despite herself had entered the system of hegemony created by the Yalta agreements which had divided Europe into two rival zones of influence (these are General de Gaulle's words, not mine), the American and Soviet, obviously two rival zones. In the eyes of de Gaulle, this double hegemony constituted an inadmissible barrier to the freedom of France and still prevents the European nations today from seeking among themselves a settlement of the problems inherited from the war. For the past ten

years, therefore, France has concentrated her efforts within the Western world on freeing herself in all areas from American ascendancy over the destiny of France and Europe. At the same time, she wanted to spark a similar process in Eastern Europe, particularly through bilateral contacts. General de Gaulle often stated that this policy was not anti-American: it was French and European and sought to avoid at all costs a Europe divided up between the super powers who would decide on its future together without taking into account the vital interests of the European countries. The objectives I have just named have inspired France's entire European policy over the past ten years in the strategic, political and economic fields.

What France wanted to accomplish in Western Europe was what was first of all called "l'Europe des patries..." and then "l'Europe européenne". For Western Europe, General de Gaulle was forced to accept the Treaty of Rome but he nevertheless attempted to change it and succeeded in preventing the evolution towards supra-nationality which the authors of the Treaty held as essential. For the idea of supra-nationality he wanted to substitute a personal concept. The object of the plan was a division of world and particularly European responsibilities between the United States, on the one hand, and a renewed Europe in which obviously France was to play a key role. To the structure which she then proposed, France wanted to give not only political jurisdiction, but also powers in the field of economics and defence. (It is important to emphasize that it was an equal sharing of responsibilities between Europe and the United States that General de Gaulle seems once again to have proposed to Mr. Soames, British Ambassador to Paris, during a famous interview last February 4 and to Chancellor Kiesinger the following week.) To this idea of a Western Europe as an equal partner with the United States was grafted an old, personal dream of which de Gaulle had spoken in his war memoirs, that of a Europe extending from the Atlantic to the Urals. In the opinion of General de Gaulle, the Soviet Union would sooner or later discover its European vocation and seek to establish both with the United States and Europe a lasting *modus vivendi* which would enable it to face the greater danger threatening it from outside, China. Thus the Gaullist regime believed in a progressive liberation of Eastern Europe which the USSR, for political

and strategic reasons, would be forced to accept. Its policy of a *détente* with the East is in accordance with this line of thought and General de Gaulle continued to state, even after the events of Czechoslovakia, that although the evolution desired by France was temporarily thwarted, it is good because it exists and because, basically, it remains irreversible.

In the field of strategy, NATO like the Warsaw Pact have always represented for the President of France the military instruments of the American and Soviet hegemony in Europe. Even before acceding to power, the General had condemned the military organization of the Atlantic Pact which, in his opinion, involved the integration of the French forces in a system entirely run by the United States. The major steps of the Gaullist policy in relation to NATO may be roughly summarized as follows.

(a) First of all, the General was to propose on several occasions an organization involving France, England and the United States which would be responsible for making joint decisions on international problems and which, in the military field, would grant each of these three countries an equal voice "in common decisions on the use of nuclear weapons".

(b) This proposal, several times renewed, was to be rejected by Washington. The General thus concluded publicly in 1959 that the only defence possible was national defence. Again in 1959 he was to withdraw French forces in the Mediterranean from NATO control.

(c) In 1962, the General was to propose unsuccessfully to France's partners in the Common Market the Fouchet Plan which provided for a European political union involving responsibilities not only in the economic and political fields but also in the military sector. The same year, following the Nassau Agreements, de Gaulle refused to commit the French nuclear dissuasion force to a multilateral forces project integrated within NATO, the famous M.L.F. (Multilateral Nuclear Force). The same year he was to withdraw all the French naval forces from the NATO combined command.

(d) At the beginning of 1966, all the French forces were withdrawn from the integrated command of the Atlantic Alliance. France, however, still remains a member of the Atlantic Alliance but her political role in it has become minor.

To fully understand the situation of France in relation to NATO it is important to emphasize that the French government has been able to move away from the Atlantic Alliance without compromising her higher interests. One might even say that France could permanently leave the Atlantic Alliance at very little cost if international circumstances, and particularly relationships between East and West, lent themselves to such action. Indeed, France's geographic position in Europe is a strategic one and even if she left the Atlantic Alliance, she would nevertheless continue to benefit not only from the protection of American nuclear weapons but from the shield of the standard forces of the NATO countries which surround her. What is more, France has no need of the pretext of NATO to maintain troops in Germany, a right she possesses on the same grounds as the United States and Britain as a result of the postwar agreements. In other words, the Atlantic Alliance needs France more than France needs NATO. Even in the political field, it is through American nuclear protection and the protective shield of the Atlantic Alliance that she has been able to pursue a relatively autonomous policy with regard to the USSR and the countries of Eastern Europe. For the immediate future, it is fairly unlikely, however, that France will leave the Atlantic Alliance. In fact the events of the past year including the serious internal crisis followed by monetary difficulties as well as the events of Czechoslovakia have helped to bring France closer to her allies. De Gaulle clearly indicated to Messrs. Nixon and Kiesinger that international circumstances would not justify France's withdrawal from NATO.

In strategic matters, General de Gaulle has wanted to give his country the means for an autonomous, French defence system, that is, a nuclear defence system. Gaullist France does not feel that the United States would risk a final nuclear confrontation with the Soviet Union to defend European interests which are not vital from the American standpoint. When Mr. McNamara substituted for the doctrine of massive reprisals of Foster Dulles the concept of a graduated riposte, General de Gaulle saw there new evidence that France and Europe must rely only on themselves for their safety and defence. The Gaullist regime, moreover, continued to support the nuclear doctrine of Mr. Dulles. In summary, from the French point of view, the existence of a national dissuasion force places France immediately behind the super powers among the number of nations who can rightfully

participate in the discussion of major, international problems. In Europe, the dissuasion force constitutes for France a powerful political tool, particularly with regard to Germany. Finally from the French standpoint, the nuclear weapon which might be used unilaterally greatly reduces the chances that the United States, in certain circumstances, might prefer the destruction of Europe and France to a nuclear confrontation. I shall give here a few statistics on this national form of dissuasion: at the present time France possesses a force of 60 bombers (Mirage IV) equipped with 50-kiloton atomic bombs. (These bombers may be reinforced with 12 planes obtained from the United States.) Next year she will have the first missiles of a squadron of ground-to-ground, medium range missiles equipped with atomic warheads of a yield of 50 kilotons. In 1971, 27 of these missiles will be at her disposal. The same year, she will launch the first nuclear submarine equipped with 16 missiles provided with atomic warheads of a force of 500 kilotons each. Other atomic submarines will be added to this force at the rate of one every two years.

The above figures take into account delays in nuclear production made necessary by the budgetary reductions decided on in recent months. In summary, if the French programme proceeds as planned, France in 1971 will have nuclear power equivalent in megatons to that of an American minuteman. In 1975, the French nuclear force will have the equivalent power of a Soviet intercontinental missile.

Although it has not yet been officially adopted by the French government, the doctrine of "all azimuth" defence which caused much stir in the international press last year would appear to be a logical corollary of the Gaullist strategic theories. As early as 1959, General de Gaulle had publicly broached certain aspects of this doctrine by stating that France must have absolute control of her own means of defence and that this defence was to be valid everywhere in the world. In 1967, General Ailleret, then Chief of Staff of the Armed Forces, was to develop this theory in a famous article, doubtless with the approval of the Chief of State. He was to maintain that for a long time, French national defence had been oriented towards a particular enemy, England first of all, then Germany and then the Soviet Union. But as the Soviet Union was more interested in the development of her economy than in war with the western

countries—this is the General speaking—France no longer had any designated enemies; national defence was therefore to be orientated, like that of the other great powers, against any possible aggressor, anywhere in the world. It is therefore to be an “all azimuth” expenditure. The “all azimuth” defence program is not dead. It is presently being discussed within the Defence Board. An “all azimuth” force could only develop over a period of ten years. It could include intercontinental ground-to-ground missiles or atomic submarines equipped with long-range missiles or both.

The strategic objectives of the Gaullist government, particularly that of developing a national dissuasion force independent of external pressures account for France's attitude on the question of disarmament. Since 1962 when it refused to participate in the Commission of Eighteen, the French government has reiterated that it would only be interested in international discussions involving essentially the nuclear powers and aimed at the conclusion of a world agreement on total disarmament involving the banning and destruction of bombs, stocks and vectors and providing for complete international control. With regard to the French position on peace-keeping operations, this forms part of General de Gaulle's theory of the role of the United Nations. For him, only the decisions of the permanent members of the Security Council on which the great powers sit, count. The Security Council is the only organ of the United Nations which is capable of ensuring respect of its decisions on the international level and it alone should have the right to decide on the use of multi-national forces in operations designed to maintain peace in the troubled areas of the world. This explains French policy in the Middle East at the present time.

From the necessarily simplified summary which precedes a few conclusions may be drawn. First and foremost, General de Gaulle wants to establish equal relationships between the United States and Europe but on his own terms in Europe. Secondly, with regard to European defence, France has been able to move away from the Atlantic Alliance without affecting her major interests. As we emphasized earlier, it is obviously not the same for other countries. Thirdly, on the political level Gaullist ideas on relationships between East and West appear, at least at the present, to have relied too much on a liberalization of the Soviet bloc, as witnessed by the

events of Czechoslovakia. For the future and whatever the divergences over east-west relations and the security of the western world, France, as General de Gaulle said so himself, has no other alternative but that of remaining “in the camp of freedom”, that is, in the western camp. She could not, even if she wanted, break away entirely from a certain solidarity which is the essential condition for her security, her prosperity and even her influence.

Thank you Mr. Chairman.

The Acting Chairman: Thank you, Mr. Minister. I am convinced that this outline you have just given us will be of enormous assistance to the members of the Committee and we shall now proceed immediately with the questions. We have until ten thirty when our programme provides for a coffee break, fifteen minutes before the arrival of General Gallois.

[English]

The Acting Chairman: I would ask if there are any members interested in asking questions. Yes, Mr. Lewis.

[Translation]

Mr. Lewis: Would it be possible to obtain copies of this speech?

[English]

The Acting Chairman: I guess it would be interesting to get that as early as possible.

An hon. Member: If the photocopy machine holds up.

[Translation]

Mr. Asselin: On a point of order, Mr. Chairman.

The Acting Chairman: Yes, Mr. Asselin.

Mr. Asselin: Can questions be addressed to Mr. Black or to everyone?

The Acting Chairman: To everyone. You can address them either to Mr. Black or to the Ambassador, whatever the case. Mr. Stewart?

Mr. Stewart (Cochrane): Your Excellency, my question does not concern NATO at all but it is a question which is much more important from my point of view: our relations with France. I am aware that your predecessor had a few problems with the Government of France—little things, but all the same things which were insulting to us. I

am wondering if you could tell us what are our relations from this point of view; are our relations good or is France going to continue to manipulate the Province of Quebec?

Mr. Beaulieu: Sir, obviously this is a question which is very difficult to answer in definite terms. There are certain indications that the Gaullist government attaches primary importance to what it calls *la francophonie* of which the Province of Quebec is a part. One of the problems which Canada must face is that of convincing French authorities that Canada is also a French-speaking country.

As you are aware, a few years ago we signed a covering agreement providing for exchanges of students and teachers. Very recently in Paris there was a meeting of the Joint Franco-Canadian commission, Canadian in the wide sense of the word, following the visit of Mr. Cardinal. In the opinion of all those who took part in it, a spirit of optimism emerged. It seems, not only seems—considerable progress was in fact accomplished. It is perhaps not all we would like for the moment but—and this is subject to correction by my colleagues as they will perhaps have something to say on the matter—there seems to be a willingness to facilitate things.

The Acting Chairman: In view of the importance of this question, we can at this point allow additional questions.

Mr. Marceau has another question.

Mr. Marceau: Your Excellency, is it correct to say that the present policy of France with regard to Quebec is the policy of General de Gaulle; this is in fact the policy of France at the moment, and that when the General will be replaced, there will be certain variations, certain methods and even certain principles which will be changed at the time of the hoped for or unhoped for withdrawal of the General.

Mr. Beaulieu: I feel that since I am just newly-arrived here in Paris, perhaps Mr. Black who has been here longer can answer your question more precisely as he is aware of the past context.

Mr. Black: I feel that we might say that any policy, any international policy of France, is the policy of the head of the government and, pardon me, not the head of the government but the head of state, and that this has been true for eleven years now; it is as true for attitudes vis-à-vis Canada as it is

for attitudes vis-à-vis Europe, no matter what. As for the future, then... Your guess is as good as mine.

The Acting Chairman: A further question, Mr. Asselin?

Mr. Asselin: A little while ago, Your Excellency, Mr. Stewart used the word "manipulation" and I do not feel that France is manipulating Quebec. For example, I feel that Mr. Stewart perhaps used the word in another sense but I should like to know, Your Excellency, whether relations between France and Quebec are not presently proceeding along the lines provided for in the 1964 covering agreement, an agreement which was to the effect that Quebec could carry on relations on the international level in matters of culture and education.

Mr. Black: It is certainly true that in almost all areas, relations between France and Quebec have fallen under the covering agreements which include the Franco-Canadian covering agreement first of all and the Franco-Quebec agreement secondly, but it is also true that after the Cardinal visit, there were certain letters which were signed which, from the point of view of the Canadian government as you are aware, and it was my minister who stated this before you in the House of Commons. This is our point of view beyond these cases. I am speaking particularly of the problem of telecommunications by satellite.

The Acting Chairman: Mr. Asselin.

Mr. Asselin: A further question. Would it not be better Your Excellency, instead of having personality conflicts—I am thinking of the conflicts of personality between Canada, between Canadian leaders and French heads of state—to revise the agreements between the Province of Quebec and the Canadian government to facilitate relations within the framework of federalism?

The Acting Chairman: I believe, Mr. Asselin, that your question is somewhat political. It passes judgment on the leaders, on our diplomats. Now if you would like to rephrase it, I should be glad to accept it.

Mr. Asselin: No, I shall not rephrase it. It is the ambassador's privilege to refuse to answer.

[English]

The Acting Chairman: Are there any other supplementary questions on this point before we leave it? Mr. Laprise.

[Translation]

Mr. Laprise: Your Excellency, it was announced quite recently, I believe it was yesterday, that there will shortly be a referendum in France. Do you feel that in this referendum the question concerning external affairs, both NATO, the NATO alliance, and the matter of *la Francophonie* will be raised?

Mr. Beaulieu: No, the referendum concerns only the reorganization of the Senate and the creation of a new system of regionalism by which the regions will have more freedom or authority to decide on certain projects which concern them. As you are aware, the French State is a very centralized State and, I would not say the least detail, but what often seem to us to be details must be referred for final decision to the responsible minister who is in Paris.

Now in this referendum, General de Gaulle is seeking to reform the Senate by granting it certain powers and taking other powers away from it and by granting the regions more, I would not say autonomy, but more freedom of action in areas which concern these regions immediately. I could give you many examples, but I believe that the newspapers are full of them.

[English]

The Acting Chairman: Mr. Allmand.

Mr. Allmand: It is on another point. When we arranged the meeting, Mr. Ignatieff said that France did not take up its place on the 18 nation disarmament conference for several years now though its place is still open. And this morning you have said that this is explained by the fact that France's general policy is to believe that disarmament should only be discussed by the great powers. I think that is what I understood you to say. To me this does not sound very believable. Is this—I mean, I would like you to give me if possible the real reasons. If France is really interested in disarmament, why are they playing this game of keeping their place on the ANDC and putting forward these reasons? Are there other reasons you see behind this pose, this position that they take with respect to such an important thing as disarmament?

Mr. Black: I hope I will not be quoted outside this room...

Mr. Beaulieu: I may add to what Mr. Black has said. As you know, when the gun restriction treaty was discussed, the council in NATO, France made it very clear that they were not prepared to sign that treaty both

because they do not want to be prohibited from doing their own studies but also because there was a flaw in this, some sort of agreement which was supposed to be given by the four great powers and that succinctly included France or the permanent power and this is why they are not in disagreement toward the United States, the UK and the Soviet Union—were prepared to make this commitment, but not France.

The Acting Chairman: Mr. Brewin.

Mr. Brewin: Mr. Chairman, I wonder if in the light of the particular French relationship with NATO and the doctrine that one's national interest should prevail, whether the French government leaders have expressed any views at all about the problem that faces this Committee and Canada's contribution to NATO. We have heard in the other countries very definite opinions on this matter and I wondered if the French have expressed any views as to whether they thought Canada's contribution was essential or are indifferent to it. This might help us in the line of questioning that we might put later.

Mr. Black: This is a very good question. I might first of all say that they have never expressed any view. They take the line that it is up to us. They also point out that they have the integrated military side of the alliance therefore it is not for them to express an opinion. And I have never heard an official opinion. However they undoubtedly have views and I think this is a very valid question to be put to, in particular to Mr. Mesner and Mr. Lipovski this afternoon. Now whether you get a response I do not know. The response may well be the one I have just said. It is really up to you. But they obviously officially must take the line that not only is it our business but that they are no longer in that game and therefore it is not for them to... They have taken a certain position and because of their own particular national reasons, as I tried to point out...

The Acting Chairman: Mr. Ryan.

Mr. Ryan: Mr. Ambassador, what progress, if any, has been made in the settlement of American and Canadian claims for damages incurred by reason of the French notices to them to vacate their French bases?

Mr. Black: I think I am right in saying that there are two claims. There is the multilateral claim by everybody and then there are the bilateral claims, one by the Americans and obviously one by ourselves which we have on

individual bases. Now the multilateral claim has been put in and is in the process of negotiation, I think in Brussels and in Brussels they may be able to give you more information on that. On the bilateral one, this is still under study—both the American one and ourselves. I think there is a general feeling of everybody that it was wiser to settle the multilateral claims before one got on to the bilateral claims. But this is still unfinished business, let me put it that way.

Mr. Ryan: It is still very much alive?

The Acting Chairman: Mr. Buchanan.

Mr. Buchanan: Thank you, Mr. Chairman. Is it true that while officially there has not been any change at all since Czechoslovakia last fall—is it true that, for instance, in the naval operations particularly and possibly even quietly in the land operations there has been a little more interest in perhaps reviving the integrated military involvement?

Mr. Black: If I could ask the Military Attaché to reply to that one. Mr. Legacé.

Mr. Legacé (Military Attaché): We have noticed that there is a changed attitude on this. They are working more closely with us and I will be able to exercise with them on the Mediterranean this summer. The French previously had kept it more quiet and this is our firm belief that France possibly decided that it was good to talk about it more. But you are right, I think, to assume that from the military side there is a very long way to go to be friends with us.

Mr. Buchanan: A supplementary, Mr. Chairman. I believe it was our understanding in Germany that there is still a substantial number of French troops on German soil. What is the intention then in the event of any conflict? How would these be used. Is there an announced desire of how these forces are going to operate within NATO or outside of NATO or co-ordinate at all?

The Acting Chairman: Before the answer is given I think it might be... would it be possible for you to come close so that we could hear your interest in this discussion.

Mr. Legacé (Military Attaché): As you are aware, last year there was roughly 50,000 troops in Germany—in Southern Germany. Last year, after France decided to pull out definitely of integrated military command, discussions began between the French Chief

of Staff, and SACEUR. It was agreed eventually after lengthy discussions that the French troops in Germany would under certain strictly-defined situations, would fight with NATO. But the main thing that the French wish to avoid was any automatic commitment to a NATO alert. There again, I think as Mr. Black said to the other question, I think you may as well get further details in NATO. But this basically was the nucleus of the matter, that France objected to any automatic commitment so, as you can see, this made it difficult for NATO planning. They never know where they stand with the French troops.

The Acting Chairman: Mr. Nesbitt on a supplementary.

Mr. Nesbitt: What exactly is the status of the French troops that are now in Germany? Is it by some agreement with the German government or are these in the nature of occupation troops as a result of World War II or what?

Mr. Black: They were originally there, of course, under arrangements not so dissimilar as our own arrangements for troops in Germany. When they...No...It is part of the NATO forces under the NATO status of forces agreement. Obviously when the French left the integrated side of the alliance this had to be changed and the bilateral—and correct me if I am wrong Colonel—bilateral arrangements were worked out between the French and German governments for the stationing of these troops. The Germans wished to have French troops remain in Germany as before.

Mr. Lewis: A further supplementary, Mr. Chairman. Are these troops in any zone other than the French zone? Are the French troops anywhere in Germany, other than what was the old French zone?

Mr. Black: They are still in the French zone, and in Berlin. In Berlin they are under a quite different status.

The Acting Chairman (Mr. Laniel): We have reached your name, Mr. Lewis. Will you ask your questions?

Mr. Lewis: I try to read and understand the French position vis-à-vis NATO and I am afraid I still and despite the very excellent resumé given this morning, I am still at a loss to understand the basic reason for it. If a

country that remains in NATO that is right in the centre of Europe, that withdraws from the integrated military arrangement, but after it withdraws still wants to maintain some relationship with the military arrangements of NATO was the basic reason for the act, the objection to American leadership of the NATO forces?

Mr. Black: This is certainly one of the reasons. The other, of course, is the General and his conception of how nation states should operate. He does not believe that in any form of supernationality and of course an integrated command it goes directly contrary to this belief. Another reason obviously was that because France's vital interests, such as I tried to explain are not affected. It gave him much more room to manoeuvre on the diplomatic front. He has always said that alliances are ephemeral and he looks at the NATO alliance or the North Atlantic Alliance and the French make a distinction here which is not really a valid legal one, but it is one they will make and you will hear it today, NATO—when they say NATO, they mean the integrated military command and when they talk about the alliance that is something separate. They claim that they signed the alliances in the good nineteenth century fashion and it remains that sort of alliance and that the concept of an integrated command was something that was created merely by the Americans afterwards which in point of fact is true. It was created in 1951-52 and the Treaty was signed in 1949.

The Acting Chairman: Mr. Asselin.

[Translation]

Mr. Asselin: Just some clarification. Do you not feel that as a result of the events of Czechoslovakia as mentioned earlier, and as a result also of new political developments and alliances between the United States and France, that France will decide, within a short time perhaps, to play a new role within NATO?

Mr. Black: You know, Mr. Asselin, I would be very surprised if there were any change in the basic ideas of General de Gaulle. Although bilateral relations with the United States have improved for other reasons, French reasons, and also the end of the war or rather the beginning of the end of the war in Vietnam, and other reasons, I do not believe that he will change his ideas on an organization which is integrated. Indeed, I would be very surprised.

Mr. Beaulieu: All the more so as in the press release or in statements, General de Gaulle has been very, very discreet; he said that France did not intend to leave the Atlantic Alliance but he never gave the least indication of a new participation in the military domaine. As you are aware, General de Gaulle is a man who is very careful to weight his statements and I feel that, if my colleague is in agreement, it is perhaps to a certain extent an indication of his profound thought.

Mr. Asselin: Is this one man's thought or that of the whole Cabinet?

Mr. Black: I feel that it is fairly fundamental in all the Gaullist thought and this is much more widespread than the General with regard to the supranational. (sic) It is a personal idea, but I feel that it is so.

[English]

The Acting Chairman: Gentlemen, I still have one name that was given to me ahead on my first list but I have quite a few people that want to ask supplementary questions. I will call upon Mr. Cafik for his question and if you want to carry this on during the coffee break because we have reached the coffee break for ten minutes. I have decided to extend our time of questioning because of our late start, because we are expecting General Gallois within five minutes or so. So I will call on Mr. Cafik.

Mr. Cafik: Mr. Ambassador, about three or four weeks ago a statement was made by a French official here in Paris to the effect that Separatism was a problem for the Province of Quebec, for it to make its own decision, but in the event that it did decide it wished to separate that the French government would give it all the support that it might require in order to achieve this objective. Are you aware of this statement and if so what is being done about it, if anything?

Mr. Black: I think I can perhaps help you out Mr. Ambassador. Mr. Debré in answer to questions at a lunch about three weeks ago took the position which has been taken regularly by the French government that Quebec problems or Canadian problems are a matter for Canadians and Quebecois to solve, that naturally France has special ties with Canadians in the French-speaking language. If you would like to pose this question but not perhaps quite in the same way but in terms of asking just what is French policy towards the federal government and towards Quebec to Mr. de Lipkowski who is Mr. Debré's number

two and also a minister and a member of the Cabinet this afternoon I think we would be as interested in his reply as you.

Mr. Beaulieu: But I do think that the statement was not worded in the way you indicated. I do not think that the statement was worded in the way you reported. I think that there was a reference but he was talking of general assistance to Quebec not to an independent Quebec. This is the way I have read the statement, but as...

Mr. Black: If we could—the text is perfectly available. We have it somewhere in the embassy if you want to read what he...

Mr. Cafik: Yes, I would certainly like to see the exact text because I only have a newspaper report on this thing and it may or may not be accurate.

Mr. Black: Well, we have the correct text which was given at a lunch for journalists and we will certainly try and find it for you.

Mr. Cafik: Thank you very much.

[Translation]

Mr. Prud'homme: Your Excellency, this afternoon we shall be meeting Mr. Jean de Lipkowski. Our information, whether erroneous or not and this is what I should like to know, is to the effect that Count Lipkowski is apparently an ardent supporter of a certain political separation for the Province of Quebec. Is our information correct? Are our fears justified? Or again, as Mr. Cafik stated, is it a result of reading newspapers and incomplete texts that we arrived at such a conclusion? What should our attitude be towards Count Lipkowski this afternoon? If we follow the development which has taken place over the past while, are our fears well-founded? And on what basis should we discuss with him when the time comes?

Mr. Beaulieu: I believe that the question of discussion obviously is open. Personally, my contacts with Mr. de Lipkowski lead me to believe that he is following the same general policy as General de Gaulle and expressed by Mr. Debré to the effect that it is an internal Canadian problem which has to be settled, that his aim, as the minister responsible for relations between France, Canada and Quebec, is to promote exchanges. I do not believe that I can read his mind further than that.

Mr. Marceau: If it were on the question of NATO, Mr. Black, we have heard during our

trip, especially in Germany, that France seemed to be regretting its attitude towards NATO and that it was planning a rapprochement. Is this the feeling here in France or is it merely an interpretation that might have been given in other countries?

Mr. Black: I believe that from the standpoint of the present government in France, there is no intention of changing their basic policy which I tried to explain and that the feeling is linked more to closer bilateral ties with the United States than they have had in the past three or four years, but that as far as NATO is concerned, I do not believe there is any basic change. But that does not alter the fact, as Colonel Lagacé has already stated, that there is a feeling on the military level that they have to be slightly more prepared than before.

The Acting Chairman: Gentlemen, we will now call off the meeting and wait for the general. It might give you a minute or two to stretch your legs.

Mr. Anderson: Could you tell us when we are going to get to see the report of the steering committee or the drafting committee? Could we pose our questions to whoever is on that committee?

The Acting Chairman: Do you mean to study our draft report? You had better ask Mr. Wahn who is next to you. I do not think that it can be done before we get to Canada. Could I have your attention please? In your name I wish to thank Mr. Ambassador and Mr. Minister, Mr. Black for their kind co-operation with the Committee this morning and all through this day.

On your behalf, I wish to thank the Ambassador. Thank you, Mr. Ambassador, thank you, Mr. Black. I am sure that each of the members of the Committee is perhaps counting on you and on our subsequent meetings during the day, perhaps, to help us and guide us somewhat in our discussions with the French representatives. Therefore, I thank you and I adjourn the meeting for the moment.

The Chairman: Gentlemen, come to order, please.

Mr. Beaulieu: Gentlemen, parliamentarians. We thought that one of the best ways for you to examine the problems of European security in France would be to have you meet two French dignitaries whose careers are very

different but whose reputation, competence and intellectual integrity are recognized not only in France but also abroad. We have therefore invited for the open discussion which is to follow General Pierre Gallois, who is on our Chairman's right, whom you obviously already know. About him, I will simply say that after a very brilliant and very fruitful military career in the Air Force in which he rose to the rank of General, he became commercial director of the Marcel Dussault general aeronautical company. General Gallois is not only a military man who has become a businessman, but he is basically a thinker and a strategist who has published several works including "l'Europe au défi", "Stratégie à l'ère nucléaire" and "l'Alliance atlantique". He is a member of the large editorial staff of the newspaper *Le Figaro* for which he covers military and strategic questions. He also works for several magazines and teaches at the Institut des Études stratégiques. Professor Jacques Vernant, who is on the General's right, is the other French dignitary who kindly agreed to participate in our discussion. A professor of international renown, he is a graduate in law and a professor of philosophy. He taught philosophy at Clermont-Ferrand and Marseille. Since 1945, he has been general director of the Centre d'Études de politique étrangère and since 1956, director of studies and professor of political sociology at the Ecole pratique des hautes études. He has published several works including "Les réfugiés dans l'après-guerre", a work which was written at the request of the United Nations High Commission for Refugees. Responsible for the editorship of the magazine "Politique étrangère", he also works for the magazine "Revue de Défense nationale". Before turning the meeting over to our two distinguished guests, and I am sure you will have many questions to ask them, I wish to extend to them my sincerest thanks for having kindly accepted our invitation despite their busy schedules.

Mr. Wahn: Gentlemen, all the members of our Committee are very pleased to have this opportunity to discuss various topics of common interest with General Gallois and Professor Jacques Veernant. You have already received biographical notes. We already know that the discussions will be interesting and profitable. Now, I would like to ask our colleague, Mr. Asselin, to act as acting chairman of the meeting this morning.

The Acting Chairman: Thank you, Mr. Chairman. Our guests, General Gallois and Professor Vernant, have implied that they each want to make a short opening statement; they would have preferred rather to answer your questions. Therefore, we are going to hear General Gallois first, then Professor Vernant and after that, you may ask questions.

Mr. Gallois: Mr. Ambassador, Mr. Chairman, gentlemen, first we wish to thank you for this meeting because we are very pleased and very honoured to be here among you. We know that on such vital questions as those concerning our security, neither of us can but benefit from an exchange of views with you. However, I wish to point out that any analogy between the problems concerning security which arise in my country and those which arise in your country may be of a different nature in view of the respective geographic, economic, social and human situations of the two countries. However, I shall add that we are all, if I may say so, in the same boat because there are general problems common to all humanity, namely those created by the advent of new weapons. In any case, we should, I believe, deal separately with the general problem and then with the impact of that general problem on the respective situation in our two countries. What we note, without having yet analyzed, it, is that formerly, when major conflicts broke out, all countries were directly concerned; today, essentially because of the advent of new weapons, it seems that there is one law for the rich and another for the poor, and that the advantages of peace, like the horrors of war, are no longer shared equally. Some countries have succeeded, mainly through their good fortune, to safeguard one against the other to the point where they know that henceforth, their territory can be sheltered from war. This security permits them to intervene more vigorously in matters outside their own country, either to preserve acquired rights or to acquire others, and this outside activity is all the more vigorous and more frequent when such countries know that they are risking nothing at home and that they are sure of impunity. This new world situation leads to forced stability in some countries and increases instability in others. That is why, although there was an average of four or five conflicts, coups d'état, insurrections, crises a few years ago, we now have twelve or fifteen a year. Thus, while some countries which have become increasingly stable and which face ever decreasing danger, the rest of the

world finds its military in stability growing. That is the general situation with regard to our country's policy; as I understand it, it is as if we were seeking at any cost to safeguard ourselves so as to defend the vital minimum, our national territory, and to emerge from this area of instability into which a part of the world is unfortunately plunged. Those, to us, seem to be the facts of the present situation; I hope that from the questions you ask, we shall be able to proceed to an analysis of the problem and consequently, draw therefrom the points for a synthesis. I thank you for your attention.

The Acting Chairman: Thank you, General. Now, I am going to ask Professor Vernant to make his opening statement and we shall then proceed to the questions.

Mr. Jacques Vernant: Mr. Ambassador, Mr. Chairman, gentlemen, I wish to add my thanks to those already expressed by my friend, General Gallois. I greatly appreciate the honour which has been conferred on me by being invited to discuss with you problems which arise in Europe and in Canada within the framework of questions touching on security and all related questions. I would like to limit my statement to a certain number of points which seem essential to me. Point one: all these points refer to the principle of French policy in this matter; I think that is what you are most concerned about during your brief stay in Paris. Point one, as you know, the general direction of French policy regarding defence, as in purely policy matters, in matters of military policy and in matters of political policy, is towards the idea of independence. The French Government, at least since 1958, has stated that independence had to be assured in every sector and that there could not be political independence without independence, or autonomy, in defence matters. You may think that if it had appeared that there was a complete contradiction between that desire for independence and concern for security, the French Government would have been induced to modify its position. But the French Government's assessment is that independence in political matters and autonomy in defence matters is perfectly reconcilable with the concern for ensuring security and that this is reconcilable for the reasons which General Gallois will explain to you much better than I, if you need explanations which are due to new technical conditions which have been created because of the existence of new weapons, to the balance

between the two great powers and to a political evolution which has been taking shape in the world since 1960 at least, and of which we have had evidence day after day, particularly in the past few weeks. It is in terms of such principles that the French Government decided, as you know, to terminate its participation in the integrated NATO organization while continuing to affirm its desire to participate in the Alliance. The integrated NATO organization was considered as a stumbling-block to military independence and consequently, to political independence. To the contrary, maintaining the Alliance is considered, at least for the future, as being imperative to security, security from the standpoint of French national interests and security from the standpoint of Western global interests.

My third point will deal with the assessment that can be made by France, in my opinion, of the nature of the threat. I feel that well-informed circles in Paris think that for some years now, that threat has been much smaller, in the past few years at least, has been much less military than political in nature and that even on the political level, in recent years, pressure on Western Europe has been decreasing rather than increasing.

You know that the French Government had summarized its policy towards Eastern Bloc countries, since when threat is mentioned, it essentially refers to Eastern Bloc countries, in three words: *détente* which is our present situation, understanding which was to be the subsequent stage, and finally, cooperation. The assessment made in Paris of the evolution underway was that sooner or later, it would bring the countries of Eastern Europe and the countries of Western Europe to a formula for co-existence and even co-operation.

It is interesting to recall in this connection that as early as 1962 and 1963, at a time when such predictions seemed rather amusing and made some people laugh, the President of the French Republic had announced that because of the inescapable confrontations between Red China and Soviet Asia, the Soviet Union would be forced to seek formulas for cooperative co-existence with Western Europe, apart from other motives which might prompt them to find a solution along that line.

Of course, the events of last August, August 1967, in Czechoslovakia, struck a blow to that political assessment and they wondered in Paris, as elsewhere, how that unusual action by the Soviet Union was to be interpreted since it was the first time since the end of the

war that the Soviet Union had used military intervention; although that military intervention did not degenerate into actual armed conflict, it was the first time that the Soviet Union had used military intervention against one of its allies.

The prevailing interpretation here is that it was more a defensive and preventative operation by the Soviet Union against the dangers of disintegration of its empire than an offensive operation which would lead up to subsequent expansionist action. The future will tell whether this interpretation is legitimate or not. Nevertheless, the fact remains that despite the Czechoslovakian incident, it is thought in Paris that the general interpretation prevailing before August 1967, 1968, was still valid afterwards and that while there was still mistrust, an attempt was being made to find ways and means to follow a policy of contact and if possible, of co-operation, with the Soviet Union, much in the same way, it seems, as that professed by the new President of the United States.

I thank you, Mr. Chairman, for these few minutes.

The Acting Chairman: On your behalf, I wish to thank General Gallois and Professor Vernant most sincerely for their statements. I have several speakers on my list, the people want to ask questions; therefore, I am going to ask you, nevertheless, to ask your questions slowly in order to give the translators and our hosts a chance to grasp the question. I now turn the meeting over to Mr. Laniel.

Mr. Laniel: General, our presence here results from the Canadian Government's decision to re-examine its foreign policy regarding defence mainly and our trip is connected, in particular, with Canadian participation in NATO. I put my question to you in particular because I would like to cover the security rather than political aspect. Since the beginning of our trip, it has been reiterated in each of the countries, even in Sweden, a non-aligned country, it has been reiterated how important the solidarity of NATO and its integration of command are for the security of Europe and the security of the world in general. France opted for a more autonomous policy, both on the political and military level, and I wonder whether this does not endanger the security of the world because automatically, I believe, at least, that decision weakened NATO and however, I ask my question as a citizen of Canada which is contributing to that alliance, I ask whether, in

your mind, as an experienced military man, you can predict whether in the near future, a similar alliance will not be as necessary and whether the countries of Europe will be able to cope alone with security right here on the continent.

General Gallois: I feel that there are actually two NATO's. There was an organization, the North Atlantic Treaty Organization, which went from 1950 to 1961. Then, there was another which began in 1961. For us, these two organizations have nothing in common. Until 1961, the American Government had undertaken, in commitments and on the territories, to defend Europe unconditionally by using, if necessary, all the most appropriate weapons including the most terrible ones. We felt in Europe that we were protected in the same way as any citizen on American territory might be protected. There was no difference in security between Ankara and St. Louis, between Chicago and Hamburg, between New York and Paris. There was a fundamental reason for the risk that America was taking with regard to Europe; it found itself militarily and strategically beyond reach, the risk was small. But after 1961, the United States realized that for the first time in their history, they were as vulnerable as any country in Europe; they had lost the invulnerability that geography had afforded them. The Russian experiments in the Caspian Sea and the China Sea had shown that the Russians were mastering the techniques of the long-range missile and that henceforth, America was threatened at home without its being able to imagine any check. The natural consequence was for the United States to modify its strategy regarding Europe and to inaugurate the second phase of NATO, that is, a second North Atlantic Treaty Organization. Instead of Europeans being defended unconditionally, Mr. Kennedy explained to us that we would be defended only conditionally. This meant that henceforth, there would not be an automatic reaction to aggression but that the American Government would deliberate and decide on what it thought was the right thing to do.

From that time onwards, we understood that there was a law for the rich and another for the poor and that if America, for just cause, kept the atomic arsenal for the defence of its territory, it preferred to defend Europe with conventional weapons.

Confronted by an opponent who has nuclear weapons, the deployment of conven-

tional weapons makes no sense; it is even a military absurdity. The use of conventional weapons is based on concentrations of people and equipment, on long delays in using them, on vulnerable, costly logistic support, on time to manoeuvre, to mobilize men and industries. Nuclear defence precludes any concentration of people, a concentration of equipment does not need a vulnerable and costly logistic system, is not designed in terms of a long, drawn-out war, does not permit manoeuvring or mobilization of men or the mobilization of industries. There is complete incompatibility between the two systems over the same theatre. This is not a French discovery; it was American experts who, from 1950 to 1960, endeavoured to explain it to us. Consequently, the moment we militarily entered the second NATO, we felt that the military system offered to us was absurd. The only guarantee that it gave us was the presence of American troops on European soil. But actually, it was not the American troops that were our guarantee, it was the danger of American blood being spilled, to the extent that jokingly, we could say that it would suffice to replace the American divisions by American schoolchildren; the result would be the same.

It was under such conditions, confronted with the fact that the military system was invalidated and that in our opinion it had lost its credibility, among other reasons we left NATO. But with regard to the Europe of tomorrow, it seems inconceivable to us French that it is guaranteed indefinitely by the continued presence of foreign troops, even if they are friendly troops, which are under a command 6,000 kilometers away with other concerns in the world. When the war in Indochina came to an end, it was explained to us that the conventional forces could be reduced because there were too many of them and as soon as the war in Indochina was less important and because the American forces seemed too numerous, it was explained to us also that it was absolutely necessary to raise the level of forces deployed in Europe. All that was not serious.

In addition, little by little, the military organization deployed in Europe also became an agency for economic compensation. The British, for their part, left their troops on the Rhine provided that Germany paid. Likewise the United States deport (sic) in Germany provided that Germany paid and spent for armaments in the United States each year more than France devotes each year to its

own nuclear programme. This is not the way to build the Europe of tomorrow.

And therefore, for military, economic and then political reasons, I believe that my government adopted the attitude that it did. The military integration of conventional forces confronted by a nuclear power is an absurdity. We are convinced that because of the dangers inherent in the possible use of new weapons, such weapons cannot, in any case, be the weapons of a military coalition. They are valid only for the defence of the quick works of the country possessing them and never for the profit of interests outside such countries. To the arsenal of traditional conventional forces in the world is added the nuclear arsenal, but the two systems do not mix; they are as incompatible as water and fire. The nuclear system defends the national life, national territory, national sovereignty of the country which holds those armaments; as for conventional weapons, they can be used by such countries, outside their own territory, to acquire marginal interests, to defend others in conflicts which could be lost without endangering national life. Because the immensity of the nuclear threat is now increasingly apparent, we are convinced that those armaments cannot be, in any case, the armaments of an alliance system. Therefore, the words "military integration" seem as ridiculous to us in the world of today as the use of a group of archers or the use of the Roman balista. It is a system that belongs to the past.

The Acting Chairman: Thank you.

[English]

Mr. Wahn: My question is directed to either of the two witnesses. I understand the desire for détente leading to entente, and also the reasons given in answer to Mr. Laniel's question. I would like to ask, remembering our interest in deciding a similar question which they have already decided, if they could tell us, why did France, give specific reasons why France has decided to withdraw from the NATO integrated command, and remembering that sometimes in Canada we feel oppressed by the friendly but almost overwhelmingly American influence, could they tell us whether in their view the NATO integrated command is dominated by American, by America, and also whether if Canada withdrew its forces from the NATO integrated command and perhaps performed its NATO commitment to North America, would NATO be seriously weakened, or would European security be seriously weakened?

[Translation]

Professor Vernant is going to reply.

Mr. Vernant: Yes, I am going to add a few points in reply; there are probably other technical reasons which General Gallois will give you more accurately than I.

One of the reasons which motivated the French Government's decision, which, I repeat, was announced in 1963 already, in press conferences, which poorly justify the astonishment of certain governments when those decisions were carried out after prior notice. I believe that, as I see it, the essential reason which motivated the French decision is that it was not considered necessary and consequently, it was no longer considered possible for the French Government to not fully assume sovereignty over its national forces and over its national territory. You know that participation, being a member of the integrated NATO organization, had certain consequences, not only from the point of view of the structure of the command but certain other consequences, the presence of American bases in France, the utilization of those bases and the utilization of those bases under conditions which did not meet the requirements of French sovereignty; for example, it was recalled in Paris that when the American Government had to use forces for operations in Lebanon, for example, it used means of transport from airports that it had at its disposal in France. Therefore, this was an encroachment on what was considered in Paris as the requirements of full sovereignty over French policy. On the other hand, it was hoped in Paris, it was hoped mainly after we began to actually have nuclear weapons at our disposal, it was hoped that we could preserve the right, which is recognized by the North Atlantic Treaty, to decide on the way that each of the members of the alliance would participate in the joint effort. The existence of the integrated command which, in fact, obeyed the directives of the President of the United States more than any other directives, the existence of such territorial encroachments reduced to almost zero the remains of sovereignty which were contained in the treaty of 1949. The French Government therefore planned to put the alliance back into force, both in letter and in spirit, by ridding itself of what it had become, for reasons which were probably justified, considering the dangers of the 1945-1965 period, but which, by the same token, no longer seem justified. The French Government thought, consequently, that it was necessary or prefer-

able where it was concerned to withdraw from the integrated organization, and in addition, that that would not result in considerable modifications from the viewpoint of security.

A voice: Thank you, sir.

The Acting Chairman: Mr. Harkness.

[English]

Mr. Harkness: Yes. I would put my question in the simplest form in this way. What is the purpose of the French nuclear force, primarily military or primarily political, and to be a little more precise—do you consider that your comparatively small nuclear force as compared with that of the United States and the U.S.S.R. is a credible military deterrent or on the other hand do you take the position that it gives you a great deal more political leverage we will say, than would be the case if you did not possess it?

[Translation]

General Gallois: In truth, contrary to public opinion, the new weapons are not political instruments. In French we often say that we can do anything with bayonets except sit on them. Well I would say that it is just the opposite for the atom and atomic weapons. The only thing we can do with them is to sit on them because it is not believable for one second that any country whatsoever will use them for anything other than defending absolutely vital interests. Consequently, such weapons are not available for foreign policy or for diplomacy. They are weapons for the defence of the vital minimum, that is the survival of a state. For that reason they will never constitute the weapons of an alliance and in an alliance, the leader of the alliance will never use them to the advantage of an ally.

Now, respecting the credibility of the armaments we have, I shall refer to a statement by Mr. Kennedy, who, when the Pentagon asked him for additional funds, had answered: "How many thousands of times will we have to be able to kill the same Russian for you to feel safe?" The American and Russian military arsenal does not correspond for one moment to any military reality. It is so large that it too is absurd. I shall remind you that to destroy the equivalent of 1,400 Hiroshimas and so to send 140 million human beings to another world, in theory 28 megatons are sufficient. However, the American stockpile is estimated at 400 thousand megatons. No one

has yet explained to me the reason for the difference between the 28 essential megatons and the 400 thousand existing megatons, unless it is the desire to discourage other states from doing the same by explaining that 400 thousand megatons are essential for any form of security based on nuclear arms.

Furthermore, I shall remind you that in 1962 at the time of the Cuban Crisis, the Russians did not have 100 weapons capable of reaching American territory but the Americans had five thousand weapons, thanks to NATO, which could reach Russian territory. So, I find that the objectives of the war, or rather the Soviet war objectives, were to keep Mr. Fidel Castro in Cuba and the American action was intended to get rid of him. I find that Cuba was in American territorial waters and 10,000 kilometers from Russian waters. As a witness to the incident, I must ascertain that in spite of the overwhelming American qualitative and quantitative superiority, Mr. Fidel Castro is still in Cuba and even if the Americans did succeed in having the weapons, which were waiting there to be installed in Cuba, withdrawn, inversely it seems that they promised not to install any in Europe. As such, we are now faced with 700 Russian medium-range ballistic missiles without any equivalent missile on European soil.

History will judge the Cuban invasion severely. It was presented as an American victory but appears to us to be a bloody defeat. Yet the proportion of forces was 1 to 30 which goes to show that what counts today, much more than the size of the military establishment, is the political will.

There has just been an example of that. Until now we believed that the United States was the master of the Mediterranean. We have just discovered that in spite of that overwhelming superiority, they have now agreed to share control of the Mediterranean with the Russians. If the 6th fleet had had ten, twenty or even thirty more or less ships, nothing would have been changed.

To conclude, we think that our nuclear inventory will contain the equivalent of 2 to 300 megatons and that, in view of the military and political value for France, no one will dare place her in the desperate situation in which she found herself in 1940, knowing that as a last resort measure she could release her 200 megatons and kill several million people in the aggressor country.

That policy is not a prestige policy, as is believed, but is rather a humble policy. The prestige policy was what we practised when, with standard numerous forces, we waged war in Asia and Africa by supporting some 50 million non-French people. Today, within the context of the humble policy, we are content to defend what is sacred to us—the homeland and because we know that if France is invaded or subjugated by force, the course of the world will not change, we think that it is easier to use the atom to defend a small or average-size country, whose disappearance would not be decisive, than to defend a very large country whose removal from the map would give a world victory to the other. It is in that context that the efforts which we are making must be understood.

[English]

Mr. Harkness: General I presume you would agree that what is important is not the amount of megatons possessed by a country but the ability to deliver that on target?

[Translation]

General Gallois: I do not at all think so, sir. I have only to see the efforts which the Russians and the Americans are making to impose the Non-Proliferation Treaty on other states. Those states will not be in a position for a long time to have weapons such as the Minute Man or Titan missiles or the Russian T-three or T-four missiles. Nevertheless, Russia and America are doing the impossible to prevent the spread of that armament. They are not afraid of the carriers but they fear the existence of the explosive itself. A small country, such as Israel, with about ten Boeing 707's which have the same autonomy and speed as the B-52, tomorrow can represent an enormous potential for aggression. The carrier, the quality of the means of delivery, is a ploy used for the past twenty years by the great powers to discourage others from following the same course. However from the point of view of military fact, it falls down under cursory examination. The proof of that is seen when in Cuba Mr. Fidel Castro had hung onto 40 old "Il-28's" which are airplanes designed in 1945... all America was afraid. On a Pentecost Saturday at midnight, no one could have prevented about twenty of those airplanes from flying 30 meters above the ground and from dropping twenty atomic bombs on twenty American cities. There is no power in the world which can halt such a surprise assault. The Americans, like the Russians, are well aware of that.

Mr. Anderson: Well, you have explained France's highly logical theory very well. However, my question is this: do you feel that that logic and theory is just as logical for Israel or another small country?

General Gallois: Of course. Obviously the theory is valid for all states. France does not have a monopoly on it. I am even convinced that as you descend the hierarchy of states on a power scale, it is increasingly valid.

The Acting Chairman: Thank you. Mr. Lewis. Do you want to add anything, professor?

Mr. Vernant: No, but perhaps for two minutes I will simply add a point on that subject to qualify the statement.

I believe that Gallois is perfectly right in saying that from a logical point of view what he has just related respecting the French position is obviously valid for other countries. It is still a fact that politics is not logic and decisions made by politicians are political decisions and not logical ones. That means that the French government made a political decision respecting a particular situation, that of France, and it is not true, in my opinion, that that same particular situation occurs when other countries, small or large, are involved.

The Chairman: Thank you. Mr. Lewis?

[English]

Mr. Lewis: I think I followed your military analysis and explanation but I cannot understand where it leaves us in the world. If I understood you correctly one of the objections you have to remaining in NATO was that the idea of retaliation was abandoned and that meant that the United States would no longer be ready to defend some European countries in a proper way. What kind of war do you visualize, what kind of confrontation do you visualize that would ever justify the massive retaliation? Why do you by implication reduce to nil the nuclear weapons which NATO now possesses on European soil? And what difference in a nuclear war does it make whether you have to pick up a telephone in Europe and speak to the President of the United States which you can do in one minute, across the Atlantic as easily as you can do from Marseilles to Paris but you can get to the President of the United States much more easily from Brussels than you can from Paris, all this military analysis that you

did, if I may say so brilliantly leaves me a poor citizen of the world completely at a loss to know what it is you are after.

[Translation]

General Gallois: Of course I can answer you very easily.

In Europe, because of the Russian power, we cannot imagine the Russians attacking West Germany, for example, along conventional lines. Therefore, there are two assumptions: either we do not resist along conventional lines and we are lost or else we resist. If we resist, we cannot for one minute imagine that if Russia launched a full-scale attack on us with conventional forces, when faced with our conventional resistance that same Russia will withdraw its troops, excuse herself and send flowers to the chancelleries saying that that was not what she wanted! That assumption of Mr. McNamara's is not feasible in Europe. It is out of the question because it is absurd.

If the Soviets should launch a full-scale attack on Europe, it will be to achieve their war objective. If we resist conventionally, as Mr. McNamara hoped, I cannot see what will prevent the Soviets from including in their stockpile twenty small French bombers with the same power as the French bombs because with twenty atomic bombs our conventional resistance is ended. Conventional resistance is based on a concentration of airplanes, on a concentration of manpower and on fuel pipelines. All that is vulnerable. A small bomb would leave five supply ports, Hamburg, Bremen, etc., in ashes. With twenty to thirty 20 kiloton (megaton?) Hiroshima-type bombs, there is no longer a conventional defence in Europe. It is finished. For that reason, we shall not be able to tolerate the system.

The use of 7,000 tactical weapons, which you were discussing, is not conceivable with the type of military installation which exists in Europe because I cannot believe for one minute that we shall be able to drop 7,000 atomic weapons on Russian troops without the Russians doing likewise. If they respond in the same way on the type of armament which we have, thirty seconds will be sufficient to destroy the accepted force in Europe.

On the same plan, you cannot have the conventional installation desired by Mr. McNamara and the use of 7,000 tactical atomic weapons, which you were discussing. That is like mixing fire and water. It is impossible.

[English]

Mr. Asselin: I have a very short supplementary.

The Acting Chairman: I am sorry I have a long list of questioners.

Mr. Asselin: I am sorry I think it is important to pursue this, and if that is true and I agree that it might be, please tell me where the French nuclear armament would be any more useful in any war which the Soviets start in Western Europe.

Mr. Lewis: It is because the same logic applies, if you throw your two or three hundred megatons, they will throw more.

[Translation]

General Gallois: We cannot imagine a Russian command concentrating conventional troops along the French borders knowing that the command stands to lose its troops in a matter of seconds. I am talking of troops not of Russian cities.

I cannot believe that the Russian command would be stupid enough to mass standard forces against us knowing that with our vitals threatened, we risk, as a last resort measure, like that we would have made when faced with Hitler's tanks in 1940, destroying its battle corps in a few minutes with our atomic bombs and low-altitude airplanes.

Consequently, the Russian command would be forced to disperse. If it disperses, it cannot concentrate itself. Therefore, it is no longer the threat represented by its numerical superiority. It cannot put sixty dispersed divisions along the same stretch of territory. Rather it will mass ten divisions but is then not a danger and knows it.

An attack on French national territory by a volley of Russian nuclear weapons is possible just as an attack on American or British territory is possible. If we only have traditional weapons, the sole difference is that we know that our divisions scare no one and the only way they will reach Moscow will be as prisoners of war. However, no one can be certain that our Polaris missiles and our airplanes, flying at a low altitude, will not reach Moscow or another Russian city and cause more damage there than even we intend. An unbalanced situation would be created. Russia would have to take revenge for our reaction by destroying that which she wants to conquer—which is ridiculous. Russia would have to rebuild its ruins while America, on the one

hand, continues on its road to prosperity and China, on the other, continues on its road to power.

To capture France, Russia would be specially penalized and that would not bring her a great deal. That is why our system appears sound to us. We no longer pretend to defend ourselves conventionally with a conventional installation like that of NATO in Germany especially. We do not understand what purpose it serves.

The Acting Chairman: Thank you. Warren Allmand.

Mr. Allmand: You are no longer in NATO militarily but you are still a member of the Alliance.

I do not understand the value of that participation. Why are you still part of the Alliance?

General Gallois: We belong to a community of states which share the same moral, social and political ideals. Therefore we are friends and allies. However we are convinced that against Russia, who has nuclear arms, any military system, whether united or ununited, based on traditional weapons, makes no sense at all. We hope to defend ourselves on our own and alone.

Mr. Allmand: What will you get out of that alliance? What will you give in return?

General Gallois: Perhaps I did not make myself clear enough. If all countries truly consider atomic weapons as only being intended to defend the vital interests of a state when threatened with death—as France was in 1940 and I know that that is a special case which is hard to understand in America—we have been in a situation which explains our present behaviour.

People do not find themselves in such extreme circumstances every day, month or year. Therefore the political alliance has its merits for all alternatives other than that vital threat. If there is a vital threat, that is our business. However, fortunately such vital threats are not common occurrences. Every day, month and year of the national existence, we have to deal with situations which do not endanger national survival. We are facing such a situation in the case of a political alliance. We know very well that if we were threatened with death, no one would come to our aid because we can no longer beg for security in the world today. The risk is

too great. Previously the danger for America was sending an expeditionary force 4,000 kilometers away from home. Today, in her own words, the danger is of losing 50, 100 or 200 million inhabitants. Soliciting aid in that field is forbidden because it is not warranted. Security cannot be asked for when the danger which one's ally must run is not the loss of an expeditionary force, an army or a province or payment of a tribute but rather is national genocide. For that reason we cannot seek protection in such an extreme situation from the United States or from anyone else.

The Acting Chairman: I believe the Professor wanted to add a few words?

Mr. Vernant: Only a few words to complete the answer by adding something to what Gallois has just said. Actually I am not sure if what I am going to say is absolutely necessary. Why has France remained in the Alliance after having quit the organization? She quit the organization for the reasons which I pointed out to you earlier and which are relatively clear.

What does France get from the Alliance that she did not get from the organization? The Alliance is insurance. The Alliance was mainly defensive and is insurance which has a certain role to play by covering a certain number of assumptions, as Gallois said. If you will, that reinforces the potential for political-military dissuasion which plays against the enemy, should the enemy have to be dissuaded. Similarly, nuclear weapons, our nuclear armament is an insurance. As Gallois said, it is a mainly defensive insurance not only for us but for all who have such weapons. They are defensive from the point of view of vital interests.

Consequently, there is no contradiction in our having nuclear arms and our remaining in the Alliance. There are only apparent contradictions. We shall remain in the Alliance as long as we feel that the European situation requires that kind of insurance in the face of an ever-present threat.

The Acting Chairman: Thank you. Mr. Laprise.

Mr. Laprise: In the light of the relatively clear statements which you made, I would like to know if the Russians should attack Germany, for instance, whether France would participate in the defence of Europe. If so, how?

General Gallois: Probably with a few traditional forces, if that made any sense. With nuclear forces? No, no more than would America or England.

Mr. Vernant: I could perhaps add something to your question. I believe that you asked your question in a much too general and somewhat theoretical way. It is obvious that everything depends on the way in which your assumption would occur and the interpretation which would have to be given to it. Many situations which would cause Soviet military intervention against the Federal Republic can be imagined. Everything depends on the circumstances. I do not know whether Gallois would contradict me, but it can be thought that if the attack involved a mass penetration of Soviet troops into Germany for the purpose of starting a real battle, a conquest of Western Europe, the French government would possibly not wait until the Russian troops reach the border before using her arms. I think you understand that kind of assumption. The context in which the situation would occur must be seen to some extent.

The Acting Chairman: Mr. Laprise, do you have a related supplementary question?

Mr. Laprise: I understand that France decided to withdraw her troops from NATO which she was fully entitled to do. In what way would France see other nations, Canada or Germany for example, withdrawing from NATO?

Mr. Vernant: That is a very interesting question for both of us.

I believe that here again the question must be considered in the light of its logical and political aspects. If Canada makes such a decision, it involves Canada. If the Federal Republic should make such a decision, it involves Germany. Canada and Germany are not the same thing. France and Germany are not the same thing. When we made our decision it was argued: "If you make that decision, others will follow suit". The argument may have been useful at the time but is not justified because we were legally and politically in a position to make such a decision without creating worry. It is obvious that it would not be the same thing if Germany were involved because then it could be asked what is behind such a move.

Respecting Canada, I do not think anyone would wonder what was behind such a move

and the French government would see no objection in view of the fact that it is Canada and because of the obvious interpretation we would give to such a decision.

[English]

Mr. Gibson: I could understand your reasoning, sir, if it were not for the fact that the Warsaw Pact countries outnumber us 3 to 1 in armed force, at least conventionally. Now, if there is this large superiority of conventional force opposing us now and if neither side is going to use nuclear weapons, why I ask you sir, why do you not advocate equalizing the balance of conventional force and then striving for disengagement on both sides rather than unilaterally?

[Translation]

General Gallois: I have already answered that question somewhat.

Due to the fact that the Warsaw Pact countries are conventionally three times stronger than we, a standard defence against them makes no sense.

I cannot believe that the Warsaw Pact forces, with a superiority of 3 to 1 over us, would move off towards the West and that when faced with the miraculous resistance of the standard NATO forces, which are weaker in a one to three comparison, would excuse themselves and return to their barracks. To win a victory, they would probably be the first to take the initiative and use their own atomic weapons.

As we would be all the more vulnerable for having resisted them and strongly banded together against them, our own forces would be liquidated in a matter of seconds or minutes. Victory would immediately belong to the Warsaw Pact forces. That is not what we are seeking. On the contrary, we want just the opposite.

Consequently, we feel that the whole system of conventional defence is without foundation. Furthermore, it was so in the minds of all the American generals beginning with Gruenther and Norstad until 1961 when America began to feel vulnerable at home. Norstad left. Gruenther left. For ten years they explained to us that it was just the opposite.

However, it is not because Russian missiles can now travel from Kiev to San Francisco that the strategic situation or the vulnerability of conventional forces has changed. That is of no consequence. America can simply no

longer take the same risks as in 1961. Therefore she changed her strategy and through a great propaganda effort tells us that the new strategy is as good as the old. For ten years she explained to us that a conventional defence of Europe was absurd. She was right.

[English]

Mr. Gibson: Are you not flooding us with propaganda to just get out of here and let it all go and take a big risk.

Mr. Asselin: Mr. Gibson, I am very sorry, is this a supplementary, because I have got many questions on my list? Has your question been answered? What did you wish? Will you repeat your question, please?

Mr. Gibson: I say, are you not flooding us with propaganda to weaken the whole structure of the conundrum, basing it entirely on the concept that any conventional attack would be answered with nuclear attack?

[Translation]

General Gallois: It was the policy which supported the American generals until 1961 and rightly so, we believe. However no one has been able to explain to me why that policy which was valid in 1961 then became bad policy. I have never heard an explanation other than the vulnerability of American territory. I do not care. I am sorry but I am French and what interests me is the vulnerability of my territory.

The Acting Chairman: Mr. Prud'homme?

Mr. Prud'homme: General, your final words leave me completely dumbfounded. First of all, I would like to know what role you think Canada plays. We believe that we are here on behalf of the community. We are not here: Canada, Germany that concerns you. Canada, Belgium, that concerns you. Canada, France.(?)

I believe in Canada's participation in NATO. Our country is located thousands of kilometers from here. I think it is a useful role. Otherwise we might say: "Well yes, Canada, as Canadians, is withdrawing because the general has clearly indicated: I am speaking as a Frenchman". However it is as a member of the Western World that I am asking my question on behalf of the community of nations.

Anything that affects Europe has always in the end affected America. There have been two World Wars in which probably very few

people wanted to participate; nevertheless, in spite of this, in spite of events and desires, in spite of isolationism, we have been called upon, against our will, to get involved in both these Wars.

My question, then, is this: obviously, if you consider it to be a matter of one country facing another, obviously I would suggest that we retire from NATO. But, the reason is that I think we are playing a useful part. And I believe that France is playing a useful part. You see, when you said to us just now...

The General has brought up so many subjects that it would take the whole day. When you told us that 1,400 Hiroshimas would take 20 megatons, or 28, but the 1,400 Hiroshimas are not situated in the same area? For me, that is enormously important.

The Acting Chairman: Would you kindly elaborate upon what you just said?

General Gallois: I understood what you wanted to say; I am very touched...

The Acting Chairman: It is very important; it is a very important question.

Mr. Prud'homme: The General seems to have understood my question.

General Gallois: I am very touched by the position that you are taking; it seems to me to be a sentimental position, to which I, as a Frenchman, am just as sensitive as you are. Yet I must say to you that my country has, all the same, been, since my generation, a kind of door-mat on which the others have wiped their feet, for 50 years, and we think that is enough. Fortunately you have not known that, in your country; put yourself in our position. That is the first point.

The second point is that we are not the ones who invented a new technology that changes the traditional strategic facts. That was done outside our country. What we are trying to understand is the significance of that for our security; and I know very well that these new arms are very disturbing, that we do not understand their meaning. That is normal. Armour was condemned in the 14th Century. But in the 17th Century armour was still worn. The lance was condemned by the musket in the 17th Century. But in 1938 there were in the regulations for manoeuvres of the British Army 33 pages devoted to handling of the lance; and there was in Verona, in Italy, a cavalry regiment of lancers.

In 1939 Mr. Mussolini decided to replace the lances made of wood by lances made of iron. The colonel commanding the regiment committed suicide. That is normal; Technology is not assimilated brutally; it takes years. Now, nuclear armament is sufficiently revolutionary to place its consequences beyond comprehension. In order to have a good understanding we must know what those consequences are. I shall make a fast resumé of them for you.

The first is that the power of populations no longer counts. It was because Napoleon led the most populous country in Europe that he conquered Europe. It was because America had 150 million inhabitants that she was capable of mobilizing 12 million soldiers in 1941. It was because Russia had 190 million inhabitants that she was able to lose 22 (sic) and still recover. When Mr. Paul Nitze, the American Minister for the Navy, put to sea his 12th submarine, in 1961, he wrote the following letter to Congress:

Of these 12 submarines, eight are constantly in service. With these eight submarines we are capable of inflicting from 30 to 40 million deaths upon any potential adversary of America.

Now, these eight submarines have, each of them, a crew of 200 men, that is to say, the submarines in all have a total of no fewer than 2,000 combatants, served ashore by 50,000 specialists. Mr. Nitze, with one stroke of the pen, deletes the importance of demography.

The second factor was heavy industry. America needed Pittsburg and Cleveland to forge arms by the thousands, by the tens of thousands, by the millions—for soldiers. Russia needed Magnitogorsk to arm her soldiers. Today, to make 10 submarines it is not necessary to have heavy industry; what is needed is a small industry consisting of specialists. And thus the great iron metallurgy complexes are condemned, the big plants in Cleveland, Pittsburg, Magnitogorsk, in the Ruhr, of Schneider-Creusot complex in France.

A third fact to note concerns the dimensions of territory. When Hitler went to Stalingrad he saw the meaning of the thousands of verstes that he had to make his soldiers travel. When Napoleon went to Moscow he realized what distance meant.

Today if there were a conflict between Russia and America, and if a missile were

shot from California to Irkutsk, or Odessa, the difference in the trajectory would amount to two or three minutes. That no longer counts. Finally, for Russia, old General Winter played a part. Hitler and Napoleon noticed that. The arms of today bear no relationship to atmospheric conditions; today's arms are indifferent to such conditions.

Thus the great nations, because they are great nations, were the first to invent armament that robs them of the benefit that geography, economics, industry and population made possible. They opened Pandora's Box, from which burst a technical flood that deprived them of advantages which they alone possessed. For, America and Russia were the only nations that had vast territories, great heavy industries, massive populations and were conveniently located on the map.

Well, it was they themselves who invented an armament that deprived them of these privileges, and you can no longer consider the strategic positions in the same way as before such inventions, because of these upheavals. After the invention of the simple firearm, the stronghold chateau disappeared. After the invention of the atomic explosion, upheavals of the same nature exist; they must be exploited.

Mr. Prud'homme: Thank you, Professor.

Mr. Vernant: May I add a few brief words in response to your anxiety, my dear Mr. Prud'homme. I should like to add a few words in reply to the anxiety that shows through in your question. I believe that Mr. Gallois has made an excellent resumé of the military consequences of nuclear armament, armament that constitutes a revolution of which we are often not aware. Such armament has consequences; but it is still true that your question remains; what, then, is there left of solidarity? And if I understand correctly, you asked: do these consequences, these technical revolutions, as they are interpreted by Mr. Gallois, simply mean that the Western World is dissolving, that nobody any longer thinks of anyone but himself?

I do not think so, because there are other phenomena that occur at the same time; France remains an Occidental country, we remain in solidarity with the Western World, just as we and Canada stand together. This is something different. The military hypotheses that Mr. Gallois conjured up are, if you like, the exception; and the armament in question, he tried to explain, are valid only in exceptional circumstances.

As for the rest, the field for cooperation, the domaine of interdependence, remains considerable; it is stable, and there is even nothing to prevent its being developed. In other words, one must not believe that, just because we are becoming aware of a revolutionary reality in the military sphere, with its potential consequences regarding alliances, we are purely and simply returning to a kind of international jungle where nobody thinks of anybody but himself.

The Acting Chairman: Obviously there will be an enormous number of questions to ask still; there are still people on the list; Mr. Marceau seems to have a supplementary question; I can admit two supplementaries. Mr. Marceau?

Mr. Marceau: First, you have dealt with so many ideas, General, that I am lead to call you, as Mr. Lewis did, General de Gaulle; as he told you just now, because you seem to personify France's policy. But I cannot conceive of anything in particular. You say 200 megatons, with a gesture of despair, we can shoot forth that much. Have you considered that, before the actual launching, others could do the same, and that you would no longer be there to launch anything? Which means, in my view, that the only solution is the equilibrium of forces; and France, through its decision to retire, throws the forces into disequilibrium, and thus she... Have you considered that your decision could bring about a world war? Or was your thought merely: France's sovereignty?

General Gallois: Well, I shall answer this way: First, the nations, beginning with the largest, that is, with the United States and Russia, use, for their defence the principle of indirect defence. They no longer defend themselves from their frontier limits; they put their bombers, into the air, their submarines under the seas and, probably, their satellites into the cosmos. That is to say, these nations have learned that the extent of their territory is already too limited. They use international space to protect themselves, by putting their arms into permanent movement there. But I and you have the same right as they have, to do this. We are all equal in the matter of utilization of international space. So much so that, if I put my armament there, it benefits from the same advantages as the armament of the Americans or the Russians, the British, or the Chinese, tomorrow. To destroy simultaneously and preventively is

impossible, because simultaneous localization is impossible.

Then, if the Russians, as you say, destroy my country, they simply provoke a reaction of despair against their own country, and I do not know of any Russian leader who would be fool enough to destroy France—French territory—leaving intact half a dozen submarines, for example, or a few satellites that would be brought down on their heads a few hours afterward; no, that is unthinkable. It is the same system that is created, that is used, by the Americans, the Russians themselves, the Germans, the Chinese tomorrow, the English. Consequently I cannot follow you in that direction for one minute.

Secondly, once again, such armament has no meaning if we were to find ourselves in the situation of despair in which we found ourselves in June of 1940, and during which nobody came to our rescue; for, in spite of everything, we were the ones who endured four years of occupation. We endured four years of occupation and there was no way of avoiding it; we were paying for our faults. Well, we had to wait four years.

As a result, situations such as the one in June of 1940, come about, fortunately, only very rarely in the life of people. That is the reason for my saying to you that with nuclear armament we can do nothing except "sit on it" and wait. But, regarding all the rest of international life, for all the other ties and actions in the world, and which do not put our social existence in peril, well, we are, I believe, fraternally allied with the United States, with Great Britain and with other nations, etc.; that is very obvious.

One must comprehend that the advent of the atomic explosion does not, for us, change the meaning of international cooperation; it gives us some assurance, some insurance, which we take out if the house is on fire; but the house is not on fire all day; it happens, even, very seldom. It is indeed in this spirit that one must consider the French effort. It is to avoid having someone put us in the situation in which we were placed in June of 1940.

Mr. Marceau: It was said that the French, during the period of the occupation, prayed and said: "Liberate us; but not too fast", which left the supposition that they were finding some profit in the occupation?

The Acting Chairman: I have been told that we absolutely have to conclude. I must in your name thank General Gallois, as well as

Professor Vernant. I think that this is one of the liveliest sessions we have had since the beginning of our trip.

I should like to thank you, General, as well as the Professor, for your information and for your presentation. We hope we shall see you later during the day, to continue, not the debate, but the questionnaire. Thank you very much.

[English]

EVIDENCE

(Recorded by Electronic Apparatus)

Brussels, Belgium,
Friday, March 21, 1969.

The Chairman: We are very fortunate that the Canada's permanent representative to the NATO Council is here this morning to give us a briefing following which Mr. Campbell is very happy to answer questions. We had expected Admiral Murdoch to be here as well but he has not been able to make it this morning because of weather conditions. I call upon His Excellency Mr. Campbell.

His Excellency Ross Campbell: Thank you, Mr. Chairman.

Gentlemen, I welcome you here after your fatiguing journey around Europe. I am sorry that Admiral Murdoch could not be here to answer some of the questions on the military side. However, defence planning in NATO is a civilian function and the execution of the plans is a military one so I will endeavour to cope with your military questions as well.

May I just give you one word of guidance about the use of these microphones in front of you. They will go on after the Chairman has identified you as the next speaker or questioner. In order to operate the translation system which I advise you to do at least for amplification purposes. It is useful in this room, if you put it to "A" for English or "F" for French on the dials in front of you and on the right is a rheostat for the degree of sound. In order to assist the Chairman if you would hold your pencil like this if you wish to speak and then when you have been identified as the speaker if you would hold it high above your head so that they can see.

Gentlemen, although your Chairman said I was going to give you a briefing. I think you must have been briefed to death in this trip around Europe therefore, I do not intend to

do that but rather to leave the maximum time for question and answer.

The only point that I do think worth drawing to your attention as a sort of introductory remark is that since you embarked on this enterprise there has been perhaps the most significant development in East-West relations in the postwar period. I am referring to President Nixon's lightning visit around Europe with this significant new message of his which is no more or less than an all-out attempt by the United States to move from confrontation to negotiation with the Soviet Union.

To my knowledge this is the first time in the postwar period that a United States administration has committed itself to an attempt at accommodation with the Soviet Union. President Nixon was here and he spoke for an hour and a half with the 15 permanent representatives to NATO in a rather confidential way, and therefore, I would be very grateful if anything that I tell you of that conversation be treated with a certain care.

The significant thing to me in President Nixon's presentation here was that this bold enterprise that they are about to embark upon is not based on any assessment that there has been a change in Soviet objectives. They have assessed the situation. The United States looks upon the development, for example, in Czechoslovakia and in eastern Europe as showing no change whatsoever. In Soviet policy in Europe they are still applying immense pressure in that country to make it conform to Soviet wishes. They have extended that to Roumania in a slightly less overt form and they are exerting pressure on Yugoslavia. They continue to exert enormous pressure on the Federal Republic of Germany. They are still mobilizing their east European satellite states and any progressive governments in this world—progressive in quote marks—under the slogan of an anti-imperialist campaign, namely, anti-us among others, although that term does not really fit and never did. They are still using subversion as a main instrument of Soviet policy throughout the world and especially in the western world and they are proceeding unabated with a massive arms build-up on a global scale.

This is the American judgment that none of the Soviet objectives have appreciably changed. It is legitimate therefore, to ask why have they chosen this particular moment to

embark upon a serious attempt at negotiations with the Soviet Union. Judging from President Nixon's comments here the answers are many but they are principally three, in my judgment, sorting out in retrospect what he had to say while he was here.

I would put first on the list their assessment that China has become possibly the principal menace of the future in Soviet planning and that this is conflicting with their ambitions in Europe and other parts of the world.

Secondly, the Americans assess that financial problems and resource allocations in the Soviet Union are becoming a major problem and particularly are inhibiting their ability to maintain their momentum in the arms field.

Thirdly, that liberal and national ferment in eastern Europe and liberalism within the Soviet Union are now permanent phenomena of the eastern European scene that are going to more and more demand expression. Those satellite countries want the technology of the West. They want more materially-satisfying societies; they want more democratic societies even though they are under Communist minority regimes.

These three factors as far as I can see are those that have impelled the Americans at least to conclude that even though the objectives of the Soviet Union have not changed their ability to carry them out and achieve them has been circumscribed by these three developments. The implications for this alliance of the American decision are important. The United States believes, and I think correctly, that in embarking on this ambitious endeavour they are responding to the wishes of the majority of the members, indeed all the members of the alliance. But the Americans are not doing it unconditionally or unilaterally. They offer to us, that is, the rest of us in this alliance continuous consultation throughout the negotiation process so that it is not just a unilateral American endeavour but a collective western one to resolve the main problems of the East. They are prepared to maintain, of course, their protective umbrella over Europe and to maintain their forces here in Europe while this process goes on but they want from the rest of the allies also an undertaking or at least an understanding that they too will maintain political solidarity and adequate defence preparedness during the negotiating period. This means that the Americans are approaching this endeavour with great caution and I must say

very pragmatically. They are committed to start these negotiations but as far as I can see they are not committed to end them on any preconceived basis and make it quite clear that neither their security nor the security of the allied countries is negotiable, only the terms of a settlement of outstanding political problems; therefore, they are not going to give anything away in these negotiations. They are only going to trade away both arms and political position in exchange for arms reduction or real political concessions from the Soviet Union.

The implications for Canada of this state of affairs, this new era that seems to be opening, is that since it is only the members of the western alliance that are going to be the consultative partners of the United States as the principal negotiating member then it is only from within this alliance that Canada can have really any influence on the course of those negotiations.

It seems to me that our choice is whether we want to be in political terms, part of a process that I am certain is going to dominate the next five years of the international scene and a process that in my judgment directly affects our security too, or whether we are going to be outside that process trying to make our own voice heard alone in the world.

That is all I have to say, Mr. Chairman. I am sure everybody knows about the structure of NATO and all these routine things and I do not want to bore the Committee with them.

The Chairman: Thank you very much, Mr. Campbell.

The first questioner is Mr. Nesbitt.

Mr. Nesbitt: Mr. Chairman, I would like to direct a question to Mr. Campbell and it is of a military nature. Since he volunteered to provide information in this regard I am sure he will be able to do so, that is why I put it.

In Canada and during our trip a suggestion has been made, marked principally by those perhaps without too much military expertise, but also by others, that Canada should remain in NATO but that she should have a different sort of role as far as forces are concerned. I think we should have entirely air forces in The suggestions here vary somewhat. Some NATO and no army and vice versa and some have suggested some sort although it has never been clearly defined, of a light mobile force which might be usable. As I say, the terms of the mobile force have not been defined as far as I know. I wondered if you

would care to comment as to whether you think our commitments, should Canada remain in NATO, be the same type of military commitments that we have now, or do you think it should be varied with particular reference to what is sometimes termed as a light mobile force.

Mr. Campbell: Mr. Chairman, in reply to Mr. Nesbitt's question I have seen these suggestions aired before and I think that there are some possibilities in this direction. May I say first that Canada's contribution to NATO is partly mobile; two battalions of the mobile command in Canada are assigned to the Eighth Mobile Force and from that same mobile command in Canada we derive the source of our other mobile obligations in this world, for example, to the UN if necessary.

If the proposal about mobile forces is to convert the present mechanized brigade to a fully mobile role I think we have to take a number of factors into consideration. The first is that the present life of the heavy equipment of the brigade and, if you like, of the air division too, have a useful life until the mid-70s or a little later. We would face re-equipment of costs in changing our role and we would face the problem of deliberate wastage of still usable equipment.

The second thing is that the brigade, where it is now in its present location and role, is undoubtedly playing a useful part in the most sensitive area of the East-West front, namely, in Central Europe and in Germany.

Thirdly, I think we have to take account of the fact that we are part of a collective military endeavour. The purpose of that collective endeavour is to checkmate the even slightly heavier forces that are ranged on the other side of that line. We would have to be quite sure that in changing our role it was one that was as militarily effective and useful as the one which we are discharging now. We would have to make sure that the Supreme Allied Commander thought that it was a useful role and we would have to make sure that our allies thought that what we were doing was in the collective interest.

Having said that, I do not really rule out that some such change might come about. The ideas in this Alliance about what Allied Command Europe is for, are evolving all the time. For example, it is now thought less likely than it was a few years ago that there will be a direct, deliberate and massive attack across frontiers even in Europe. That means that the

role of the forces in the Central front can perhaps be regarded as more to cope with a limited front or, war by accident or miscalculation, or any high risk policy on the part of the Soviet Union anywhere along that front rather than against a massive attack which almost certainly would call for outside forces, not just those stationed in Europe.

If this is the changing assessment, and this is not yet fully agreed in the Alliance, then there might be a requirement for lighter more mobile forces stationed in Europe, but available for use anywhere along this frontier to cope with these lesser kinds of conflict. If that were so, Canada would be particularly well suited, I think, for that sort of a role and if our role were cast northwards I think we would be particularly welcome to the people that we would be assisting—mainly, Norwegians, or possibly Norwegians—most likely Norwegians, I would think.

Mr. Nesbitt: May I interrupt just for a moment? Would we be permitted to be stationed in Norway under those conditions?

Mr. Campbell: No, Mr. Nesbitt. It is possible that we could station some—I do not know what you would call them—headquarters, that is, peacetime standby staff in Norway, but the Norwegians have pursued a policy of no foreign forces on their soil in peacetime. It would be a matter of prepositioning perhaps some equipment and having tight liaison and staff arrangements in advance. But the point is that the forces to be useful would still have to be in Europe, possibly based in Germany or the U.K. or somewhere nearby. So there are some possibilities here and there are even possibilities, I suppose, of combining the air division and the brigade to give us greater national identity which is one of the things that is attractive to Canadians, but on the other hand it is sort of a denial of the collective security and the best use of available forces that has always been the principle of this organization.

In my judgment perhaps in entertaining the viability of some of these ideas we could perhaps look forward to a gradual shift to such a role rather than throw away our present equipment when it is still usable, we could simply move gradually to this mobile role as attrition reduced the size of the units bearing heavy equipment that we have now in the central front and in the air division.

The Chairman: Mr. Buchanan?

Mr. Buchanan: Mr. Ambassador, I would be curious to know what is the attitude amongst the NATO members towards the re-unification of Germany. Officially maybe they are for it, but unofficially is there a general reluctance to see Germany put together again?

Mr. Campbell: I think the answer to your question is that there is a total reluctance to see Germany reunified violently in any way, but that there is an awareness amongst all our partners here in Europe that as long as Germany is divided, forcibly divided, into two parts—one forcibly communized and the other by its own free will a democracy—you are going to have a cold war front running through Europe; it is almost impossible to conceive of settling the issues between East and West without some resolution of the German problem. The thinking has been for a long time here that the re-unification of Germany is a long term project, that it can only come about as a result of, rather than as a precursor of some fundamental change in the relationships between the Communists and the non-Communists in this country—on this continent. That is to say, as long as there is as much hostility being shown by the Soviet Union, especially against Germany, it is impossible to conceive of the re-unification of Germany. We look forward to this happening at a time when perhaps the Soviet Union has realized that it is pursuing too tough a policy in Europe in drawing these strict ideological lines through this continent and is prepared to see a greater movement between the two sides.

Mr. Buchanan: Mr. Chairman, more from the point of view of the NATO members, are they concerned about the existence of a re-unified Germany?

Mr. Campbell: No, I do not think so. Of course, there are memories of World War II that are present in everybody's minds, but anyone who is analyzing this matter seriously realizes that even a re-unified Germany is bound to be, in some ways, limited as to armaments; it cannot become a military giant or a military threat. If our Western partners are worried about Germany it is because it has become a dominant economic and financial power and there you are into a realm that one really cannot discuss in an Alliance of this kind. I believe myself that it is the economic power of Germany that is feared

far more than the military power, both by the East and the West.

The Chairman: Mr. Brewin?

Mr. Brewin: The report as I understand it, said that the peace and stability in Europe rested in using the NATO Alliance constructively in the interests of detente. You have told us about President Nixon's general approach to this, and seeing that he represents a great nuclear power, presumably he is thinking partly in terms of dealing with the problems of strategic nuclear balance, but you could say in a little more detail than we have had an opportunity to hear, what is the planning within NATO in respect to that aspect? I presume it took something of a setback with the Czechoslovakian invasion, but is it still going forward and will the forthcoming NATO Council meeting be directed to this end? Will it be made clear to the outside world that this is a real function and not just a verbal function of NATO?

Mr. Campbell: It is a very real function, Mr. Brewin. Prior to the Czechoslovak invasion we had spent an entire year in this Alliance—the whole of 1967 was devoted to a review of precisely that second function of the Alliance, namely, the active promotion of detente. What had happened was that until—I can only answer this thing in historical terms, really one has to see it in this way—1962 when we had the Cuban missile crisis, and the year before when we had a Berlin crisis, it was perfectly obvious that the Soviet Union was pursuing high risk policies and they gave us ample reminders, periodically, we would have Berlin crises on a regular basis or they would invade one of their own partners again as they did in 1953 in Germany and 1956 in Hungary. There had been a long history of aggressiveness on the part of the Soviet Union. Following Cuba we seemed to come upon a very long period of more sensible policies on the part of the Soviet Union. So much so that by 1967 this alliance had concluded that perhaps the military side of this organization could become just a holding operation and practically all its energies could be devoted to promoting actively the creation of those conditions that would lead to a negotiated settlement of all the problems left by the Second World War, including frontiers, the division of Germany, and a sort of new deal in Europe that would allow us to dispense with this organization. By the beginning of 1968, we had embarked upon an active

policy—a co-ordinated one—within the Alliance of stimulating a multiplication of contacts at all levels with the East European countries and the Soviet Union in an effort to break down the barriers and to create that normal interchange between the two halves that would eventually lead to the conditions I described.

It had reached its culmination in the development by the Alliance of a proposal for a balanced reduction of forces, which had been very deeply researched in this organization and for which we made an offer at the meeting in June of 1968, to proceed with the Soviet Union and the East Europeans to a negotiated balanced mutual reduction of forces in Europe. Well, we all know what the response was. The response was Czechoslovakia. Far from wanting to reduce forces, the Soviet Union invaded one of its own allies. I know it is said that this was not the end of the Alliance and we know that. But what it did do was to upset the very basis upon which we had been proceeding. It destroyed many of the assumptions of the preceding five years. We had thought that they would never use force again for the attainment of their ends. We thought that they were reconciled to the need for greater liberalism within their own country and within the satellite countries, greater nationalism, greater materialism. We thought they were reconciled to this process of convergence between the two systems that would render military measures unnecessary. We were wrong and they proved that we were wrong. What they did in Czechoslovakia really showed that the Soviet Union is, when it can be, the same predatory power that it was and has been since 1939. In that period the Soviet Union has either absorbed into its own body politic or established satellites or made territorial claims on 12 out of its 13 neighbour states. We do not know whether they have abandoned these objectives. The history of their behaviour does not show it. We are uncertain as to what the Soviet intention is after this display of military might in Czechoslovakia and it was not just Czechoslovakia. They not only moved in with their troops of which they have moved out most of them, but they have continued to digest that country to progressively profess liberty. They have gone on to exert pressure on Romania and Yugoslavia for example it is now going on almost today, going almost on to a full

mobilization basis. They are so uncertain as to what the Soviet intentions are. Prudence is what we have to absorb. We cannot draw any final conclusion.

Mr. Cafik: Ambassador Campbell, on the policy of balanced force reductions the thing that rather puzzles me is that if the Warsaw Pact were to agree to this policy does this mean that you would reduce arms in the same proportions on both sides and if so in view of their marked superior strength in terms of arms would this not leave NATO in an even worse position that it is at the present moment or just what do you have in mind in terms of balanced force reductions?

Mr. Campbell: I would dispute your comment about the marked superiority that they have within mobilizable regions of the frontier between the two.

Mr. Cafik: This is what we have been told Ambassador.

Mr. Campbell: Who told you three to one?

Mr. Cafik: In terms primarily, Ambassador, if I may say, in terms of conventional forces I think this meant more than nuclear forces.

Mr. Campbell: We have—this is a slight digression—we have under way now an intensive study called the relative force capability study. There has been a great deal of nonsense talked about the disparity between the two sides. They are stronger but as nearly as we can judge now it is a bridgable gap between the two. It is not even a particularly dangerous gap. After all, that gap has existed presumably over these years and whatever strength we have had, has been sufficient to prevent adventure on the other side. So I do not agree with the basic premise that there is a huge distance between the two. Therefore, it does not become a dangerous act to think in terms of mutual force reduction. These would be in a limited area of the front—the most sensitive area. One thinks in terms of Poland, Germany, Czechoslovakia perhaps. I cannot go into the details of the dozen or so odd models. There has been a most exhaustive study done of exactly what constitutes equivalents on each side between various types of forces. I can assure you that it is possible to envisage a system whereby you could arrive at norms which would ensure that any reductions or withdrawals were balanced and were mutual. We would have to make sure that they were balanced not only

as to quantity but as to timing of withdrawals. There is a very difficult problem of inspection involved in this problem and on that you may have heard of Exercise First Look that was run in the United Kingdom last year and we are now mounting an international—in all likelihood we will be mounting an international exercise of this kind to look at exactly the non-intrusive means of controlling and verifying any such mutual production plan. Certainly this is the way, the only safe and prudent way to proceed with a reduction of tensions in this Continent.

Mr. Thompson (Red Deer): Mr. Ambassador, you paint a picture that seems to be at paradoxical variance. You speak of the American's new posture or new expressed intent at least of proceeding on the basis of negotiation rather than confrontation. You speak from the opposite side that there is no hope of detente that the present situation is grim. What new policies, what new approach is the American's change going to produce or is producing already in NATO particularly in view of the fact that you have said that this is not just a unilateral thing, that this is an American initiative, something which involves the entire NATO participants. How is this going to change?

Mr. Campbell: Mr. Thompson, I do not think I said there was no hope. I would agree with you that what I have been describing is not detente. Detente is a most misleading term which I think should be thrown right out the window as soon as possible. It means relaxation of tension and as somebody says everybody talks about detente but nobody feels relaxed. It has been equated with the word peaceful co-existence on the other side and it is nothing of the sort. When we talk about detente we are talking about normal relations between states, where there is free interchange, and there is no fear involved. When the Soviet Union talks about peaceful co-existence it means that it continues to hold exactly what it has and to control the lives of 100 million people in Eastern Europe according to the needs of the Soviet system, and to deal on a limited basis with the West, just only according to its own needs and interests, mainly to acquire Western technology. So if we could just have an understanding that I believe that the word detente has been misleading but then not to assume that what I am describing is a hopeless situation. It is not a hopeless situation or the Americans for one

would not have embarked upon this new endeavour of theirs and I think I outlined at the beginning of my statement why they think that there are grounds for expecting that the Soviet Union might be prepared to come to some arrangements of a more tolerable kind with the West. It is because they are being forced to do so by forces of change within their own sphere of influence. These are going to compel the Soviet Union. That is going to compel them and the fact that they are falling behind in the race to provide their people with a 20th century standard of living. These are the things that are going to break down the barriers between East and West. It is a matter of the Soviet Union leadership coming to the realization that they are condemning their people to a stagnant antiquated form of life unless they enter into more open relations with the rest of the world.

Mr. Thompson: My question, Mr. Chairman, was what new policies, what new changes do you see taking place within NATO as the result of this new policy that is being advocated by the Americans?

Mr. Campbell: I think you will find at the April meeting, Mr. Thompson, of the Ministers—I cannot anticipate what the Ministers will decide—but there will be a prudent resumption of contact with the Eastern States. I am sure that they are going to endorse this but the accent is going to be on the word prudence. We are going to try within limits to restore the climate that existed prior to the invasion of Czechoslovakia which was a very hopeful period from 1962 to 1968. We are going to patiently try to reconstruct that hoping that in the meantime the Soviet Union will have learned some lessons from the errors it made in Czechoslovakia and that these other pressures on them will induce them to allow a freer exchange with the West. Not just confined to acquiring our technology but removing the whole pressure and the fear that exists in this Continent.

The Chairman: Mr. Marceau.

Mr. Marceau: Excellency, I should like first to thank you, for my part, for your inaugural declaration, which, I think, brought to us some new and very interesting elements, that are, in my view, very important.

During our visit to France a few days ago, we thought we discovered that France's decision to retire militarily from NATO was in part based on the absence of personal deci-

sions, or the absence of participation in the decisions of NATO, leaving the supposition that the Americans made decisions without consulting the Allies. You spoke of the part played by Canada in the new orientation of American policy. It is well known that Canada, militarily, plays a part in NATO. I should like to know whether, from the point of view of participation, Canada, in your opinion, really plays a part; in other words, does the United States take an interest in our point of view, do Americans discuss matters with us, and are they prepared, in this new policy, to consult a country like Canada and to accept the opinions that such a country might express?

Mr. Campbell: I think that there has been—I do not agree with General de Gaulle's assessment of the situation as it was before. I believe that that was rationalization after the fact as an excuse to make an anti-American gesture and to seek to play a more independent and dominant role in Europe. The fact is that nearly all of the great powers within NATO have been guilty of moving in their own national interest without proper consultation endless times in the past. When the French wanted to move forces massively into Algeria they moved them without consulting this organization prior to 1962, back in the period of the Algerian war when the British fought at Suez, when the French fought at Suez, they did not consult anybody here. When the Americans went into Vietnam they did not consult anybody here. This has been the practice in the past. It is a practice which I think is on the sharp decline now as the interdependence of all of these major world issues becomes more obvious day by day and certainly the Americans appear—I will be a little cautious—to have drawn the conclusion from their Vietnam experience that they never again want to enter into a major military enterprise or any other kind of enterprise in this world without allies. One hears words like, no Roman solution to the world's problems and by that they mean precisely the lonely role that they have had to play in the Far East. I believe that President Nixon has drawn the conclusion that the United States must move in company from now on and not try to be the arbiter of all the world's troubles alone. Of course there is a financial aspect to this as well. I think they found it a very costly enterprise, politically and financially.

The Chairman: Mr. Forrestall, and then Mr. Lewis and Mr. Laniel.

Mr. Forrestall: Mr. Ambassador, I wonder because finances keep coming up and it seems to be the basis of our quandary at home, the efficient use of our money, whether or not there has been any appreciation done by NATO particularly the countries immediately involved here in Europe, whether or not they would or would not pick up some of the tab particularly, Mr. Ambassador, for the civilian employees of our land brigade and two air groups, for example.

Mr. Campbell: Whether the Europeans would pay us to keep them here as mercenaries, is that the idea?

Mr. Forrestall: No, not quite.

Mr. Campbell: That is what it would amount to, I think.

Mr. Forrestall: That would be your appreciation?

Mr. Campbell: Yes, that would be my appreciation, Mr. Forrestall, but that is a slightly flippant comment on my part, which I did not intend. I think what is wrong with that whole approach is that it fails to take account of the fact that we are not here to protect Europeans. I think a case could be made that it would be a valid expenditure of Canadian defence money to be here only to protect European interest, because the prosperity and freedom of Europe is of direct consequence to us, as it has been proved in the last couple of wars. But it is not in that sense that I think we should justify our participation in the integrated force structure in Europe. It is because it is only here that there exists both the power to reach Canada, namely in the Soviet Union, that can cause us physical harm. It is only from this continent, from the Soviet Union that that power exists. It is only here that the two superpowers are in such direct confrontation and have such vital interests at stake that a nuclear war could start. It is for this reason that Canada has its forces here. It is to prevent little wars, by accident or miscalculation or by a risky thrust by the Soviet Union on any part of the front, from escalating into the kind of war that can harm Canadian territory. We are very directly protecting our own interests, our own security interests by participating here.

Mr. Lewis: Mr. Campbell, one has a lot of questions to ask, but may I ask you this. You were talking about there having been some contact between NATO and the Eastern countries prior to all this in 1968. And emphasizing that at the next meeting of the NATO ministers in Washington next month that policy, you are quite certain will be re-stated and the activities resumed. Arising from that I would like to ask you two related things. One is, were there such contacts? Was it more than a statement by NATO that they wanted them, or were there actually some contacts in being before August 1968, if so, what was their nature.

Secondly and very much related to that, I have had difficulty ever since last August to understand logically why Soviet action within its own sphere whatever it may be, without of course condoning it, feeling as angry about it as anyone else, why Soviet action was limited to its own sphere whatever it does, in Rumania, Czechoslovakia, or Albania or what not, why that should have such a deleterious effect on our search for an understanding or some relationships with the Soviet Union. What was it in Czechoslovakia that caused this re-thinking and the re-awakening of fears?

Mr. Campbell: There are several questions wrapped up in yours, Mr. Lewis. The nature of the contacts before all this in 1968, I did not mean that the two alliances as such were holding joint meetings; not at all. What I meant was that it was the policy of the member states of this alliance actively to pursue a multiplication of bilateral contacts at all levels. Ministerial visits were taking place back and forth between Belgium, Holland, all these countries, to countries behind the Iron Curtain and that policy was actively espoused and developed in this alliance. That is what the Harmel study was about.

Mr. Lewis: Did they stop at all? Did those bilateral contacts stop?

Mr. Campbell: Almost entirely at senior levels they have been stopped. About all that has gone on since Czechoslovakia has been commerce where that was serving clearly Western interests and a certain amount of low level cultural exchanges.

Mr. Lewis: That is a terrible phrase.

Mr. Campbell: Which? Low level cultural exchange? I did not mean it was low culture that was being exchanged. These countries

had to express their displeasure and their fear somehow and they did it by interrupting contacts with them, as indeed we did too.

You say you cannot see how it made matters worse there, but first of all I think you would recognize that the policy of spheres of influence is something that cannot really be condoned where independent states are concerned. What happened in Czechoslovakia was the denial of the very principle of the United Nations regarding sovereign independence of states. There was no external threat whatsoever involved in the case of Czechoslovakia; what was involved was that the virus of freedom had broken out within the Soviet bloc and this virus evidently is considered such a menace to the Soviet Union that it is prepared to have recourse to force to suppress it. If they will use that kind of tactic against their allies, what are they not prepared to do against people to the overthrow of whose system they are overtly dedicated. They go on repeating it every day that their object is the overthrow of the present system in all of the free countries of this world. It is as if the United States were preaching all day long the overthrow of our system. That is how the Europeans feel vis-à-vis the Soviet Union, and as if the United States had suddenly decided to take over British Columbia, or to do something to the Dominican Republic.

Dominica, I do not want to go into Dominica, but there is a difference between Dominica and Czechoslovakia.

The Chairman: Gentlemen, I have a large number of names still on my list. The period for this particular discussion has ended but there is an opportunity for further questions later on, so possibly I could just carry these names forward and give them priority at our next discussion period. We will be joined almost immediately by senior officials in NATO. Is that satisfactory?

AFTERNOON SITTING

Mr. Tremblay (Canadian Ambassador in Brussels): Honourable Minister, Gentlemen, it is a pleasure and an honour for me to introduce to you Mr. Wahn, the Chairman, and Mr. Ryan, the Vice-Chairman, as well as all the members of the External Affairs and National Defence Committee of the Canadian House of Commons.

Their presence in Brussels has set a fortunate precedent and illustrates, I believe, in a

quite striking way, how much political consultations between the leaders of our two countries have increased in recent years.

You are already familiar, Honourable Minister, with the matter and I do not want to evoke the reasons, but you know that Belgium has nothing but friends in Canada and that the diplomatic role of Belgium is of the greatest interest for us, since we are countries that it has been agreed to call medium powers. I know that the members of the Committee will benefit from the reflections you will kindly express for them on the problems of the Alliance, in the present circumstances, and especially on the active part that Belgium is taking in solving those problems, under your enlightened direction.

Honourable Minister, I thank you for having so amiably consented to arrange for the members of the Committee the pleasure and advantage of this meeting with you and your colleagues. Thank you.

Mr. Harmel, Minister of Foreign Affairs: Mr. Chairman, Gentlemen, I hope you will permit me to address myself first to a friend, Ambassador Tremblay, to tell him that I am very happy to see you (sic) in the Ministry of Foreign Affairs in your capacity as representative of your country, as a member of the Canadian External Affairs and National Defence Committee. I must evoke, in your presence, after Ambassador Tremblay, the cordial, and why not say the friendly, bonds that your Ambassador in Brussels maintains and cultivates daily between our two countries, and also I must mention the bonds of very sincere confidence that have never ceased to exist between the Foreign Affairs departments of your country and ours. There is no need for me to evoke the personal remembrance that I retain of Mr. Martin, nor the very vivid impression that I had when I was welcomed last October in Ottawa and met Prime Minister Trudeau; and my meeting since then, several times, with the Minister of External Affairs, Mr. Sharp; I wish you would agree to serve, with many other voices, as my interpreter before them, to salute them, first, but also to tell them of the great pleasure and honour that you confer on us by coming to work together here this afternoon.

Gentlemen, I do not know how things are in your country, but here in Belgium we have had enough of so-called masterly exposés, and we prefer the question period. Since you are at the conclusion of a sojourn in Europe—a

stay that has certainly filled your mind with reflections, but also perhaps with final questions—I would indeed like to try my hand at the game, to try to answer the questions, with the collaborators that are here and who have already begun such an exercise with you today; and thereupon, distinguished Ambassador, I forthwith take advantage and disobey you by not making any introductory exposé, and by, on the contrary, answering questions—Chairman Wahn—that you yourself and the Honourable Members of the Delegation will want to ask.

The Chairman: Thank you very much, Honourable Minister.

Mr. Laniel: Honourable Minister, this morning our Ambassador to NATO, Mr. Campbell, told us of the change in the approach of the United States to the situation in Europe; the President of the United States apparently said that the American policy would be directed less toward confrontation and more toward negotiation, in future; at the time, Mr. Campbell presented the fact with much optimism. And then, knowing that you were one of the persons who helped, at least, to put forward a formula for reduction in the forces that face each other in Europe, a reduction paralleled on both sides, knowing that for this very reason you are greatly interested in the question, I wondered to what extent Mr. Campbell's optimism was justified. Does the simple fact that the President of the United States said, "Well, tomorrow we shall launch out into negotiations", mean that one can hope that the other side will be in a hurry to engage in dialogue, especially when it is known that in the months preceding the Czechoslovakian crisis, NATO had already studied the question, had already, through diplomatic means, let it be seen in the East that there was a possible intention to disarm mutually—can one hope that, at present, progress is taking place, simply because the President of the United States made that declaration; or, what is more, could there already have been a reply of intention from the other side?

Mr. Harmel: Mr. Chairman, do you want me to make a one-time reply, or do you want me to reply to each question?

The Chairman: Yes, I think that would be better.

Mr. Harmel: Then, I shall now reply. Well, I do not believe that it is necessary to take

into account exclusively the inclinations of the new head of the American administration. It is an important phenomenon to have seen, to have heard, the declarations by the President of the United States; and even if it had been an isolated phenomenon, it would nevertheless be important. But it follows a continuous effort of 15 countries in the Alliance, which at the time when they prepared the exercise on the future of the Alliance, wished to give to that Alliance as much political force as defensive force, as much power for the diplomacy of co-existence as for military defence in case of attack, and that, in this perspective, and after describing it, have prepared themselves; and I repeat, the United States—but you also, Gentlemen, and we with you, and with what interest and conviction, have prepared ourselves to make propositions to the countries of Europe which belong to the Communist world. And during the whole of the first part of the year 1968, from January to the day after that meeting of the Alliance which gave the Alliance's agreement to this new perspective of two pillars—defence and relaxation—the interior committees have worked on models that you are very familiar with, models of parallel reduction of conventional and nuclear regional forces in Europe; and it was an event that has certainly already been much stressed during your conversation, and which you know very well yourselves—it was an event that in its meeting in Reykjavik last June, the Alliance devoted a whole document to formal negotiation proposals with the Eastern countries, namely the "USSR and the other countries of the East", said the recommendation of last June, to obtain a parallel reduction in armament. And you know that that was sufficiently well prepared so that technically one could already compare, within the Alliance a certain number of models of parallel reduction in armament. There was one from your country, there was one from ours, one from the Federal Republic, one from Great Britain, in short, there was no lack of models, that is to say, of details for parallel reduction of armament.

And I might add that, without having completed, I presume, Mr. Ambassador, these studies, the Permanent Council at the ambassadorial level, continues to analyse the document that has just come out of the meeting in Budapest, this time on the Eastern side, in order to ascertain if there is any convergence or resemblance, if it is an echo from proposals that were made by the North Atlantic

Pact—and what value it has. I can, then, add, to be very precise with your very precise question—I could add that for our part, and in the hope that the Alliance could proceed in this direction, that is to say in the direction of a relaxation of armaments, and with the thought that there is no accord on security as long as obvious signs in disarmament matters have not been given—even a sign ever so slight, but a concrete sign—we have during the preceding years taken note of the fact that Poland, in Mr. Rapacki's plan, and then that of Mr. Gromulka, also searched in this direction, still informing our Alliance partners, and Poland furthermore notifying the Pact partners—its partners in the Warsaw Pact—we considered it possible, not to enter into detail, but to take soundings of the interest of the average people in the Communist world in connection with such a project; and I think I can say here that at a certain time, that is, before June 30, we really felt that there was enough interest in that world, for that kind of proposition, to assure some echoing of it. Alas, since then there occurred the Prague crisis, which put many things in question again. However, as you know, at the last meeting of ministers in November, at Brussels, the Reykjavik proposals were, without being described again, confirmed by the Alliance.

It seems to me that there has since been a back-and-forth movement that is very significant of the will of the Atlantic Alliance in favour of a reduction, of a "freeze" in armaments, a progressive and parallel reduction in armaments.

An hon. member: Mr. Minister, I have a rather frank, perhaps blunt question to ask. If Canada were to withdraw her NATO forces entirely from Europe, if...

Mr. Harmel: Would you ask your question again? Because, when you were asking it I was not listening to it, I was instead looking for the translation. Excuse me.

An hon. member: Yes. I said, Mr. Minister, that I proposed to ask a rather frank question, perhaps a blunt one. If Canada were to withdraw all her NATO forces which are now in Europe what would be the effect on and the reaction of the smaller countries of NATO, countries the size of Belgium and secondly the general effect on the alliance, as a whole, and thirdly, in your opinion, how would this be read by the Warsaw Pact?

Mr. Harmel: There, indeed, is a very frank question; and permit me to reply with equal frankness.

The question is in three parts. What would be the reaction of small countries if a country the size of yours were to withdraw all its NATO forces from Europe? That is indeed the first part of the question.

Well, the effect would be deplorable, in the opinion of our population, and it would cause great trouble, for several reasons. First, because we believe, and you will allow me to be frank up to the point of mutual brutality; this is to incite you to brutality in your questions, because we believe that we are each and all of us, Canadians, Belgians, Hollanders, Italians, it matters little which, we are one and all faced with the same problem. In any case, the essentials of defence of our countries in case of attack do not necessarily lie in the conventional category, from the point of view of the final result of a war; these essentials are, alas, outlined around the nuclear problem and the problem of intercontinental nuclear arms. If there were no intercontinental nuclear arms, as possessed in large quantity by the Russians, and which the United States, on the other side has, too, then it is clear that the problem would present itself in different terms. But we are all in the same boat, because if the nuclear deluge—I hope I may so express it—were to be let loose, it would indisputably reach the collectivity of Alliance countries, whether they had or had not troops at the outset of the conflict in Europe.

But what we find it hard to understand is that the general system of defence, involving an existing intercontinental nuclear defence, the advance posts of the intercontinental nuclear defence system being in Europe, and being made up on the one hand of the Warning System, of the alert system that covers the advance posts, if I may so express myself, of this defence that Western Europe constitutes for the United States and for Canada (sic.) That, participating in the benefits of this Warning System, Canada and the United States do not participate simultaneously to assure such a benefit on the ground, and to guarantee the ground upon which, from which, the Warning System is organized.

Indeed, I repeat, it seems to me that the greatest danger for the collectivity of our countries remains, finally, nuclear destruction, from which none of our countries will escape.

It is for protection against this danger that there exists an advance defence; another reason is to avoid having the European countries succumb in the first minute. But, if the European countries happened to succumb, the Warning System, would disappear at the same time, or, in any case, would be considerably reduced in efficiency so far as the United States is concerned, that is to say for the whole of the Atlantic coast of the United States and of Canada. In that event, it is hard to understand, since we are mutually insured and since we are in a mutual insurance system, how these systems of mutual insurance are not themselves insured by all the parties that are covered by such insurance, are not guaranteed by everyone thus insured.

Secondly, we do understand because we have, for our part—and I do not understand exactly the scope of your question—is it a matter of simply withdrawing their forces from NATO, or is it a matter of retiring from NATO?

An hon. Member: It is withdrawal of the forces in Europe.

Mr. Harmel: It is withdrawal of the forces in Europe, while remaining in NATO. That is precisely it. Well, to that question, then, I reply mainly by what I have just said.

The general effect on the Alliance, well, I think the general effect on the Alliance would be serious. It would be serious because it is being wondered why, if Canada did that, then why would not the United States do the same thing. And why would other countries not follow the example, saying: "We are going to decrease our guarantees", one and all; consequently, it is clear that the Alliance would find itself considerably deprived of force and reduced in its impact.

Consequently—to deal with the third of your questions—it would obviously be greatly appreciated by the Warsaw Pact. The Warsaw Pact could only rejoice at seeing the integral system of defence dismantled; and, as for us, we consider that, being small countries and having taken a great many risks, and assumed responsibilities by accepting on our territory the general system known as SHAPE, that is to say the general headquarters, having taken responsibility politically vis à vis our people, by accepting the Atlantic Council in Brussels—we are a small country and we thereby put ourselves, let us say, in a quite apparent position to find the large countries ceasing to be directly interested in our

efforts, our own effort, as Europeans, efforts that we have put forth for ourselves. We made these efforts relying upon the solidarity of the large North Atlantic countries. To find that we had come to that one day, I repeat, would cause a great disturbance in our country, great joy in the Warsaw Pact countries, and a deplorable effect on the Alliance.

Mr. Asselin: A supplementary question: Approaching the argument another way: Canada, as well as all the countries of the Alliance, spend considerable sums of money to be members of the North Atlantic Pact. And for my part, I think, still, that the best defence of the American Continent continues to be the show of a dissuasion force in Europe.

But what would happen if, one day, Russia decided to attack Canada? Would the forces of NATO have enough mobility to come to our assistance?

Mr. Harmel: You know the Atlantic Treaty as well as I do, and you know the terms of its Article 5. What you would do to defend another country in the Alliance, would call forth from the other countries in the Alliance the same treatment with regard to you. Article 5 leaves great freedom of action for the Alliance countries to go to the assistance of the other countries. And in the same way, I answer you by saying that, indeed, if we maintain our solidarity in integral defence now, there is obviously much more of a guarantee of total mutual protection than there would be if we withdrew from the system of mutual insurance, on the part of one country with regard to the forces integrated during a period of peace.

Mr. Asselin: But, have the integrated forces of the Alliance a sufficiently supple mobility, and a sufficiently rapid mobility, to be able to ensure our defence in case of attack?

Mr. Harmel: I should simply like to state that before the alliances, you have shown that when there were no alliances there was no mobility, that when there was no integration, there was no mobility, and I remember the time which the Belgians will never forget, when on two occasions, during the first world war and the second world war, the Canadians came to our help. But we all know how many demands that creates by way of a slow mobilization. On the contrary, the mobilisation and the defence become more rapid, to the extent that the forces are integrated.

The Chairman: Mr. Brewin?

Mr. Brewin: When the Committee was in Paris we certainly received the French view on NATO, on the Atlantic Alliance and the European Common Market. Now to me personally what I heard seemed to place France in a position of being somewhat isolationist, nationalist, or obstructionist.

I would like to ask in view of what we heard yesterday both on the military and the economic policy point of view of France, what is the view of Belgium in this apparent antagonistic approach on both the military and the economic field and what is your approach in tackling what must be a difficult situation for your country?

Mr. Harmel: I was not quite sure of the translation and I apologize to the translator and would like to thank her, but someone gave me the synthesis of your question. Gentlemen, we have had experiences in the military field and we have had all the experiences in the field of economics. For countries of our size and for the majority of the European countries, for prosperous countries like ours and for peaceful countries like ours, there is no independent action or independent economic existence, meaning, economic stability and real defensive protection in what I would call isolationism or in neutrality.

And I will start with the military aspect. You know it, because so many of your fathers and uncles have shed their blood on our soil; twice, you know it; until 1914 we had occupied a position of forced neutrality. It did not protect us; that neutrality had been guaranteed. It had been guaranteed by the countries that surrounded us. That did not prevent us from being the first victims of an invasion in 1914, or from being the area, mainly with France, on which the war raged the most.

With respect to the 1939-1940 war, we again had chosen a policy of independence since 1936, which we had called the policy of independence, meaning that we had no engagement before having been the victims of an aggression. History has shown that that position did not protect us.

Since then, the circumstances of defensive aspect of Nations have changed to such an extent that we feel sure that for countries of our kind there is a choice: either disarmed neutrality or integration. We have chosen integration, that is clear, and we believe that

it is also a gesture of solidarity, in fact, maybe of *self respect*. In fact, if we counted on others or on the existence of an alliance which the others would guarantee in order to guarantee our own independence or, what you might call our nationalism, we would believe that that would be just an idea, or that it would not be suitable. Since then we believe that by participating in one large integrated organization of nations that have a desire to get along, because they are defending the same ideals in life, we are creating the conditions not only for our defense, but also for the flow of exchanges of all kinds favorable to our country, that are, in our opinion, also favorable to other countries.

In other words, we believe that with respect to the military aspect of things we cannot shut ourselves up in so-called position of political independence, because we had the experience on several occasions, and because we believe that under the present conditions of the defense systems there are no more countries that can really guarantee their defense, except in the case of a war in a system, or in the case of a crisis in a system that is mostly prepared in advance for that defense.

Finally, with respect to the field of economics, Belgium, since the last war, has formed an economic union, first with the Netherlands and with Luxemburg, called the Benelux. We then noted that this was not large enough and we wished to participate and said that we would seek a solid economic integration of the six countries. And we have said and will continue to say: it is still not enough. And we should have a larger hinterland than what we are having, to answer the dimensions of a contemporary economy.

And since we have had burdens as well as benefits, because it required from us, especially in agricultural matters, largely the support of the French agriculture and of the agriculture of other countries than our own, we have paid for that burden gladly, because the homogeneity of a large economic area seemed to us to be to the advantage of the whole world, including our own advantage, with the result that we are, therefore, very multilateral. We are, therefore, convinced that multilateralism in the military field and in the economic field has great advantages, which is our experience. We have had experience with both of them and, as far as we are concerned, the balance is overwhelmingly in favour of multilaterality.

An hon. Member: May I ask the Minister if you have any hopes or anticipation that the United Kingdom will eventually be allowed to enter the European Common Market?

Mr. Harmel: I do not look very often in the crystal ball and, consequently, I do not wish to say what are my hopes and my worries, but I am going to tell you my convictions. But I would say, to the representatives of France, because they are the only ones who oppose the start of negotiations with Great Britain for its entry in the Common Market, that Great Britain will enter in the Common Market. I am not the one who is saying it, the French leaders are saying; only, they are saying: not now. And we are saying, as far as we are concerned, since it will take time at any rate to adjust the greatly differing economies to each other—the economy of the Common Market which was built up over a period of twelve years and which is not yet complete, and an industrial and agricultural economy which is quite different in Great Britain—it will take time to do it, which is an additional reason to start the negotiations.

But, gentlemen, we are true and faithful partners of treaties that we have signed and we know quite well that we cannot cause the opening of negotiations, other than by a unanimous vote. We observe that the Common Market Commission and five countries are in favour of the opening of the negotiation; we observe that one country is not in favour and within that multi-lateral democracy we respect the veto voice. But that does not prevent us from keeping the problem open and, I repeat, I believe that one day it will happen.

[English]

The Chairman: Mr. Ryan?

Mr. Ryan: Mr. Harmel, you have been the champion of the multilateral approach to détente between East and West as against the bilateral approach. I am wondering what your view is about President Nixon's proposal to have talks with the Russians at the super-power level, talks which—there is some indication—are upsetting some of the West Germans at least, talks that certainly do concern NATO, in the European area in any event. I would like to have an indication of your reaction to this American proposal and to the further proposal to change confrontation in Europe to negotiation. In this respect I would like to see how you see the evolution of NATO in the next five years. Will NATO

itself become a negotiator for the West or will the lead always come from the United States, and will that country always be the negotiator?

[Translation]

Mr. Harmel: Thank you very much for that question. I believe that President Nixon, like all the other representatives of the countries, believes that there is a level of negotiating that is truly bilateral with Russia, which is in the field of the ABM weapons, meaning the anti-missile weapons. Negotiations can only be conducted between countries that have inter-continental weapons. Consequently, since there are only two countries that really have inter-continental weapons, it is very important on this exact point, to obtain the signature and then, above all, the ratification of a certain number of parliaments of the treaty concerning the non proliferation of atomic weapons. It is good that negotiations take place and that they take place between partners to whom we have given a special responsibility. I have said a special responsibility in nuclear matters, because we have given them those responsibilities mainly in the intercontinental field, some sort of privilege and, consequently, responsibility.

And do not forget that we have said to several nations, to those super powers, that the non-proliferation treaty would not exist five years from now, if the nations that had agreed to the non-proliferation treaty, to not have atomic weapons in their countries, unless they saw a progress in the disarmament of atomic weapons of the large powers. We have to be logical and admit that that negotiation has taken place between those having inter continental atomic weapons.

As to the remainder and with respect to the problem of regional disarmament, especially the disarmament between the communist world and the democratic world in Europe, because that is the site where the big confrontation existed during the past 50 years, it seems to be clear to the whole world, and President Nixon, like the Alliance nations, has said, that that was a problem for all of the European nations. And I should like to draw your attention to the day on which there will be an agreement on the reduction of weapons. It is clear that this will not be a negotiation between the United States and Russia alone, but that it will be a negotiation in which the European nations and Canada, and Canada and the European nations that are Alliance members will participate, but also

eight or nine non-aligned European nations, meaning neutral nations, not participating in any alliance. As you know, that starts with Finland, to continue with Sweden, then down to Austria and on to Switzerland, to Yugoslavia, and a relative non-alignment of Albania, on to Spain to go north to Ireland. I have just mentioned the European countries not belonging to either of the two groups.

Consequently, it is clear that it is not up to one single super power to persuade the European nations to reduce their armament, but all the European countries with the United States, with Russia, with Canada, that must settle this problem together. Consequently, I believe that President Nixon is not planning to refer the negotiation to NATO, and it seems to me that he already has made several statements in that sense. Will NATO then be the negotiator, in five years, for the West with the nations belonging to the Warsaw Pact? On that point I must say that we have not yet reached agreement. I am not sure that a negotiation on the reduction of armaments in Europe or in the Atlantic area and in the area of the Warsaw Pact should be conducted through the channel of the Secretariat General of the Alliance. I am certain that the large countries will be associated with it, as the result of the fatality of things. Will all nations participate in a global conference? It is likely that this would be preceded by many steps, approaches, if I may express myself in that manner. But, I repeat, NATO will not be absent from that great event, nor will the countries belonging to the Warsaw Pact be absent, and it is clearly understood that the hopes of countries like ours and its problems which affect us all, will not be dealt with in our absence.

[English]

The Chairman: Mr. Thompson?

Mr. Thompson (Red Deer): Mr. Minister, I would like to come back to the economic side of the picture for just a few moments. You have already answered my question in regard to Great Britain's admittance into the EEC, but what is the view of Belgium towards bringing in the extra nations—the other seven—or even to enlarging the economic community to include Canada or the United States, or on the other side towards being able to bring in some of the Warsaw Pact countries into the economic détente that is probably more feasible than the military as a means of breaking through to the larger objective. What is the view of your government in this regard and

the possibility of expanding the economic aspect of NATO out of European co-operation or North Atlantic co-operation?

[Translation]

Mr. Harmel: On that subject I should like to answer as follows. I believe that I must give two different answers with respect to the countries from the East and with respect to the economically highly developed countries, like your country and like the United States, and like some European countries belonging to the EFTA area.

If you do not mind, I will begin with the countries of the East. I believe that I must advise you that until a short time ago, the Common Market as such, appeared in the panoply of the Western arms against the Communist world, as an additional Trojan horse. I mean that the Communist world was extremely hostile. I am forced to observe that for some time now, the success of the Common Market has caused several of these countries to change their point of view. Several of these East European countries are now taking a great interest in the success, if I may express myself in that manner, of the Common Market and I will quote as evidence, so to speak, the requests on the part of Yugoslavia to enter into associate relations, or at any rate, into relations of privileged commercial status with the Common Market.

But other East European countries are expressing the same interest, although still somewhat embarrassed, because things and the change have been too recent. With respect to the relations between the economically integrated nucleus and the countries of Eastern Europe, there is little else for the time being, than the unified commercial system that still must be worked out be the Common Market. Until now, we are living, in the Common Market countries, with individual bilateral commercial agreements, if you please, with the countries of Eastern Europe. And these commercial agreements have all multiplied during the last years. I am unable to speak for other countries, but we actually have commercial agreements of Belgium, the UEBL, Belgian-Luxembourg Economic Union, and often also with the Netherlands, with almost every country in Eastern Europe.

The volume of economic exchanges, and you are correct in saying that that is where the easing of the situation starts, is increasing. There is obviously always the problem of the balance of payments, which is always

very difficult to solve for those countries, because they have few products which they are able to import in our country that are of interest, and the reverse is only too true, but, nevertheless, the curve is growing. We have tried to improve the situation on a multi-lateral basis and the Economic Commission of the United Nations for Europe, at Geneva, has tried for the past two years to thaw relations between the countries from the East and the Common Market European countries. Therefore, countries with a State-controlled economy and countries with a market economy brought their points of view closer together, and only since then, during the past one year and one half, has the Geneva Commission been able to establish freer relations, if I may express myself in that manner, on a multi-lateral basis.

And I believe, to finish, that this is, therefore, a very slow process, this getting together of economies that are so different in their system and principle, but that that getting together is making progress, first on a bilateral basis and then by the start of multilateral ways.

With respect to the EFTA countries, and *a fortiori* with respect to the more developed countries, yours and the United States, you know that the relations between the Common Market and these countries are expressed in agreements that are not always easy in their execution, especially with respect to the Kennedy Round agreements. Progress was made, last year and, with respect to the EFTA area exclusively, the West German federal republic had proposed, and France had also proposed—but in a slightly different tone—that commercial agreements be studied to lower the privileged tariffs, with respect to other European countries. And that proposal is still being studied in the Common Market. We know that the Common Market is not a closed entity and that, consequently, the more it develops its economic potential the more it will have to open up for the economies of highly developed countries and also for the economy of underdeveloped countries or countries developed to a lesser extent than our own.

And I cannot tell you at this point how far that will go, let us say, that expansion of the privileged commercial relations of the Common Market with countries. I just stated to you how we are standing with respect to the countries of the East and I just told you that with respect to the EFTA countries a

proposal had been made by the Federal Republic for privileged commercial agreements, for a lowering of the tariff that would have started with approximately 30 per cent; and with respect to the United States, we are still within the limits of the Kennedy Round.

[English]

An hon. Member: "Would you expect the application for associate status from some of the other countries to be approved by the EEC?"

[Translation]

Mr. Harmel: That should be higher, because Norway and Denmark have already applied and Ireland; they have applied not for the status of associates but for the status of adherence, with Great Britain. You know, therefore, the three systems that are possible, meaning: joining, which means being full members associating, which is a status that will normally lead to a term membership and then there are the privileged commercial agreements which are specific in nature.

[English]

The Chairman: Mr. Buchanan?

Mr. Buchanan: Mr. Minister. One of the areas which is giving consideration is that of whether or not there are useful alternative roles that Canada could be playing within NATO and I realize that you would not want to tell us what we should be doing but I wondered from your experience if you would be prepared to suggest some other credible roles that Canada might possibly play within the NATO framework?

[Translation]

Mr. Harmel: I do not think your delegation demands to play a full membership role in the general NATO effort to develop and maintain its defence potential, but to considerably increase its diplomatic power. And within that framework, it is clear that the presence, the wisdom and the independence of Canada, and its preferred position, if I may say so, in certain respects, because it is looking from a somewhat greater distance at the difficulties we are having in the building of a European integration, it is clear that Canada can play an extremely important role, somewhat because of its distance, and consequently, because of its perspective.

But in this problem of easing, in the problem of an intensification of the relations of peaceful coexistence between countries of differing regimes, I am well aware of the psy-

chological changes that are taking place in your country in that respect, as in most of the other countries, and we need your psychological support and your moral support for that action.

The Chairman: Mr. Marceau?

Mr. Marceau: Sir, there are four points on which I should like to have your opinion. Canada can be compared to a certain extent to Belgium, in that it is, let us say, a small power. Do you sincerely believe that Canada is playing truly a role within NATO or that it is rather a symbolic role? Does our country, like Belgium, really participate in NATO? In other words, is it important?

Second question. We have been told in France, and in rather clear terms, that a conventional force is an absurd thing. Do you truly believe and is it your accepted point of view, do you believe that in case of war were to be started, that it would be a conventional war at the beginning, or a nuclear war?

Third question. Do not believe that Canada is playing a different role within NATO, in your opinion, than the role the United States is playing, or that these roles blend into each other? And finally, what do you think of the Berlin question? Do you believe that the situation at present is better under the circumstances, or that the unification of Berlin would be a cause for additional problems, or an occasion for an easing?

Mr. Harmel: I thank you for the four questions. Belgium is truly a small power. I cannot compare it with Canada, which is, in our opinion a nation for which we have a great respect, due to its size and, I repeat, due to the role of elder brother which it has played twice in our national history. But you are asking me if the small powers, like ours, and the big powers, like yours, are able to truly play a role and not a symbolic role within NATO. Sir, I can only answer for Belgium and for what I have seen. I have the privilege of having on my left the ambassador de Staercke, who knows the whole history of NATO since its beginning. I am only acquainted with the last three years, and I would contradict myself if I were mistaken.

I have the maybe naive impression, but I do not believe that it is so, that the small nations have been able to play a role almost equal to the role of the big powers in the whole development of the last three years, especially around the twentieth anniversary of the

Alliance, meaning especially the anniversary of this year, and notably in the effect upon the future of the Alliance and in the strengthening of the diplomatic and political pillar within the Alliance, and also especially in the orientation of the efforts of the Alliance toward an easing of the situation.

I do not know whether in saying so, we are expressing ourselves with pride or whether we are expressing ourselves with immodesty, but what I am saying for Belgium I am saying for my colleagues of the Foreign Affairs of Canada whom I have seen successively in the person of Mr. Martin and Mr. Sharp, whom I have seen act within NATO. And I wish to testify that, never at any time, did I have the impression that we had different thoughts on the goals we were pursuing.

I, therefore, confirm that during the last three years we have not at all had the impression to be followers; on the contrary, we have had the impression sometimes of running ahead of the party, of which Mr. Ambassador de Staercke may have been the victim at times. Consequently, we have at times felt that we were not at all being taken in tow. This being the case, it represents the answer to your first question.

You said that they told you in France that a conventional force was something absurd, because there would be no further conventional war and that it would be a nuclear war. Gentlemen, that is exactly the problem of strategy which has been studied by the Alliance during the last years, as well as of the choice to be made between the immediate use of the atomic bomb as soon as a confrontation starts between countries, or, on the contrary, the idea one may have that there may be at the start a conventional action that might run the risk of rapidly changing into a nuclear action, if we are not successful in halting the fighting where it has started. I should like to tell you that we have been witnesses in a few wars or a few confrontations lately. We have seen in Korea, in Vietnam and now, unfortunately in the Middle East and a great conflict within Nigeria-Biafra, and we are witnessing confrontations on the Amour river, and I do not observe that in any of these situations nuclear weapons have been used at the start. That is all I am able to tell you, and, at any rate, the system which we have chosen is a system in which conventional weapons are used to the largest extent possible, in order not to proceed with the

destruction of the world as from the first minute.

In the third place; is Canada playing a different role from the role the United States is playing within NATO, or does it blend with the role of the United States? Gentlemen, let me say that you have, it seems to me, to play a role that is quite different from the role of the United States. You are never mistaken for the United States with respect to your person and I may be saying something that does not please you or that does please you, I am telling you the truth. The truth is that you are a nation with defence problems of the North American continent, which defence problems of the North American continent are common problems. And we readily recognize that they have grown during the last years, not to say during the last months, and it is clear that when your Atlantic defence is assured, there still remains the Pacific defence. That is another problem in which you have specific military solidarities, or rather in which you have known and legitimate military solidarities with the United States.

But within NATO, the position of Canada appears to resemble, as far as I can see, the position of the biggest nations that are not the United States. And the role which I see the Foreign Affairs Ministers of Canada play in the Atlantic Council or by the Ministers of the National Defence, if you permit is comparable to the role played by the Minister of Great Britain, or of the Federal Republic or of nations of that size. And when I say, play, I mean a role of authority and it is clear that when Canada does not agree, much pain will be taken to find a point of view that is common to all the countries.

Finally, you asked me a question on Berlin. You know that each time when there is a war, the seed for the following war is left behind. The previous time it was Danzig; this time it was Berlin. There is always a corridor, there is always an isolated city, there is always an impossible situation and that impossible situation was this time the one we know. Do you believe that the Berlin problem will be solved before the whole German problem, meaning it is part of the whole problem of peace with Germany, and of our philosophy of easing, we have always said what I am going to summarize:

1. During the first phase we must start with a coexistence, as you have just said, an eco-

nomic, technological and cultural coexistence, in short, at an extremely multiple level of relations that may be increased and decreased depending upon the possibilities. We must try to move forward and, as I have just said, we have made quite a bit of progress. It seems to us that the second test must be the military easing, meaning the beginning of a reciprocal and parallel reduction of arms. When a certain number of results have been achieved in the economical-technological-cultural field, followed by results in the field of disarmament, we can then start with the third phase, which is the phase of the political problem. To try to put the cart before the horse is an utopia.

The Chairman: Mr. Allmand?

Mr. Allmand: What do you think is the significance for NATO of the statement made in Budapest, this week? Do you believe that it is a new sign of liberalization in the Warsaw Pact or of closer ties between Russia and its partners?

Mr. Harmel: There is a sentence in that document—I do not have the document before me, but I have read it again this morning for the Ministers Council—there is a sentence which is very characteristic and which surely can be used as an argument when Russia is questioned concerning the Breshnev doctrine.

In fact, the doctrine according to which the independence of the countries must be subordinated to the benefit of the socialist community, seems to be contradicted by a sentence in that document which lays the foundation for the relations between the European countries concerning the respect for their independence and their free decision. That is, therefore, a controversial element, if I may express myself in that matter, which can certainly be used to try to cancel what was unacceptable in the position of the Breshnev doctrine.

2. Our analysis is not finished. It will only be finished when the ambassador de Staercke will have told us what have been the results of the discussions between the allied countries, and we are waiting to learn also the point of view of Ottawa. Our first appreciation was that the tone had changed greatly, with respect to the Federal Republic, when it is compared with the Bucharest statement of 1966 to which this document refers. The tone has changed very much and the ambassador for peace, who is present, said in his analysis:

in comparing the 1966 and 1969 texts, there is obviously a desire to be tactful and to soften the brutal accusations which the 1966 documents still contained. Basically there is no change with respect to the Federal Republic. They want a recognition of the Oder-Neisse frontier. They want equal recognition of the Federal Republic and of the DDR as nations. They want to divide Germany; this has still been said, but they have said it politely.

Finally, they are proposing a conference on European safety. We have said that, as far as we are concerned, conferences on European safety would have been useful a long time ago, when we would have been sure that they could succeed, but that we should avoid like the plague the getting together of a large number of persons in order to come only to the conclusion that there are only disagreements and no single point of agreement. And that, consequently, the best test would be to prepare them on the basis of what the Atlantic Council has advised, especially in the field of a reduction in regional armaments in Europe, and that texts should be prepared having a great consistency. And, consequently, if you ask us if this is a sign of a liberalization in the Warsaw Pact, I will answer that I think this declaration to be, on the contrary, an admirable screen of the divisions and difficulties which they have experienced among themselves. It is much easier to make a showing of their good understandings when addressing the West, than by taking positions concerning the identity of the communist or socialist convictions of the various countries. And I believe that in that respect this is not necessarily the liberalization of the Warsaw Pact, but that it is an indication of the fact that they must show a united front on a point, on the point of the easing.

An hon. Member: You said earlier, I believe, that you would regret it if Canada withdrew its forces from NATO or seriously reduced them. In your opinion, if that did happen, is it likely that Belgium and other western European countries which are so close to Russia would reduce theirs? Or is it more likely that, in your opinion, that they would increase them to fill the gap? And the second completely unrelated question is this. In your experience, are the important political and military decisions in NATO made in effect by the United States, or are they the result of co-operative decision making? I ask this latter question because, as you know, people in our country are sometimes concerned about the

degree of dependency of Canada upon the United States.

Mr. Harmel: Excuse me again. Well, as to your two questions I would like to answer quite candidly, Mr. Ambassador.

You asked if, in our opinion, when Canada withdraws or considerably decreases its forces, Belgium and the other countries would increase theirs or if, to the contrary, they would be discouraged? My candid answer is to tell you that we have never thought of it, because we do not think that this may happen.

I have said it under different conditions than two years ago, when the Head of the French Nation said that he would remain within the Alliance when he pulled his peace-time forces out. The other fourteen countries, and I must remind you that Canada is among those fourteen, decided to remain integrated and to maintain their effort *a fortiori*, because it is obvious that on the day the Alliance becomes a loosely woven entity and the countries are beginning to count on the others to increase their forces, to assure their own defense and also their defense in the case of a crisis, it is obvious that that loosely woven connection will be much less sure than the tightly knit entity.

Second question: Do the United States make important military decisions in cooperation with the other countries; there is truly a worry in all the countries concerning a real dependence.

Gentlemen, that is one of the reasons why the United States has asked us on several occasions to better identify the answers of the other countries, other than the United States, in such a manner that Europe, and I hope Canada, might have one single voice to express their needs which would have a greater weight in the Alliance than if there were one super power and other powers having different forces, but that speak different languages. And I, therefore, believe that it all depends upon the cohesion within the Alliance of medium and small countries.

For the rest I am going to turn to the ambassador de Staercke to ask him if he truly has the impression of, as we say in my country, being minorized very frequently. He does not give me the impression of being distressed. He never gave the impression that he had inferior complexes, but if he has a confession to make, I will gladly let him

speak. If he really could unburden himself to us, I believe that it would do him good, if such were the case.

Ambassador Staercke: That is not the case. On the contrary, I have the impression that sometimes the United States are distressed, because we sometimes take positions, with respect to them, that are quite distinct within the Atlantic Council.

Mr. Harmel: I believe that what Mr. de Staercke has said to you and what Mr. Campbell would tell you, who are with the Alliance all the time, is very important, believe me.

We are there twice per year, in the sessions of the Ministers Council, and we see the preparatory documents and the rest, but the daily life is illustrated by ambassador de Staercke. But I can confirm that there is the same feeling with respect to the Ministers Council.

[English]

The Chairman: Thank you very much, Mr. Minister. I believe that brings the period of questioning to an end and before turning the meeting back to His Excellency, I would just like to thank you, on behalf of all the members of our Committee.

[Translation]

Mr. Harmel: I would like to say just one word, gentlemen. I will not have the privilege of seeing you again during your visit. I truly wish to tell you how highly we have estimated, my colleagues and I, your visit and your frank questions, which, I hope, have been answered equally frankly.

I would like to tell you what has not been said at the beginning, because I had hoped that the circumstances of the debate would permit me to do so. I would like to say, first of all, that I thank you for your appreciation addressed to the Foreign Affairs Department. They are particularly appreciated by the Secretary General of the Department, Ambassador Vave, who is sitting here on my right, as well as by the Director General of policies, Baron van der Straaten, who is here, and by ambassador Forthomme.

The Chairman: I would like to thank Ambassador Tremblay for having arranged this meeting. I would also like to thank the Foreign Ministry for having made available this committee room with its excellent facilities. I would like to thank officials of the Foreign Affairs Department for being present, and particularly Mr. Harmel for having answered our questions so fully and so helpfully. Thank you.
